Montserrat, is. of the Brit. W. Indies, one of the presidencies of the Leeward Is.; it lies in lat. 16° 45' N. and long. 61° W., and has an area of 32 sq. m. and a pop. of 11,000. It is entirely volcanic, and has sev. groups of mts., the highest elevation being the Soufrière (3000 ft.) in the S. Forest clothes the summits of the main ranges and streams are plentiful; but the land of the N. hills is treeless and dry. The climate is comparatively cool and healthy, and the mean ann. temp. is 78° F., and the rainfall from 40 to 80 in. The cultivation of sea is. cotton is the staple industry, and over 4000 ac. are under this crop. M. is the largest producer of this commodity in the Brit. W. Indies, its output just before the Second World War being nearly 700,000 lb., the next best being that of St. Vincent, 420,000 lb. The cultivation of limes, begun in 1852, is the next most important industry, the is.'s

lime-juice cordial being very well known. M. has an executive and a legislative council, over which a commissioner presides, in the absence of the governor of the Leeward Is. Plymouth, the cap. (pop. 2000), is on the S.W. coast, and has an open roadstead. The is. was once strongly fortified, and the ruins of many forts and batteries, including Fort Barrington and Fort St. George, are interesting places for tourist visits. Beautiful tropical scenery repays a drive across the is. to Harris vil. 4 m. from Plymouth, in the hills near the middle of the is. M. was discovered by Columbus in 1493, on his second voyage, and named by him after a mt. near Barcelona, which he thought it resembled. It was first colonised by the Eng. under Sir Thomas Warner in 1632, though it is probable that D'Esnambuc, the first Fr. coloniser in the W. Indies, effected a short-lived settlement there in 1629. It was certainly captured by the Fr. in 1664, and probably at one time (c. 1665) attacked by De Ruyter; but the early records of the is. were destroyed in a disastrous fire in 1724, so that the facts are somewhat obscure. It is establ., however, that Warner's colonists were a body of Irish people who had been causing trouble in St. Kitt's with other Rom. Catholics. Even to this day the people of M. speak with an Irish brogue. In 1667 the Fr. under de la Barre suddenly appeared off the coast with a large force of ships and an army of 3000. The Eng. offered a stout resistance, but most of the Irish, who greatly outnumbered them, went over to the enemy, and the is. was captured. In 1668 the is. was restored to England, and remained in Eng. hands until 1782, in which fateful year of Brit. W. Indian hist. it again surrendered, together with a number of other Brit. is., to the famous and gallant Marquis de Bouillé. Under the treaty of Versailles in the following year, however, it was again restored. Rodney's great naval victory ensuring that result (see SAINTS, BATTLE OF THE). Since then it has remained a Brit. colony. See G. Mannington, *The West Indies*, 1930, and A. M. Albareda, *Histoire de Montserrat*, 1931.

Mont-sur-Marchienne, tn. in the prov. of Hainaut, Belgium, 3 m. S.W. of Charleroi. It has coal-mines, coke-plants, quarries of freestone, and grft, plating mills, foundries, and manufs. of machinery. Pop. 11,000.

Montucla, Jean Etienne (1725-99), Fr. mathematician, studied classics and mathematics at the Jesuits' college of Lyons, his native tn. In 1758 he pub. his great *Histoire des mathématiques*, afterwards completed by Lalande, and twenty years later he issued a much-improved ed. of Ozanam's *Recréations mathématiques* (4 vols.).

Monumenta ecclesiae liturgica, ed. of old liturgical texts begun in Paris by the Benedictines F. Cabrol and H. Leclercq in 1902.

Monumental Brasses are plates engraved with an inscription, figure, or similar symbol of a departed person of whom they serve as memorials. Though

invariably spoken of as brasses, the material from which the plates are made is not brass at all. It was anciently known as latten, and consists of an alloy of about three-fifths copper, three-tenths zinc, and one-tenth lead and tin. Brasses probably began to be used as memorials in England about the beginning of the thirteenth century, but it was not until the reign of Edward I. that they became common. The earliest brass remaining, that of Sir John Daubernoun (1277) in the church of Stoke D'Abernon, Surrey, belongs to this reign. The art of brass-making reached its height in the period 1372-99. There are slight declines and revivals until the time of James I., when the art rapidly declined, to disappear finally in the eighteenth century. See *Transactions of the Monumental Brass Society* (in progress) and M. Stephenson, *Monumental Brasses in the British Isles*, 1926.

Monuments (Lat. *monumentum*, memorial), any memorial of a durable nature erected to perpetuate the memory of a great person or event.

Monuments, Ancient. The Ministry of Works is empowered under the Ancient Monuments Act, 1931, and under the Consolidation and Amendment Act, 1913, to grant state protection to such M. as are of national importance (and certain others). Lists of the M. are pub. from time to time by H.M. Stationery Office, and the interest of the owners and others is thus enlisted. The Acts also minimise the dangers of unsuitable treatment and of exploration by unqualified persons. Much has been done along these lines in recent years, and public interest in anct. remains of all kinds is growing. The ministry, through its inspectorate of A. M. (in England, Scotland, and Wales), is able to give expert advice on treatment, and in limited cases guardianship is accepted and preservation work carried out at the cost of the state. A few M. are in the custody of the ministry by deed of gift, while others are the property of the Crown as such. Some buildings in occupation are also in charge of the ministry, e.g. the Banqueting Hall and the Horse Guards, Whitehall, London; the Royal Hospital, Chelsea; the Royal Naval College, Greenwich; Hampton Court Palace; Holyroodhouse, Edinburgh; and Dunblane and Glasgow Cathedrals.

In 1938 the list included more than 5500 M. of all kinds, ranging in date from prehistoric camps, megaliths, and tumuli, to the remains of castles, monastic houses, bridges, and even relatively modern buildings. It provides a most useful indication of M. of all kinds in Great Britain. It should be noted that a structure occupied as a dwelling other than by a caretaker cannot in general receive protection under the Acts.

For more than thirty years the Royal Commission on Historical M. has been engaged in making an exhaustive and authoritative first-hand survey of the anct. and historical M. and constructions yet remaining in Great Britain. The scope of the survey extends from pre-

historic times down to the beginning of the eighteenth century, and it embraces as far as is possible every object that may throw light on the past life of the country. In addition therefore to castles, churches, monastic buildings, manor houses, and cottages, a full description is also given of prehistoric camps, burial places, and to other notable field antiquities. The inventories, pub. by H. M. Stationery Office, are magnificently illustrated by original photographs. They cover England, Scotland, and Wales.

Since its inception in 1900 the *Victoria County History*, a large series of vols. in which one or more deal with each co., has pub. information about A. M. While the earlier vols. are not altogether satisfactory, the most recent, pub. under the auspices of the Institute of Historical Research, include authentic period studies, as well as a detailed topographical record. In this hist. the cos. of Berkshire, Devon, Somerset, Hereford, Stafford, Dorset, Cornwall, Gloucester, Shropshire, Worcester, London, Middlesex, Surrey, Kent, Buckingham, Oxford, Hertford, Cambridge, Norfolk, Suffolk, Essex, Lancaster, York, Durham, and Sussex have received attention.

A. M. are recorded on the gov. ordnance survey maps. There are special period maps, e.g. Rom. Britain, Britain in the Dark Ages, Neolithic Wessex, Trent Basin, Celtic earthworks of Salisbury Plain, which show the distribution and geographical setting of various classes of M. On the general maps M. may be recognised by the lettering used to describe them: all prehistoric remains (i.e. before A.D. 43) are lettered in O.E.; Rom. remains (A.D. 43 to A.D. 420) are in Egyptian characters; while Ger. text is used for Saxon and medieval remains down to A.D. 1700. The following are the officially accepted terms used on the maps to denote archaeological remains: long barrow (where the barrow is of earth); long cairn (where the barrow is chiefly of stones); horned cairn (a Scottish variant); burial chamber (this replaces the old-fashioned terms of dolmen and cromlech); standing stone; stone circle; stone avenue; tumulus (burial mound); camp; earthwork; Rom. road (course of, or probable course of, castle mound. Where possible the age is indicated as palaeolithic, prehistoric, Romano-Brit., Rom., Saxon, or medieval, and in cases of doubt the term 'ancient' is used.

Among the most famous A. M. in Britain are Hadrian's Wall; Stonehenge; Chedworth Rom. Villa; Maiden Castle Camp, Dorchester; Chichester Market Cross; and Netley, Tintern, Fountains, and Rievaulx Abbeys.

In the U.S.A. certain A. M. are protected by regulations which vary from state to state. The sites of some of the famous battlefields of the War of Independence and of the Amer. civil war are vested in historical and archaeological societies. A list of public M. is issued in the Statistical Abstract of the Dept. of Commerce. In France the Ministry of Fine Arts normally assumes responsi-

bility for the care of national M. where there is risk of their neglect. In pre-war Germany great care was taken in the preservation of A. M. New housing schemes were not allowed to interfere with structures of interest; landowners were compensated by the state for loss of their land, while owners of M. of importance who were not able to maintain them in proper condition received financial aid from the gov. There was a wide education in the appreciation of such remains; even the workmen on housing sites were exhorted by propaganda posters.

Monza, tn. in the prov. and 10 m. N.N.E. of the city of Milan, Lombardy, Italy. The cathedral of San Giovanni, founded by Queen Theodelinda in 595 and rebuilt in the fourteenth century, contains the famous iron crown of Lombardy. There are manufs. of silk, woollen and leather goods, and hats. King Humbert of Italy was assassinated here in July 1900. Pop. 45,000.

Monzonite (derived from Mt. Monzoni, Tyrol, where it was discovered), plutonic igneous mineral, intermediate in chemical composition between the diorites and syenites. It is a grey-green compact mineral, resembling hornstone. Hardness, 6; sp. gr., 3; translucent in thin fragments. Composition: silica, 52.60; alumina, 17.10; protoxide of iron, 9.0; magnesia, 2.10; lime, 9.65; soda, 6.60; potash, 1.90; water, 1.50; -100.45. In Argyll olivine Ms. are found of an unusual type, consisting of olivine and green aegirine, as well as orthoclase and plagioclase feldspar, which latter occur in all M.

Moody, Dwight Lyman (1837-99), Amer. evangelist, b. at Northfield, Massachusetts, U.S.A.; opened a Sunday school in Chicago in 1855, which subsequently developed into the Chicago Avenue Church. After controlling the Young Men's Christian Association there for four years (1865-69) he was joined by Ira David Sankey. Together they wrote the Moody and Sankey 'gospel hymns', which were so characteristic a feature of their revivalist meetings both in England (1873, 1881, and 1892) and America. See life by W. R. Moody, 1930.

Moody, William Vaughan (1869-1910), Amer. poet and playwright, b. at Spencer, Indiana; graduated at Harvard Univ., 1893. He was for some time asst-tantr. prof. of rhetoric at the univ. of Chicago. Among his works are *A Masque of Judgment* (1900); *Poems* (1901); *History of English Literature* (1907); *The Great Divide* (1907), a play which caused a great sensation; and *The Faith Healer* (1909).

Mooi River Dorp, see POTCHERSTROOM. Mooltan, see MULTAN.

Moon, William (1818-94), Eng. inventor of M.'s embossed type for the blind, b. in Kent. Becoming totally blind in 1840 he set at work producing an embossed type for those so afflicted, and in 1845 brought out his system, which differed from former systems in almost

entirely discarding contractions. His first pub., *The Last Days of Polycarp*, appeared in 1847, followed by *The Last Hours of Cranmer* and other books of devotion. He also issued an ed. of the Bible, and extended his system to foreign languages, beginning with Irish and Chinese. He was made a fellow of the Royal Geographical Society in 1852, and of the Society of Arts in 1859.

Moon, Mountains of the. From classical times Africa, with its geography hidden beyond the Sahara, has been the source of mythical legends, some based on truth. The sources of the Nile remained undiscovered till 1861, when Capt. Speke explored the region S. of Lake Victoria Nyanza. Ptolemy and all other geographers had placed the source in the 'mts. of the M.', and these were mapped E. and W. in equatorial Africa. There was nothing but rumour and legend, based probably on information 'passed down' among African tribes to Egypt. Capt. Speke considered the crescent of mts. explored by him N. of Lake Tanganyika to be part of them. Dr. Beke considered them to be a N. and S. extension of the Abyssinian plateau. They are now generally identified with the group round Mts. Kenya and Kilimanjaro, or the group round Ruwenzori further W. The latter is more probably correct.

Moonstone, variety of orthoclase, yielding moon-like white reflections. The best specimens, which are used in jewellery, are found in Ceylon.

Moon, The, satellite of the earth, was observed for the first time through a telescope by Galileo in 1610. Galileo came to the conclusion that it was a body that resembled the earth in many respects. The M. is generally believed to have been formed from the earth (see under **ASTRONOMY**), but the manner of its origin is still unsettled. Its real diameter is 2160 m., rather more than a fourth of that of its parent, while its mass is 7.27×10^{19} tons, about an eightieth of that of the earth. It follows that the gravitational attraction at a point on the surface of the M. is only a sixth of the gravitational attraction at a point on the surface of the earth and, as a result, the M. has no atmosphere. Further, there is no evidence of the presence of water on the M., either as vapour, liquid, or solid. These two facts taken together imply that life as we know it does not and cannot exist on the M. As will be seen from the astronomical details given below the M. rotates on its axis in about twenty-seven days; and that any point of the M. is in darkness for nearly fifteen days, when it emerges to enjoy fifteen days' bright sunshine. These alternations of long nights and days mean that the variations of temp. on the surface of the M. are enormous. The nature of its surface and the absence of any protecting atmosphere make for intensely cold 'nights' and unbearably hot 'days'.

Viewed through a telescope of moderate magnifying power the rotundity of the M. is well shown and its surface features are readily distinguished. The 'man in the M.' is seen to consist of enormous volcanic

craters and mt. ranges, whose details are made so clear when viewed through the most powerful of modern telescopes that their heights have been computed. Magnificent photographs have been obtained by these telescopes that bring the M. to a virtual distance of 250 m. from the earth, and the details of its surface can be most easily seen sev. days before or after full M. when the sun's light falls obliquely on its surface, casting shadows of its mt. ranges that show up in bold relief. The surface is seen to be broken and uneven. Large shallow depressions, named *maria* by Galileo, the dull patches visible to the

F.N.A.

THE SURFACE OF THE MOON

The photograph shows several ranges of mountains and craters, some of which are over 100 miles in diameter.

naked eye, mts., valleys, plains, are to be seen; but evidences of volcanic action, in the form of volcanoes, cracks, and fissures, far transcending anything of the kind on the earth, form the most striking feature. Over 30,000 craters, some of over 100 m. diameter, are grouped and ranged on the side of the M. that we can see. If, as some astronomers believe, these craters are due to volcanic action, we need not be surprised to find that they are much larger than terrestrial craters, for, as mentioned above, the force of gravity on the M. is only a sixth of that on the earth. Nevertheless it is true that it is difficult to account for their enormous size on these grounds alone. The volcanic theory of their origin is, however, more acceptable than the alternative theory that they were caused by external forces such as meteoric bombardment. Other features of the M.'s surface are rills (deep crooked valleys).

clefts of unknown depth, some half a mile wide and sev. hundred miles long; rays, light coloured and brilliant streaks, radiating from the craters. Ten ranges of mts. are noted, and heights are estimated by micrometer measurements of the shadows cast by the light from the sun. The Leibnitz range is the highest, its culminating peak being some 33,000 ft. above the neighbouring valley. Names have been given to each and all of the craters, mts., etc., on the M., and its surface has now been mapped carefully.

The M. revolves round the earth in a period of 27 days, 7 hrs., 43 min., $11\frac{1}{2}$ sec., but eccentricity of orbit and 'perturbations' cause this to vary by as much as 3 hrs. The ordinary month is its synodic revolution period of mean value 29.53 days—the period from one phase to the same phase again.

Apparent Motions. from E. to W., rising and setting 51 min. (mean, varying greatly) later each day; the 'circle' is in a plane inclined to the equator from $28^{\circ} 6'$ to $18^{\circ} 3'$; during the month its declination varies from $+28^{\circ} 6'$ to $-28^{\circ} 6'$; this variation gradually decreases over a period of $9\frac{1}{2}$ years to $-18^{\circ} 3'$, and causes great variations in retardation of rising and setting, most striking when the M. is at full. When the full M. occurs near the time of autumnal equinox, i.e. when it is near the First Point of Aries, it rises for some nights at much the same time and 'coasts along' the horizon. This is the harvest M., the full M. nearest to the autumnal equinox. The next full M. is the hunter's M. The M. revolves around the earth from W. to E., moving on the average more than $12\frac{1}{2}$ a day. Hence each night our satellite is further E. than on the previous night at the same time, which accounts for the retardation in the rising of the M.

True Motions.—(1) Revolution in an orbit round the earth, the shape of which is found from the variation in the apparent diameter of the M., ranging from $29' 21''$ to $33' 30''$; it is elliptical with an eccentricity to $\frac{1}{4}$; the line of the apsides (q.e.) moves round eastwards in about nine years. The mean distance of the M. from the earth is 238,857 m. (maximum, 252,972 m.; minimum, 221,614 m.); orbital velocity, 2288 m.p.h.; mean horizontal parallax, $57' 2''$, giving that the earth at the M.'s surface, 17 17. (2) Axial rotation in exactly the same time as the period of sidereal revolution whereby it presents always the same aspect to us. Actually we are enabled to see on the whole 50 per cent of the total surface, 41 per cent constantly turned towards us, 18 per cent visible at times. This is due to three librations. The first arises from the inclination of the M.'s axis to its orbit, about $83\frac{1}{4}^{\circ}$, as a result of which the N. and S. poles are alternately turned towards and from the earth. This libration in lat. enables us to see about $6\frac{1}{2}^{\circ}$ beyond the M.'s N. and S. poles at different times. The second—libration in long.—is due to the fact that the M.'s rotation in a sidereal month does not keep in exact step with its revolution throughout the month, though they coincide at the end.

Consequently we are able to see about $7\frac{1}{2}^{\circ}$ in long. around each edge of the M. more than we could see without this libration. The third—the diurnal libration—is produced by the earth's rotation. We see the M. from slightly different directions from hour to hour and hence at one time observe objects on her surface, just round the rim on the other side, which cannot be seen at another time, and in fact when the M. is rising we see $57'$ round the W. edge and when setting $57'$ round the E. edge.

Phases.—These are due to the varying angular distance from the sun. At new M. it is zero; at full, 180° ; half M., 90° , the positions being called conjunction, opposition, and quadrature respectively. The accompanying diagram shows these and the phases. The M. is shown on its orbit viewed from outside the whole system, while the outer series shows the views, for corresponding positions, from the earth. It will be observed that (1) the 'horns' are always turned from the sun; (2) the waxing M. has its right side illuminated, the waning M. its left. When less than half of the illuminated side is seen it is called the *crescent*, when more, the *gibbous* M.

THE PHASES OF THE MOON

The inner circle shows the moon as seen from the earth.

Light of the full M. $\frac{1}{2}$ of the direct rays of the sun; *albedo* (q.v.), 0.074—about the reflecting power of light-coloured sandstone, but there are great variations.

Lunar Theory (i.e. that branch of lunar study which is concerned with the motions of the M.) is not yet perfect. The 'perturbations' or irregularities of movement due to disturbing influences are not fully accounted for or accurately predictable by the theory of gravitational attraction (see Bibliography). The lunar theory does not form a well-defined body of doctrine, as do other branches of mathematical science, but is in effect a series of researches over more than twenty centuries which are hardly susceptible of being summarised into a consistent whole. This arises from the fact that no one method or system has yet been formulated by which

all the inherent difficulties can be overcome; and each investigator, who has made an appreciable advance on his predecessors, has found himself compelled to approach the subject from a new point of view and to devise a method suited to his special object.

The most up to date and authoritative work on this subject is that of Prof. E. W. Brown of Yale Univ. His *Tables of the Moon* take into account about separate terms and has saved computers much time and labour.

The Future of the Moon.—The influences of the M. on the earth, besides magnetic disturbances, are comprised in tides (q.v.), that are principally caused by the M. The effect of the tidal friction between the oceans and the solid earth is to slow down the earth's rotation so that our days are gradually lengthening. Ultimately two things will happen (provided always that no comet or celestial body disturbs the M. or the earth, and Sir James Jeans has pointed out that the chance of such an event is ridiculously small). In the first place after thousands of millions of years the terrestrial day and the lunar sidereal day will each be equal to the time of revolution of the two bodies about each other and their period will be about forty-seven of our present days. The earth will always present the same face to the M. and the M. the same face to the earth, so that the inhab. (if any) of one hemisphere will never see the M., while the inhab. of the other hemisphere will see it every night. The distance between the M. and the earth gradually diminishing after the above stage has been reached, in the end the M. will approach within 12,000 m. of the earth and the gravitational attraction will then be large enough to shatter the M. into fragments that will continue to describe orbits round the earth and form a 'Saturnian' ring. Research on the problems of travel to the M. is proceeding, and the development of rocket propulsion and atomic energy makes it possible that solutions can be found. The dispatch of radio-controlled rockets equipped with cameras and television apparatus would be a first step, and landings on the M. by human beings are not beyond the bounds of probability (see INTER-PLANETARY SOCIETY. BRITISH; ROCKETS).

Moon-worship and Myths.—The worship of the M., as of other heavenly bodies, was one of the earliest forms of polytheism. It prevailed widely among the E. nations and under many aspects. In Egypt Isis was identified with the M. In Phœnicia Ashtoreth, as the feminine equivalent of Baal, was the M.-goddess. In Assyria Sin was the M.-god. Mt. Sinai is supposed to have derived its name from this god, to whom worship was paid there. Not a few names, however, manifest the prevalence of his worship, e.g. Sennacherib (meaning 'the M.-god has increased brothers'). Jericho, by its name, would seem to have been the seat of M.-worship in times before the Israelite conquest. Cautions against the worship of the M. and punishment by death for the convicted worshipper are to be found in

Deut. iv. and xvii.; whilst a superstitious salutation of the M. by kissing the hand is mentioned in Job xxxi. 26-27. In the O.T. we meet more than once with crescent-shaped ornaments (Judges viii. 21 and 18. iii. 18), but whether these are an indication of the worship of the M. is uncertain. Language which was probably derived from the appearance of the M. during eclipses is used by the prophets—the M. is to be darkened or turned into blood before the 'terrible day of the Lord' (Joel ii. 10 and 31). In the figurative language of Scripture the M. is frequently noticed as presaging events of the greatest importance through the temporary or permanent withdrawal of its light. Even in the seventeenth century in England the M. was supposed by the common people to have much influence over human affairs. Various activities such as gathering herbs, slaughtering animals for food, or taking particular medicines were regulated by the 'age' of the M., and these set periods were thought to be a necessary part of practical knowledge, ignorance of which infallibly entailed loss. Some of these superstitions prevailed even later, especially in the Scottish highlands, and throughout Scotland the waning M. was believed to have an evil influence, while full M. was thought to be the most favourable season for initiating an enterprise. The belief that the changes of the M. influence the weather is really little better than a superstition, for the only actual influence is a slight tendency to dispersion of cloud shortly after full M. There are numerous lunar myths from very early times and among many widely different races and countries. In Gk. myths the M. loved Endymion (q.v.) and was bribed to be the mistress of Pan by the present of a fleece. Like the Dawn in Australia, whose unchastity was rewarded by a gift of a red cloak of opossum skin. Both solar and lunar myths usually account for the observed phenomena of eclipse, waning and waxing, spots on the M. and so on, by various mythical adventures of the animated heavenly beings. Thus in the Andaman Is. the sun was held to be the wife of the M., and among aboriginal tribes in India the M. was the sun's unfaithful bride whom he cut in two but occasionally allows her to shine in full beauty. In late modern folk-lore the M. is a place to which the wicked are consigned, rather than the impersonation of a man or woman. The mark of the hare in the M. has impressed the imagination of Mexicans, Bantus, Sinhalese, and others in bygone times and evoked myths among all of them. See also POLYTHEISM.

Jeans, *The Universe around Us*, 1929, 1943; W. Goodacre, *The Moon*, 1931; Sir F. Dyson and R. v. d. R. Woolley, *Eclipses of the Sun and Moon*, 1937; and J. H. Sidgwick, *The Heavens Above: a Rationale of Astronomy*, 1948.

Moore, Albert Joseph (1841-93), Eng. painter, b. in York, youngest son of Wm.

M., of York, a painter, most of whose sons were also painters. The mural decorative work he executed at Coumbe Abbey for the earl of Craven, and in the chancel of St. Alban's Church, Rochdale, influenced all his later pictures. The supreme merit of 'Sea Gulls' (1871), 'Blossoms' (in the National Gallery, 1881), 'Dreamers' (Birmingham Corporation Gallery, 1882), and 'A Summer Night' (Liverpool Corporation Gallery, 1890) is the harmonious blend of delicate colour, combined with graceful posture and charming lines of drapery.

Moore, Edward (1712-57), Eng. dramatist and man-of-letters, *b.* at Abingdon, Berkshire. Garrick played the part of Beverley, the gambler, in M.'s once popular tragedy, *The Gamester* (1753), and Horace Walpole and the Lords Chesterfield and Lyttelton contributed to his weekly jour., *The World* (1753-57).

Moore, George Augustus (1852-1933), Irish novelist, *b.* in co. Mayo. He was intended for the army, but his own inclination was towards painting, though he began by writing poetry: his *Flowers of Passion* appeared in 1878. As a young man he studied painting in Paris, and *Modern Painting* (1893) displays his intimate knowledge of the work of contemporary artists. He remained in Paris for ten years, but was recalled to London as a result of the Land League agitation; he had already decided that he was not a painter. His first book, *A Modern Lover* (1883), appeared while he was living in lodgings in impoverished circumstances. This, and other books, earned him the heated opposition of librarians and others, but his success gradually enabled him to ignore the Puritans and Philistines. *Confessions of a Young Man* (1886, revised 1904 and 1916) is a record of his early life; by its frankness and unconventionality it aroused much discussion. His lively interest in the Irish movement is shown by his comedy, *The Bending of the Branch* (1900), *Diarmuid and Grania* (1901), in which W. B. Yeats collaborated, and *Hail and Farewell*, comprising *Ire* (1911), *Salute* (1912), and *Vale* (1914), a trilogy of candid autobiographical revelations. M.'s early novels, *A Summer's Wife* (1885), *Eather Waters*, a masterpiece of realism recounting the life of a domestic servant (1891), *Ereun Innes* (1898), and *Sister Theresa* (1901), are an imitation of the Fr. philosophical novel, besides restoring in England the Fielding tradition and introducing an element of the realism usually associated with Zola. But if his later work, which with the chief exception of *In Single Strictness* (1922, reissued in 1927 as *Celibate Lives*), is concerned with historical themes, he developed a form of 'prose narrative' which is entirely individual. *The Brook Kerith* (1916, revised 1927), which retells the story of Jesus, and *Heloise and Abelard* (1921) are the best examples of this. By their grandeur of conception, their wealth of incident and descriptive detail, and their melodious, highly finished style, they have estab. M. as one of the most accomplished literary

craftsmen of the century. Other later works are *Arrows* (1919) and *Conversations in Ebury Street* (1924), which are chiefly criticism; *A Storyteller's Holiday* (1918, revised 1928), *Ulick and Soracha* (1926), and *Aphrodite in Aulis* (1931), which are fiction; *The Coming of Gabrielle* (1920), his first play, *The Making of an Immortal*, a play about Shakespeare (1927), and *The Passing of the Essenes* (1930), a play giving a new historical version of the life of Jesus. M. is unique amongst modern writers in that he revised and largely rewrote almost all his chief works. M. was entirely identified with his art and in the craft of writing; he never married. His Irish home, which remained empty for many years, was burned by the Republicans in 1923. If no real painter, at least his reactions to the fine arts made of him a champion of the Fr. Impressionist school of painting in England. See studies by Susan L. Mitchell, 1916; J. Freeman, 1922; H. Wolfe, 1931; C. Morgan, 1933; J. Hone, 1936; and his *Letters*, ed. J. Eglinton, 1942.

Moore, Grace (1901-47), Amer. prima donna, *b.* at Jellicoe, Tennessee, educated there and at Ward Belmont School, Nashville. She studied singing under P. M. Marafiotte and, later, Albert Carré. Her first stage appearance was at the Colonial Theatre, Boston, in *Hitchy-Coo*, in 1920. Coming under the notice of Irving Berlin, she was engaged by him in *The Music Box Revue*. She then took further training under Miss Mary Garden in Europe, and sang in *La Bohème* in Milan, later securing a contract with the Metropolitan Opera House, New York, 1928. She made her début as an operatic vocalist at that house as Mimi in *La Bohème*, a performance which put her at once in the front rank of opera singers. She sang as Juliette in *Romeo et Juliette*, Marguerite in *Faust*, Micaela in *Carmen*, and the title role in *Manon Lescaut*. At the Opéra Comique she played Louise in Charpentier's opera of that name. Her début at Covent Garden as Mimi in 1935 was very successful, her reputation in London having been greatly enhanced by her brilliant film *One Night of Love*. Of her other films the best were *Love Me For Ever*, *The King steps Out*, *Interlude*, and *For You Alone*, which last-named gave her scope with the aria 'Vissi d'Arte' from *La Tosca* and Schubert's 'Serenade.' She was killed in an aeroplane accident in Denmark.

Moore, Henry (1831-95), Eng. sea painter, *b.* at York, was a brother to Albert M. After painting animals and landscapes with all the loving detail of the Pre-Raphaelites, he discovered his talent for seascapes, and henceforward painted little else. His best pictures are 'The Newhaven Packet' (1878); 'Mount's Bay' (1886); and 'Hove-to for a Pilot' (1893).

Moore, Henry (*b.* 1898), Eng. sculptor and painter, *b. s.* Castleford, Yorkshire, son of a coal miner. He studied at Leeds College of Art and the Royal College of Art, London, proving to be a brilliant

pupil. He first gained insight into the real nature of sculpture at the Natural Hist. Museum (chiefly in the section now transferred to the Geological Museum) and at the Brit. Museum. Here he studied the effect of natural forces on stone, wood, etc., primitive art, and particularly Egyptian, Mexican, early Gk., Etruscan, and Negro sculpture. M. held one-man shows in Eng. and various continental tns., the U.S.A., and Australia. His first commissioned work was 'North Wind,' for the underground railway headquarters in London. As official war artist 1940-1942, he produced the famous series of drawings of shelterers in the London tube stations. Other famous works include 'Madonna and Child' (St. Matthew's Church, Northampton), 'Reclining Figure' (Tate Gallery), 'Three Standing Draped Figures' (Battersea Park, London), 'Family Group' for Stevenage New Tn.

Out of widely differing influences, M. has evolved a style which in individuality and innovation of form is second only to that of Picasso. His work, which consists chiefly of stone and wood carving, makes truth to material rather than verisimilitude its first aim. It has a monumental power and a vitality of expression which has commanded the attention of a wide public and ranked M. among the most notable sculptors since Rodin. See monographs by H. Read, 1934; J. J. Sweeney (New York), 1948; and G. C. Argan (Turin), 1949; also *Henry Moore: Sculpture and Drawings*, (introduction by H. Read), 1949.

Moore, John (1729-1802), Scottish novelist, attended Glasgow Univ., and was a doctor by profession. As he was attached to the Brit. Army in Flanders in a medical capacity (1747-48), was for a time surgeon to the Eng. ambas. at Versailles, and travelled for five years (1772-77) on the Continent as tutor to the young duke of Hamilton, he had admirable opportunities for observing the social manners of his time. Carlyle availed himself of his *Journal of a Residence in France* (1793), whilst Byron formed his Childe Harold on Zeluco, a selfish libertine, whose name supplies the title to the most popular of M.'s novels (1789).

Moore, Sir John (1761-1809), Brit. general, *b.* in Glasgow, was the son of John M. (d. 1802). Entering the army as ensign in 1776, he served a long and distinguished apprenticeship to war. During the descent on Corsica he was wounded at the capture of Calvi (1794); in the W. Indies he distinguished himself at the taking of the Vigie and Morne Fortuné (1796), and two years later he was engaged in quelling the Irish insurrection. In 1799, during the Dutch campaign, he was wounded at the engagement of Egmont-on-Zee, and he was again disabled at the battle of Alexandria during the expedition to Egypt (1801). At the camp at Shorncliffe in England M. evolved a system of training for light infantry, as an answer to the Fr. use of *tirailleurs*. From this nucleus developed the light div., which took a prominent part in Wellington's operations in Spain. In Oct. 1808 M.

took command of the Brit. forces in Portugal. He left Lisbon, advanced over the border, and arrived at Salamanca on Nov. 23. There he learned of Napoleon's victories over the Sp. forces at Gerneral and Tudela, near the Ebro, and, fearing attack by greatly superior forces, determined to withdraw. On Dec. 3, however, he learned that Napoleon was moving southward to Madrid and not westward against the Brit. forces, and seized the opportunity to strike at Napoleon's line of communication in Old Castile, distract his attention, and give the Spaniards a breathing space. M. knew the dangers he faced, and knew that a rapid retreat to Corunna would be inevitable as soon as Napoleon turned northwards in answer to the threat to his rear. M. hoped to fall upon an isolated Fr. body under Soult, but on the 23rd received the expected news of Napoleon's advance against him, and immediately turned for Corunna. The pursuit was pressed through the wilderness of Galicia, with great suffering to the Brit. troops, and a noticeable deterioration in discipline, for both of which M.'s refusal to stand and fight, though probably correct, was largely responsible.

Arriving at Corunna M. found the transports delayed, and turned to give battle. At the height of the action on Jan. 11, 1809, M. was killed. Whatever errors of detail were committed, the campaign as a whole was a sound strategic concept, disrupting Napoleon's plans, and giving a much-needed respite to the hard-pressed Spaniards. See lives by J. C. Moore, 1831, and J. F. Maurice, 1897. Also *Diary*, ed. by J. F. Maurice, 1904; C. W. C. Oman, *History of the Peninsular War*, 1902-11; and J. F. C. Fuller, *Sir John Moore's System of Training*, 1794-1823, 1925.

Moore, Mary (Lady Wyndham) (1861-1931), Eng. actress, *b.* in London. After the death of her first husband, James Albery, she married Sir Charles Wyndham, 1916. Her association with the latter began in 1885; she acted in numerous plays with him, and became a partner with him in the proprietorship of the Criterion, Wyndham's, and the New Theatres. Her earliest big success was as Ada Ingot in *David Garrick*. Many of her later roles were in the plays of Henry Arthur Jones and Hubert Henry Davies.

Moore, Thomas (1779-1852), Irish poet, satirist, and biographer, *b.* in Dublin, May 28. His father was a grocer, who later became a quartermaster in the army. He may be regarded as the national poet of Ireland. An Act of Parliament having opened Dublin Univ. to Rom. Catholics, he went there in 1793. He began to write poetry, and in 1799 was permitted to dedicate a metrical trans. of *Anacreon* to the Prince of Wales. In his nineteenth year he came to London to keep his terms as a law student of the Middle Temple. In 1803 he was given the appointment of Admiralty registrar at Bermuda, the work of which was done by a deputy. In 1801 appeared his *Poems by the late Thomas Little*, and six years later began to appear

his *Irish Melodies*, with music by Sir John Stevenson. In another branch of letters M. was also to make a great success, and he showed himself a master of the airiest satire in *Intercepted Letters*; or *Two-penny Post-bag* (1813) (written under the name of Thomas Brown the Younger), in which he lampooned the regent and his associates. One of the most popular books of the day was his E. poem *Lalla Rookh* (1817), for which he received £3000 from Messrs. Longman's. He now removed to the residence in which he died, a rural home beautifully situated near the woods of his patron, Lord Lansdowne, but, owing to the default of his Bermudan deputy in the sum of £6000, most of what he earned went to the payment of this debt. In the following year appeared the amusing *Fudge Family Abroad*, written in the vein of *The Two-penny Post-bag*. Turning to prose he reverted to his long-meditated *Life of Sheridan*, which was issued in a quarto vol. in 1825; but the life did not come up to expectation. Byron had entrusted M. with his *Memoirs*, but when Byron died in 1824 M. destroyed the *Memoirs*, and wrote an excellent biography of his friend (1830), which ranks among his best work. He also wrote a biography of Lord Edward Fitzgerald, and in 1834 pub. *Travels of an Irish Gentleman in search of a Religion*. M.'s *Memoirs, Journals, and Correspondence* was ed. by Earl Russell (1853-56). There is a monograph by Stephen Gwynn in the Eng. Men of Letters series (1905).

Moore, Thomas Sturge (1870-1944). Eng. poet and wood engraver, b. at Hastings. Member of the Academic Committee of the Royal Society of Literature. His writings include, Poetry: *The Lindesesser and other Poems* (1899); *Aphrodite and Artemis* (1901); *Absalom* (1903); *The Little School* (1905, enlarged 1917); *The Sicilian Idyll and Judith* (1911); *Tragic Mothers* (1920); *The Powers of the Air* (1920); and *The Unknown Known* . . . (1939). Prose: *Correggio* (1906); *Art and Life* (1910); *Some Soldier Poets* (1919); *Why Beautiful?* (1926); *Armour for Aphrodite* (1929); and *Mystery and Tragedy*, two dramatic poems (1939).

Mooreas, see FIMEO.

Moorhead, city and co. seat of Clay co., Minnesota, U.S.A., 212 m. N.W. of Minneapolis. It is the centre of an agric. region, has flour mills and machine shops, and manufs. bricks. Pop. 9400.

Moorhen, see WATERHEN.

Moorish Architecture, see ARCHITECTURE, *Mohammedan*.

Moor Park, Hertfordshire, near Rickmansworth, on the Metropolitan Railway. The house, built about 1670, was the seat of Lord Ebury, who sold it for building land after the First World War. Here is Northwood, where the Merchant Taylors' School was moved from Charterhouse Square in 1933. There is another M. P. on the Wye, 2 m. from Farnham, Surrey. It was the residence of Sir William Temple and here Swift first met 'Stella' (Esther Johnson), and wrote *The Tale of a Tub* and *The Battle of the Books*.

Moors (Lat. *Mauri*, meaning dark; Sp. *Moros*) are a people who form the great majority of the pop. of Barbary, and gave their name to Morocco. Their appearance indicates their origin, which is a mixture of the Mauri (from which they derive their name), Numidians, Phoenicians, Romans, and Arabs, who have successively held possession of the country. In consequence they are found to vary considerably in appearance and character in different parts of Barbary, but all show more or less strongly the symptoms of a considerable infusion of Arabian blood. They were, after a severe struggle, conquered and converted by the Arabs in 707. The M. in Spain were a composite African race, who, invited by the Church party to assist in the suppression of the Visigothic aristocracy, invaded the whole peninsula (710), and became the dominant power until the eleventh century. Cordova was the great centre of the Saracen dominion after 755, when its univ., famous in Rom. days, revived. These Arab invaders, though luxurious in their mode of life, were a highly cultivated race, and in the study of mathematics, science, and philosophy, eclipsed all the European races. Through the M. the culture and civilisation of the ancients were chiefly preserved, and were transmitted to the modern world. The race widely intermarried with the natives of Spain. The Christian victories of the eleventh century in Spain seemed at one time likely to annihilate the Moslem power in that country. From this fate, however, it was saved not by internal strength, but by the arrival of help from Yusuf, king of the Almoravids of N. Africa. Yusuf eventually made himself master of Andalusia, and in the course of a few years the whole of Moslem Spain became reunited under the king of Morocco, and the death of the Cid (q.v.) in 1099 enabled the M. to recover Valencia, which he had taken in 1094. After the fall of the Almohades the triumphs of the Christian arms were rapid and decisive, and in 1238 the M. retired to Granada, where they formed their kingdom, which was trib. to Castile. The subsequent hist. of the M. cannot be separated from that of Algiers, Tunis, and Morocco. See ALGIERS; TUNIS; SPAIN; MOROCCO.

Mooruk, see CASSOWARY.

Moose, see Elk.

Moose Jaw, tn. in the prov. of Saskatchewan, Canada, about 50 m. W. of Regina. It is a mkt. tn. in the middle of the wheat belt, and has co-operative stock yards. M. J. derives its name from a great pile of bones of moose which were formerly near the tn. Pop. 22,600.

Mopiha Island, see under LORD HOWE ISLAND.

Moplas, or **Mapillas**, race of fanatical Muslims, found along the Malabar coast in S. India. It is thought that they are sprung from a body of Arab merchants who came to India in the third century after the Hegira. The M. to-day number about 1,000,000.

Mopsus, in Gk. legend (1) a celebrated soothsayer, son of Apollo and Manto, the daughter of Tiresias. He contended in

prophecy with Calchas at Colophon, and showed himself superior to the latter. He was believed to have founded Mallos, in Cilicia, in conjunction with the seer, Amphilocheus. A dispute arose between them over the possession of the tn., and both fell in combat by each other's hand. (2) One of the Lapithæ, son of Amphyx and the nymph Chloris, and the prophēt and soothsayer of the Argonauts. He is said to have died in Libya of a snake-bite.

Moquegua, coast prov. of S. Peru, with an area of 3550 sq. m. The cap., M., is 20 m. from the Chilean frontier, and 85 m. S.E. of Mollendo. The tn. is the terminus of the railway from Ilo (60 m.). The chief products are wines, olives, cotton, oil, copper, and lead. The tn. suffered severely from earthquakes in 1715 and 1868. Pop. (prov.) 34,000; (tn.) 4000.

Mora: 1. Com. and tn. of Spain in the prov. of Toledo, 18 m. S.E. of the city of Toledo. Pop. 10,000. 2. Com. and vil. of Sweden in the prov. of Kopparberg, on the R. Öster Dal, 45 m. N.W. of Falun. Pop. 9500.

Moraceæ, fleshy fruit, the stems of which are filled with a milky juice. To the same family belong hops, mulberries, figs, rubber trees, the Indian banyan, bread-fruit, and the W. African timber known as *iroko* or African teak.

Moradabad, or **Muradabad**, dist. and municipal tn. of the United Provs., India, 50 m. N.W. of Bareilly. The dist. covers an area of 2282 sq. m., and wheat, rice, and cotton are grown. Other tns.: Anroha, Sambhal, and Chaudausi. Pop. 1,200,000. See also BAREILLY.

Moraine Garden, modern development in horticulture. It solves the problem of the successful cultivation of a number of Alpine plants, some of which could not previously be grown away from their native M. There the conditions of plant growth are continuous root moisture in summer from the melting of ice and snow, and complete dryness and protection by the snow against frost at other times. These conditions are reproduced by excavating a hole in a sunny mound or bank, about 2 ft. deep, and of any extent, great or small. After providing perfect drainage the hole is filled with small sandstone chips mixed with a little leaf soil, and the plants are introduced with great care. Water can either trickle through or be poured in daily, and the stones retain moisture in the hottest weather. In the autumn the water supply is stopped, and later the M. is drained dry. The names of suitable plants may be found in plant dealers' catalogues.

Moraines, see under GLACIER.

Morales, Luis (d. 1586), Sp. painter, b. at Badajoz, surnamed 'El Divinlo' because he confined himself to sacred subjects. In 1581 Philip II. found him in poverty at Badajoz, and presented him with an ann. pension of 300 ducats, a tardy recompense for a former unceremonious dismissal. Despite the deductions of his critics, he deserves remembrance for his consummate skill in expressing Christian suffering and grief,

notably in his chief works 'Ecce Homo' and 'Mater Dolorosa' in the Prado, Madrid. See life by Berjano Escobar, 1921.

Morality, Fr. term commonly used to describe the plays always known in England as moral plays or moral interludes. These plays, though developed out of the miracle plays (q.v.), are still more closely related to a Lat. origin. Their real source is Prudentius (c. 400), who in his *Psychomachia* had the same subject as did all the moralities, namely, 'personified abstractions fighting for the human soul.' A brief outline of one of the earliest extant moralities, *The Castle of Perseverance* (c. 1450), will give some idea of the *dramatis personæ*. It tells the hist. of Humanum Genus tempted by Luxuria. When about to be lost entirely he is saved by Penitencia, who brings him to the castle of Perseverance. Here he remains until his old age, when he is tempted by Avarice. Then follows a swift descent towards Hell, whence he is saved by Pity and Mercy. For *Everyman*, the most famous of the moralities, see *Everyman and Other Interludes*, ed. by E. Ryms in *Everyman's Library*. The latest development of the M. was to make it convey some special lesson, theological or educational. In Bale's *King Johan* it became the medium of hist., and hence led to the historical drama.

Moral Philosophy, see ETHICS.

Moral Theology, the 'science of human acts considered in the light of man's supernatural destiny; consequently not only reason, but also the light of faith is employed in establishing and applying the principles of the science' (Attwater). M. T. is distinguished from moral philosophy or ethics, which is concerned with the principles of right and wrong, and their application so far only as they can be known by the light of reason; whereas M. T. measures the moral character of actions by their conformity, not only with ethical standards, but also with the Christian revelation and positive law of the church. Again it differs from dogmatic theology in that it is not concerned with speculative truth, but the moral obligations arising from faith and with the truths of faith as principles of conduct. A clearer if less scientific idea of M. T. may be given by defining it as 'the science of priests sitting in the confessional, or the science which enables them to distinguish right from wrong, mortal sin from venial sin, counsels of perfection from strict obligations, and so to administer the sacrament of penance.' The literature of M. T. had its rise in the Middle Ages, but the more familiar works are those of writers of the fifteenth century, such as Jean Charlier de Gerson (1363-1429), the famous chancellor of the univ. of Paris, whose *Opusculum tripartitum de præceptis, de confessione, de arte moriendi* acquired so great a repute that a score of synods enjoined its use in expounding the Decalogue, hearing confessions, and visiting the sick. Also may be mentioned the *Summa theologiae* and *Summa confessionalis* of St. Antoninus (1389-1459), bishop

of Florence and church historian. A true conception of M. T. is, however, not to be acquired merely from an account of works exclusively devoted to the science; for the greatest moral theologian of the Middle Ages was St. Thomas Aquinas, who treats M. T. as an organic part of dogmatic theology from which he does not separate it as have many since his age, deeming this the true scientific method. From the time of Medina (1528-81), a Sp. Dominican and prof. of Salamanca, theories affecting the whole system of M. T. arose and divided moral theologians into schools—probabilist, laxist, probabiliorist, rigorist, tuttorist—sharply separated and often bitterly hostile to each other. It was Medina who propounded in his *Exposition of St. Thomas* the theory since known as 'probabilism', and thereby started a controversy which raged for 200 years after his death. Probabilism, as formulated by Gury (*Compendium Theologiae Moralis*, 1853), is the doctrine that, in matters of conscience 'of two opinions it is lawful to follow the less probable, provided that this opinion rests on solid grounds.' The doctrine flourished until about 1650, and then a reaction set in in favour of 'probabiliorism' the doctrine that a law is always to be obeyed unless an opinion clearly more probable (*probabilior*) is opposed to it. A formidable attack on the M. T. of the Jesuits, which (*inter alia*) embraced probabilism, was made by Pascal in his classic work, the *Provincial Letters* (1656-1657). In his two works, *Theologia Moralis* and *Homo Apostolicus*, St. Alphonsus Liguori (1696-1787) (*q.v.*) revived probabilism, which then became the ordinary rule of confessors in the Rom. church. The literature of M. T. may be said to have at length attained its definite form in the above two works of Liguori, which were pub. about the middle of the eighteenth century; for nearly all the works on the subject since then have been influenced by his teachings. In the first of these works Liguori (in his own words) 'selects from a mass of opinions those decisions which, on the one hand, should uphold the obedience due to the precepts of God and of the church, and on the other should not add burdens which God has not imposed, by binding every one to that perfection which, through human weakness, is morally impossible to the general body of believers.' The second work was intended for the guidance of priests in hearing confession.

Casulistry is defined 'as the reasoned application of law to concrete cases; it determines with all possible exactitude the limitations of law or the bearings of law in particular cases' (Davis). A casuist is therefore like a lawyer working on a given case in the light of the principles of his science. See W. Addis and T. Arnold, *Catholic Dictionary*, 1917; T. Slater, *Manual of Moral Theology* (2 vols.), 1925; II. Davis, *Moral and Pastoral Theology*, 1934; and II. R. McAdoo, *The Structure of Caroline Moral Theology*, 1940.

Moral Welfare. see PROSTITUTION; VIOLENCE SOCIETIES. As to the moral

welfare of children and young persons see CHILDREN ACTS, 1908, 1933; CHILD WELFARE AND LABOUR; see also BORSTAL SYSTEM; JUVENILE OFFENDERS. On the probation system see also under CRIMINAL LAW.

Morand, Paul (b. 1888), Fr. diplomat, poet, and novelist, b. in Paris. He was attaché at the Fr. Foreign Office and then secretary to embassies in various parts of the world. In 1944 he became ambas. at Berne. He began in literature as one of the most determined exponents of modernity. His poems in free verse had affinities with the Dadaists. His books of short stories, *Ouvert la nuit* (1922) and *Fermé la nuit* (1923), dealt with various parts of the world seen through the lives of women. *Levis and Irene* (1924) grew out of memories of Oxford. His chronicle of the twentieth century, *L'Europe galante* (1926), is a daring series of stories about women, in his earlier manner. *Bouddha vivant* (1927) attempts to probe the soul of Asia. *Magie noire* (1928) deals with black folk all over the world. *Champions du monde* (1930) is a fantastic story of Ainer. life. Other works are *Green Shoots* (1922, New York, 1930); *Frenchman's London* (1933); *Flèche d'orient* (1934); *The Epic-makers* (1935); *Rond-Point des Champs Elysées* (1935); *Les Extravagants* (1937); and *Isabeau de Barvire* (1938). See A. Rousseaux, *Œuvres et visages du XXe siècle*, 1932.

Morant, Sir Robert Laurie (1863-1920). Brit. educationist; son of Robert M., Hampstead. He was educated at Winchester and New College, Oxford. He was appointed tutor to the Siamese royal family. On his return to England he engaged in social and education work in E. London. In 1895 he became assistant director of special inquiries and reports in the education dept. He was acting secretary to the Board of Education, 1902, and permanent secretary, 1903. He was made K.C.B., 1907. From 1912 to 1919 he was chairman of National Insurance Commission. M. was one of the most distinguished administrative officials in the list of the Brit. civil service. See also FISHER, SIR WARREN. See R. W. Harris, *Not So Humdrum*, 1939, on M.'s part in the work of the Insurance Commission.

Morar: 1. Dist. and loch of W. Inverness-shire, Scotland. The loch, 12 m. long, is noted as being the deepest in the Brit. Isles, its maximum depth being 1017 ft. 2. Tn. of central India in the state of Gwalior, and 3 m. from that city. Pop. 31,000.

Morat, or Murten, anct. tn. of W. Switzerland, with picturesque avenues of laurel and a Gothic castle of the thirteenth century and city wall and towers of the same period. Manufs. electrical apparatus and cooking-stoves. Pop. 2400.

Morata, Olympia Fulvia (1526-55). It. scholar and poet, b. at Ferrara, daughter of a distinguished prof., Fulvio Feligrino M. She lectured in public at an early age, and upon the death of her father took up teaching to maintain the family. About 1550 she married a Ger. physician,

Andreas Grundler, but they were unsettled, and she suffered much by the siege of Schweinfurt. She d. at Heidelberg, leaving many Lat. and Gk. poems, a commentary on Homer, etc.

Moratín, Leandro Fernández de (1760-1828), Sp. poet and dramatist, b. at Madrid, was the son of a poet. On the recommendation of Jovellanos he became secretary in 1787 to the Sp. embassy in Paris, and after travelling in Europe at public expense to study the contemporary stage, received, through the kindness of Don Manuel Godoy, the post of official translator to the Foreign Office. The arrival of Napoleon in Spain brought misfortune and exile to M. as to others. Of his five comedies the best are *La Comedia nueva*, *El café* (New Play, 1792), a satire on the extravagant dramas of the day; *El Sí de las Niñas* (Little Girls' Consent, 1806); and the satire *La Mojiquta* (The Female Hypocrite, 1804). An imitation of Molière's *Tartuffe*. In 1812 was produced *Escuela de los maridos*, a trans. and adaptation of Molière's *École des maris*, and in 1814 *El Médico a Palos* (from *Le Médecin malgré lui*). His complete works were ed. by Ruiz Morcuende in *Clásicos castellanos* (1924).

Moravia (Ger. *Mähren*), prov. of Czechoslovakia, formerly a margravate and crownland of Austria. It is situated to the E. of Bohemia. After the First World War it was linked with W. Silesia, the total area of the political div. being 10,324 sq. m. It is watered by the March, a trib. of the Danube, which flows through the country from N. to S. Along its N. boundary run the Sudetic Mts.; on the W. are the Bohemian highlands, on the E. the Carpathians and White Mts. The country is principally engaged in agriculture, though there are rich mineral deposits of iron, lignite, coal, etc. Cereals of all kinds are extensively produced, and there is some woollen manuf. In March 1939 Hitler declared that Czechoslovakia had ceased to exist and that the terr. of Bohemia and M. formed a protectorate of the Reich. It was liberated by the Allies between Oct. 1944 and May 1945, when the Axis-created protectorate of Bohemia and M. ceased to exist (May 9, 1945), following an armed rising staged by the Czech National Council in Prague. Pop. of M. and W. Silesia, 3,565,000. For hist., etc., see articles on AUSTRIA; BOHEMIA; CZECHOSLOVAKIA; also EASTERN FRONT IN SECOND WORLD WAR; WESTERN FRONT IN SECOND WORLD WAR.

Moravians, known also as the **Moravian Brethren**, the **Bohemian Brethren**, or the **Unity of the Brethren** (*Unitas Fratrum*), small Protestant body who somewhat doubtfully trace their origin to the fifteenth century. In the middle of that century a section of the sect known as Taborites gathered round the Calixtine bishop of Prague, and formally constituted themselves a sect in 1467. At the time of the Reformation they had friendly intercourse with Luther, though their sympathies were, on the whole, more with the reformed churches. At this time there

were some 400 churches in the sect. During the persecutions of the sixteenth century many of the brethren fled to Poland, where they were gradually absorbed in other Protestant bodies. In the first quarter of the seventeenth century the Bohemians and M., being implicated in the revolution which came to an untimely end in 1620, were almost completely exterminated. No more is heard of them until the beginning of the next century. Then under the leadership of Christian David, a carpenter, certain M. emigrated to Saxony, where they were well received by Count Zinzendorf (1700-1760), who then became their leader. Here they lived at first as ordinary Lutherans, but later erected a church of their own. They lived a strict life, with daily prayers, a community of interests and strict exclusiveness. They still retained the form of the episcopate. Branches have now been estab. in other parts, and the unity has now four provs.: Ger., Brit., N. Amer., and S. Amer., each prov. managing its own affairs. Once in ten years a general synod meets, representing all the provs. The Moravian Church has always been characterised by its missionary vigour. See hist. of the brethren by A. Gindely (1856-57); I. Groll (1878-85); A. C. Thompson (1883); E. de Schweinitz (1885); J. T. Hamilton (1900), and J. Müller (1922-30). See also B. T. Jenkins, *Moravian Brethren in North Wales*, 1938.

Moray, Earl of, see RANDOLPH, THOMAS. **Moray, or Murray, James Stuart**, first Earl of (c. 1531-70), regent of Scotland, was the natural son of James V. of Scotland by Lady Margaret Erskine, daughter of the fourth earl of Mar. On hearing John Knox at Calder, he joined the lords of the congregation (1559) in opposition to the queen regent's party. In 1561 he escorted his half-sister, Queen Mary, from Paris to Scotland, and became her chief adviser. He was created earl of M. in 1564, but lost the queen's favour when he showed his disapproval of her marriage with Darnley (1563). After the murder of Rizzio he was restored to favour, but made his escape to France at the time of Darnley's assassination and Mary's marriage to Bothwell. After the abdication of Mary at Lochleven, he was summoned to Scotland to take up the duties of regent, and after her escape defeated the queen's forces at Langside in 1568. He came to England to bring accusations against Mary at her trial. He was murdered at Lindlithgow by James Hamilton of Bothwellhaugh, and was buried in St. Giles's Cathedral, Edinburgh.

Moray (fish), see MURENA.

Moray (formerly **Elgin**), N. Scottish co., fronting the M. Firth and lying between Banff and Nairn; mountains in the S. but flat in the N., and watered by the Spey, Lossie, and Findhorn. The chief industries are agriculture, stone-quarrying, distilling, and fishing. It has some imposing ruins and interesting antiquities. Area 305,000 ac. Pop. 43,800.

Moray Firth, arm of the North Sea. It is about 18 m. across the entrance, from

Tarbat Ness to Burghhead, and about 30 m. long from there to the entry to the Caledonian Canal. The Spey and the Deveron are the chief rivs. draining into the firth.

Morbihan, dept. of W. France, named after the gulf of M. (Inner Sea), formed in 1790 from part of Lower Brittany. The Atlantic coastline has many inlets. The Vilaine and the Blavet, into which flow the Auray and the Scorff, are both canalised, whilst the Oust forms part of the waterway from Nantes to Brest. The highest land (975 ft.) is in the Montagnes Noires of the N. Barren heath covers a quarter of the prov., whilst a third part produces good crops of wheat, rye, buckwheat, and mangels. The fisheries and oyster culture are important. Vannes is the cap.; Lorient is a shipbuilding centre. These tns., together with Pontivy, give their names to the three arrons. M. is noted for its prehistoric remains, especially megaliths. Area 2738 sq. m. Pop. 506,884.

Moreau, Saxon earl, grandson of Leofric and brother of Edwin, earl of Mercia. He helped the Northumbrians to expel their Earl Tostig, whose conduct had made him unpopular, and was then elected in the place of Tostig. Harold, earl of Wessex, agreed to this election, but later was deserted by M. and Edwin, and left to fight alone first with Tostig and the king of Norway at Stamford Bridge, then with William of Normandy at Hastings. Subsequently M., having failed to raise the country against William the Conqueror, fled to Ely to join Hereward the Wake, but was captured and d. in prison. See F. M. Stenton, *Anglo-Saxon England*, 1947.

Mordants, see under DYEN and DYEING.

Mordaunt, Charles, see PETERBOROUGH AND MONMOUTH, EARL OF.

Mordecai, Jewish Benjaminite exile in Persia, who figures in the O.T. book of Esther as the queen's cousin and foster-father. With the elevation of his cousin, the Jewish maiden, Hadassah, as queen under the new name of Esther, M. became an official of the Persian court and thus learned of a conspiracy against the king, Ahasuerus, which he frustrated. When the king raised Haman to be vizier, M. refused to do him reverence, apparently because he believed it to be the duty of every Jew to show enmity to Amalek, and Haman then determined not only to destroy M. but the whole Jewish race. The service that M. had rendered the king induced the latter to call upon Haman to show honour to M. After the deliverance of the Jews was secured, through the intervention of Esther, M. became vizier instead of Haman.

Mordvinian Republic, autonomous republic of the R.S.F.S.R., lying about 250 m. W. of the R. Volga, with the Moscow Region to the W., the Gorky Region to the N., and the Kulishev Region to the S. and E. The people are of Finnish origin (see MORDVINS), and the area is chiefly given over to agriculture. Cap. Saransk. Pop. 1,189,000.

Mordvins, people of Finnish origin, inhabiting E. Russia. Until the middle of the eighteenth century they were virtually

pagans, but later became largely intermingled with the Russians, and now comprise two main divs., viz. the Moksha and the Erzya. They are of medium height, with fair skins, blue eyes, and generally oval faces. They number about 800,000.

More, Sir Anthony, see MORO, ANTONIO.

More, Hannah (1745-1833), Eng. authoress, b. at Stapleton, Gloucestershire. She came to London in 1774, and made the acquaintance of Dr. Johnson, whom she flattered unduly, of Burke, and the leaders of the "blue-stocking" coterie. Garrick produced her play, *Percy* (1778), an artificial and introspective play which finds an outlet for emotional intensity in tragic action. After the death of Garrick, however, she came to the conclusion that play-going was immoral, and she henceforth led a retired life. She consorted chiefly with the clergy and philanthropists, started Sunday schools in Cheshire, and organised a movement that led to the formation of the Religious Tract Society (1789). She wrote *Cælebs in Search of a Wife* (1808) and a tract, *The Shepherd of Salisbury Plain* (1820?), and also many other religious works. She left her fortune to charities and religious institutions. See lives by W. Roberts, 1838, and H. Thompson, 1838; and M. A. Hopkins, *Hannah More and her Circle*, 1947.

More, Henry (1614-87), Eng. philosopher, b. at Grantham, Lincolnshire. At Christ's College, Cambridge, from which he took his M.A. degree in 1639, he lost himself in the delights of philosophical, and especially Platonic, studies. His *Divine Dialogues* (1668) ('containing Disquisitions and Instructions concerning the Attributes of God and the Providence in the World'), *Philosophical Poems* (1617), and *Euchiridion Metaphysicum* (1673) are all penetrated with Neoplatonic mysticism and spiritualistic phantasies, which he owed in part, it seems, to his intimacy with Lady Conway, the Quaker. M. represents more than any other member of the school the mystical and theosophic side of the Cambridge movement. The *Divine Dialogues* is his best known work, the most authentic ed. appearing in 1713.

More, Paul Elmer (b. 1864), Amer. author and editor, b. at St. Louis. He was educated at Washington Univ. and at Harvard, where he was assistant for Sanskrit from 1894 to 1895. He was associate for Sanskrit and classical literature at Harvard and Bryn Mawr College, 1895-97. He lectured on Plato at Princeton Univ. and was literary editor of the *Independent* (1901-3) and of the *New York Evening Post* (1903-9), and editor of *The Nation* (1909-14). His pubs. include *Shelburne Essays* (1904); *Life of Benjamin Franklin* (1908); *Platonism* (1917 and 1927); *The Religion of Plato* (1921); *Hellenistic Philosophers* (1923); *The Demon of the Absolute* (1928); and *The Scriptural Approach to Religion* (1933).

More, Sir (Saint) Thomas (1478-1535), an Eng. lawyer and statesman, b. in Milk Street, London. He received the

rudiments of education at St. Anthony's School, Threadneedle Street, at that time held to be the best in the city. He was early placed in the household of Cardinal Morton, archbishop of Canterbury, a high privilege which he owed to the influence of his father, Sir Thomas M., who was later a justice of the court of king's bench. M. soon made a name for himself as a lawyer. He entered Parliament in 1504, first attracting public notice by his bold opposition to King Henry VII.'s demand for a grant on the occasion of his

SIR THOMAS MORE

Engraving after an enamel by Holbein.

daughter's marriage. The king was entitled, by feudal law, to a grant, but he had come to the Commons to ask for a much larger sum than he proposed to give as dowry. On M.'s intervention the Commons much reduced the subsidy. Henry never forgave M.'s audacity, but the only revenge he could take for the moment was to throw Sir Thomas M. into the Tower, whence he was released on payment of a fine, while the son discreetly withdrew for some time from public life. The death of Henry VII., however, restored him to the practice of the law and to his public career (1508). There was no cause of importance in which he was not engaged, and he soon attracted the attention of the young king and Wolsey. In Parliament he frequently opposed the Crown. In the Star Chamber he obtained judgment against the Crown in a case of the Crown c. the Pope. Instead of resenting this defeat, however, the king promptly took M. into his service. In 1514 M. was appointed master of requests and made a privy councillor. He was often sent on embassies to the Low Countries. While on a mission to Flanders

he began to write his most famous work, *Utopia*, which was first pub. in Lat., 1516. It had immediate popularity and was trans. into Ger. 1524, Fr. 1530, It. 1548, Eng. 1551, and Sp. 1790. (See ed. with Roper's life, and some letters, by W. G. Sampson, 1911.) It gives an account of an imaginary is. and people, under cover of which it describes the social and political condition of England, with remedies for abuses. The opinions on religion and politics are not, however, always those by which he was himself guided, as will be seen later. In 1519 he was compelled to give up his private practice at the Bar; he accompanied the king to the Field of the Cloth of Gold in 1520, and in 1521 he was knighted and made treasurer of the exchequer. In the Parliament of 1523 he was elected Speaker, being in effect put into that office by the court in order to make use of his popularity in the Commons to carry the money grant which Wolsey required. But to the chagrin of the court M. espoused the popular cause, and owing to his influence Wolsey's demand was resisted, and from that moment the cardinal's jealousy of M. had its beginnings. Wolsey tried to get him out of the way by sending him as ambas. to Spain, but the king, who was already on the look out for a successor to Wolsey, thwarted the latter's design. He appointed M. chancellor of the duchy of Lancaster (1525), and indeed embarrassed him by constantly seeking his company either at the palace or at M.'s house at Chelsea. In 1529 M. succeeded Wolsey as lord chancellor of England, in which capacity he showed great ability. He was, however, too conscientious for the comfort of the monarch. In his *Utopia* (1516) M. had declared for tolerance of religious creed with a liberality of philosophical detachment to which there is no parallel in any Englishman of that period. But at the same time he was not in sympathy with Lutheran heretics and opposed a Bill designed to relax the severity of the heresy laws. Above all, the royal divorce was a matter on which he absolutely refused to give way, and when he realised that the marriage with Anne Boleyn was settled he petitioned the king to be allowed to resign the great seal, alleging indifferent health. The resignation was reluctantly accepted. For a while M. lived in retirement, devoting his energies to a controversy on religious subjects with Tyndale and others. But he was too conspicuous a figure to be allowed long to enjoy the happiness of a retired life. He was summoned by the king to attend the coronation of Anne Boleyn, but declined, and from that moment he was marked out for vengeance. In 1534, when the Act of Supremacy was passed, matters came to a head with his hostility to any action of the king against the pope's authority and he was committed to the Tower. Refusing to take the oath of supremacy, after much attempted negotiation, he was indicted for high treason in Westminster Hall, found guilty, and sentenced to be hanged, drawn, and

quartered. The sentence was eventually commuted to decapitation. At the block he protested that he *d.* for his religious opinions. A patron of art, an excellent writer, a sound lawyer, and a capable statesman, he was a great loss to his country. He was canonised in 1935. Among his works, apart from *Utopia*, are a life of Pious, earl of Mirandula (1510), and a *History of Richard III.*, written about 1513. He wrote many controversial works, among which is *Dyaloge concerning Heresies* (1529), also epigrams and dialogues in Lat. His pure and religious character, his constancy and fortitude under misfortune, combine to make him one of the most attractive and admirable figures in Eng. hist.

M.'s early ideas of clerical celibacy were dispelled after he had become acquainted with the family of John Colt of New Hall, Essex; for the 'honest and sweet conversation' of the daughters attracted him and he married the eldest. Erasmus has left a picture of his happy life in his Chelsea home—'a modest yet commodious mansion. There he lives surrounded by his numerous family, including his wife, his son, and his son's wife, his three daughters and their husbands, with eleven grandchildren. There is not any man living so affectionate to his children as he, and he loveth his old wife as if she were a girl of fifteen.' After the execution of M., the vindictive king expelled Lady M. from the Chelsea house and set aside the assignments which had been validly executed by M., and settled his property on Princess Elizabeth. M.'s eldest daughter, Margaret, married to his biographer, W. Roper, was remarkable for her wide accomplishments—Lat. and Gk., music, and the sciences so far as they were accessible and also for her great devotion to her father. See lives by R. W. Chambers, 1938, 1949; D. Sargent, 1936, and A. Cecil, 1937; and Elizabeth F. Rogers (ed.), *The Correspondence of Sir Thomas More*, 1917.

Möre, co. of Norway, lying between the Dounefeld and the Atlantic. It has a long coastline with many fjords. The prin. industry is fishing. The chief tns. are Kristiansund, Aalesund, and Molde. Area 5811 sq. m. Pop. 181,089.

Morea (riv.), see **ECROTAS**.

Morea (the anct. **PELOPONNESUS**, the is. of Pelops), peninsula forming the S. part of Greece (*q.v.*), connected with Central Greece by the isthmus of Corinth. The surface is mountainous. Area 8288 sq. m. Patras is the chief port.

Moreas, Jean (1856-1910), Fr. poet and novelist, *b.* at Athens. His real name was Ioannis Papadimitriopoulos. His acquaintanceship with Verlaine inclined him in such earlier work as *Pèlerin passionné* (1891) to the symbolist as opposed to the realistic school; but, believing the former to have no enduring literary quality, he became the founder and leader of the 'École Romane,' whose ambition it was to rival the *Pléiade* (*q.v.* and **ROSSARD**), and turned to the old medieval-romantic style, producing in that vein his *Contes de la vieille France* (1903). But his best

work is a reversion to the classical precision of Mahesterbes and Corneille, and includes *Iphigénie* (1903) and *Les Stances* (1905). See E. Raynaud, *La Mêle symboliste*, 1920, and study by R. Niklaus, 1936.

Moreau, Gustave (1826-98), Fr. painter, *b.* in Paris. On four occasions he won prize medals at the Salon, where he regularly exhibited. At his death he left 8000 pictures, water-colours, and drawings to the nation, this fine collection being housed in the Moreau Gallery, Paris. In his early pictures, such as a 'Pietà' (1852) and the 'Death of Darius' he expresses his indebtedness to Chassériau. One of his finest paintings was 'The Young Man and Death' (1866). His subjects were chiefly taken from classical or religious story; among his best known works are the 'Athenians with the Minotaur' (1855); 'Oedipus and the Sphinx' (1864); 'Gala-tion' (1880); and 'Moses on the Nile' (1878). See study by L. Bénédict, 1922.

Moreau, Hégésippe (1810-38), Fr. poet, whose sad death in a hospital heightened interest in a posthumously pub. collection of his poems entitled *Le Myosotis* (1830). His range is somewhat restricted, but his verse is always inspired by a genuine passion. Some of his best pieces, such as the elegy *La Poulzie*, are to be found in standard anthologies.

Moreau, Jean Victor (1761-1813), Fr. general, *b.* at Morlaix, in Brittany. He took the side of the revolution, and in 1794 he was made a general of a div. When Pichegru fell under suspicion the Directory appointed M., in 1796, to the chief command on the Rhine and Moselle. He defeated Latour at Rastadt and the Archduke Charles at Ettingen, and drove the Austrians back to the Danube, though the final victory was gained by the archduke, in brilliant manoeuvring which compelled a Fr. retreat to the Rhine. A suspicion of participation in the plots of Pichegru led to his being deprived of his command after the *coup d'état* of 18th Fructidor. In the following year he succeeded Scheerer in the command of the army in Italy. By a retreat conducted with consummate skill he saved the Fr. army from destruction. The Directory, nevertheless, deprived him of the chief command, and gave it to Joubert. But M. remained with the army, and aided that young general; and after his death again assumed the command, and conducted the defeated troops to France. The noble disinterestedness of M.'s character, his military talent, and his political moderation induced the party which overthrew the Directory to offer him the dictatorship of France, which he declined, and lent his assistance to Bonaparte on 18th Brumaire. M. gained victory after victory over the Austrians in the campaign of 1800, and won the battle of Hohenlinden. A strong feeling of mutual distrust now arose between M. and Bonaparte. The latter surrounded him with spies, and he was accused of participation in the plot of Cadoudal and Pichegru against the life of the first consul. He was arrested, sentenced to two years'

imprisonment, which was commuted into banishment, and went to America. He however, landed at Gothenburg (1813), and accompanied the emperor of Russia and the king of Prussia in the march against Dresden, where a Fr. cannon-ball broke both his legs, and he *d.* soon afterwards.

Morecambe, municipal bor. and watering-place of N.W. Lancashire, England, on M. Bay, 3½ m. W.N.W. of Lancaster, 25½ m. N. of Preston, and 236 m. N.W. of London. It has a promenade along the shore, and also a pier and a winter garden. Pop. with Heysham, 33,800.

Morse, tn. of New S. Wales, Australia, in Courallie co., 130 m. N.W. by W. of Tamworth. Pop. 2300.

Morel, or **Morehella**, genus of fungi, of which the common *M. (M. esculenta)* is one of the most delicate edible Brit. fungi (*q.v.*). The cap is much wrinkled and ridged, and is attached to the stem from centre to edge. It is yellowish or buff in colour, and somewhat resembles a mass of honeycomb. Ms. are often dried for seasoning soups, sauces, and gravies, and are commonly used fresh in ragouts.

Morelia, city of Mexico, and the cap. of Michoacán state, 126 m. W.N.W. of the city of Mexico. It was named in honour of Gen. Morelos, the rebel patriot priest who carried on the struggle for independence despite the execution of Hidalgo, also a priest, whose fate he shared (1815), though only after he had called a national assembly and proclaimed Mexican independence for the first time in the hist. of the country. The tn. was founded in 1511, its location being determined by its situation, backed by a mt. range, and its proximity to the Rio Chiquito dry climate. Its cathedral was founded in 1640. It is reached from Mexico city (228 m.) by National Railways. There is some mining in the vicinity, but the chief products are agric. produce and cattle. Pop. 44,000.

Morelli, Giovanni (1816-91), It. patriot and art critic, *b.* at Verona. He exercised his influence as a member of Parliament to pass the M. Bill, which was directed against the alienation of works of art. In his *Die Werke italienischer Meister in den Galerien von München, Dresden, und Berlin* (1890-93), and again in his *Della Pittura italiana* (1890), he emphasised the need of making a careful study of ears, hands, and all detail, especially where the authorship of a painting was in question. He used the pseudonym of Ivan Lermoliev.

Morelos: 1. State of Mexico, bounded by Mexico, Puebla, and Guerrero, and covering an area of 1916 sq. m. In the S., where it is fertile, coffee, sugar, and grains are extensively cultivated, but the N. part is mountainous. There is mining of zinc, copper, and silver. Cuernavaca is the cap. Pop. 132,711. 2. Tn. in the state of Nuevo Leon, Mexico, 45 m. S.E. of Monterrey. Pop. 4500. See also **NUOVA LEON**.

Morena, Sierra, range of mts. in Spain, stretching E. to W. between the Guadiana

and Guadalquivir Rs. Minerals abound. Altitude 7900 ft.

Moreri, Louis (1643-80), Fr. encyclopædist, *b.* in Provence. In 1674 he pub. his *Grand Dictionnaire historique*, which was widely trans. The twentieth and best ed. of this encyclopædia (pub. in 1759) is still consulted for biographies.

Moresnet, or **Kelmis**, part of Eupen and Malmédy, was, prior to the First World War, a com. and neutral ter. between Prussia and Belgium, 5 m. S.W. of Aachen. It has valuable forests and also some lead and zinc mines. After the war the allied powers assigned it to Belgium as compensation for damage done by the Gers. to their forests. It now forms part of the prov. of Liège.

Moresque, see **ARABESQUE**.

Moreton Bay, bay on the E. coast of Queensland, Australia, 40 m. by 17 m., which is formed inside the is. of M. and Stradbroke. It was discovered by Cook in 1770.

Moretoy Cabaña, Agustin (1618-69), Sp. dramatist, *b.* at Madrid. He was a disciple of Calderón (*q.v.*). His finest comedy is *El Desdén con el Desdén* (Disdain met with Disdain), but his fund of humour, his excellent characterisation, and his animation are also apparent in *The Handsome Don Diego*, the heroic *Brave Justiciary of Castile*, and the farcical *Trumpet Adiante*.

Moretto, commonly known as **Alessandro Bonvicino** (c. 1498-c. 1555), It. oil, fresco, and portrait painter, *b.* in Rovato, Brescia, Italy. He studied under Ferramola, in Venice under John Bellini and Titian; eventually he became a devoted admirer of Raphael, but it is not known that he ever visited Rome. Vasari says of his work: 'His heads are vigorous, in Raphael's style, though of very inferior excellence.' Moroni was a pupil of M. There are examples of his work in the galleries of Brescia, Florence, Venice, Verona, Berlin, Paris, and Vienna, and in the National Gallery, London, which contains a fine altar-piece.

Morgagni, Giovanni Battista (1682-1771), It. anatomist, *b.* at Forlì. In 1716 he became prof. of anatomy at Padua, a position he retained till his death. His reputation was made by his *Adversaria anatomica*, first pub. in 1706, and he may be considered the founder of pathological anatomy, his great work *De Sedibus et causis morborum per anatomem indagatis*, pub. in 1761, establishing pathological anatomy as a science. See life by Mosca, 1768.

Morgain, or **Morgue le Fay**, witch of Arthurian legend, and sister of King Arthur, also known as Fata (fairy) Morgana, in the lt. romances. In the romance of *Morte d'Arthur* she is the chief character, and discovered to Arthur the intrigue of Geneva with Lancelot. She is a leading personage in numerous other tales of chivalry, and the various traditions in connection with her character have come down to us somewhat confused.

Morgan, Augustus de, see **DE MORGAN**.
Morgan, Charles Langbridge (*b.* 1894), Eng. novelist and critic, *b.* in Kent.

Entered Navy as cadet in 1907, serving in the Atlantic and on the China station. From 1914 to 1918 he was interned in Holland, and from 1919 to 1921 was at Balliol College, Oxford. Then joining *The Times* he was its dramatic critic from 1921 to 1926. From 1929 to 1940 he served in the Naval Intelligence Div. of the Admiralty. His first novel, *The Gun-room* (1919), was based on his naval experiences. His other pubs. include *My Name is Legion* (1925); *Portrait in a Mirror* (1929), which won the Femina Vie Heureuse prize in 1930; *The Fountain* (1932), which won the Hawthornden prize; *Epitaph on George Moore* (1935); *Sparkenbroke* (1936); a play, *The Flashing Stream* (1938); *The Voyage* (1940), which won the James Tait Black memorial book prize; and *The Judge's Story* (1948). His essays in *The Times Literary Supplement* were pub. as *Portraits in a Mirror* (1929) and *Second Reflections in a Mirror* (1944). His earlier works were marked by an elaborate style which gives way, in *The Judge's Story*, to a simpler and more direct narrative form. He is concerned with the spirit and the soul of the individual, and the attempt to preserve 'singleness of mind,' an idea finding perhaps its clearest expression in *The Flashing Stream*. In 1949 appeared another novel, *The River Time*.

Morgan, Sir Henry (c 1635-88), Brit. buccaneer and colonial governor, b. in Glamorganshire, of good farming stock. He was, apparently, kidnapped at Bristol and shipped to Barbados as a slave. M., however, joined the buccaneers, soon became their leader, and ravaged the Sp. colonies, his justification and that of the governor of Jamaica (Modyford), who gave him his privateering commission, being that the Sp. claimed exclusive possession of the Caribbean. It was only after M.'s victories that the Sp. king at length acknowledged England's title to Jamaica. The rapidity and skill with which M. secured his objectives proved him a born sea-captain and soldier. His most extraordinary feats were those at Puerto Bello (1668), Fort Chagres, and his sea-fight near Maracalibo. Puerto Bello was thought to be nearly impregnable, but M. overcame the guns of its 'iron castle' by the use of broad scaling-ladders which he forced his prisoners, including priests and nuns, to place against the walls of the forts while his men came on behind. On his return to Jamaica M. gave an oral account of his victory to Modyford, and his recital was sent to Westminster for the information of the secretary of state, it being evident that Modyford was uneasy over the extent to which M. was always exceeding the powers given under his privateering commission. However, after Puerto Bello Modyford gave M. a new commission, and it was decided to attack Maracalibo, which M. did with only 500 men in eight ships, the largest of which had but fourteen guns. M. sailed into the lake of Maracalibo, sacked the tn., and got out again through the narrow strait against four Sp. warships, this exploit being accomplished by the adroit use of a *brûlot* or fireship

rigged up like a warship filled with dummy soldiers, which was driven against the first Sp. man-of-war and exploded, the remaining three ships falling an easy prey to M.'s men and to panic. After this M.'s name resounded through the Caribbean more than ever, and so great was the fear of him that the Spaniards often lost a chance of destroying him and his privateersmen through sheer cowardice. In 1669 there was a renewal of official hostilities with Spain, and a Sp. expedition from Florida ravaged the Eng. settlements in the Bahamas. Modyford and the Jamaican council then gave M. an admiral's commission, and made him commander-in-chief of all the ships at Port Royal, and bade him make war on the Spaniards. M.'s capture of the fortresses of Old Providence Is. and St. Catalina sealed the fate of Panama, for the Sp. soldiers feared to make a stand against the redoubtable M. except in Panama itself. M. set out from Chagres Castle with 1200 men in thirty-two canoes and sev. boats of artillery on Aug. 18, 1670, the march being one of the most dramatic events in the hist. of buccaneering, the hardships endured by the buccaneers through starvation (as narrated by Esquemeling) seeming incredible. In the result Panama, then a city of 30,000 people and 5000 stone houses and thousands of cedar-built dwellings, fell to M. (see also under BUCCANEERING). M.'s spoil in the years 1669-70 in gold pieces of eight alone was £240,000, besides a vast haul of silks, linen, gold and silver, lace, plate, and jewels. Complaints were received in England from the Sp. people of S. America, and M. was ordered to return to England to answer the charges made against him. He was sent to the Tower, but was soon afterwards released and was knighted by Charles II. in 1674, receiving the commission of lieutenant-general of Jamaica. He returned to Jamaica in that capacity, and as senior member of the council and commander-in-chief. For a few months he was acting governor. He died in Jamaica.

The only first-hand source of the exploits of M. and of the facts pub. in the calendar of state papers, used by all later biographers, is the book *Buccaniers of America* (1678, Eng. trans. 1741 and 1893), written by J. Esquemeling (or Oexmalin), whose real name is given by some as Hendrik Smeeks, and who was a Dutch buccaneer who went with M. on all his sea-rover's exploits. Esquemeling suggests that M. won his remarkable victories by the most brutal methods, torturing prisoners to extract information or ransom, sacking and plundering the places he captured, and condoning the nefarious practices of his debauched followers. But allowance must be made for prejudice, particularly as M., after the sack of Panama, sailed away in haste without giving the other buccaneers their share of the loot; while further allowance is to be made for possible omissions and interpolations by Esquemeling's Dutch editor and translators who tinkered with his text in order to satisfy the national prejudices

of the Dutch and others. See life by J. C. Hutcheson, 1890; also C. Haring, *Buccaneers in the West Indies*, 1910; W. A. Roberts, *Sir Henry Morgan, Buccaneer and Governor*, 1933; and E. H. Cruikshank, *The Life of Sir Henry Morgan, with an Account of the English Settlement of Jamaica*, 1935.

Morgan, John Pierpont (1837-1913), Amer. financier, b. at Hartford, Connecticut, U.S.A. In 1857 he entered the bank of Duncan, Sherman & Company, and in 1871 became a member of the firm of Drexel, M. & Company, now M. & Company, the great bankers of the U.S.A. In 1901 he formed the Steel Trust with a cap. of \$1,400,000,000, and he was the controller of railways and ocean transportation lines. He had a vast collection of pictures and art treasures, and was a yachtsman.

Morgan, John Pierpont, junior (1867-1943), Amer. banker, b. at Irvington, New

Topical Press

JOHN PIERPONT MORGAN, JUNIOR

York, son of the preceding. He graduated at Harvard, 1889, and became a member of J. P. M. & Company, New York, and of M., Grenfell & Company, London. Chief legate under his father's will, he inherited the art collections. On his father's death he succeeded to the directorship of New York Central and Hudson R. Railroad. Early in the First World War M. organised a New York bankers' syndicate with \$100,000,000 in gold. He acted for Brit. and Fr. Govs. as agent for purchase of supplies in America; also for the Amer. Gov. when it entered the war in 1917. Under the Dawes plan his firm issued loans up to not less than \$1,550,000,000. In 1920 he gave his London house at Prince's Gate for an Amer. embassy. M. left a gross estate of \$10,021,482 and a net estate of \$4,642,791, most of the difference being accounted for by federal and state taxes. In his

lifetime M. gave \$35,655,000 to charitable and public institutions, including \$14,750,000 to the Pierpont M. Library, \$9,000,000 to the Metropolitan Museum of Art, and \$4,000,000 to New York hospital. In 1933 he made over to trustees, as an institution to be used for research by the world's scholars, the magnificent library, valued at \$8,500,000, which had been collected by his father and himself in a superb marbled building near the family residence in E. 36th Street. It contained about 25,000 vols. of illuminated MSS., early printed books, and examples of the work of famous presses.

Morgan, Lewis Henry (1818-81), Amer. ethnologist, b. near Aurora, New York. He practised as a lawyer at Rochester, New York, and made a study of the Indian tribes, particularly of the Iroquois, living amongst them for a time to learn their manners and customs. He pub. in 1851 *The League of the Iroquois*, containing the result of his researches. Other works include *The American Beaver* (1868); *Ancient Society* (1877); and *House-life of the American Aborigines* (1881).

Morgan, Sydney, Lady Morgan (c. 1783-1859), Brit. authoress, b. in Dublin, began her literary career with a vol. of poems, which she set to Irish tunes. She then wrote the novels *St. Clair* (1804) and *The Novice of St. Dominick* (1806), followed by *The Wild Irish Girl* (1846), which last estab. her reputation. In 1812 she married Charles M., M.D., whom the lord-lieutenant knighted. Two years later appeared her best novel, *O'Donnell*. During the later years of her life she pub. *Dramatic Scenes from Real Life* (1833); *Woman and her Master* (1840); *The Book without a Name* (1841); and *Passages from my Autobiography* (1859). See life by W. Fitzpatrick, 1860.

Morgan, Thomas Hunt (1866-1945), Amer. zoologist, b. at Lexington, Kentucky, son of Charlton H. M. He graduated at the State College of Kentucky, 1886, and became Ph.D. at Johns Hopkins Univ., 1890. He was prof. of biology at Bryn Mawr College, 1891-1904, and prof. of experimental zoology at Columbia Univ. His pub. include *The Development of the Frog's Egg* (1897); *Regeneration* (1901); *Evolution and Adaptation* (1903); *Experimental Zoology* (1907); *Heredity and Sex* (1913); *Mechanism of Mendelian Heredity* (1915); *Critique of the Theory of Evolution* (1916); *The Physical Bases of Heredity* (1919); *The Theory of the Gene* (1926); *Experimental Embryology* (1927); *The Scientific Basis of Evolution* (1932); *Embryology and Genetics* (1933); and monographs and papers on biological and embryological subjects.

Morgan, William Fend De, see DE MORGAN, WILLIAM FRIEND

Morgan, par. of Glamorganshire, Wales, S.E. of Aberavon. Coal is found in the vicinity. Pop. about 10,000.

Morgana Fata, see FATA MORGANA.

Morgan & Company, J. P., Amer. banking house, estab. in 1860 in New York by J. P. M., senior. It attained the position of America's leading banking house, notably in connection with railroad

financing. The founder d. in 1913, and left the bank to J. P. M., junior and ten partners. In 1914 there was something of a sensation in financial circles in New York when members of the firm resigned their directorates in a large number of the greatest industrial and financial organisations in the U.S.A. This step, which was taken in response to public opinion, which disapproved of the system of 'interlocking directorates,' had also a close connection with the passing of the Federal Reserve Banking Act, which completely revolutionised the banking system of the country. In the First World War the M. banking house, handling purchases on allied account aggregating \$3,000,000,000, made tremendous profits, and exercised no little influence on policy. After the war the house was a force in reparations policy. It directed Amer. loans to Europe and controlled the world's money markets. From 1923 to 1929 the total issues through M. syndicates were \$5,000,000,000. The net worth of the bank was \$30,000,000 in 1914, \$118,000,000 in 1929. But the economic depression of 1930 and the New Deal policy, particularly the Banking Act (see under BANKS AND BANKING), the Security Exchange Commission, and the Public Utility Holding Companies Act, adversely affected its position. The Roosevelt administration subjected the house to a series of investigations by the Senate, and the scandal connected with a former leader of the New York stock exchange and brother of a M. partner, so gravely damaged its prestige that its net worth fell to \$44,000,000 by 1938. But the house remains a powerful institution. Underwriting business was transferred to the new firm of M., Stanley & Company in 1935, and this new house became the first issuing house in America (1938). The parent firm maintains a strong position in the National City Bank of New York (q.v.), the Guaranty Trust Company, the U.S. Steel Corporation, the General Motors Corporation, and other great concerns. Good relations with the Brit. Gov. are a tradition in the policy of its board. In 1910 the house of M. was incorporated as a trust company. All the members of the firm became directors of the company, which has a paid-up capital of \$25,000,000, and a paid-in surplus of the same amount. See F. L. Allen, *The Great Pierpont Morgan*, 1919.

Morganatic Marriage, name given to a marriage union, otherwise perfectly regular, between a man of the blood of a reigning royal family and a woman of lower social rank, e.g. the marriage of George IV. of England, when Prince of Wales, with Mrs. Fitzherbert. The issue of a M. M. are legitimate, though they are debarred from inheriting the rank and property of the father.

Morgan City, tn. and port of entry, Louisiana, U.S.A., on the E. bank of Atchafalaya Bayou, 20 m. from the gulf of Mexico. Pop. 7000.

Morgan Combine, see ATLANTIC SHIPPING TRUST.

Morgantown, city of W. Virginia, U.S.A., in Monongalia co., 60 m. S. of

Pittsburg. The W. Virginia state univ. was founded here in 1867. Pop. 16,600.

Morgarten, locality on the S.E. shore of Lake Ageri, Switzerland. In 1315 the Swiss here defeated an army under Leopold of Austria.

Morghen, Raffaello (1758-1833), It. engraver, b. at Naples. In 1781 he engraved Raphael's symbolical representations of poetry and theology in the Vatican. He also engraved the chief works of Titian, Correggio, Poussin, Guido, da Vinci, and Murillo. His engraving combines exquisite delicacy and remarkable clearness. In 1794 he founded a school of engraving at Florence, at the invitation of Ferdinand III., grand-duke of Tuscany. Napoleon invited M. to Paris, and made him a member of the institute of France. His finest works are the 'Last Supper' from da Vinci; the 'Transfiguration' from Raphael; the 'Magdalen' from Murillo; and the 'Car of Aurora' from Guido. See his *Engraved Works*, ed. by Halsey, 1885.

Morgue, La, building in Paris, behind the cathedral of Notre Dame, where unknown bodies, either found in the streets or recovered from the Seine, are exposed for identification. After three days, if not claimed, they are buried.

Morgue le Fay, see MORGAIN.

Morhange, Charles Henri Valentin, see ALKAN.

Morhof, Daniel Georg (1639-91), Ger. author, b. at Wismar. In 1665 he became prof. of eloquence and poetry at Kiel, and in 1673 prof. of hist. there. His most famous works are *Unterricht von der deutschen Sprache und Poesie* (1682), a systematic hist. of European literature, and *Polyhistor, sive de auctorum notitia et rerum commentarii* (1688), an encyclopedia of general knowledge and science. See life by R. von Liliencron, 1885.

Moritz, Sigismund (1879-1942), Hungarian novelist, b. in Csécsé, son of a peasant farmer. He studied theology at Debreczen, and then came to Budapest to study law and literature. He began as journalist in the cap., but soon branched out as a naturalist novelist. His novel, *Rare Gold* (1910), destroys the Hungarian illusion of the moral purity and idyllic happiness of the people of the vils. and farms. One of his most successful works was *Behind the Back of God* (1911), in which he painted a sombre image of the middle class, stifled by the narrow life of a prov. tn. In 1922 he pub. *The Fairy Garden*, a novel the scene of which is laid in Transylvania in the seventeenth century. See A. Schöpplin, *Magyar irok*, 1919, and J. Gassner, *Masters of the Drama*, 1940.

Morier, James Justinian (c. 1780-1849), Brit. traveller and novelist; secretary to the Brit. ambas., 1810, during the six years of his residence in Persia he became thoroughly acquainted with the character of the natives. Pub. *Journey through Persia, 1808-9*, in 1812. The best of his E. novels, entitled *The Adventures of Hajji Baba of Ispahan*, appeared in 1824.

Morier, Sir Robert Burnett David (1826-1893), Brit. diplomatist, b. in Paris;

educated at Balliol College, Oxford, graduating in 1849. In 1851 he entered the diplomatic service, and subsequently held various appointments at Ger. courts. His knowledge of Ger. politics was unrivalled. In 1876 he was transferred to Lisbon as Brit. minister, while office he held until 1881, and then at Madrid from 1881 to 1884. From 1884 to 1891 he was ambas. to St. Petersburg, and at this time enmity sprang up between himself and Bismarck. At the outbreak of the Franco-Prussian war M. was wrongfully accused by Count H. Bismarck (*q.v.*) of giving information to Bazaine (*q.v.*). He was appointed to succeed Dufferin at Rome in 1891, but died before he could assume office.

Mörike, Eduard (1804-75), Ger. poet, *b.* at Ludwigshurg. From 1834 to 1843 he was a protestant pastor, but retired early on account of illness. He was appointed prof. of literature at the Katharinenstift, Stuttgart, in 1851, an office he held for sixteen years. He belonged to the Swabian school of Uhlend, and his *Gedichte* are, for the most part, simple lyrics, graceful in style and original in conception. He also wrote short stories and an autobiographical novel, *Maler Norton* (1832). His complete works were ed. by H. Mayne (1914) and letters by K. Fischer and R. Kraus (1903). *See* life by K. Fischer, 1901; also L. Mürtens, *Die Mythologie bei Mörike*, 1925, and W. Zemp, *Elemente und Anfänge*, 1939.

Morin, or Morinus, Jean (1591-1659), Fr. writer and theologian, *b.* at Blois. He was a Protestant clergyman at Leyden, but was converted to Catholicism and became a priest of the Oratory at Paris in 1618. He ed. the *Paris Polyglot* (1645), which includes the Samaritan Pentateuch and the Targum. M. claimed the superiority of the Samaritan over the Heb. version. He also wrote a Samaritan grammar and *Exercitationes* on the Heb. and Gk. texts of the Bible. A memoir of M. is prefixed to the *Exercitationes* (ed. 1669).

Morioka, tn. of Hondo, Japan. 85 m. S.E. of Aomori. Silks, textiles, and hardware are produced. Pop. 69,120.

Morioka, *see* under **MAORIS**.

Morisonians, *see* **EVANGELICAL UNION**.

Moritz, Gustav, *see* **ARMFELT, COUNT OF**.

Moriaix, seaport of France, off the N. coast of Brittany, cap. of the dept. of Finistère, and 33 m. E.N.E. of Brest. Many of the houses date from the fifteenth century. Pillaged by the Eng. during the Hundred Years war, when the tn. joined the League, its castle was stormed by Henri IV. (1594). The chief manufs. are tobacco and paper. Pop. 15,100.

Morland, George (1763-1804), Eng. painter, *b.* in London. He left his home in 1782 and abandoned himself to a dissolute and irresponsible mode of life, which renders his artistic achievement all the more remarkable. Indeed debt seems to have been his greatest incentive to work. His pictures deal with the mellow aspect of domestic and rustic life, and reveal great beauty of conception and harmony of execution. In his animal studies he approaches very near to Landseer. Of

his many fine pictures 'The Gypsies' (1790) and 'Inside of a Stable' are representative. *See* F. W. Blagdon, *Memoirs of George Morland* (1806). There are lives by G. C. Williamson, 1904; W. Sibey, 1907; and B. Henderson, 1923.

Morlanwelz, tn. in Hainaut, Belgium, 11 m. E. of Mons, on the R. Haine, trib. of the Scheldt. It has coal-mines, foundries, workshops for railway material, and manufs. of cement. Pop. 8700.

Morley, Edward Williams (1838-1923), Amer. chemist, prof. of chem. at Western Univ., U.S.A. He carried out accurate determinations of the atomic weights of hydrogen and oxygen, and was associated with the Michelson-Morley experiment (*q.v.*).

Morley, Henry (1822-94), Eng. critic and man of letters, *b.* in London. His *How to make Home Unhealthy* (1850) attracted the attention of Dickens, who secured him a position on the staff of *Household Words* and *All the Year Round* (1850-65). M. was also editor of the *Examiner*. He was elected prof. of Eng. at King's College (1857), at Univ. College (1865), and at Queen's (1878), and in 1882 he became prin. of Univ. Hall, London. He wrote a number of critical and biographical works, including biographies of Jerome Cardan (1854), Cornelius Agrippa (1856), and Clement Marot (1871). His *First Sketch of English Literature* commanded great popularity. He was also the editor of M.'s Universal Library (63 vols., 1883-88, 1891), Cassell's National Library (205 vols., 1886), and the Carisbrooke Library (14 vols., 1889-92). *See* life by H. S. Solly, 1898.

Morley of Blackburn, John Morley, first Viscount (1838-1923), Eng. Liberal statesman and man of letters, *b.* at Blackburn, second son of Dr. Jonathan M. He was educated at Lincoln College, Oxford, graduating in 1859. He became quickly known in the literary world of London, being editor of the *Literary Gazette* and the daily *Morning Star*; and in 1867 he succeeded G. H. Lewes in the editorship of the *Fortnightly Review*. In 1878 he ed. for Macmillan the Eng. Men of Letters series, his own vol. on Edmund Burke (1879) being most masterly. In 1880 he became editor of the *Pall Mall Gazette*, on the staff of which were Alfred (afterwards Lord) Milner and W. T. Stead. In 1883 he was elected as a Liberal for Newcastle-on-Tyne. His intellectual stature, his powerful pen, and the influential position he held as an uncompromising exponent of philosophic Radicalism, marked him out for office; and in 1886, a canonised home ruler, he became Irish secretary in Gladstone's Cabinet, an office he occupied again in 1892, after the defeat on home Rule in the general election of 1886. In 1895 he was defeated as an anti-imperialist at Newcastle, but was returned for Montrose Burghs. He stood somewhat apart from politics during the Unionist administration of 1895-1906, being engaged on his *Life of Gladstone* (1903), but he was a strong opponent of the Boer war policy. In Sir H. Campbell-Bannerman's Cabinet (1906) M. became secretary of state for

India; in which capacity he met the outbreak of disorder with firmness, at the same time proceeding with his own plan for meeting the national demand for a widened share in the gov. In Asquith's first Cabinet, 1908, he was raised to the peerage, still retaining the India office; but in 1910 his age and health forced him to hand that office to Lord Crewe, while remaining in the Cabinet as lord president of the council. Being completely pacifist, he retired from public life on the declaration of war in Aug. 1914. M. was one of the original recipients of the Order of Merit at the coronation of Edward VII., 1902. Besides the works mentioned above

LORD MORLEY

he wrote, *inter alia*, *Voltaire* (1872); *Rousseau* (1873); *Diderot and the Encyclopaedists* (1878); *The Life of Richard Cobden* (1881); *Walpole* (1889); *Oliver Cromwell* (1900); and *Recollections* (1917). See lives by J. L. Morison, 1920; J. H. Morgan, 1924; and F. W. Hirst (with letters), 1927; also F. W. Knickerbocker, *John Morley and his Friends*, 1945.

Morley, Samuel (1809-86), Eng. politician, b. in London. He was a prominent dissenter, philanthropist, and temperance advocate. Owned a huge hosiery business. In 1865 he became M.P. for Nottingham, but was unseated on petition in 1866, and was M.P. for Bristol, 1868-85. He was proprietor of the *Daily News* and a member of the London School Board, 1870-76. See life by E. Hodder, 1887.

Morley, Thomas (1557-1602 or 1603), Eng. musician, studied under Byrd. After being organist at St. Paul's, he was appointed to the Chapel Royal (1592); and six years later he was granted a twenty-one years' monopoly in music printing, in succession to Byrd. He excelled as a composer in madrigals; but he also devoted considerable attention to church

music and to instrumental composition. Some of his work appears in the Fitzwilliam Virginal Book; and he wrote some of the original music for the productions of Shakespeare, with whom he was personally acquainted. His theoretical treatise, *Plaine and Easie Introduction to Practicall Music* (1597), was popular for two centuries and is one of the best sources of information on sixteenth-century methods of composition and musical life in general (a reprint appeared in 1937). See E. H. Fellowes, *The English Madrigal Composers*, 1921.

Morley, municipal bor. of the W. Riding, Yorkshire, England, 5 m. S.S.W. of Leeds. Machinery and woollen goods are manufactured. Pop. 23,400.

Morley College, London institution for adult education, founded in 1885 and named after Robert M., who supplied much financial assistance. Apart from a new wing built in 1937, the college was destroyed in an air-raid in Oct. 1940. It receives a maintenance grant from the L.C.C., and provides evening classes on a wide range of subjects, as well as weekly lectures on current affairs.

Morley-Minto Reforms, constitutional reforms introduced in India in 1909 by Lord Morley, as secretary of state for India, and the earl of Minto, as viceroy. These reforms enlarged all the legislative councils, accepted the elective principle, provided for non-official majorities of nominated *plus* elected members over official members, in all the provs., and of elected members alone in Bengal. They enabled the councils to vote on all matters of administration and gave Indians a direct share in it by admitting an Indian member to the executive council in each of the provs., and at the centre or gov. of all Brit. India.

'Mormon, Book of.' In Sept. 1823 Joseph Smith told of a vision he had received of a new gospel written on two gold plates, and after a series of other visions he claimed in 1827 to have been given these plates written in 'reformed Egyptian.' He was enabled to translate this with the aid of the anct. stones of divination, the Urim and Thummim, which were also given him. The trans. is known as the *B. of M.*, and after this had been made the plates, etc., were returned to an angel. Unbelievers, however, have declared that the *B. of M.* is clearly founded on an unprinted book by Solomon Spaulding, to which Smith might have obtained access. The book purports to give a hist. of religion in the Amer. continent from the time of Babel downwards to the fifth century A.D. It had been written by the prophet Mormon, and hidden by his son Moroni.

Mormon Church, called by its adherents 'the Church of Jesus Christ of Latter-Day Saints,' or shortly 'Latter-Day Saints,' was founded in the year 1830 by Joseph Smith in the U.S.A. About 1820, while living at Manchester, New York, Smith claimed, during a period of religious revival, to have received a vision of God the Father and God the Son. These visions continued and the further

revelation of the *Book of Mormon* (q.v.) was made to him in 1827. In 1830 he founded his sect (see MORMONS). In 1833 the *Book of Doctrines and Covenants* was pub. This, with the *Book of Mormon*, forms the basis of the M. belief. This is grossly materialistic. The theology reminds one at the first glance of the gnostic systems, with its numberless gods springing from a male and a female deity. The hierarchy is divided into two parts, the priesthood of Melchisedec and the Aaronic or Levitical priesthood. To the former belong the first presidency, patriarch, apostles, seventies, high priests, and elders; to the latter, bishops, priests, deacons, and teachers. The former is the more exalted, and the first president is supreme. The Ms. have carried on an energetic propaganda in Europe as well as in the States. The M. C. had an Amer. membership of 774,000 in 1936, with 2072 churches. The Reorganised Church numbers about 105,000, with headquarters in Missouri. See J. E. Talmage, *Articles of Faith*, 1899, and A. Jensen, *Encyclopedic History of the Church of Jesus Christ*, 1941.

Mormons, History of the. After the foundation of the sect in 1830 (see MORMON CHURCH), a vigorous propaganda was carried on in the U.S.A., and was crowned with much success, among the converts being Brigham Young, who succeeded Smith as first president. In 1831 the whole body of saints moved to Kirtland, Ohio, later moving further W. to Jackson co., Missouri, where 'Zion, the New Jerusalem,' was founded. The prophet himself had trouble at Kirtland, where he managed sev. business enterprises. Here he and Rigdon, one of his chief followers, were tarred and feathered by the mob in 1832. The people also rose against the saints in Jackson co. In 1837 the first missionary enterprise was started, England being its object. The same year saw the failure of the bank which Smith had started. During the next year, after a conflict between themselves and the mob, the saints came into conflict with the gov. and were driven into Illinois. A settlement was made at Nauvoo, and the body increased so rapidly that it soon numbered 15,000. In 1841 a temple was commenced here. In 1843 Smith incited his followers to destroy the offices of a newspaper which had written against him, and was imprisoned in consequence at Carthage. Here the mob rushed the prison, and he and his brother Hyrum were shot. In 1845 the M. left Nauvoo and settled at Salt Lake city (1847), under the leadership of Brigham Young. Young d. in 1877 after a period of conflict with natives and the U.S. Gov. Utah, the ter. developed by the M., was admitted as a state in 1896, but not until the M. were forced by Act of Congress to give up polygamy. The Mormon Church dominates the politics of Utah and is also strong in the neighbouring states of Idaho and Wyoming. The Church, by reason of rigid adherence to the biblical system of tithes, is very rich. In 1852 the Reorganised Church of Jesus Christ of Latter-

Day Saints had come into existence, differing from the main body in sev. essentials, especially polygamy, which the Reorganised Church renounced as not being in accordance with the wishes of their founder. The Reorganised Church is now recognised as continuing the traditions of Mormonism in its purest form.

See W. A. Linn, *The Story of the Mormons*, 1901 and 1923; J. E. Talmage, *The Vitality of Mormonism*, 1919, and *The Story of Mormonism*, 1920; W. E. La Rue, *The Foundations of Mormonism*, 1919; E. E. Erickson, *The Psychological and Ethical Aspects of Mormon Group Life*, 1922; J. F. Smith, *Essentials in Church History*, 1924; F. S. Harris and N. I. Butt, *The Fruits of Mormonism*, 1925; H. Standage, *The March of the Mormon Battalion from Council Bluffs to California*, 1928; J. A. Gove, *The Utah Expedition*, 1928; S. Y. Gates, *The Life Story of Brigham Young*, 1930; and N. Anderson, *Desert Saints: the Mormon Frontier in Utah*, 1942.

Morne-a-l'Eau, maritime vil. of Guadeloupe, W. Indies, a few miles from Pointe-à-Pitre, on the is. of Grande-Serre. Pop. 6400.

Morning Glory, popular name of various species of *Ipomoea purpurea* of the order Convolvulaceae. They are twining climbing bindweed herbs, with heart-shaped leaves and large funnel-shaped flowers, crimson, blue, purple or white, or striped. Ivy-leaved and other forms occur. *I. purga*, or jalap (q.v.), is also a species.

'**Morning Post**,' prominent Conservative penny daily which enjoyed the distinction of being the oldest of the then existing London dailies, having started in 1772 as the rival of the celebrated *Morning Chronicle* (see *under* NEWSPAPERS). It was notable for court news and social gossip, a legacy from the time of the 'gallant Parson Bate,' who became its editor in 1775, and who, by his free and fearless comments upon the events of the day, no less than by his scintillating paragraphs of court doings and the movements in the world of fashion, set the new paper on the high road to popularity. Charles Lamb, Samuel Taylor Coleridge, Robert Southey, Wordsworth, and Sir James Mackintosh were noted contributors. Its later prosperity was largely the result of the industry of the Glenesk family. Algernon Borthwick (subsequently Lord Glenesk) by unremitting efforts freed the paper from its heavy debts which had gradually accumulated. In 1877 Borthwick became sole proprietor, and from the time he reduced its price from 3d. to 1d. the paper's success became prodigious as a powerful Conservative organ. From 1897 to 1905 the paper was fortunate in having as its editor James Nicol Dunn; and during the Boer war it gained a tremendous vogue from the messages of its war correspondent, Winston Churchill. After the death in 1908 of Lord Glenesk, the M. P. passed into the hands of his only surviving daughter, Lady Bathurst. The eighth duke of Northumberland was chairman of the board of directors till his death

in Aug. 1930. After 1911 the paper was ed. by H. A. Gwynne. In the succeeding years, however, the social and political outlook of the *M. P.*, always extreme Tory, was shared only by a rapidly declining section of newspaper readers and the paper appeared for the last time on Sept. 30, 1937. It was amalgamated with the *Daily Telegraph* the following day. See C. Pebody, *English Journalism*, 1878, and W. Hindle, *The Morning Post*, 1772-1937, 1937.

Mornington, Garret Wellesley, first Earl of (1735-81). He was the son of Richard Colley Wellesley, first Baron M., and father of the duke of Wellington. He was educated at Trinity College, Dublin, and in 1757 became M.P. for Trim. co. Meath, in the Irish House of Commons, going to the House of Lords on his father's death the next year. In 1760 he was raised to the peerage as Viscount Wellesley of Dangan Castle, and earl of M. He was an accomplished musician.

Morny, Charles Auguste Louis Joseph, Comte de (1811-65), Fr. politician, b. in Paris. He was reported to have been half-brother to Louis Napoleon, and was adopted by the comte de M. He entered the army in 1830, and served in Algeria. In 1838 he left the service and estab. a beetroot-sugar factory. He was elected to the Chamber of Deputies in 1842. At the revolution of 1848 he was elected to the Legislative Assembly, was a staunch supporter of Napoleon III., co-operated in the *coup d'état*, and became minister of the interior. He was president of the Corps législatif (1854-65) and ambas. to Russia (1856-57). See F. Loliée, *Le Duc de Morny et la Société du Second Empire*, 1909, and M. Boulenger, *Le Duc de Morny*, 1925.

Moro (van Dashorst), Antonio, or Sir Anthony More (c. 1525-81), Dutch painter, b. at Utrecht. He studied under Titian in Italy during 1550-51, and in 1552 visited Spain. In 1553 he came to England as painter to Queen Mary, remaining till her death in 1558, when he went into the service of Philip II. of Spain at Madrid. In 1568 he returned to Holland, and settled at Antwerp. He was a popular and successful painter of portraits. See lives by H. Hymans, 1910, and G. Marlier, 1934; also M. J. Friedländer, *Altonerlandsche Malerei*, 1936.

Morocco, or Marocco (*El Maghreb el Aksa*, the furthest W.), largest of the Barbary states, with a total area, according to current estimates, of about 172,000 sq. m. (or 167,220 sq. m.) for the three spheres of influence. Older estimates gave the area as 219,000-220,000 sq. m., the difference being explained by the uncertain S. boundary. M. is situated in the N.W. corner of Africa, its N. coast being washed by the Mediterranean, and the W. by the Atlantic; the E. boundary, which marches with Algeria, has been settled by the protectorate treaty (see below under *Spheres of Influence and Government*) between France and the sultan; while the S. merges indeterminately in the Sahara. The country is traversed by sev. parallel ranges of the

Atlas Mts., the highest point being Tizi-n-Tagharet (15,400 ft.) in the Great Atlas. The mt. system in M. is more complicated than in Algeria: the main range is constituted by the Great Atlas; roughly parallel to but further S. of it is the Anti-Atlas, or Saharan Atlas following the general trend of the whole Atlas complex to the N.E. From the S. flanks of the Anti-Atlas run torrents that irrigate long oases before losing themselves as wadis in the desert sands. N. of the Great Atlas is the Middle Atlas, which, in some parts, is well wooded, and is the haunt of the small lions of Barbary. The N. slopes of the ranges are for the most part well wooded, and between them lie well-watered and fertile plains, while the S. slopes are exposed to the dry winds of the desert, and are generally arid and desolate. Beyond the Atlas lies the desert, scored by the oasis valleys of the Draa and Sus. Here on the mt. range may be seen huge *kasbahs* or feudal strongholds, looking rather like the tall Arab buildings of San'a in the Yemen or other similar buildings in S. Arabia, and comparatively modern. They served as outposts of imperial authority, and were built by Mulay Ismail, the most famous monarch of the present dynasty; later they became centres of resistance of local rulers. The rivs. flowing from the N. slopes of the Atlas are perennial, and of great commercial value; the Muluya, with its trib. the Sharef, drains the N.E. of the country and enters the Mediterranean after a course of 400 m.; the Sebou, by removal of a sandbank at its mouth in 1905, was found to be navigable as far as Fez (125 m.). Other rivs. are the Umer Rebiah (230 m.), the Tensift (190 m.), the Sus, the Ghir, and the Draa, all flowing into the Atlantic. The other rivs. are lost in the sands of the desert. The Mediterranean coast is rocky, and contains many bays and inlets, including the bays of Alhucemas, Tetuan, and Tangier, the last-named containing the best harbour in M. The most northerly point is the peninsula of Ceuta, dominated by the Jeb-el-Musa, and separated from Europe by the straits of Gibraltar. The Atlantic coast is low and sandy for the most part, the trade of the ports of Larache (El Arish), Rabat (with Sali), Casablanca, Mazagan, Saffi, and Mogador being greatly hampered by the lack of safe harbours. Casablanca is the chief port; Rabat has a good riv. harbour, but it is obstructed by a bar; Saffi has only an open roadstead. The harbour of Tetuan on a riv. entering the Mediterranean requires to be cleared of sand. The Jeb-el-Musa or Ape's Hill dominates the promontory, and, with the rock of Gibraltar, was known to the ancients as the Pillars of Hercules, the W. gateway of the Mediterranean. Between 32° N. and 30° N. is the headland of Ghir, enclosing a bay and the port of Agadir, once known as the 'gate of the Sudan.' The climate of M. is generally good and healthy, especially on the W. coast, the country being sheltered there by the Atlas Mts. from the hot winds of the desert. The extremes of temp. in Tangier

and Mogador are, in the summer, 92°, in the winter 37° (the temp. at Mogador generally ranges from 60° in Jan. to 75° in Aug.), with a rainy season between Nov. and April; but the summer heat at the intermediate ports, Casablanca, Larache, Safi, and others is appreciably higher. The winter Mediterranean coast is drier and less temperate, while in the interior it is intensely hot in summer.

Population and Towns.—The native pop. consists mainly of Islamite Berbers, known locally as Amazigh, who live mainly in the mts., and Arabs dating from the invasions of 700 years ago, who now inhabit the plains. These stocks have to some extent intermingled with each other and with people of Negroid descent. Moors, of mixed Berber-Arab descent, inhabit the tns. In the mountainous regions of the S., as in the N. Rif, the people are pure Berbers, and follow their own laws and customs. The S. Berbers are sheep-herders and horse-masters. The Arabic-speaking people of the plains are fairly homogeneous, rather similar to the 'Arab' pop. of E. Barbary. The Negroid admixture is palpable everywhere in M. except in the mountainous regions. Some of the Sherifian families (i.e. those claiming descent from the prophet) are almost blond. N. Africa contains nearly two-thirds or nearly 31,000,000 of the speakers of the Arabic language, and of these some 7,000,000 are in M.; but a considerable proportion of the pop. is bilingual in Arabic and Berber, though some Moroccans know no Arabic. Berber or Shilha is the language of the mt. dists., but Arabic of the tns. and plains. From 1912 the European element greatly increased owing to the influx of Fr. into the tns. of the Fr. zone and of Fr. colonists in agriculture, and a most marked increase occurred in the early years of the Second World War due to the influx of refugees from France, whilst M. was in effect also used as the camp for as large a number of the Fr. Army as could be transported there. The 1946 census of the Fr. zone gave a total pop. of 8,993,000, including 8,447,000 native Muslims, 208,000 native Jews, 338,000 Fr. and other Europeans, being an increase of more than 40 per cent of the 1936 total. The 1940 census of the Sp. zone gave a total of 991,900, including 914,000 Muslims, 63,000 Europeans, and 15,000 Jews. The pop. of the Tangier zone in 1941 was 100,000 (36,500 native Muslims, 16,500 Europeans, and 7000 native Jews). The pop. of the prin. tns. of the Fr. zone in 1946 was Casablanca 505,000 (107,000 Europeans); Marrakesh 241,000 (11,000); Fez 221,000 (17,000); Meknes 153,000 (21,000); Rabat 148,000 (35,000); Oujda 86,000 (24,000); Salé 52,000 (2000); Safi 48,000 (2500); Mazagan 38,000 (2000); Port Lyautey (Kenitra) 35,000 (6000); and Mogador 32,000 (1000). In 1936 the pop. of Casablanca was 257,400; of Marrakesh 190,000; Fez 144,400; Rabat 83,000; and Meknes 74,000. Casablanca was transformed in ten years from a collection of hovels into a great modern tn., with a splendid port; Meknes is also a relatively modern city

situated around the remains of a large flimsy imperial palace built to rival Versailles by an eighteenth-century sultan. Fez, Marrakesh, and Rabat are also fine tns. The reason why Fr. M. can boast such fine modern cities is that the celebrated pro-consul, Lyautey (*q.v.*), when virtually dictator of M., used large credits drawn on the military budget for development, unhampered by parl. control, though these achievements were purchased at the price of much indebtedness and the domination of such great financial concerns as the Banque de Paris et des Pays Bas, which once directly or indirectly controlled much of the economic life of the protectorate. The prin. tns. of the Sp. zone are Tetuan (1910) 73,000; Larache 36,000; Alcazarquivir 33,000; Sheshawen 12,000; Arzila 11,000; Villa Nador 9000; and Villa Sanjurjo 7000.

Spheres of Influence and Government.—In theory M. is an absolute monarchy, in which the sultan, Sidi Mohammed, who was proclaimed sultan in 1927, on the death of his father, Moulay Youssef (reigned 1912-27), exerts supreme religious and civil authority; but actually the country is divided into three spheres of influence, the Fr. zone, the Sp. zone, and the international Tangier zone—in each of which a different system of government prevails through the combined operation of the protectorate treaty signed by France and Spain on March 30, 1912, the subsequent convention between those two powers of Nov. 27, 1912, and the tripartite convention between Great Britain, France, and Spain of Dec. 18, 1923, which latter provided for a special statute in the Tangier zone.

The Fr. zone comprises all M. (excepting the Ifni enclave and Cape Juby area) from the Atlantic to the Algerian border, and from the confines of the Sahara to the boundary of the Sp. zone. The Franco-Sp. boundary follows an easterly direction from a point on the Atlantic about 16 m. S. of Larache to the R. Moulouya. The Sp. zone comprises the area between this line and the sea, with the exception of the small Tangier zone. The S. and E. boundaries of M. being largely indeterminate no precise estimate of the total area can be made, but it is approximately as follows: Fr. zone 153,870 sq. m.; Sp. zone 18,000 sq. m.; Tangier zone 225 sq. m.; total 172,095 sq. m. (other estimates give the Sp. zone as only 13,350 sq. m., including Tangier). Until her collapse in the Second World War in 1910 France was the paramount power in M., and represented the sultan in foreign relationships; but in 1915 Fr. influence was restored. The sultan resides in the Fr. zone, usually at Rabat, though sometimes at other traditional caps., Fez, Marrakesh, or Meknes. His gov. or *maghzen* consists of the grand vizier and viziers of justice, public instruction, pious foundations (analogous to the Egyptian Waqfs), and others. All *de facto* authority, however, in the Fr. zone is exercised by the protecting power through its representative, the resident-general, who is minister of foreign affairs to the sultan and head of a Fr. adminis-

tration with headquarters at Rabat, comprising all the usual gov. depts: finance, public instruction, economic affairs, etc. The Fr. authorities have enacted a large body of modern law designated as imperial edicts (*dahirs*) of the sultan, but promulgated by the resident-general. All decrees, even those of minor importance, must be approved by the protectorate authority. Local native affairs are administered by native pashas or *kaid*s under Fr. controllers. Spain has had relations with M. for centuries. The Sp. zone is under the sultan's *khalifa*, whom he selects from candidates presented by a Sp. high commissioner resident at Tetuan, and assisted by a delegate-general and a number of other delegates in charge of various gov. depts. Sp. authority in this N. sphere of influence was confirmed by the successful military operations against Abd-el-Krim in 1926, and the final pacification of the Fr. and Sp. zones in the succeeding year. Spain occupied Ifni in 1934, since when the ter. has gained some importance from its transit trade with the hinterland. A special international regime was designed for Tangier before the First World War by negotiation between Britain, France, and Spain but, owing to the war, did not come into operation. A new convention, instituting the international zone, was signed by all three powers in Paris on Dec. 18, 1923, and came into force on June 1, 1925. This convention was modified by a protocol of July 25, 1928, by the three powers, together with Italy. It provided for a complete international administration of the zone except for native affairs, which were reserved to the Sherifian authority. Brit. capitulatory (see CAPITULATIONS) rights in the Fr. zone were abolished in 1938, but are still retained in the Sp. zone, and there is a Brit. postal agency at Tetuan subordinate to the central Brit. post office at Tangier. The international zone is permanently neutralised and demilitarised. Legislative power is vested in an international assembly of twenty-seven members, but the parties to the Tangier statute agreed on a special code of law. A right of veto is vested in a committee of control, consisting of consuls-general of the powers. The administration of the zone is in the hands of an administrator and his departmental assistants. The sultan of M. is represented by a *mendoub*, who is *ex officio* president of the assembly, and has charge of native affairs. During the Second World War, in 1941, Sp. Khalifan forces occupied Tangier, and Spain was in *de facto* control of the zone until 1945. In that year a conference was held in Paris between representatives of the W. Allies to discuss the restoration of the international regime in Tangier. It was decided to put into force, with modifications, the statute of 1928, and the last Sp. troops left the zone and the sultan's *mendoub* returned to take up residence; but the present regime is temporary, pending the revision of the status of Tangier and the reorganisation of its gov.

Production and Industry.—Before the advent of Fr. influence the gov. of M. was of the most fanatical, holding all Christian nations in contempt and aversion. Foreign commerce was, therefore, unsought and the exportation of valuable commodities, like esparto grass and grain, was discouraged by high export duties, thereby preventing the fertility of the soil from being greatly utilised. There were no railways, no wheeled transport, and no internal navigation. All goods were borne by camels or other beasts of burden, and the only ports open to European commerce were Tangier and Mogador. But great changes followed on European intervention, coupled with the natural fertility of the soil, and a great many farms have been sold to European settlers, who are developing agriculture by modern methods, such as mechanisation. In the Fr. zone agriculture is the leading industry, producing wheat (about 1½ million quintals in 1945), barley (2½ million quintals), maize, and other cereals, linseed, beans, chick-peas, esparto grass, cumin, coriander, birdseed, and hemp. The fruit-bearing trees of the N. slopes of the Atlas produce many fruits, particularly almonds, wines, and olives, and also fig, walnut, orange, lemon, plum, apricot, and dates. The 'citrus' or gum sandarach-tree and the argan-tree are found near Mogador. Other trees grown are cork, cedar, and oak. The palmetto is widely grown for its vegetable fibre, and the tizra-tree for its tanning bark. Nearly 8,000,000 gallons of wine were produced in 1945. Agriculture in the Sp. zone has possibilities, but is undeveloped. Wheat, barley, and chick-peas are grown in the Tangier zone. The mineral resources of M. are known to be great, the chief mineral exploited being phosphates, the output of which under a state monopoly reached nearly 1,750,000 tons in 1945. Important deposits of coal, iron-ore, lead, zinc, and, in smaller quantities, copper, antimony, manganese, gypsum, and other minerals are being increasingly exploited as native antagonism is overcome. Iron-ore mined in the Rif is exported from Melilla in the Sp. zone.

The fauna of M. includes the leopard, bear, hyena, and wild pig; the bustard, partridge, and water-fowl abound; the dromedary and horse are bred extensively, as also are cattle, sheep, mules, asses, and goats. There are abundant fish off the coasts, and the fishing centres near Cusa-blanca and at Fedhala have a preserving industry. The manufs. include leather, pottery, textiles, carpets, embroideries, copper and brass goods, silver filigree, slippers, and shawls. Various miscellaneous industries have grown up in recent years for local consumption, including flour mills, cement factories, soap and candle factories, and breweries. The trade of M. is now chiefly with France, Great Britain, the U.S.A., and Spain. The chief exports are phosphates, wheat, fish, wool, palmetto fibre, hides, skins, eggs, cattle, sheep, pigs, barley, almonds, linseed, gums, and Taffet dates. Some native manufs., such as fez caps and

leather, are exported to various parts of Africa. The chief imports are cotton, sugar, tea, hardware, petrol, coal, motor vehicles, edible oils, flour, semolina, and wine. The Sp. zone exports iron-ore, lead, cork, skins, and vegetable fibre; and the chief exports from Tangier are preserved fish, skins, M. leather, and eggs.

Commerce.—Fr. zone: imports in 1946 were valued at 17,529,000 fr.; exports at 10,395,000 fr. In the Sp. zone imports in 1944 were 314,202,000 pesetas; exports 93,711,000 pesetas. Tangier zone: imports, in 1944, 181,357,000 fr.; exports 14,630,000 fr. Imports from M. to Britain in 1947, were valued at £3,771,776; exports to M. from Britain were £1,449,422. The foreign commerce of M. is characteristic of a developing country, the imports

Rabat, Casablanca, and Mogador. There are Brit., Fr., and Sp. postal agencies at the ports of Fez and Marrakesh. Telephones are in use in all the prin. tns., which are connected with the European systems through Ceuta. There is a daily air service between Barcelona and Melilla, stopping at Madrid, Seville, Tangier, and Tetuan. Air services by Air France have been re-established between Rabat and Paris and Bordeaux. There is also a B.O.A.C. service between Rabat and the United Kingdom via Lisbon.

Religion, Education, and Justice.—The religion of the country is a strict form of Mohammedanism, much purer than that practised in Turkey and Persia. The bulk of the native pop. is illiterate. There are numerous Koranic schools which give

Governor of Morocco

AN OASIS IN THE DESERT OF MOROCCO

much more valuable than the exports, indicating an excess of investment.

Communications.—There are about 860 m. of normal-gauge railways in operation in the Fr. zone, the Fr. authorities having begun serious development in 1939. In addition, the completion of the Tangier-Fez full-gauge line affords through service between Tangier and the chief tns. of the Fr. zone, and a normal-gauge line connects Fez with the Algerian frontier at Oujda. Casablanca is joined by rail with the Algerian border and Tunis, and with Marrakesh by two branch lines, one eastward via the Khouribga phosphate mines, the other to Saffi and Oujda. The existing railways in the Sp. zone are Ceuta to Tetuan, Larache to Alcazar, and Nador to Tistutin. There are about 2800 m. of first-class roads and about 2000 m. of second class. The Sp. zone has some 500 m. of good roads and the Tangier zone 65 m., but the highway S. from Tangier to the M. line of demarcation is the only really first-class road in Sp. M. There are submarine telegraph cables from Tangier to Chdz. Tarifa, and Oran, and wireless stations at Tangier,

a very elementary education, and a number of higher schools attached to mosques. The most notable is the Kairouan Univ. at Fez, which has high repute in the Islamic world. In the Fr. zone education on European lines is given in the Fr. schools, and schools are provided by the protectorate gov. for Moslem natives. There are state schools in the chief tns. of the Sp. zone and certain Hispano-Arabic schools for natives. Native justice is administered in the Fr. zone by religious courts, and the pashas or *kadis* also have a wide jurisdiction in both civil and criminal cases, subject to supervision by a Fr. controller. Two courts of appeal have been set up at Rabat corresponding to these jurisdictions. Fr. courts modelled on those in the metropolitan country were set up in 1913 to deal with cases by or against Fr. and other foreigners. The Fr. courts are the court of appeal at Rabat and the courts of first instance at Rabat, Casablanca, Marrakesh, Fez, and Oujda. Rabbinical courts have jurisdiction in cases on the personal status of Jews. Native and Jewish justice in the Sp. zone is similar to that in the Fr. zone, except

that all criminal cases are tried in the Sp. courts. In the Tangier zone native justice is administered as in the Fr. zone, the *mehdoub* having a jurisdiction similar to that of the pashas and *kadis*.

History.—The known hist. of M. begins in the eighth century with the introduction of Islam and the estab. of the dynasty of a branch of Mohammed's family, the Idrisids, contemporary with Haroun al-Raschid. A succession of dynasties, of which the most famous were the Almoravides (*q.v.*) and Almohades (*q.v.*), ended in that of Filali, originally Sherifs of Tafillet, which reigned from 1546 to the present day. What brought the Sherifs to power as rulers of M. was their fight against Portugal, which ended in 1578 with their conquest of all M. except Mazagan. Their gov. was an absolute despotism, opposed to all progress and corrupt in administration, and European intervention had been necessary at different periods. During the Fr. conquest of Algeria M. adopted an anti-Fr. policy by helping and, later, sheltering, the formidable Abd-el-Kadir; but with his defeat and capture at Isly (1843) Franco-Moroccan relations were peaceful during the second half of the nineteenth century. None the less the Moroccan problem remained to be solved. Since 1878, despite Brit. objections, a Fr. military mission had been stationed at Fez. The Madrid convention of 1880 was an agreement to maintain the *status quo*. Fourteen years later Abd-el-Aziz, secretly aided by Germany, launched a number of guerrilla attacks which threatened to imperil European interests generally. In 1904 by the agreement of April 8, which permanently settled the question of Egypt, England gave France a free hand in M. and a few months later France signed an agreement with Spain, which defined their respective spheres of influence. In 1906 the Ger. emperor, Wilhelm II., visited Tangier with the object of protesting against the Anglo-Fr. agreement, and the tension between France and Germany became acute. In 1906 an international conference was convened at Algeiras to define the interests of the various powers, and to establish order in M. by means of an organised police force. This conference laid down the principle of the 'open door' in M. Between 1906 and 1911 there were various conflicts between the Fr. troops and the Moroccan tribesmen, and at Melilla between the Spaniards and the Rifian mountaineers. In 1908 the sultan, Abd-el-Aziz, was defeated and deposed by his brother, Mulai Hafid, who was recognised by the powers in 1909. In 1911 fresh troubles began. Fez was besieged by the rebels, but relieved by the Fr. (May 21), while a Sp. force at Larache dealt with the Rifian rebels. In July 1911 the Ger. gunboat *Panther* anchored in Agadir harbour ostensibly to protect Ger. interests. After protracted negotiations between France and Germany the latter left Agadir and relinquished all claims to the country in return for compensation in the Congo. In 1912 the Sultan Hafid abdicated, and was succeeded by his brother Mulai Tusef.

During the same year the Franco-Sp. treaty divided the country into the above noted spheres of influence or protectorates; but the arrangement was not accepted peacefully by the various tribes, and very quickly the Sp. zone became the arena of contention and guerrilla warfare, which quickly involved the Fr. area as well.

Poincaré thought that a distinguished soldier should be placed at the head of the new protectorate and Gen. Lyautey (*q.r.*), appointed on account of his colonial record, showed himself to be a great modern pro-consul both as builder and reformer. The Fr. troops were beginning to overcome their chief difficulties when the First World War broke out in 1911, and the Moroccan Army, which contained some of the best-trained Fr. troops, was needed at home. Lyautey had to maintain order and continue his constructive work with weak effectives and also to repel constant attacks organised by Mulai Hafid and a son of Abd-el-Kadir, who had been armed by the Gers. After the treaty of Versailles the Fr. reduced their last opponents, the Beni-Quarain, and occupied the region of Quezane. By that time the network of roads constructed by Lyautey was almost completed, and this was the moment chosen by a new adversary, Abd-el-Krim (*q.r.*), who had won some influence by his defeat of the Sp. at Anual in 1921, to attempt a coup against France. At first Abd-el-Krim won a few successes and stirred up trouble in the region N. of Fez. But an expedition under Gen. Boichot proved successful, and by 1930 only the Tafillet and the Bou-Deub plain remained to be conquered. Ten years later M., completely pacified, administered on modern lines, weathered Fr. reverses in the Second World War. After the armistice of 1940 not a single hand was raised against the Fr. protectorate. Marshal Lyautey's achievement was the reason for the continued loyalty of the colony. He settled the judiciary problem and, as a supreme guarantee of Moroccan rights, introduced courts of appeal. He laid the foundations of free public education; he provided schools for the sons of notables, Muslim colleges, and practical primary schools. By agric. colonisation, and by carrying out an immense public works programme, he created economic prosperity. He introduced the registration of deeds in a country where no land statute had previously existed. Large fens, were purchased by the protectorate for settlers and for public works, in a country where the Muslims habitually sell unwillingly, but Lyautey succeeded in carrying out this part of his programme without conflict, acting always without injustice or arbitrariness. Like a Rom. pro-consul, Lyautey, with a view to military operations as well as for other reasons, planned an immense network of roads and built them in fifteen years. Finally he regulated the exploration and exploitation of mines, though the mineral wealth of M. is still far from being completely exploited, particularly the reserves of oil; the discovery, however, of an important oil deposit was made at Jebel

Teflat in 1934. The gov. of the Tangier zone was planned before the First World War by negotiations between the Fr., Brit., and Sp. Govs., and though the plan was delayed by the European outbreak, an agreement embodying its terms was signed by the three powers in Paris on Dec. 18, 1923, and brought into force in June 1925. This convention was somewhat modified by a protocol signed at Paris in 1928, to which Italy became an additional subscribing member (see further under *Spheres of Influence and Government*). The Sp. zone was the base of Gen. Franco's military rising against the Sp. republic in 1935 and Moroccan troops, known as *Moros*, played a great part on the Nationalist side. The Tangier Convention of 1923 was automatically renewed in 1936 for a further twelve years. The zone was occupied by Sp. troops in June 1940. In 1941-42 Hitler put heavy pressure on Franco to give passage to Ger. troops by land and the use of Sp. airfields, so as to complete the policy of infiltration into M. and thereby acquire control over Brit. Atlantic communications. But whatever progress he may have made in these machinations was abruptly nullified in Nov. 1942, when a large Anglo-Amer. force occupied M. and Algiers and thereby began the first phase of the N. African campaign for the control of the Mediterranean. At Casablanca, Jan. 14-24, 1943, President Roosevelt and Mr. Churchill, together with their leading political and military advisers, arrived at general agreement on broad strategic plans for the conduct of the war against the Axis (see CASABLANCA CONFERENCE).

Although the Fr. protectorate has been in existence for less than forty years, and although the final pacification of M. was not completed until 1934, the Fr. have in that relatively brief period transformed the country almost beyond recognition. Before 1912 internecine and fratricidal warfare was the rule rather than the exception; the authority of the sultan was confined to a few dists., most of the country being ruled either by tribal chiefs and usurpers or by powerful brigands. To-day lawlessness has dwindled almost to nothing; standards of public health and education are incomparably higher; excellent roads or railways—many of them electric—cover the country from the N. right down to the Sahara. The present (1949) Fr. resident general and commander-in-chief, Gen. Juin, who assumed office in May 1947, is a most efficient administrator who, within two years, has succeeded in suppressing the insecurity and lawlessness that were an inevitable aftermath of the world war. Marshal Lyautey, the first resident general, began to prepare the Moors for ultimate self-government, at the same time strengthening the authority of the sultan. But not all his successors have followed his policy. Although it is stated on high authority that ultimately France envisages nothing less than total independence for M., the nationalists there contend that the Fr. administration at Rabat does little to further the cause.

Moors are excluded from higher and even medium rank civil service posts; they receive little if any training for future responsibility; there are next to no native technicians, economists, or doctors in the making. At the same time there is a constant flow of Fr. experts, whom at present the Moors could not replace, but also of lower officials, police, engine drivers, and postmen from France. Yet most of the Moors realise that any sudden withdrawal of the Fr. would result in chaos, and that they are not ready for self-government. Potentially M. is among the richest countries in the world; but on the whole hardly 1 per cent of the mineral wealth is exploited. Fr. capital and technical resources are insufficient for a more thorough exploitation. Again, as regards agriculture, the output could, with more widespread irrigation and the application of modern techniques, probably be trebled; but a general modernisation of agriculture in M. would need a capital outlay far beyond the present means of France.

Morocco, or Marrakesh, old cap. of the Moorish empire, on the N. side of the Great Atlas range, 90 m. from the Atlantic coast and 250 m. S.W. of Fez; has manufs. of carpets and leather, and is the centre of the trade of S. M. The city was founded in 1072, and had a pop. of 700,000 in the fourteenth century, which has now declined to about 190,000. **Moron**, tn. of Cuba, W. Indies, 250 m. E.S.E. of Havana. Pop. 10,000.

Moron (Gk. *μωρός*, stupid), term applied to the highest grade of mentally defective person, those whose 'mental age' is somewhere between seven and twelve years. The M. is able to transact work requiring rational judgment, but in social matters he is largely dependent on the help or guidance of other people. Such

mental defectives may often be educated in special schools for simple employment, where they can be kept under observation with respect to their social and moral qualities.

Moron de la Frontera (anct. *Arumí*), tn. of Seville, Spain, 32 m. S.E. of Seville. The dist. is noted for its marble and chalk. Olive oil is produced. Pop. 18,700.

Moroni, Giambattista (1510-78), It. painter, b. at Bondo, Bergamo; studied under Moretto. He was especially successful in portrait-painting, and was praised by Titian. Five of his works are in the National Gallery, London, including the excellent 'Tailor.'

Morosini, illustrious Venetian family, probably of Hungarian origin. Among the most famous members were *Domenico M.* (doge, 1148-56), who recaptured Pola and other Istrian tns. from the Dalmatian corsairs; *Mariño M.* (doge, 1219-52), who introduced the Inquisition into Venice; *Michele M.* (doge, 1382), a celebrated financier; *Andrea M.* (1558-1618), who became historiographer to the republic (1598), was one of the Council of Ten, continued Paolo Paruta's *Annali Veneti*, and wrote a hist. of Venice (1521-1615, pub. 1623) and other works; and *Francesco M.* (1618-94), a great sea captain, who became doge in 1688.

Morpeth, municipal and parl. bor. of Northumberland, England, 14 m. N. by W. of Newcastle. It has remains of a medieval castle and gateway; the par. church of St. Mary dates from the fourteenth century. There are large collieries in the neighbourhood, also iron foundries and quarries. In the tn. are breweries, corn mills, and flannel factories. M. has one of the most important cattle markets in the N. of England. Pop. 10,000.

Morpheus (from Gk. *Morphy*, form), in classic mythology, the son of Sleep and Night; the god of dreams, and creator of the visions of the sleeper.

Morphia, popular name for the alkaloid morphine, $C_{17}H_{19}O_3N$. Morphine is contained in opium or the juice of poppy-heads (*Papaver somniferum*). The opium extract is boiled with milk of lime and the product filtered. Morphine is contained in the filtrate, all other alkaloids being precipitated. After digesting the filtrate with ammonium chloride to remove all trace of lime, the separate morphine is collected and recrystallised from boiling alcohol. Morphine forms colourless prisms with one molecule of water of crystallisation; it is only slightly soluble in water and in cold alcohol, and on this account is used in medicine in the form of its salts, particularly the hydrochloride. Morphine is the most effective anodyne known to science, relieving pain and producing sleep either when administered by the mouth or injected hypodermically. One grain of the hydrochloride may be a fatal dose, but persons habituated to its use are capable of taking more than 15 grains a day. The effects of the M. habit are moral degeneration, disturbance of secretions, lowering of physical and mental powers. The habit is most difficult to break, owing to the moral weakness of the

victim; the sudden withdrawal of the drug is highly dangerous, and the only cure is the gradual diminution of the dose under circumstances which render it impossible for the patient to obtain more than his allowance. Various derivatives of morphine also find application in medicine, particularly diacetylmorphine hydrochloride (heroin), which acts as a repellant to the respiratory centres and is used to relieve cough; but as an analgesic it is inferior to morphine. Two other related alkaloids occur in opium: codeine (see CODEIA or CODEINE) and thebaine, the former being a mild narcotic, the latter a violent tetanising poison. The chemical constitution of M. was finally estimated in 1925 by Sir Robert Robinson.

Morphology concerns itself only with the analysis of any organism into its parts, and is not concerned with the life which produced, or is possessed by, that organism. Thus M. is that sub-science of biology which deals with the study of form or structure of the organism, as opposed to physiology, which is concerned with the functioning of those parts described by M. Expressed in another way, M. is the 'statics' and physiology the 'dynamics' of the organism. The scientific study of the form of an organism cannot be completed merely by description. Such phenomena as those of the development of form in the individual, and the presence of similar forms in different individuals, must be considered before the M. of an organism can be elucidated. Thus M. is intimately associated with embryology, in so far as the disposition of tissues is concerned, and with comparative anatomy. Some descriptive M. is found in anct. Egyptian, Babylonian, and Chinese records. Aristotle compared man with a quadruped; Hieronymus and Fabricius (1537-1619) compared and contrasted the structure of certain mammals, and Pierre Belon (1551) made an important advance in extending his investigations to birds and fishes. Giulio Casserio (1561-1616) contributed to M. by comparing the ear ossicles of sev. mammals and the goose. Considerable progress in the science was made towards the end of the eighteenth and in the early nineteenth centuries. Goethe, Huxley, and particularly Haeckel, advanced M. by the formulation of synthetic views. Goethe (1790) in his *Metamorphosis of Plants* stated cotyledons, subsequent foliage leaves, and floral leaves were equivalent structures, and this was confirmed. Goethe also showed that, contrary to the general belief at that time, the human skull resembled that of other mammals in possessing a premaxillary bone. He strongly believed in 'unity of plan,' and to this conception St. Hilaire (1818) added the 'principle of connections,' viz. that similar parts occupy similar relative positions in all animals. The study of M. involves the recognition of homology as distinct from analogy. This was emphasised by Owen (1843). Corresponding parts developing in similar ways may have very different ultimate forms and

functions, but nevertheless are homologous. Petals and foliage leaves of delphinium, the human arm and the wing of a bird, are examples of homologous organs. The leaf-like stem of *Ruscus aculeatus* and the leaf of smilax, insects' and birds' wings, are merely analogous, for their modes of development and the relation they bear to associated parts are entirely different. Although homology does not necessarily imply relationship, Haeckel and Gegenbaur regarded it as indicating common descent, and this view is held by most biologists. That branch of M. which traces descent by means of homologous characters Haeckel distinguished as phylogeny. As a result of embryological homologies, discovered by von Baer, Haeckel formulated his 'Biogenetic Law of Descent,' generally spoken of as the 'Recapitulation Theory,' which states that the development of the individual organism recapitulates the course of its evolution: this theory is now accepted with considerable reservation since many features of an embryo obviously have no evolutionary significance. Thus M., from its apparently insignificant beginnings, has developed into the keystone of evolutionary biology. See also ANATOMY; BIOLOGY; CELL THEORY; EMBRYOLOGY; HISTOLOGY; HOMOLOGY; PHYSIOLOGY. Morphy, Paul (1837-84), Amer. chess player. See under CHESS.

Morris, Sir Edward Patrick (1859-1935), first Baron, Newfoundland statesman, b. at St. John's, and educated at Bonaventure College, St. John's, and univ. of Ottawa. He became a solicitor of the supreme court in 1884, and was called to the Bar in 1885. He sat in Parliament for St. John's, 1885-1919. In 1889 he became a member of the Cabinet, but left his party on the vote for the Reid railway contract, which he was mainly instrumental in carrying. He was leader of the Independent Liberal party, 1898-1900, but held a seat in the Cabinet 1900-7. In 1905 he became leader of the People's party. Attorney-general and administrator of justice, 1902-7. Premier of Newfoundland, 1909-18. P.C., 1911. He represented Newfoundland at the Imperial Defence Conference in 1909, at the Imperial Conference and the coronation in 1911, and at the Imperial War Conference, 1917. He was a member of the Brit. War Cabinet, Feb.-June 1917. He ed. the Newfoundland law reports, 1830-1905, cited as *Morris's Reports*.

Morris, Gouverneur (1752-1816), Amer. diplomat and statesman, b. in New York. Called to the Bar in 1771. He had joined the patriotic party by 1775, and sat in the Continental Congress, 1777-80. He became assistant-financier to Robert Morris (1781-85), after publishing a series of essays on Amer. finances in the *Pennsylvania Packet* (1780), and practically founded the national coinage. M. helped to draw up and revise the document setting forth the U.S. constitution (1787). He then travelled in France, England, and Germany, becoming minister to France from 1792 to 1794. He was elected U.S. senator for New York (1800-3), and chairman of the Erie Canal Commission (1810). See J. Sparks, *Memoirs of Gouverneur Morris, with Selections from his Papers*, 1832; E. Duyckinck, *Cyclopaedia of American Literature* (vol. I.), 1855, and Anne Cowley Morris (ed.), *The Diary and Letters of Gouverneur Morris*, 1888. See also life by T. Roosevelt (Amer. Statesmen Series), 1888.

Morris, Sir Lewis (1833-1907), Brit. poet, great-grandson of the Welsh poet, Lewis M. (d. 1765). He graduated from Oxford (1853), and was called to the Bar at Lincoln's Inn in 1861, practising till 1881. Always interested in higher education in Wales, he became deputy-chancellor of the univ. of Wales, and served on the governing bodies of the three Welsh colleges. His works include *Songs of Two Worlds* (1871-75); *The Epic of Hades* (1876-77, which went through numerous eds.); *Athena, a Drama in Monologue* (1879); *The Ode of Life* (1880); *Songs Unsung* (1883); *Songs of Britain* (1887, containing odes on the queen's jubilee and the foundation of the Imperial Institute); *Idylls and Lyrics* (1896); *The Harvest-tide* (1901); and *The New Rambler: from Desk to Platform* (1905). A collection of his works appeared in 1882 (revised 1907). M. was made a knight of the order of the Saviour (of Greece) in 1879, and awarded a jubilee medal (1887).

Morris, Richard James, see ZADKIEL.

Morris, William (1831-96), Eng. poet and artist, b. at Walthamstow, Essex. He was educated at Marlborough and at Exeter College, Oxford. At the univ. he read widely, and began his friendship with Edward Burne-Jones. M. was one of the originators of the *Oxford and Cambridge Magazine* (1856), to which he contributed short stories, essays, and poems. In 1858 he pub. a book of verse, *The Defence of Gomerere*, but at this time his interest was inclining to painting and illuminating. He married Jane Burden in 1859, and built a house at Upton for himself, for which he designed the decorations. It was probably this that gave him the idea of forming (1861) a firm of manufacturers and decorators, known as M., Marshall, Faulkner & Company, the main object of which was to produce artistic furniture and to undertake artistic furnishing.

In 1868 he began to write, *The Earthly Paradise*, which he completed in 1870. After this was pub. M. turned his attention to illuminated MSS., and later studied the arts of dyeing and

carpet-weaving. In the early eighties he embraced socialistic tenets. In 1890 he started at Hammersmith the Kelmescott Press (so called after his house near Lechlade, which he had leased in 1871), and thence issued the magnificent and much-sought-after books. It is difficult to over-estimate the great influence that M. has had on book production. Although his direct influence is somewhat decayed at the present time, it is undeniable that the form of the better class modern book owes a debt to the impetus given by M.

His first vol. of verse, *The Defence of Guenevere* (1858), was the earliest manifestation of what is called the second romantic revival, of which he and Rossetti were the leaders. Both writers were drawn to medieval sources, as were their early nineteenth-century predecessors, but they used those sources in a novel and much more scholarly manner, and in some sort seemed to succeed in reviving the sentiments and modes of thought of the Middle Ages. Yet M.'s *The King's Dream*, *Haystack in the Floods*, *Sir Peter Harpdon's End*, and *Shameful Death* all show that he realises the savage element in the Middle Ages which he is far from representing as a past golden age of prosperity and bliss. In *The Life and Death of Jason* (1867), *The Earthly Paradise* (1868-70), and *Love is Enough* (1873) there is an even flow of narrative, if somewhat diffuse and monotonous in general effect. Both the two former of these works contain a memorable envoi to Chaucer, and the scheme of *The Earthly Paradise* is so conceived that M. can select from all the great stories of the world's literature, classical, medieval, or oriental, and clothe them in medieval dress. *Love is Enough* is a well-constructed mystery play. *Sigurd the Folsung* (1876) is an ambitious version of Scandinavian legend, reproducing the wild spirit of Norse poetry and the austere passion of N. sagas. M.'s theory of art may be briefly mentioned. Like that of his master, Ruskin, it was one with a very practical bearing on the conduct of life. The key to his position in this regard is to be found in his own words: 'That thing which I understand by real art is the expression by man of his pleasure in labour' (*Lectures on Art*). M. believed that all creative work whatsoever ought to be artistic so as to produce the pleasure that comes from the healthy exercise of man's energies and 'appeals to his emotions and his intellect by means of his senses.' To M. the greatest happiness is happy work, and the greatest sin, the sin against beauty of life, thought, or natural environment. Among his other writings were long, verse trans. of the *Æneid* (1875) and the *Odyssey* (1887); *The House of the Wolfings* (1889); and *News from Nowhere* (1891). A collected ed. of his works, with introductions by May M., was pub. 1910-13. See lives by A. Vallance (with bibliography), 1897; J. W. Mackail, 1899; Holbrook Jackson, 1908; J. Drinkwater, 1912; A. Compton-Rickett, 1913; G. D. H. Cole (in *Revaluations*), 1931; P. Bloomfield, 1934; Esther Meynell, 1948; and E. and S. Godwin (*Warrior Bard*), 1948; also B. I. Evans,

William Morris and his Poetry, 1925; F. L. Lucas, *Eight Victorian Poets*, 1930; and A. D. M. Hoare, *The Works of Morris and Yeats in Relation to Early Suga Literature*, 1937.

Morris, William Richard, see NUFFIELD, FIRST VISCOUNT.

Morris (Morrice, Mourice, Mores) Dance, O.E. dance probably of Moorish origin, and most likely introduced into England by Eleanor of Castile, queen of Edward I. In Henry VIII.'s reign it formed an essential part of most rustic and parochial festivities. When later it was associated with the May games, the dancers frequently represented characters of the

MORRIS DANCERS

At the English Folk Dance Society's annual festival at Carleton

Robin Hood legend, especially Maid Marian and Friar Tuck. The hobby-horse was at one time a prominent figure in this dance. It was suppressed by the Puritans and never generally revived. See J. Strutt, *Sports and Pastimes*, 1810; J. Brand, *Observations on Popular Antiquities*, 1815; F. Douce, *Illustrations of Shakespeare* (vol. II.), 1839; C. Sharp and H. MacIlwaine, *The Morris Book*, 1907; J. H. Crampton, *Folk Dance Book*, 1940; V. Alford, *Peeps at English Folk Dances*, 1940; D. Kennedy, *England's Dances: Folk Dancing To-day and Yesterday*, 1948; and also *The Journal of the English Folk Dance Society*.

Morris Motors Limited, important motor-car manufacturing company, which was registered June 29, 1926, as having acquired the businesses of a previous company of the name of Hollick and Pratt Ltd. and Osberton Radiators Ltd. The business is the outcome of the remarkable capacity, inventiveness, and organising skill of its chairman, Lord Nuffield, who, from small beginnings at a little workshop he started at the age of seventeen, developed the great factory at Cowley in Oxfordshire. The works cover 82 ac., with an ann. output capacity exceeding

100,000 cars. The authorised capital of the company is £5,650,000, viz. £2,650,000 in ordinary and £3,000,000 in 7½ per cent cumulative preference stock. No prior or *par passu* shares can now be issued without the consent of the preference stockholders. The company controls Morris Commercial Cars Ltd.; Nuffield Acceptances Ltd.; Nuffield (Australia) Pty. Ltd.; Nuffield Exports Ltd.; Nuffield Mechanisations Ltd.; Nuffield Metal Products Ltd.; Nuffield Tools and Gauges Ltd.; Riley Motors Ltd.; The M.G. Car Company Ltd.; The Nuffield Press Ltd.; The S.U. Carburettor Company Ltd.; and Wolseley Motors Ltd.

Morrison, Arthur (b. 1863), Eng. novelist and writer on art. His best stories are *Tales of Mean Streets* (1894); *A Child of the Jago* (1896); *The Dorrington Deed-box* (1897); *The Hole in the Wall* (1902); *Green Eye of Goona* (1904); *Green Ginger* (1909); *Fiddle o' Dreams* (1933); and a series of detective stories centred on the fictional character, Martin Hewitt, investigator. He wrote also *The Painters of Japan* (1911), and other books on oriental art. Co-author of the plays *That Brute Simmons* (1904); *The Dumb Cake* (1907); and *A Stroke of Business* (1907).

Morrison, George Ernest (1862-1920), Australian explorer and journalist; b. at Geelong, Victoria; son of a Scotsman, principal of Geelong College. He left Melbourne Univ. at eighteen and became a wanderer. He visited South Sea Is. as a common sailor, 1882, and pub. observations on forced labour there in *Melbourne Age*. In the same year he crossed Australia N. to S. In New Guinea he was nearly murdered by natives. M.D., 1887. He visited U.S.A., W. Indies, Spain, and Morocco. In 1890 he went to Ballarat and was for two years in charge of the hospital. He crossed from Shanghai to Rangoon by land, 1894. In 1895 he became correspondent of *The Times* in China and Siberia, and in Peking during siege of the legations, 1900. In 1907 he crossed China, Peking to Tonquin, and in 1910 rode from Honan to Russian Turkestan.

Morrison, Herbert Stanley (b. 1888), Eng. tradesman. He was educated at an elementary school in London, and later was a shop assistant, a telephone operator, and a deputy newspaper circulation manager. In 1915 he became secretary of the London Labour party, holding office until 1940. Entering local government M. was mayor of Hackney, 1919-20, and, in 1922, became Socialist leader in the L.C.C.; an alderman from 1931, he was leader of the council from 1939 to 1940. His first appearance in national politics was in 1923, when he became M.P. for S. Hackney. He lost this seat in 1924, but regained it five years later, becoming minister of transport in Macdonald's minority gov. until the Labour defeat of 1931. Concentrating upon local government M. was responsible for the legislation setting up the London Passenger Transport Board. Returning to Parliament in 1935 he became minister of supply in the wartime Coalition Gov. In 1940, but soon exchanged that post for the Home Office

and the Ministry of Home Security. From 1942 to 1945 he was a member of the War Cabinet. In the third Labour gov. of 1945 M. became leader of the House of Commons and lord president of the council. Besides being an administrator of ability he is an original thinker on the problems of socialism and the Labour party, tending rather to the old tradition of Eng. Radicalism than to doctrinaire Marxism. He has written *Socialisation and Transport* (1933); *How Greater London is Governed* (1935, 1949); *Looking Ahead* (1943); and *The Peaceful Revolution* (1949), a collection of speeches. See life by M. Edelman, 1948.

Morrison, Robert (1782-1834), Brit. missionary, founder of Protestant missions in China, b. at Morpeth. He studied in England from 1801 to 1807, when he was sent to Canton by the London Missionary Society. In 1809 he became translator to the E. India Company. He estab. an Anglo-Chinese college at Malacca in 1818. He trans. the Bible into Chinese (1809-1819), and compiled a *Dictionary of the Chinese Language* (1815-23); *Chinese Grammar* (1815); and *Chinese Miscellany* (1825).

Morrison, riv. of Ross and Cromarty and Inverness, Scotland. Its source is near Loch Cluny, and it flows into Loch Ness at Invermoriston in Inverness. Length 19 m.

Morristown, co. seat of Morris co., New Jersey, U.S.A., on Whippany R., 26 m. W. by N. of New York. It is a favourite summer and health resort. Pop. 15,000.

Morrow, Dwight Whitney (1873-1931), Amer. diplomat and banker. He was a member of J. P. Morgan & Company (q.v.), from 1914 to 1927; chairman of the Prison Inquiry Commission, New Jersey, 1917, and of the New Jersey State Board Institutions and Agencies until 1920. He was advisor to the Allied Maritime Transport Council, 1918. U.S.M., 1919. He became chairman of the President's Aircraft Board in 1925, and was ambas. to Mexico from 1927 to 1930. He was successful in bringing to an end the tension between Mexico and the U.S.A., and in establishing an era of better feeling. He was one of the U.S. delegates to the London Naval Conference in 1930 and, later, was elected to the U.S. Senate as a Republican from New Jersey. See life by H. Nicholson, 1949.

Mors, or Morso, is. of Denmark, off the W. coast of Jutland, in the Lüm Fjord. Chief tn. is Nykjøbing. Length 22 m. Pop. 18,500.

Mors, tn. in the Rhineland prov., Germany. 17 m. W. of Essen, with coal-mining and iron foundries. Pop. 24,000.

Morse, Samuel Finley Brees (1791-1872), Amer. inventor of telegraphic system. b. at Charlestown, Massachusetts. In 1811 he came to England to study art under West, and gained a gold medal in 1813 for a statue. He returned to America in 1815, and was first president of the National Academy of Design, New York, during 1820-42. He also studied chem. and electricity, and in 1832 conceived the idea of a magnetic telegraph.

The original M. code (see under TELEGRAPHY) was devised in 1837 with Alfred Vail and introduced by M. for use with a self-recording telegraph. In 1843 Congress granted \$30,000 for an experimental telegraph line between Washington and Baltimore, and M.'s system was soon widely adopted. See life by S. I. Prime, 1875, and E. S. Morse (ed.), *Letters and Journals*, 1914.

Morse, see WALRUS.

Morse Code, see TELEGRAPHY. *Morse System*.

Morshansk, tn. in the Voronezh Region of the R.S.F.S.R., 58 m. N.N.E. of the city of Tambov. It is a trade centre for wheat grown in Tambov, Penza, etc. The manufs. include glue, tallow, soap, and malt. Pop. 30,000.

Mortain, vil. in the dept. of Manche, France, 20 m. W.S.W. of Avranches. For details of the fighting here during the Second World War see under FALAISE, *Battle of the Falaise Pocket*. Pop. 1707.

Mortality.—*The Law of Mortality*. In actuarial calculations the law which, founded on the average M. for any given number of years, determines the proportion of persons who die in any assigned period of life or interval of age out of a given number who enter upon the same interval.

Bills of Mortality.—Abstracts from par. registers giving the number of persons that have died in any par. during certain periods of time, and denominated according to the period taken, weekly, monthly, or yearly bills. They originated in London in the sixteenth century, during the time a plague epidemic was ravaging the city, and have been pub. regularly from shortly after that year till the present time. See also BILL OF MORTALITY.

Mortality, Bill of, see BILL.

Mortar (Lat. *mortarium*), material used to bind together the bricks and stones of a building. The use of such a material dates back to early times. M. is a mixture of lime with water and sand. The sand is placed on the mixing platform and formed into a ring, into which the required quantity of lime is placed. The whole is then well sprinkled with clean water, the sand turned over the lime, and it is left to 'slake' for a day or two, when it is well mixed up. It is preferable to leave the M. for some time after mixing, until it is 'tempered.' 'Hydraulic mortar' is a name sometimes given to M. which hardens in water (as opposed to ordinary M., which hardens only in air), but this is really cement (*q.v.*).

Mortar, short piece of ordnance with a very wide smooth bore, the width of which in early pieces equalled the length of the M. It was formerly employed against forts during sieges owing to its power to develop high angle fire. Before the First World War Ms. were heavily constructed and unsuitable for field work, but during the war a light portable pattern was invented (the Stokes M.) which could develop an accurate destructive fire at short range. In trench warfare such a weapon was invaluable against hostile machine-gun emplacements, snipers'

posts, or any construction in the front line which could not be destroyed by rifle fire. As they must be well to the front to be of service, their ammunition supply became one of difficulty. In the Second World War Ms. were extensively used as an infantry support weapon. Besides the 2-in. M., throwing a bomb about the size of a hand-grenade, Brit. battalions in the Second World War included in their support company a M. platoon armed with 3-in. Ms. which were carried in Bren-carriers. As pieces of this calibre could conveniently be broken down into loads for one pack animal, they were extensively used in mt. warfare. Their high trajectory permitted their use in wooded country where the problem of crest clearance could not be surmounted by light artillery at short range, and on the N. sectors of the Russian front they tended to replace the light field gun as a close-support weapon. As a result of experience by both sides in this theatre heavier models were developed, of which the Finnish Tampela (120 mm.) M. was one of the first. This and similar weapons up to 150 mm. had a round instead of a square baseplate with detachable wheels and could be towed like a field-gun, but muzzle foremost. Owing to their smooth bore and less complicated recoil mechanism, Ms. could be more speedily and cheaply manufactured than field guns, and besides were well suited for transport by air. In the Ger. Army, handicapped by its insufficient estab. of artillery, Ms. tended more and more to replace the infantry support gun, especially in airborne divs. This led in the Brit. Army to the development of a counter-M. organisation at brigade level. A 4.2-in. M. was used in the N. African campaign, with a range of over 2000 yds. and a 20-lb. bomb. In the Normandy landings 6-in. Ms. were mounted on tanks. At the end of the war the U.S. army was testing a self-propelled M. firing a 2-ton projectile 4 m.

Mortara, tn. of Italy in the prov. of Pavia, 25 m. S.W. of Milan. The Austrians gained a victory over the Sardinians here in 1849. It is a railway junction, and has iron works. Pop. 11,000.

Mortar and **Pestle**. M. is a vessel in which substances are ground to fragments or pulverised by beating with an instrument called the pestle. They are made of various substances according to their use. Glass, agate, flint, porphyry, stoneware, or cast-iron is generally used. Glass and stoneware Ms. are used in the laboratory for analytical work, agate is used when the substance is to be reduced to a very fine powder, whereas iron Ms. are employed for crushing coarser substances.

Mortehoe, vil. of N. Devon, 14 m. from Ilfracombe. The church has interesting carving and a good specimen of mosaic. Between M. and the sea is Morte Point, 1 m. N. of Woolacombe and 6 m. from Ilfracombe. Between Croyde, 11 m. from Ilfracombe, and Morte Bay are many acres of fine bold headland and agrie.

land with splendid views of Morte Point, Kipling Tors, and Hartland Point. This land has been given to the National Trust. Near M. is the Pull Point lighthouse, where mechanism for signalling both by light and sound is to be seen, notably the reflected red light on to the dangerous Morte Stone, where there are treacherous currents.

Mortgage. transfer of land or other property as security for the repayment of a loan. It is to be distinguished both from a hypothecation and a pawn or pledge. In hypothecation the creditor has rights over but does not take possession of the hypothecated property of his debtor. Thus latter term in Eng. law is practically confined to a master's (*q.r.*) power to raise money on his ship or cargo for necessary purposes (see also *BOTTOMRY*), but is a common form of security in Scots law (see *HYPOTHEC*). In the case of a pledge of goods, possession is given to the pawnee, and herein it differs from a true M. of chattels by bill of sale (*q.r.*). Under a bill of sale to secure a debt, the property in, but not the possession of, the scheduled goods and chattels passes to the grantee, subject either to a condition cancelling the transfer on performance of the condition to repay the loan with interest, or to a proviso enabling the grantor (debtor) to redeem his property by such payment and at once to have it reconveyed to him.

Mortgage of Land.—A legal as distinct from an equitable M. (*q.r.*) is created by a deed (*q.r.*) conveying the full ownership of the land comprised in it to the mortgagee, subject to the mortgagor's 'equity of redemption,' a right to have his land back again on payment of the prin. money and interest. Most Ms. include an express covenant (*q.r.*) on the part of the mortgagor personally to repay the loan, but such covenant is obviously only useful where the mortgagor has money with which to repay, and, generally speaking, the mortgagee sues on it only if the land becomes less valuable and insufficient to secure the loan. The rights of the mortgagee are: (1) To sue on the covenant to repay at any time after the expiration of the period (usually six months) fixed for payment. (2) To enter into possession of the land at any time; though usually the mortgagor is left in possession pending the necessity of realising the security. In any case, if the mortgagee goes into possession he will be called upon to account strictly not only for the rents and profits received by him, but for all he might have received if he had exercised the utmost care. When in possession he may make building leases for ninety-nine years, or occupation leases for twenty-one years. If he remain in possession for twelve years without acknowledging the title of the mortgagor, he becomes absolutely entitled to the land (see *LIMITATIONS, STATUTES* or). (3) To apply after the expiration of the term for repayment, to the court for a *foreclosure* order, i.e. an order fixing a further period (generally six months) within which the mortgagor must pay the principal, interest and costs, or be forever

foreclosed of his equity of redemption. (Under the Law of Property Act, 1925, the notice requiring payment of the M. money must be in writing.) (4) To sell the land, and out of the proceeds to recoup himself, the costs of the sale, the M. debt and interest, which right is less stringent than a foreclosure, because the mortgagor is entitled to the surplus proceeds. But there is no right to sell unless either (a) the mortgagee has given three months' notice in writing demanding payment and stating his intention to sell if the money be not paid; or (b) some interest is two months in arrear; or (c) there has been some breach of the covenants in the deed other than that for the repayment of the loan. A right to sell is implied in a M. deed, and therefore no order of court is required. (5) To appoint a receiver of the rents and profits to apply the same in payment of debt and interest. The mortgagor's rights are: (1) If in possession to make building and occupation leases for ninety-nine and twenty-one years respectively. (2) If he redeems, to get his land back free from all restrictions whatever. (3) If he remains in possession for twelve years without paying any part of the principal or interest, to ignore the mortgagee's rights. Any provision inserted in the M. to prevent redemption on payment or performance of the debt or obligation for which the security was given is termed a 'clog' or 'fetter' on the equity of redemption and is void. No agreement between mortgagor and mortgagee contained in the M. can make the M. irredeemable, and no contract at the time of the M. and as part of the M. transaction, or, as one of the terms of the loan, can be valid if it provides that the mortgaged property shall become the absolute property of the mortgagee upon any event whatsoever. Redemption may, however, be postponed for a reasonable time where there is a corresponding provision for the continuance of the loan, and there do not exist any circumstances which make the clause oppressive or unreasonable. The right of redemption continues unless and until by judgment for foreclosure, or the operation of the Statute of Limitations, the character of the creditor is changed for that of owner, or the interest of the mortgagor is destroyed by sale either under the process of the court or of a power in the M. incident to the security. The mortgagee has no right of foreclosure unless the contract contains a condition upon which a forfeiture results; for the court grants a foreclosure upon the principle that the mortgagor has broken a condition which forfeits his legal right to redeem. Thereupon, however, his equitable right to redeem arises, and foreclosure is the remedy by which that right is terminated. The right of a mortgagor to redeem on payment of principal and interest and costs, was, until the changes made by the Law of Property Act, 1925, not a mere right, but an equitable *estate* or *equity* of redemption is no longer an equitable estate or interest. Under the present system of creating legal Ms., the

mortgagee takes only a term of years, leaving the legal freehold reversion expectant on the M. term in the mortgagor. Thus the mortgagor retains his legal freehold estate and he cannot at the same time have an equitable estate co-extensive with it. Hence instead of his equity of redemption constituting an equitable estate, it subsists only as a right in equity to redeem the property, this right being attached to his legal freehold estate (and similarly in the case of a M. of chattels). A deposit of title-deeds as a security for a debt, without writing or by word of mouth, may create a charge upon the property notwithstanding the Law of Property Act, 1925, since the delivery of the deeds is sufficient part performance of the implied agreement to give a security. A deposit of title-deeds does not itself create a charge, and the mere possession of deeds without evidence of the contract under which possession was obtained, will not create an equitable security. Although there may have been no actual transfer of the M. a person who advances money for the purpose of paying it off, and whose money is thus applied, becomes an equitable assignee of the M. and is entitled to have it kept alive for his benefit. Mortgages of houses to which the Increase of Rent and Mortgage Interest Restriction Acts, 1920-33 apply are subject to restrictions under those Acts on the rate of interest and on the exercise of their remedies, including going into possession.

Welsh Mortgage. A Welsh M. is a practically obsolete form of security. It is an assurance by which, to receive a debt the property is conveyed to the creditor without any condition for payment or proviso for reconveyance, the bargain being that until redemption the rents and profits are to be set off against the interest. A Welsh M. gives a right to redemption at any time on payment of principal and interest, but confers no power to compel redemption or to foreclose.

See R. H. Coote, *Law of Mortgages*, 2 vols. (9th ed., 1927, by R. L. Ramsbotham); W. R. Fisher and J. M. Lightwood, *Law of Mortgage* (7th ed.), 1931, with supplement, 1947; H. G. Hanbury and C. H. M. Waldoek, *Law of Mortgages*, 1938; and R. W. Turner, *Equity of Redemption*, 1931.

Mortification (physiology). see GAN-GRENE.

Mortification, Scots legal phrase applied to lands given for charitable or public uses. Ms. for the benefit of the poor generally fall under the administration of the heritors (*q.v.*) and Kirk session, while lands given for any charitable purpose are disposed to trustees to be held in blench or feu. The Court of Session has jurisdiction to control the management of the administration of Ms. M. is practically synonymous with *Eng. mortmain* (*q.v.*).

Mortimer, Roger, first Earl of March (c. 1287-1330). In 1304 he succeeded his father, Edmund M., the first baron by writ, as lord of Wigmore, and in 1306 was knighted. In 1316 he was appointed lieutenant of Ireland, and in 1317 drove

Bruce to Carrickfergus, and defeated the Lacys. He became justiciar of Ireland in 1319, fought for his uncle, Roger M. of Chirk, in Wales in 1320, and in 1322 he captured and sent to the Tower. He escaped to Paris in 1324, and became chief adviser to Queen Isabella. In 1327 he became justiciar of Wales. In 1330 he was accused of treason and complicity in the death of Edward II. and other charges, and executed at Tyburn.

Mortlake, vil. in Surrey, England, 6½ in. from London. The church of St. Mary the Virgin, founded in 1348, rebuilt in 1843, and often enlarged, contains memorials to Sir Philip Francis and Sir John Temple, besides many tombs of celebrities, notably of Dr. John Dee, philosopher and astrologer. The 'Ship Hotel' is notable as the finishing point of the ann. boat race between Cambridge and Oxford Univs. Maltng is the local industry.

Mortmain. An alienation of land in M. or *in mortui manū* denotes the transfer of land into the dead hand either of the church or any other corporation (*q.v.*), and was so called from the fact that the immortality and other non-human attributes of corporations necessarily prevented the lands in their possession from ever being profitable either to the king or to the immediate feudal lords of those who had alienated them, because there was no possibility of escheat (*q.v.*), reliefs, wardships, marriages, or any other feudal aids. The Statute of Mortmain, 1279, prohibited the transfer of lands or tenements 'in such a way that such lands or tenement should come into mortmain.' The learning on the subject of M. is almost as purely antiquarian as that of feudal aids, but is still of some practical importance from the fact that though the same reasons do not now exist for prohibiting the conveyance of land to a corporation, and though there are numerous statutory provisions by which almost any corporation can hold land with or without a royal licence, the Mortmain Acts of 1279, 1391, 1888, are still in force. Early in the hist. of Eng. real property law, the conveyance of land was next to impossible, but even when most of the feudal restrictions on alienation had been abolished, it still remained, and in the theory of the common law still remains, impossible for a corporation to purchase land without a licence. The only justification for such a prohibition at the present day is the objection to perpetuities, or, in other words, virtual withholding of land from the open market. But at the present day numerous corporations can hold lands in M. without either a licence from the Crown or the authorisation of a public or private Act of Parliament. Every registered joint-stock company (incorporated under the Companies Consolidation Act, 1908, or the Acts consolidated in that Act) formed for the acquisition of gain may hold lands for the purposes of the business of the company; but no company formed to promote art, religion, science, or charity, or for a non-lucrative purpose, can hold more than 2 ac. of land without the sanction of the Board of Trade. Charity trustees

may be incorporated under the Charitable Trusts Acts, and may then hold lands without further licence. Under the Public Health Act, 1875, the Municipal Corporation Act, 1882, the Local Government Acts, 1888 and 1894, municipal corporations, co. councils, and other local authorities are empowered to hold lands for the purposes of those Acts. Any assurance of land, or personal estate to be laid out as land, for educational purposes is exempted from restrictions under the M. Acts. A local authority may accept land, money, or other property for the purposes of the Housing Act, 1936, and it is unnecessary to enrol any assurance of it under the Mortmain and Charitable Uses Act. A joint board for the purposes of the Public Health Act, 1936, is empowered to hold land for the purposes of their constitution without licence in M. Railway, gas, water, and tramway companies could also hold land under their respective private Acts.

Under the Mortmain and Charitable Uses Act, 1888, every conveyance of land, or grant of money to be laid out in land, for charitable uses (*q.v.*) is forbidden, unless (1) made by deed executed in the presence of two witnesses and enrolled in the central office of the supreme court within six months after execution, except in the case of copyhold land or stock in the public funds; (2) made at least twelve months, or, if stock in the public funds, six months before the death of the grantor; (3) the assurance takes effect in possession without power of revocation or condition in favour of the grantor except a reservation of mines, easements, nominal rent, and repairing covenants. If, however, the assurance is made *bona fide* and for valuable consideration (*q.v.*), (1) and (2) do not apply. There are exemptions from the above restrictions in the case of Oxford, Cambridge, London, Durham, and Victoria Univs., and in favour of gifts not exceeding 20 ac. to public parks, 2 ac. to museums, and 1 ac. to elementary schools. By the Mortmain Act, 1891, *any devise to a charity is good, but the land must be sold within a year after death of the testator unless the court otherwise orders.* See Sir W. Holdsworth, *History of English Law*, 1922-38, and *Historical Introduction to Land Law*, 1927; G. C. Cheshire, *The Modern Law of Real Property*, 1925, 1945; and H. M. Chew, *English Ecclesiastical Tenants-in-chief and Knightservice*, 1932 (thirteenth to fourteenth centuries).

Morton, Henry Canova Vollam (b. 1892). Eng. journalist and author, entered journalism in Birmingham in 1910, and has since been connected with leading London daily newspapers in an editorial capacity and as a contributor. He made his reputation as an author with a number of books about London and the Brit. Isles, based on a close knowledge and regard for present customs, traditions, and hist. *The Heart of London* appeared in 1925 and *In Search of England* in 1927, followed by similar books on Scotland (1929), Ireland (1930), and Wales (1932). His travels in the Holy Land were recounted in the successful *In the Steps of The*

Master (1934); *In the Steps of St. Paul* (1936); and *Through Lands of the Bible* (1938). He has also written *In Search of South Africa* (1948).

Morton, James Douglas, fourth Earl of (d. 1581), regent of Scotland. In 1557 he subscribed the first bond of the Scottish reformers, but withdrew his support in 1559. When Mary Queen of Scots arrived in Scotland he became privy councillor. He was instrumental in suppressing Huntley's conspiracy in 1562, and was made lord chancellor in 1563. He offered no opposition to the marriage of Mary with Darnley, instigated the murder of Rizzio, and joined Ruthven and Hamilton in settling the crown matrimonial upon Darnley. In 1566 Darnley denounced him and he was obliged to flee, but later in the same year was pardoned through the influence of Bothwell, for whose marriage with Mary he signed a bond in 1567. He then roused the citizens of Edinburgh against Bothwell, but allowed him to escape, and brought about the queen's imprisonment at Lochleven. He became lord chancellor and a member of the Council of Regency, in which capacity he acted as adviser to Moray, and practically ruled the country during Lennox's regency. He gained the favour of Elizabeth, and induced many prominent men to desert Mary's cause. In 1578 James VI. assumed the gov., but a Parliament held at Stirling Castle re-estab. M. at the head of affairs. He was executed in 1581, having been convicted of the charge, brought by the earl of Lennox, of being privy to Darnley's murder.

Morton, John (c. 1120-1500). Eng. ecclesiastic, b. in Dorset; master of the rolls from 1473; bishop of Ely, 1479. Imprisoned by Richard III., he was taken into favour by Henry VII., and made archbishop of Canterbury in 1486 and lord chancellor in 1487. His ingenuity in extracting 'benevolences' from both the ostentatiously wealthy and the parsimonious originated the proverbial phrase of 'M.'s fork.'

Morton, John Cameron Andrieu Bingham Michael (b. 1893). Eng. author and journalist; contributor to the *Daily Express* since 1924 under the pseudonym 'Beachcomber.' He has pub. a number of books of fantasy, satire, humour, and parody, including *Morton's Folly* (1933); *Gallimaufry* (1936); *Sideways through Borneo* (1937); and *Fool's Paradise* (1941). His historical writings include *Sobieski, King of Poland* (1932); *The Bastille Falls, and other Studies of the French Revolution* (1936); *The Dauphin* (1937); *Saint-Just* (1939); and *Brunaire: the Rise of Napoleon* (1948).

Morton, John Maddison (1811-91). Eng. dramatist, b. at Pangbourne, Berkshire. His works, mainly farces and often adapted from the Fr., were very popular, and included *My First Fit of the Gout* (1835); *Grimshaw, Bagshaw, and Bradshaw* (1843); *To Paris and Back for Five Pounds* (1850); *Box and Cox* (1847); and *Going It at Toole's Theatre* (1855). See life by C. Scott, 1886.

Mortsel, tn. in Belgium and suburb of

Antwerp, 5 m. to the S.E., engaged in market gardening, breweries, and manufs. of photographic material and iron goods. Pop. 16,400.

Mortuary. A local authority may provide and fit up a proper place for the reception of dead bodies, make by-laws with respect to the management, and charges for the use of the same, and provide for the decent and economical interment of the dead bodies received into any such M. If a local authority do not provide a M. voluntarily, the Ministry of Health has power to require them to do so. The local authority may also provide a post-mortem examination chamber, which, however, must not be at a M. Co. councils have concurrent powers to establish Ms. for the reception of unidentified dead bodies, and to require bor. councils to provide post-mortem chambers. Any local authority having power to provide a M. may purchase by agreement, or by compulsion, or take on lease, any land or buildings they may require for a M. See BURIAL ACTS.

Morvi, small state of Kathiawar, Bombay, India. Area 821 sq. m. Pop. 104,000. The tn. is 110 m. S.W. of Ahmadabad. Pop. 16,500.

Moryson, or Morison, Fynes (1566-c. 1630), Eng. traveller. He visited Germany, the Low Countries, Poland, Italy, Switzerland, and France (1591-95), and Palestine, Constantinople, and Scotland (1598). In 1600 he went to Ireland, became secretary to Sir Charles Blount, and helped to suppress Tyrone's rebellion. See his hist. of Tyrone's rebellion and account of his travels, pub. 1617.

Mosaic, variety of surface decoration, used largely on floors and walls. In M. work variously coloured fragments of marble, glass, ceramic, or other substances are arranged in a cement or mastic bed so as to produce an artistic or geometrical design. The art goes back to a very remote origin, but it reached its highest development in anet. times among the Romans. Very few old Rom. villas remain in which there is not some M. work of a greater or less degree of elaboration. The best-known example is that of Hadrian's villa at Tivoli, where Pliny's doves are represented with wonderful delicacy of colouring. The tesserae (the small fragments of which the M. is composed) have varied considerably in size at different times. The Rom. tesserae measured from a quarter to half an inch in size, but those used in the later fourteenth-century It. work were frequently under one-eighth of an inch. M. work became a special feature of Christian churches under the Byzantine empire, and E. influence is clearly to be seen in the Rom. work. In the E. the art continued down to the thirteenth century. In the W. it declined in the seventh century, revived again in the eighth for about a century, but then fell away again until the fourteenth century. In modern times the art seems to have been well preserved only at Venice, though Eng. examples exist in St. Aidan's Church, Leeds, Westminster Cathedral, and St. Paul's Cathedral. See

A. Salvati, *On Mosaic*, 1862; F. Winter, *Alexander Mosaik*, 1909; M. Avi-Yonah, *Mosaic Pavements in Palestine*, 1933; Ricardo Huch and W. F. Volbach, *Christliche Mosaik*, 1943; and D. Levi, *Antorch Mosaic Pavements*, 1948.

Mosaic Gold consists of stannic sulphide (SnS_2). It is prepared by heating together a mixture of very finely divided tin with sulphur and ammonium chloride. It is obtained in golden spangles, and it is used extensively for imitation gilding.

Mosaylima, or Moseilema, contemporary and rival of Mohammed (a.c.), claiming to have equal rights with him to the title of 'Messenger of God.' He stated that Mohammed had nominated him his successor, but his claim was not acknowledged by the Muslims. He was killed in 643 by Khalid, a general of Abu Bekr.

Moscheles, Ignaz (1794-1870), Bohemian pianist and composer, b. at Prague, of Jewish parents. In 1820 he toured Germany, Holland, France, and England, giving concerts, and in 1825 settled in London as prof. at the Academy of Music and director of the philharmonic concerts. He gave lessons to Mendelssohn in Berlin in 1824 and became his life-long friend. In 1844 he, together with Mendelssohn, became leader of the Leipzig Conservatoire. He composed about 110 opus numbers, including piano concertos, sonatas, chamber music, three *Allegri di Bravura* and studies for pianoforte. He was a gifted improvisator and the inventor of the 'singing tone,' later developed by the Liszt school. See life by his wife (Eng. trans. 1873), and his correspondence with Mendelssohn, pub. 1888.

Moschus, Gk. bucolic poet, was a native of Syracuse, and fl. in the second or third century B.C. Nothing is known of his life. His works are generally printed together with those of Theocritus and Bion. Only four *Idylls* and some fragments are extant, all but one written in the Doric dialect, and remarkable for their beauty. They have been trans. into Eng. prose by Andrew Lang (1889).

Moscow: 1. The M. Region of the R.S.F.S.R. lies immediately S. of the Tver and Vladimir Regions. Area 13,000 sq. m. The surface of the dist. is level with the exception of a tract in the S.W., which is elevated. It is watered by the Moskva and the Kluzma, while the Oka forms a portion of its S. boundary. The soil, principally clayey, with some sandy and stony tracts, is on the whole unfertile, and insufficient to supply local consumption. Sown grasses form an important part of the agric. economy of the region, as also does dairy farming, which in Russia is concentrated in the damper and formerly forested areas. Pig-rearing is well developed, the chief source of fodder being the potato, and many state farms specialise in the breeding of both pigs and cattle. Few of the dists. or regions of Russia, however, equal that of M. in manufs. and general industry, the presence alone at hand of an industrial market in the M. dist. and M. city influencing the intensive growth of such industrial crops as beet, hemp, potatoes,

and sunflower. Industry in the M. dist. also owes some of its development to the brown coal in the M. basin. White limestone is quarried and much used for building in the cap.; yellow marble quarries occur on the bank of the Oka. Since the revolution there has been considerable development of electrical power. Peat is extensively used as fuel in the factories, and in some places, *e.g.* Shatura, the electric plant (opened in 1924-26), works on peat power. The M. dist. alone possesses greater supplies of electrical energy than any other industrial region in Europe. Scrap-iron and imported ores from the

famous are the monastery of St. Sergius, founded by one of the first Muscovite princes, and known for its silver shrine, said to be the richest in the world; and the vil. of Borodino (*q.v.*). 2. (Russian Moskvá.) The anc. and present cap. of Russia and formerly the residence of the tsars, is situated in a highly cultivated and fertile dist. on the Moskva, 400 m. S.E. of Leningrad, with which it is in direct communication by railway. Before much of it was destroyed by fire in 1812, M. was perhaps the most irregularly built city in Europe, and that distinction to a great extent it still retains, for, as the main

Lobuk Press

MOSCOW AND THE RIVER MOSKVA
In the distance, left, is the Kremlin Palace

Ukraine are used for the production of high-grade steel in the M. dist., especially for the purpose of supplying the engineering industry. The textile industries of the dist. specialise in the manuf. of fabrics of good quality as well as in special fabrics used in machine-building and in the chemical industries. Recently a number of modern motor roads, radiating from M. to Kiev, Minsk, and other large tns. have been constructed. The M. Region as a whole is better served by railways and modern roads than is any other part of the Soviet Union; it is excellently served by transport routes along which coal, iron, oil, grain, timber, sugar, cotton, and silk are carried to the large urb. and industrial centres. The value of the Volga to the M. dist. has been greatly increased by the construction of the M.-Volga canal (80 m.), which has been in operation since 1937, and big riv. steamers can now sail right into M. Among the places historically

object in 1813 was to build speedily, the streets rose again on the old model, undulating and crooked, and consisting of houses exhibiting the greatest variety in character and pretensions. Its hundreds of churches and convents, surmounted by gilt or variously coloured domes, its gardens and boulevards, and, above all, the high walls and crowded yet stately towers of the Kremlin or citadel, produce a most striking effect. The Kremlin, situated on the N. bank of the riv., forms the centre of the tn., and around it, with a radius of about 1 m., is a line of boulevards, extending, however, only on the N. side of the riv. Outside of this line, and concentric with it, is another line of boulevards, with a radius of 1½ m., while beyond all, and forming the girdle of the city, is the outer rampart, with a circumference of 26 m. The Kremlin comprises the prin. buildings, as the cathedral of the Assumption of the Virgin, founded in 1326, a small but gorgeously decorated edifice; the cathedral

of the Archangel Michael, containing the tombs of all the tsars down to the time of Peter the Great, who changed the royal burial-place to St. Petersburg (now Leningrad); the church of the Annunciation, the floor of which is paved with jaspers, agates, and carnelians of various shapes; the tower of Ivan Veliky, 200 ft. in height and surmounted by a magnificent gilded dome, from which, as from all the domes of M., rises the 'honourable cross'; the Tsar Kolokol (king of bells), the greatest bell in the world; sev. palaces, and collections of ant. arms and other antiquities. The walls of the Kremlin are surmounted by eighteen towers, and pierced with five gates. The Kremlin is now occupied only by important gov. officials and the Kremlin command (*see also* KREMLIN). The number of Orthodox churches has, however, declined from over 100 before the revolution to a score. Those closed included the seat of the acting patriarch and the last of the Lutheran churches. There are two univs., one founded in 1755 is the oldest in Russia, and both existed prior to the revolution of 1917, and are now administered by the People's Commissariat for Education.

M. is the seat of an extensive manufacturing and commercial industry; it imports largely and carries on a considerable export trade, especially with Asia. M. continued to develop even after Peter the Great moved his cap. to St. Petersburg. In the eighteenth century, when textile factories for producing woollen and linen fabrics for the army were set up, M. became an industrial as well as commercial centre. Later, with the construction of railways, M. became the hub of the entire Russian railway system, and this further influenced industrial expansion, notably in the development of more textile factories and metallurgical industries. Yet even up to the revolution of 1917 M. retained the appearance of a great Asiatic prov. tn.; most of its buildings were of wood, roads were in a primitive condition, sanitation and lighting were almost unknown. In 1917 the city became the focal point for the long-term industrial and economic planning of great parts of Soviet Russia; and as the agric. and secondary industries of the country expanded, so also did the industries of M. develop. Not only were new factories built but also large office and administrative blocks, with housing estates for the workers, who came to the city in great numbers. The pop., which was only 1,618,000 in 1917, was 2,000,000 in 1926, 3,500,000 in 1933, 4,000,000 in 1939, and to-day is 4,500,000. There are large chemical works and in pre-1917 Russia some 16 per cent of the output of that industry came from M., though the city is far away from the main sources of raw materials. M. is also an important centre of the manuf. of electrical machinery, precision lathes, watches, etc., requiring skill but relatively not much metal. The textile industry of R. is still largely concentrated in the older centres of production, of which M. is one. Silk manuf. was once concentrated entirely in M. but is now carried on also in many

other cities and tns. The finest thread is produced in M. A new glass machinery industry has developed. The majority of engineering works, mainly engaged in the production of machine tools, motor vehicles, and printing, textile, agric., electrical, etc., machinery, are located either in M. or in the neighbouring tns. The manuf. of machine tools and a great part of the motor vehicle industry is concentrated in M. itself. In (and around) M. are also manufactured woollen, silk, linen, and a variety of knitted goods. A variety of rubber goods, made from synthetic rubber of Yaroslavl and other centres, is produced in M. M. has nine railway stations and an air port. The main European network of railways extends from Leningrad, through M., to Astrakhan and across the Urals. Under the Four Sea Ship Canal System, M. will be linked up with the Baltic, White, Black, and Caspian Seas; in 1937 the M.-Volga ship canal made M. accessible from the White and Baltic Seas. In 1925 an aviation company was formed for the purpose of extending the air routes from M. A regular air service was estab. between M. and Berlin before the Second World War. Modern M. is served by an excellent system of trains, buses, and trolley buses, and a new underground railway which technically and artistically has set an example to the caps. of the world. The industrial settlements are grouped in zones around the periphery of the city, separated from it and from each other by green belts. In 1923 the M. Municipal Bank was opened. It had a capital of 2,500,000 roubles, and its object was to supply credits for local trade industry, municipal activities, and housebuilding.

M. was settled by Great Russians in the twelfth century. In the fourteenth century, not only had it become the cap. of the Russian religious world, owing to the residence there of the metropolitan, but it had also become the actual cap. of Muscovy. In 1368, 1370, and 1372 it suffered from the inroads of the Lithuanians; in 1381 it was sacked by the Tartars. From 1413 to 1501 it was, on four separate occasions, partially destroyed by fires, and it was burned to the ground by Devlet-Girey, khan of the Crimean Tartars, in 1571. It was taken by the Poles in 1610, and remained in their possession till their expulsion by the Russians under Minin and Pozharsky in 1612. In 1682, 1689, and 1698 it was the theatre of the revolts of the 'strelitz.' In 1812 it was burnt by its own inhab. to prevent its falling into the hands of the Fr. After the revolution of 1917, the Soviet Gov. was estab. in M. in 1918. Near the Kremlin wall are the 'Graves of the Brothers,' 500 Bolshevik men and women who lost their lives during the revolution. The Lenin mausoleum is near. The Soviet State Planning Dept. in 1935 adopted a ten years' plan for the modernisation and enlargement of M. Under this plan the Kremlin and other national monuments were to be preserved, business and residential distrs. regrouped, and provision made for blocks of lofty flats.

The scheme provided for an increase of the pop. to 5,000,000 and for the preservation of a 6-mile forest belt round the city, and large botanical gardens on the banks of the Moskva R. A series of spectacular trials of prominent Communists was held in M. in 1936-37. The trials were part of a general party purge, which resulted in the execution of many Communists who were hostile to Stalin (*see under* RUSSIA, *History*). In the Second World War there were Ger. air raids on M. on July 26, Aug. 2, 9, 16, and 23, 1941. The Ger. offensive against M. was begun in Oct. and the Soviet Gov. moved to Kuibishev. Stalin, however, remained in M. and a state of siege was proclaimed. There were further Ger. air raids on Nov. 1 and 8, 1941. The Ger. attack on the city was halted on the latter date, but a new Ger. offensive was begun about Nov. 22, which, however, was finally crushed on Dec. 13. *See further under* EASTERN FRONT OF RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR. *See* 'Wirt' Gerrard, *The Story of Moscow*, 1900; G. Duhamel, *Le Nouveau Moscou*, 1928; A. Wicksteed, *Ten Years in Soviet Moscow*, 1933; E. Lyons, *Modern Moscow*, 1935; E. Simon and W. Robson, *Moscow in the Making*, 1937; and P. Cochrane (trans.), *Moscow: Sketches in the Russian Capital*, 1947.

Moseilema, *see* MOSAYLIMA.

Moselekatse, or **Moselikatse** (d. 1870), Zulu chieftain who fled from Zululand after his defeat by the Voortrekkers and set up a new kingdom N. of the Vaal R., where he estab. the Matabele kingdom. In 1827 he led the Amangvate Zulus against Moshesh, chief of the Basutos, and was defeated at the historic battle of Thaba Bosigo (*see* BASUTOLAND, *History*). Subsequently he gladly welcomed Robert Moffat as his missionary. *See* J. P. R. Wallis (editor), *Matabele Journals of Robert Moffat* (2 vols.), 1915.

Moseley, Henry Gwyn-Jeffreys (1887-1915), Eng. physicist. Killed at Gallipoli on Aug. 10, 1915. He carried out much work on the structure of the atom and showed that the atomic number of an element may be deduced from its X-ray spectrum.

Moselle, or **Mosel**, kind of light wine obtained from the valley of the M. It is mild and delicate in flavour, not too acid, and digestible. The vines most usually grown on the M. are the Riesling and the Kleinberger, and the best growths are those of Branneberg, Bernkastel, Piesport, and Zeltingen.

Moselle: 1. Or **Mosel**. Trib. of the Rhine, rises in the S.E. of the dept. of the Vosges, France, in two head-streams uniting at St. Maurice, and flows N. through the dept. Meurthe-et-Moselle, and Alsace-Lorraine, and joins the Rhine at Koblenz. Its chief tribs. are the Meurthe in France and the Saar in Germany. It is navigable from Frouard. Length, 320 m.; area of basin, 10,950 sq. m. *See* C. Tower, *The Moselle*, 1913. 2. Dept. of France, ceded to Ger. from 1871 to 1918, on the boundary with Ger. to the E. and Luxembourg to the N. and N.E.

It consists largely of a plateau drained by the R. M. Its vineyards produce M. wine (*q.v.*). Coal and iron mines are of great importance, and its manufactures include machinery, chemicals, and textiles. There are nine arrons., and the cap. is Metz. Area 2403 sq. m. Pop. 622,145.

Moser, George Michael (1704-83), Swiss chaser and enameller, b. at Schaffhausen, but spent most of his life in England, where his watches and bracelets were in great request. He was drawing-master to George III., and assisted in establishing the Royal Academy, of which he was elected the first keeper in 1767. His daughter, Mary M. (d. 1819), was a flower painter, a foundation member of the Royal Academy. She and Angelica Kauffmann were the only women R.A.s until Dame Laura Knight was elected.

Moser, Gustav von (1825-1903), Ger. writer of comedies and farces. His chief works were *Ullimo* (1874); *Der Bibliothekar* (1878); *Der Registrator* (1879), all in collaboration with Adolf PArronze (1838-1908). Ger. conductor and theatre manager. He also wrote *Krieg im Frieden* (1881), with Franz von Schottan (1849-1913). Austrian dramatist, and chief director of the Vienna Municipal Theatre.

Moses (Heb. *Môsheh*, Gk. *Μωϋσῆς*), great Jewish lawgiver and judge. Son of Amram, of the tribe of Levi, and Jochebed, a woman of the same tribe, and brother of Aaron and Miriam. The records of his life and work found in the Pentateuch are very meagre, and if, as is now generally believed, the 'Books of M.' were not written until some 800 years later, are probably to a great extent legendary (*see* EXODUS; NUMBERS; DEUTERONOMY). He was said to have been born in Egypt and because at that time Pharaoh had decreed that every male child of the Hebs. should be destroyed, his mother Jochebed placed him in an ark upon the Nile, where he was found by Pharaoh's daughter, and adopted by her. Brought up as an Egyptian prince, his heart was yet with his own people, and, finding an Egyptian oppressing a Heb., he slew the Egyptian and then for safety fled into Midian, whence he received a divine call to return and lead the chosen people out of Egypt. (For the hist. of the plagues, the crossing of the Red Sea, and the fate of the Egyptians, *see* EXODUS.) For forty years he was military leader, social and religious organiser, and lawgiver to the turbulent tribes in the desert wanderings, finally dying on Pisgah, or Mt. Nebo, to the N.E. of the Dead Sea. For the details of his life recorded in the Pentateuch there may be insufficient historical foundation, but the deliverance from Egypt, his code of moral and social laws, his unwavering upholding of Jehovah as the one God, and his conquest of the land E. of Jordan must be accepted as facts. *See* W. Robertson Smith, *The Old Testament in the Jewish Church*, 1881 (2nd ed. 1902); G. Rawlinson, *Moses, his Life and Times*, 1887, in *Men of the Bible Series*; biographical studies by Oosterzee, 1875; H. L. Taylor, 1913; E. Fleg, 1928; E. L.

Watson, 1929; M. Buber, 1947; and S. Freud, *Moses and Monotheism*, 1939.

Moses Ben Maimon, see **MAIMONIDES**.

Moshesh (1785-1870), Basuto paramount chief and founder of the Basuto nation. He defeated the Zulu invaders from Matabeleland in 1827 and twice inflicted defeats on European commandos from the Orange Free State (1851, 1852), while in 1858 the Free State again felt the weight of M.'s hand, peace being eventually made through the mediation of Sir George Grey. In 1865 war again broke out between M. and the Free State, M., then eighty, being at length defeated, with the loss of the coveted land S. of the Caledon R. Equally able as a statesman and soldier, the stipulations which M. made in 1862 when first discussing terms under which Brit. protection might be extended to Basutoland contemplated only political control: 'The queen rules my people only through me. The man whom I ask from the queen to live with me will guide and direct me.' M. asked that no magistrates should be sent, and that native law should prevail, save with the consent of the Basuto. The proclamation of 1868 annexing Basutoland, declared that the Basuto should be taken to be Brit. subjects; but at the outset relations were guided by the spirit of the discussions of 1862 rather than any assumption that the Brit. had acquired sovereign rights and indeed the spirit of these stipulations of M. is still the interpretation put by the Basuto on the terms of protection. See also **BASUTOLAND History**. See Sir A. Pim, *Report on Basutoland*, 1935, Cmd. 1907.

Mosler, Henry (1841-1920), Amer. artist; b. in New York. During the Civil war he acted as special artist in the W. for *Hurper's Weekly*. Later he studied at Düsseldorf, and Paris. Among his best-known pictures are 'The Lost Cause,' Civil war subject; and 'Le Retour,' (1879), the return of the prodigal son, bought by the Fr. Gov. for the Luxembourg.

Mosley, Sir Oswald Ernald, sixth Bart., b. 1896. He was educated at Winchester and R.M.C., Sandhurst. His first wife was Lady Cynthia Curzon, daughter of the Marquess Curzon of Kedleston, and after her death he married Mrs. Brian Guinness, a daughter of the second Baron Redesdale. He sat as Conservative M.P. for Harrow, 1918-22, as Independent 1922-24, and as Labour 1924-30. He was chancellor of the duchy of Lancaster in the Labour Gov. 1929-30. In Dec. 1930 he issued a manifesto, in which he warned the gov. of the need of developing a policy for dealing with the economic crisis, and in the early part of 1931 he and a band of followers seceded and formed a new party, which, however, failed to get a single seat at the election of 1931. His party was known as the Brit. Union of Fascists; their activities were the occasion of some violent mob riots in the years preceding the Second World War. At the end of May 1940 M. was arrested under the Defence Regulations, and a number of his adherents were also in-

terned. After the war he founded M. Publications Ltd., and in 1948 a new Union movement.

Mosque (Arabic *masjad*), Muslim house of prayer. The form of the oldest Ms. (at Jerusalem and Cairo) is evidently derived from that of the Christian basilica. The original forms became, however, entirely obliterated in the progress of Mohammedan architecture, and the Ms., with their arched courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. While the main form of the M. is not a settled one, Ms. have three essential parts, the mihrab, or hall of prayer, which marks the direction of Mecca and which must consequently have had a different position in different countries; a place for ablutions, which precede prayer; and a large space for the entry and departure of the faithful, for the reading of the Koran and prayers. In this space are the makura, or seat of the caliph, when one was required; and a place for the preservation of the Koran; and finally in the S.E. the mimbar, or kind of pulpit. A further requirement is the minaret (*q.r.*). Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary considerably in style in different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India, the Ms. have many features in common with the temples of the Jains, while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the Ms., which commonly consist of porticoes surrounding an open square in the centre of which is a tank or fountain for ablution. Arabesques and sentences of the Koran are inscribed upon the walls. The floor is covered with mats or carpets; there are no seats. In the direction in which Mecca lies there is a niche towards which the faithful are required to look when they pray. See also **ARCHITECTURE**, **Mohammedan Architecture**; **MOHAMMEDAN ART**.

Mosquito Aircraft. In the Second World War the De Havilland Aircraft Company designed the D.H. 98, known as the M. Wood was used as the sole material for the basic structure to permit rapid production. The M. passed through various forms: beginning as a high-speed unarmed light bomber, it was afterwards used as night-fighter, fighter-bomber, and photographic reconnaissance machine. The Sea-M., for naval work, as well as a transport type, were modifications of the original M. Mark 34, the final version. It was powered by two 1025-h.p. Rolls-Royce Merlin engines, which gave it a range of 3500 m. and a maximum speed of 425 m.p.h.

Mosquitoes, or Gnats. These terms have no distinction, applying alike to those dipterous (two-winged) insects which form the family Culicidae, characterised by their long, slender, horny proboscis. The antennae are long and adorned with plumes or whorls of hairs, which in the males are

so dense as to be feather-like. The males feed on plant juices or may not feed at all. Only the females, which do not take part in the characteristic dances, suck blood, apparently an abnormal habit, which, according to some authorities, hastens their death. There are about twenty Brit. species, and the bite of some of them is as painful as of foreign species; but before the First World War, owing to the absence from Britain of ague and malaria, which are introduced by biting gnats (*Anopheles*), there was not the same danger. Owing to the return of men infected with malaria while on foreign service, there is still some danger of Brit. *Anopheles* carrying the disease. Sir Ronald Ross (*q.v.*) in 1897-98 discovered

MOSQUITO—FEMALE

A, lance-ts, B, sheaths; C, eyes, D, pupa; E, larva; F, egg raft; G, eggs.

the life hist. of malaria parasites in the *Anopheles* M. (see MALARIA; EPIDEMIOLOGY).

The number of Ms. can be substantially reduced by draining stagnant waters in the neighbourhood, or by encouraging the presence of sticklebacks and other small fish (in the W. Indies the tiny 'millions' fishes, *Girardinus pectioides*, are a natural enemy of M. larvæ, on which they feed voraciously), or by depositing a thin film of paraffin on the surface of the water and so effectually preventing the larvæ from inhaling air, and causing their suffocation. The eggs of most species are laid on the surface of the water or on water plants. The common gnat *Culex* fastens its eggs to form a 'raft', and the eggs of *Anopheles* are made buoyant by air cavities. The minute larva emerges and suspends itself beneath the surface of the water. The habit of the larva varies according to the species of M., but nearly all have to rise to the surface to breathe. Some suspend themselves horizontally beneath the surface and breathe through an air-tube projected just above the water. Others spend considerable time on the bed of the riv. or pond, and wriggle to the surface to breathe. One Brit. and a few foreign species obtain air from roots of aquatic plants. Growth

is rapid under favourable conditions, and the duration of the larval period varies considerably. Food consists of minute organisms waved into the mouth by constantly moving brush-like appendages. After the fourth moult, the larva pupates just beneath the surface of the water. The anterior end of the pupa is extremely large in proportion to the narrow posterior end, and from it breathing tubes rise just above the water. At the posterior end are flat appendages, 'paddles,' which may propel the pupa, or act as gills. The pupa does not feed, and after a few days its skin splits, and the M. liberates itself. Ms. certainly transmit malaria, yellow and dengue fevers, and elephantiasis, and possibly some other diseases (see ENTOMOLOGY; INSECT BITES AND STINGS; MALARIA; PARASITIC DISEASES; PARASITOLOGY).

Mosquito, natives of the Mosquito coast, i.e. the E. or Atlantic seaboard of Nicaragua, and the S.E. portion of Honduras. They are of very mixed blood, the original natives of the dist. having intermarried with W. Indian Caribs and shipwrecked Negro slaves, while there is also a strain of white blood, dating from buccaneering days. There are sev. tribes, differing in physical and intellectual qualities. The best type are short, dark, and very intelligent. Many are nominally Christians and most of them speak Eng. A Brit. protectorate was claimed over the M. during 1635-1850, and friction with the U.S.A. on that account led to the Clayton-Bulwer Treaty. They are now under Nicaraguan rule. The Mosquito Coast embraces the E. corner of Honduras and the E. coast of Nicaragua, but the term is commonly restricted to that part of the seaboard of Nicaragua between the Wawa and Rama Rrs.

Moss, maritime tn. in Akershus co., S. Norway, on Oslo Fjord (E.), 12 m. from Tonsberg. Timber is exported, and there are iron mines near. There is a good harbour. The convention between Norway and Sweden signed here (1814), uniting the two states under one king, was annulled 1905. Pop. 17,000.

Mossamedes, seaport of Angola, Portuguese W. Africa, on Little Fish Bay, an excellent harbour. The dist. produces cotton, sugar, and fruit, and there are fishing and oil-refining industries. Pop. 4900.

Mossbanker, see MENHADEN.

Mossel Bay (formerly Aliwal South), port of entry for the Union of S. Africa, and a municipality of the Cape Prov., 31° 11' S. lat., 22° 9' E. long. M. B. is mainly known to S. Africans on account of its natural bathing place called the Poort, the finest of its type in the Union. Out in the bay lies Seal Is., about 1 ac. in extent and inhabited by thousands of seals. M. B. is famous throughout the Union for its oysters and scales. M. B. is the terminus of a railway from Cape Town through Caledon and Swellendam. Frequent mail steamer services from Table Bay to Natal call at M. B. It was one of the first bays known in S. Africa to the old Portuguese navigators, and in about

1500 Pedro d'Ataide found refuge in what is to-day known as Munro's Bay from the storm which wrecked most of his fleet. A year later João da Nova settled there and built a hermitage, which is claimed to have been the first Christian place of worship in S. Africa. Pop. 3000 (European); all races 6000.

Mossend, tn. of N.E. Lanark, Scotland. 3 m. N.E. of Hamilton, with extensive iron and steel works. Pop. 4000.

Mosses (Musci), group of plants which with the liverworts (Hepaticae) and the hornworts (Anthocerotae) form the second great sub-div., the Bryophyta, of the vegetable kingdom. They are arranged in three sub-groups, Sphagnales, Andreeales, and Bryales, and, while the last named comprises a great number of genera and species, the others are represented each only by a single genus. The

DIAGRAM OF LIFE-CYCLE OF MOSS

numerous species of the genus *Sphagnum* occur in temperate and arctic climates and at high levels in the tropics. They are all bog or moorland plants, and their growth has contributed greatly to the formation of peat. They are usually seen as pale green or reddish patches, and in the deeper pools often attain a length of several feet. The leaves are extremely absorbent, so that these 'bog M.' are frequently used for packing round the roots of plants, and even as surgical dressings. About a dozen species occur in Britain. Of the genus *Andreaea* less than half a dozen species have been found in Britain, and they are limited to alpine dists. They are small M. of dark colour, and grow on bare rocks in tufts. The sub-group Bryales comprises all the other M., which in Britain alone number some six hundred species and over a hundred genera. Their habitat varies from soil, trees, and other damp places, and even in one genus under water, to comparatively dry rocks. They exhibit many interesting adaptations to their environment, especially in their arrangements for conducting water in the plant. Among the genera of this group is *Buxbaumia*, which seems to represent a stage that other M. have passed, and is regarded as the simplest type. In most

M. the protonema, the first stage, arising from the spore, disappears after the young moss plants have developed from it, but in *Buxbaumia*, as well as some other simple types, it persists, and is capable of assimilation, and the small plants which bear the antheridia and archegonia (male and female organs) are dependent upon it for nourishment. From this primitive stage to that in which the plants are small, and with but little branches, and to that in which the plants branch freely and differentiate the shoots, there is a fairly steady gradation. The specialisation of structure is mainly directed towards collecting and retaining as much water as possible. The sexual organs usually occur at the top of the main shoot, or of branches. Vegetative reproduction is common, but always through the protonema stage, and the social growth of M. is due mainly to the formation of numerous plants on the original protonema; reproduction by gemmae also occurs. All the M. exhibit an alternation of gametophyte and sporophyte generations, as indicated in the accompanying diagram; the gametophyte is the ordinary moss plant, whilst the sporophyte is the stalked sporogonium or capsule borne on this plant. See H. N. Dixon and H. G. Jameson, *The Student's Handbook of British Mosses* (3rd ed.), 1924.

Mossley, municipal bor. and mrkt. tn. of Lancashire, England, on the Tame. 3 m. from Oldham. There are woollen and cotton mills, and iron foundries. Fairs are held in June and Oct. Pop. 9600.

Most, tn. in Czechoslovakia, on the R. Bida, 83 m. N.W. of Prague, in the part of Sudetenland ceded to Germany in 1938 and recovered after the war. M. stands on the chief coalfield of the country; other manufs. include machinery, sugar, and distilling; the Seiditz mineral springs are near. Pop. 35,330.

Mostaganem, fortified seaport of Algeria, 45 m. N.E. of Oran. It has a pier available for small vessels, and trades in alfalfa, horses, cereals, flour, and carpets. Pop. 36,960.

Mostar ('old bridge'), cap. of Herzegovina, Yugoslavia, on the Neretva, 50 m. S.W. of Sarajevo. It is the seat of a Gk. and of a Rom. Catholic bishop. It is noted for grapes and wines. Tobacco and weapons are manufactured here. Pop. 20,200.

Most Favoured Nation Clause, clause that is often inserted in commercial treaties, the effect of which is that the one contracting nation guarantees to extend to the other the benefits conceded to any third nation or nations. Generally speaking, a treaty concerns none but the contracting states, and neither rights nor duties arise for states which are not parties to it. But treaties necessarily affect third states when they touch the previous treaty rights of such third states, and the most obvious instance of such an effect is in the case of a commercial treaty between A and B relating to matters where are already the subject of previous treaties between A and C, or B and C,

containing the M. F. N. C. Brit. Imperial Preference is exempted from the M. F. N. C. See R. C. Snyder, *The Most Favoured-Nation Clause*, 1948.

Mosul, walled tn., and liwa of Mosul, Iraq, on R. Tigris, 220 m. N.W. of Baghdad. The streets are narrow and irregular, and the houses of stone or brick, with flat roofs. It formerly had large manufs. of cotton cloths, named muslins, from the name of the tn. There is still caravan traffic in galleons, cotton, wool, hides, wax, and gum. Here is one of the four courts of appeal of Iraq. M. is on the standard gauge railway line from Baghdad to the Syrian frontier (Tel Kotehek) and also on the main bitumen sealed road running from the railhead at Kirkuk to the Turkish frontier at Zakho. Pop., mostly Arab in speech, and including Mohannedsans, Christians, and Jews, 100,000. The liwa includes the divs. of M., Arbil, Kirkuk, and Sulaimaniye. It covers a large part of the ancient kingdom of Assyria, the ruins of Nineveh being visible on the banks of the Tigris opposite the tn. of M. In 1923, a dispute arose between Great Britain and Turkey, over the sovereignty of the dist. of M., and the N. boundary of Iraq was settled in accordance with the opinion of the Permanent Court of International Justice. A concession for the exploitation of the oil in the liwa was granted to the Turkish Petroleum Company in 1925. Negotiations were completed in 1931 between Iraq, Great Britain, and France for the construction of the pipe line which, completed in 1934, runs from the oilfields to Haifa (Palestine) and Aleppo (Syria). Production was 4,300,000 tons in 1938. The oilfields now belong to the Iraq Petroleum Company, a concern jointly controlled by the (Brit.) Royal Dutch-Shell and (Amer.) Standard Oil groups, with some Fr. participation and a 5 per cent interest to the original Amer. owner. Pop. 553,488.

Moszkowski, Moritz (1851-1925), Polish composer, b. at Breslau (Wroclaw), Ger. Silesia. Taught pianoforte in Berlin and afterwards in Paris where he lived for thirty years. He had a great reputation as a solo pianist and also as a composer of pianoforte music. He also wrote overtures, concert suites, a piano concerto, a violin concerto, an opera, *Bohdan* (performed in Berlin in 1921); *Laurin*, a ballet (1906), and *Jeanne d'Arc*, a symphonic poem.

Motala, tn. of Ostergotland co., Sweden, on Lake Wetter, 42 m. W.S.W. of Norrköping. There are important mechanical works, cannon foundries, bridge and engine works, and machine shops near by. Pop. 5985.

Motanabbi, Abu'l-Tayyib Ahmed-ibn-Hosain (915-67). Arabian poet. In 945 he set up claims to be a prophet, but was arrested and imprisoned, and spent the rest of his life as a kind of court poet to various princes in Arabia, Persia, and Egypt. His work is mainly panegyric or satirical, and his collected poems were pub. with an introduction by J. von Hammer-Purgstall in 1824.

Motet, or **Motett**, polyphonic vocal form connected chiefly with medieval church music. The theme on which a M. was constructed was generally taken from some popular song, the text consisting of a biblical paraphrase in Lat. It was used largely in the church music of Tallis, Palestrina, Byrd, and other composers. The music is contrapuntal in style with great delicacy of expression. Palestrina composed nearly 200 Ms. an alternative term for them at that time being 'cantiones sacrae.' The M. reached its maturity in the sixteenth century when it was the church counterpart of the Eng. madrigal. Bach wrote six splendid Ms. the *Singer dem Herrn* being one of them. The Rom. Catholic Church still uses the title for the varied setting of successive verses in a hymn or metrical psalm.

Moth Aircraft, the D.H. 60, designed by the De Havilland Aircraft Company in 1925, and widely used for private flying, being a light aircraft with an 80-h.p. Cirrus engine. The type was developed over the next twenty years: the Tiger Moth, D.H. 82, a twin-seat open cockpit biplane, was the R.A.F. standard primary trainer during the Second World War.

Mother, see FAMILY and MATRARCHY.

Mother Carey's Chicken, see PETERL.

Mothercraft, see CHILD.

Mother of Pearl, see PEARL.

Mother-of-Pearl Clouds, see NOCTILUCENT CLOUDS.

Mother of Thousands, popular name applied to two different flowering herbs, the *Linaria cymbalaria* and *Saxifraga umbellata*. The first-named is the European ivy-leaved toad-flax of the figwort order (see Toad Flax). The second, also called creeping sailor, strawberry geranium, and wandering Jew, is a native of China and Japan, with roundish lobed leaves.

Motherwell, William (1797-1835), Scottish poet, b. and educated in Glasgow. In 1819 he was appointed sheriff-clerk depute of Renfrewshire. He had antiquarian tastes, and a deep knowledge of the early hist. of Scottish ballad literature, which he turned to account in *Minstrelsy, Ancient and Modern* (1827), a collection of Scottish ballads with an historical introduction. In 1832 he collected and pub. his poems. He also joined Hoger in editing the works of Burns.

Motherwell, municipal and police burgh and tn. of N.E. Lanarkshire, Scotland, 1 m. from the r. b. of the Clyde, has coal mines and iron and steel works. It is named from an old well dedicated to the Virgin. Dalziel Jubilee Park was presented to commemorate Queen Victoria's Jubilee. M. was united with Wishaw (q.v.) in 1920. It returns one member to Parliament, the co. constituency including the burgh and the electoral div. of Dalziel-Overtown. Pop. 66,000.

Motherwort (*Leonurus cardiaca*), erect plant (Labiatae family with deeply lobed radical leaves and dense axillary whorls of small pink flowers. The name is also given to mugwort (*Artemisia vulgaris*).

Moths (Heterocera) are the second and larger section of Lepidoptera, and are

distinguished broadly from the other section, the butterflies (Rhopalocera), by some variable distinctions which suggest that the div. is somewhat artificial, for there is greater diversity of form and structure between some of the groups of *M.* than between them and butterflies. Contrasted with the knobbed or club-shaped antennae of butterflies, the antennae of *Ms.* are usually spindle-shaped, thread-like, or comb-like. The wings are generally held flat when at rest, not vertical. *Ms.* generally have a connecting hook for fastening the wings together; this is absent in butterflies. *M.* vary

LIFE HISTORY OF A MOTH

A. 1, Caterpillar, $\times 4$, 2, Cocoon cut open to show pupa lying within, $\times 4$, 3, Imago, $\times 4$;
B. Cocoon of silk moth. 1, 4, hd

greatly in size from a wing expanse of 7 to 8 in. to the almost invisible micro-lepidoptera. The large Nigerian moth measures about 8 in. from wing tip to wing tip when fully expanded. It belongs to the family Saturniidae, and an Indian member of this family is probably the largest moth known. Though many exhibit no special beauty of colouring, others have a wealth of tint that is, perhaps, unique in nature, the colours occurring, as in all Lepidoptera, in the scales on the wings. The two uncoloured transparent spots, one on each of the upper wings, is a characteristic feature of the Saturniidae; they are due to the absence of scales at these places. On the lower wings of the Nigerian moth noticed above are two

brilliant eye-spots, and when the moth is resting in a position to expose the spots they may be mistaken for the eyes of a snake; it has been suggested that in this way they help to scare away birds. The females of some species are wingless, as in the mottled umber, or are rudimentary, as in the winter moth, two common *M.* caught on the grease-bands on fruit trees. The china-mark *M.* (Pyraustidae) are peculiar in the possession of aquatic larvae. The silkworm, the caterpillar of *Bombyx mori*, is the only member of the section of economic value, but on the other hand, great numbers are serious pests of cultivated crops, the damage in all cases being done in the larval stage. Among the most harmful of them are the goat, vapourer, lackey, cabbage, winter, and codlin *M.*, and every one is familiar with the mischievous work of the larvae of the clothes moth. Hawk *M.* are important as pollinating agents. See R. A. Ferchault de Réaumur, *Mémoires pour servir à l'histoire des insectes*, 1731-42; W. Buckler, *Larvae of British Butterflies and Moths*, 1883-95; R. Meyrick, *Revised Handbook of British Lepidoptera*, 1938; R. South, *Moths of the British Isles*, 1939; W. J. Stokoe and G. H. T. Stovin (editors), *The Caterpillars of British Moths*, 1949.

Moti, Motzu, or Meh-tzu, Chinese philosopher; fl. fifth and fourth centuries B.C., teaching in the period of Mencius and Confucius. He was in effect the precursor of two schools which were destined to prevail for some centuries and then disappear. According to his system, Moism, Heaven (*T'ien*) loved man, and universal love was the foundation of society. Hence, he taught pacifism coupled with utilitarianism, and believed that all institutions should stand or fall by their ability to further human welfare. His doctrine of universal love or the brotherhood of man as the basis of ethics was strongly controverted by Mencius's dialectic, and his doctrines, which never had a wide vogue among the Chinese, have long been forgotten. See trans. of his works by A. Forke, 1922, and Y. P. Mei, 1929; study by Y. P. Mei, 1934; also A. David, *Socialisme chinois*, 1907.

Motif, see LEIT-MOTIF; WAGNER.
Motihari, tn. of Bihar, India, 75 m. N.N.W. of Patna. Pop. 13,000 (Hindus and Moslems).

Motion, Laws of, are three laws on which the whole system of dynamics is based. They were formulated by Newton in his *Principia*. These laws cannot be formally proved by experiment, or in any other way. They are justified, for example, by the fact that the theory of astronomy, which is based on dynamics, gives results and predictions which agree with the facts which are experimentally observed. The first law states that "every body will maintain its state of rest, or of uniform motion in a straight line, unless compelled by some external force to change that state." The second Law states that the "rate of change of momentum is directly proportional to the force and takes place in the direction of

the force.' The third law states that 'to every action there is an equal and opposite reaction,' or to put it more simply, if a body A exerts a force on a body B then simultaneously the body B exerts exactly equal and exactly opposite force on A. Einstein's theory necessitated slight modifications in Newton's views. See also DYNAMICS.

Motion Pictures, see CINEMATOGRAPH; and under PHOTOMICROGRAPHY.

Motive, desire which precedes and determines a voluntary act. This involves the anticipation of the final realisation, and the consummation is said to be the object or the end of the action, and the action itself is the means of gaining or realising the object of desire. It is easy to show that while the action is the cause of the (actual) pleasure, yet the anticipation of the pleasure is the cause of the action. So M. and end are often used as synonymous terms. See WILL.

Motley, John Lothrop (1814-77), Amer. historian, b. at Dorchester, a suburb of Boston, Massachusetts. He was educated at Harvard, where O. W. Holmes (q.v.), afterwards his biographer, was a fellow student. After graduating he went to Europe, studied at Göttingen and Berlin, and visited Italy. On his return he studied law, and was admitted to the Bar in 1837. He did not, however, practise, and was in 1840 sent to St. Petersburg as secretary of legation, but returned in 1842. Meanwhile, having pub. two novels, *Morton's Hope*, or *the Memoirs of a Provincial* (1839), and *Merry Mount: a Romance of the Massachusetts Colony* (1849), which had little success, he turned to hist., and attracted attention by some essays in various reviews. Having decided to write an historical work on Holland, he proceeded in 1851 to Europe to collect materials, and in 1856 pub. *The Rise of the Dutch Republic*. It was received with the highest approval by such critics as Froide and Prescott, and at once took its place as a standard work; it has been trans. into Dutch and Fr. It was followed in 1860 by the first two vols. (concluding vols., 1867) of *The United Netherlands, from the Death of William the Silent to the Synod of Dort*. On the outbreak of the Amer. Civil war, M. pub. (with his initials) in *The Times* papers on the hist. of the relations between N. and S.; these were reprinted in pamphlet form in 1861 with the title *Causes of the Civil War in America*. The same year M. was appointed U.S. minister at Vienna, and in 1869 at London. His latest work was *The Life and Death of John of Barneveldt, with a View of the Causes of the Thirty Years War* (1874). M. holds a high place among historical writers, on account of his research and accuracy and his vivid and dramatic style, which shows the influence of Carlyle. An ed. of his works was pub. in 9 vols., 1904. See his correspondence, ed. by G. W. Curtis, 1889; and life by S. St. J. Mildmay, 1910.

Motmot, or **Houtou** (*Momotus*), genus of birds which inhabit dense forests in tropical America. The plumage is brilliant, green and blue predominating; the tail is

long. No nest is made, the eggs being laid in holes in the trees. The food is mainly insects and fruit.

Motor Aphasia, see APHEMIA.

Motor Boats. Smaller craft powered by internal-combustion engines, which are used in riv., lake, or coastal traffic, or for fishing. Larger ocean-going vessels are called motor ships (q.v.). Open launches are usually 15-35 ft. in overall length, with a motor of from 5 to 30 h.p., doing up to 30 or in some cases up to 55 knots; cabin cruisers, of 20-30 ft. overall length, usually have a 10-20 h.p. motor, doing about 8-10 knots. Speed-boats are built on the hydroplane principle: at high speed the bow rises up over the water and the boat skims along the surface, thereby reducing resistance. This is achieved by a deeply submerged propeller on a slanting shaft, and by making the stern of shallow, almost rectangular, cross-section cutting out all superfluous wood. One of the earliest hydroplanes was in fact completely box-shaped. It was found, however, that this shape was liable to excessive vibrations at speed, and greater stability was obtained by confining the shallow box shape to one-third to a half of the hull length at the stern, and then dropping the bottom through a step of a few inches, as shown in the sketch. Sometimes more steps are provided. The *Miss England VII*, which gained the world record (119.81 m.p.h.) in 1932 had a single step in the hull-bottom and two deeply submerged propellers, which gave increased directional stability. The record was beaten later in the year by *Miss America X* (124.91 m.p.h.). The record stood until 1939 when Sir Malcolm Campbell (q.v.) attained a speed of 141.74 m.p.h. in his *Bluebird* on Coniston Water.

M. B. are usually built of wood, either mahogany, oak, teak, pitch-pine, larch, or Brazilian cedar. Different kinds of wood are often used for the different parts of hull and superstructure. The hull may be clench-built, each plank overlapping the edge of the one below it, or carvel-built, the planed edges of the planks butting together to form a smooth surface. The latter method gives a better appearance and less resistance. Where a very light hull is required, two or more skins of thin wood are nailed, screwed, or sewn together with a layer of oiled calico, silk, or canvas between. Recently aluminium alloy, laminated plywood, or plastics have been used and developments in this direction may be expected.

Engines.—The petrol engines used in M. B. are generally of the same design as those used in motor cars (q.v.), incorporating change-speed and reversing gear. The latter is sometimes dispensed with, and a mechanism for reversing the pitch of the propeller blades is introduced. As the most efficient propeller speed is about 1000 r.p.m. the marine engine is usually slower than the car engine, and therefore heavier per h.p. developed. This is generally of no great importance, but in cases where weight must be reduced, propeller efficiency is sacrificed. Recently the compression-ignition engine

has been steadily gaining in favour, partly because of its higher thermal efficiency and cheaper fuel, partly because of the lesser fire risk. Petrol is highly volatile, and in time a layer of highly inflammable petrol-air mixture forms near the bottom of the boat; and fire at sea is a much more dangerous affair than on land. Further advantages of the compression-ignition engine are its reliability during manoeuvring, since there is no tendency to stalling, and the absence of the magneto, which is liable to damage from dampness and water.

Motor Cars.—*Historical.* Just as it has always been the aim of man to fly, so he has endeavoured to produce a horseless vehicle. In the sixteenth century Johann Haultach produced a vehicle propelled by coiled springs; the Dutch attempted the use of sails, while even steam carriages are recorded. Ramsay and Wildgoose patented in England, in 1619, a horseless carriage. Cugnot, a Frenchman, is, however, entitled to the credit of constructing a vehicle in 1770 which contained the germs of the modern car. His steam carriage on three wheels carried two passengers at 2 m.p.h., a speed he afterwards increased to 4 m.p.h. Dallery in 1780 ran a steam car in Arriens. Murdock in 1784 and Symington at about the same time experimented in the same direction. In France, the revolution appears to have postponed further effort, but in England Richard Trevithick attained success in 1801. His steam motor in 1802 covered the distance of 90 m. from Camborne to Plymouth. In 1803 his carriage with wheels of 10 ft. diameter, and a horizontal instead of a vertical engine, ran at 10 m.p.h., but his further efforts were confined to locomotives for railroads. The curiously mistaken notions as to smooth wheels (one mathematician tried to prove that they would merely revolve on the spot under weight), which led to Stevenson's ratchet-rails, led also to curious attempts on the part of Brunton (1813), Gordon, and Gurney to succeed with foot-and-leg propellers. Gurney, who spent large sums of money in experiment, built a coach in 1826 which ascended Highgate Hill. In 1828 he accomplished the journey from London to Bath, and in 1829 a trip through Reading, Devizes, and Melksham at such a pace that the horses of a mail cart were 'hard put to it' to keep up. Meanwhile James in 1823 had succeeded with the first tubular boiler, and in 1829 carried fifteen passengers at 12 m.p.h. In 1831 Dance ran Gurney's steam carriage regularly between Cheltenham and Gloucester at 12 m.p.h., his coke consumption being 4d. per hour. In four months it ran 3500 m. and carried 3000 passengers. Messrs. Ogle & Summers in 1830 built a car which underwent trials before a select commission of the House of Commons; it worked at 250 lb./sq. in. boiler pressure, attained a speed of 35 m.p.h., climbed a hill at 24½ m.p.h., and ran 800 m. without a breakdown. This last is a marvellous result considering the state of the roads, and the fact that the car was not hung on springs. The speed

exceeded that of Stephenson's 'Rocket' running on rails in 1829! This select commission reported in extremely favourable terms, and in particular recommended a lowering of tolls, which were then often twenty times those for horse vehicles. Largely as a consequence of this, many motor vehicles were introduced: Hancock's 'Infant' ran from London to Bristol twice; his 'Autopsy' in 1833 plied regularly between Finsbury Square and Pentonville. In this he adopted the direct drive by the crankshaft, but afterwards the chain drive, using common chains. Other services plied between Paddington and the Bank, London and Greenwich, London and Windsor, London and Stratford. More ambitious still was Dr. Church's service between London and Birmingham, 1833. All this remarkable success, so little known to the modern motorist, experienced much opposition. Gurney had been stoned by a crowd egged on by irate postillions; coach proprietors and landowners were hostile; and the growing interest of railway companies led to repressive legislation. In spite of this, we hear of Hill's steam coach in 1843 running regularly between Deptford and Hastings, negotiating hills 1 in 12 and 1 in 13, performing the return journey in one day. This coach is interesting as being fitted with a differential gear. In 1862 Patterson ran a steam coach, and Yarrow had one in the exhibition. In 1871 Thompson's road steamers adopted rubber tyres on the driving wheel for the first time; the 'Ravee' performed the record-length journey from Ipswich to Edinburgh and back, a set of three rubber tyres costing £241. The modern M. C. industry dates from the perfection of the internal-combustion engine (q.v.) by Otto. In 1876, and the patenting in 1885 by Daimler of a single-cylinder high-speed engine. Messrs. Panhard and Levassor acquired the Fr. and Belgian rights to use the engine, and constructed a car in 1894. In the meanwhile Benz, in 1885, had produced a motor tricycle, also using a petrol engine. Daimler produced the first double-cylinder V-type engine in 1889, while in 1893-94 Serpollet succeeded with his steam carriage. Press enterprise on the part of Giffard, editor of the *Petit Journal*, was responsible for the Paris-Rouen race in 1894, won by the De Dion-Bouton steam tractor. The next year saw the Paris-Bordeaux race won by Levassor driving a Daimler motor 735 m. at 14.9 m.p.h. This led to the founding of the Automobile Club of France by the comte de Dion. Onward from this clubs were formed, races arranged, and the system of definite trials started. In 1899 the Automobile Club of Great Britain held its first trials, and included heavy vehicles. In the previous year trials had been held for electric vehicles in France, following on those for heavy vehicles in 1897. In the early days of Brit. motor industry, from 1895 when the restrictions on road traffic were lifted, the only outstanding achievement was F. W. Lanchester's design of a car which was the first to embody all essential features of the modern car.

Otherwise the main occupation of the industry was the assembling of motors designed abroad while the U.S.A. and France made strides in development. Progress has been rapid, especially since 1918. In the first six months of 1948 Great Britain took the lead as an exporting country, with 115,980 cars. The total production capacity of the industry is now reckoned as 750,000 cars per annum, and the number of employees directly engaged is estimated at 186,000. But whereas the early years saw a large number of small producers (ninety-six in 1922) making a great variety of specialised cars, the market is at present supplied by only thirty-two manufacturers, and of these, Austin, Nuffield, Standard, Rootes, Vauxhall, and Ford between them account for 90 per cent of the production. At the same time, the number of models has been greatly reduced. Apart from the possible development of the gas turbine and the compression-ignition engine, no drastic change in design of cars is anticipated in

eight-compressor unit developing 160 brake horse power at 35,000 r.p.m. are so far advanced that a jet car may be run in a not too distant future. The weight of the power unit is about 300 lb., compared with 1000 lb. for a spark-ignition and 2000 lb. for a compression-ignition engine of equal power. Of the reciprocating internal-combustion engines, the compression-ignition type (see OIL ENGINES) is mainly used in lorries and other heavy vehicles destined for long journeys without frequent stopping. The engine is heavier, more robust, and of greater initial cost than a petrol engine of equal power, but is considerably more economical in fuel, though more discriminating as regards quality. It is also more noisy when running light, and the problem of accurately measuring and timing fuel injection becomes very intricate for smaller sizes of engine. For private cars, the spark-ignition reciprocating engine using 'petrol' (light oil) as fuel and working on the four-stroke cycle

1949: AUSTIN A 90 ATLANTIC CONVERTIBLE, AND MORRIS MINOR SALOON

the near future, but improvements in transmission, including clutch and gearbox, in fuel injection, and in design of electrical equipment are to be expected.

Modern Engines.—The steam engine suffers from the disadvantage that generation of steam in the boiler takes an appreciable time, and this weighs heavily against its excellent qualities of self-starting, smooth running, good acceleration, and flexibility of power output, and the manufacture of steam cars is now practically abandoned. The electric series motor is the most perfect traction motor known; self-starting, silent, flexible, simple to control. But as it needs a battery for the supply of current and present-day accumulators are very heavy in relation to their output, a car to cover considerable distances without recharging would be of quite impracticable weight. The use of the electric motor is therefore at present restricted to delivery vans in this, with frequent stopping and starting, and for such purposes the electric vehicle has no superior. For ordinary road vehicles the internal-combustion engine is now the universally favoured power unit. Of the various types of internal-combustion engine, the gas turbine for jet propulsion is still in the experimental stage, though at least one Brit. car-manufacturing firm claims that trials with a three-turbine,

(see INTERNAL-COMBUSTION ENGINES) is at present practically the only type used. The complete power unit of a car comprises the fuel tank with pump and filter, the carburettor, cylinders, ignition system, crank-shaft, and transmission, and these are here dealt with in turn. Cooling and lubrication come next, and finally electrical equipment, steering, and suspension.

The fuel tank, usually made of sheet metal and with a capacity of from 6 to 20 gal. or more, is nowadays mounted at the back of the car, but in earlier models it is found at the front, behind the engine. In modern cars, fuel must therefore be conveyed to the engine by a pump. This is usually of the diaphragm type. Fuel passes through a one-way valve into a shallow chamber, the bottom of which is formed by the diaphragm, which is held in the 'compression' position by a spring underneath, and moved down to the 'suction' position by compression of the spring. When the spring is released, the fuel passes through another one-way valve to the carburettor. The compression and release of the spring may be operated by a lever-and-eccentric combination from the camshaft of the engine, or electrically. In the S. U. electric pump the diaphragm is vertical and is fitted with an iron disk (armature), which is attracted to or released from an electromagnet (in the form

of an iron pot with magnetising winding), according as the exciting current is switched on or off by a bronze rod mounted on the armature. Other pumps still in use are the S. U. Petrolift (electric) and the Autovac. The pump is fitted with a gauze oil-filter, and a float in the tank operates the petrol gauge fitted on the dashboard. This may be simply an ammeter indicating the current (supplied from the car battery) in a circuit containing a variable resistance controlled by a lever attached to the float. As the float moves up or down, the resistance, and therefore the current, is altered.

sists of two chambers—the float chamber, containing the supply of petrol from the main tank, so regulated as to stand at a fixed level by a float actuating a needle-valve; and a mixing chamber, into which a duct from the float chamber leads the fuel. This duct ends in a fine jet, whose orifice is carefully calibrated and so arranged that the level of the liquid is always slightly below the level of the orifice. This prevents waste due to petrol overflowing from the jet if the carburettor is left standing out of the horizontal position. The jet is placed in the centre of the air passage at a point where it has

FRONTAL ARRANGEMENT
(AUSTIN A 125 SHEERLINE)

1, Air-cleaner, 2, steering-column gear-change, 3, Stromberg carburettor; 4, six-cylinder overhead valve engine; 5, thermostat, 6, distributor with automatic and vacuum advance; 7, dynamo, 8, four-speed synchromesh gear-box; 9, camgear steering, 10, power-operated hydraulic jack; 11, hydraulic shock-absorber, 12, independent front-extension; 13, crankshaft torsional vibration damper and fan pulley.

The carburettor has to break up the liquid fuel into a mist of fine droplets and mix it with the correct proportion of air for efficient combustion, according to the needs of the engine. The theoretically correct weight ratio of air to petrol for complete combustion is 14.7:1; benzol requires 13.2:1. A slightly lean mixture (16 or 17:1) gives a higher thermal efficiency, but if the mixture is too weak the power falls away rapidly; a somewhat richer mixture is needed for maximum power development, although the efficiency is lowered. On slow running, on starting and on accelerating, a richer mixture is likewise needed. The mixture is carried from the carburettor through a pipe or passage having a connection to each cylinder, and referred to as the induction manifold. The modern carburettor con-

been reduced in diameter, called the choke-tube. One of the wide ends of the choke-tube communicates with the atmosphere, and the other, past the throttle valve, with the cylinder, via the induction manifold. The suction produced in the cylinder of the engine during the induction stroke causes air to rush through the choke-tube; this produces a drop in pressure at the throat in the vicinity of the jet, with the result that fuel issues from the jet and, meeting the high-velocity air stream, is broken up into minute particles, which are intimately mixed with the air. Heat is sometimes supplied by heating a portion of the mixing chamber or induction manifold by jacketing them with hot water or exhaust gases. Special carburettors are necessary for paraffin and alcohol, owing to these

fuels being less volatile than petrol, but not for benzol, although in this case the float should be slightly weighted if the level of the fuel in the float chamber is to be maintained, because of the greater density of benzol. There are various designs of carburetors (*q.v.*) in use in modern cars, mostly employing the vertical down-draught tube. The Zenith V-type has two jets, one of which is a gravity jet, the other actuated by pressure variations and functioning as a compensator, in addition to a pilot jet for slow running. The Solex contains a main jet feeding a complete controllable 'spray assembly.' The S.U. uses a variable jet, controlled by a tapered needle, and a variable air passage. The Stromberg is an intricate combination of jets and chokes ensuring adjustments of mixture strength for varying air-speed.

The cylinders may be two, three, four, six, eight, or twelve in number, arranged in different ways. By increasing the number of cylinders and arranging the firing strokes at suitable intervals, the unevenness of the action, due to the fact that only one stroke in four in each cylinder is a working stroke, can be largely eliminated and a more uniform torque applied to the crankshaft. Two cylinders were previously placed in V-form, but the modern arrangement is horizontal opposed-motion, one cylinder on either side of the crankshaft. Three cylinders are now always placed radially. Four cylinders (usual in Brit. cars) are placed vertically in line, the two inner cylinders working in synchronism and in opposition to the two outer. Six cylinders are likewise placed vertically in line and the crankpins are spaced at 120° apart, the cylinders firing in the order 1, 5, 3, 6, 2, 4. Eight cylinders are either vertical in line, or in two banks of four, in V-form. Twelve cylinders are usually set in two banks in V-form. Other types of cylinder arrangement, such as 'five radial, three banks in W-form, or horizontal opposed-motion with four, six, or eight cylinders, have been used for special purposes like racing.

The valves in modern car engines are almost exclusively of the poppet or mushroom type, though rotary and sleeve valves have been tried with some success. The valves may be arranged at one side of the cylinder, the valve-head and seat being placed in a special pocket with the stem below the head, or overhead with the seat in the cylinder roof and the stem above, sometimes inclined at 40°, sometimes vertical. The valves are operated by lever and pushrod from the camshaft.

Ignition.—Just before the piston reaches the top of the stroke, the fuel mixture, which is then compressed, is ignited by a spark. To ensure this, a sparking plug is screwed into the combustion chamber, introducing two electrodes forming the spark gap (about 0.02 in. apart), one of which is earthed, *i.e.* connected to the metal body of the plug and thus to the frame of the engine, while the other is connected to a terminal at the top of the plug but otherwise carefully insulated

from all other metal parts, usually by ceramic material. When the insulated electrode is charged to a high potential through connecting the terminal to a high voltage generator, a spark bridges the gap between the electrodes. The high voltage may be generated by an induction coil or a magneto. The induction coil has a primary winding of copper wire which will carry 2-3 amperes when connected to the 6-V. or 12-V. car battery, and (usually inside the primary coil) a secondary winding of thousands of turns of very fine copper wire wound on a core of a bundle of soft-iron wires. A current in the primary generates a magnetic field mainly concentrated in the core. When the current is broken, the field vanishes and the variation induces an E.M.F. in the secondary proportional to the number of secondary turns and to the speed of breaking and depending also on the field strength. An E.M.F. is also induced in the primary, and to prevent consequent sparking at the contacts, a condenser is shunted across the gap, the result being that the primary induced E.M.F. surges between the coil and the condenser in a series of decaying oscillations. When the wave returns (with diminished amplitude) to the coil, the contacts should be so far apart that no spark occurs. One contact of the contact breaker is fixed, and insulated, the other (earthed) is moved by a lever-and-cam arrangement, driven by the engine, ensuring that a break occurs for each cylinder at the correct time. The secondary also has one terminal earthed, while the other is connected to a carbon 'brush' sliding on a rotating disk with a projecting arm, fixed on, but insulated from, the same shaft as the contact-breaker cam; as the disk rotates, the arm sweeps past but very close to metal knobs, one for each cylinder, connected to the corresponding sparking-plug terminals, thus transmitting the high potential to each plug in turn, through a very small spark bridging from the arm to the knob. The timing of the spark has to be adjusted to the engine speed and the throttle opening, and this is in modern cars done automatically. Apart from the automatic timing device, of which there are various designs, a manual adjustment is often available. Knocking may be remedied by retarding the spark. The magneto has a permanent magnet in the gap of which an H-shaped soft-iron armature is rotated, driven by the engine. The armature carries a primary winding, the current in which is interrupted, at certain points of the rotation, by a contact-breaker, inducing thereby a high E.M.F. in the secondary, which has a large number of turns of fine wire. An alternative design has a stationary armature while the magnet is rotated.

Transmission.—The power developed in the engine is transmitted to (usually) two of the road wheels, and at present the back wheels are used in most cars. This involves a propeller shaft from the engine to the rear of the car, and there are other considerations, connected with steering,

which favour front-wheel drive, and future developments may lead in this direction. The power is taken from the flywheel to one end of the crankshaft. This latter is enclosed in the crankcase under the cylinders and has a short parallel shaft length for each cylinder, some distance from the main shaft, and connected to it by short webs; the main shaft is interrupted between the webs. The pistons are connected to the short arms by connecting rods, so that when the crankshaft rotates the connecting rods move the pistons up and down. It is necessary to

surrounded by a cylindrical casing, the casing being filled with oil, which is set in motion by the impeller and drives a turbine fitted to the main propeller shaft.

The internal-combustion engine is most efficient at a speed considerably higher than that of the road wheels of a car, and on climbing a hill it is necessary to reduce the speed of the road wheels still further while keeping the engine running at full speed. It is also necessary to provide means of reversing the car, as the engine cannot reverse. These adjustments are made possible by a set of gears enclosed

be able to disengage the engine from the road wheels, and to engage while the engine is running, without any jerk. This may be done by a clutch or by fluid fly-wheel. The modern clutch is of the single-plate type. A disk fitted on the propeller shaft can be pressed against the flywheel face, usually by springs moving a so-called presser plate which is attached to the flywheel, but on the other side of the disk, so that the latter is gripped between flywheel and presser plate. The friction between the flywheel face and the disk carries the latter round with the flywheel, and the friction may be increased by cutting radial slits in the disk and turning the edges out of the plane of the disk. The earlier cone-type clutch is now rarely used. In the fluid-flywheel drive an impeller wheel is bolted to the flywheel and

in the gear-box. The clutch shaft carries a small gear-wheel, which engages permanently with a large gear-wheel on a parallel shaft (layshaft) below the clutch shaft (primary), the layshaft thus turning continuously at a slower rate. The layshaft carries a further three or four gear-wheels of different sizes, which can be brought to engage with corresponding gear-wheels on a third shaft in line with the primary by sliding and subsequent locking in position. In the modern synchromesh system the engaging of the different gears is operated by a clutch arrangement and the adjustment is carried out by movement of a selector fork. The epicyclic gear-box has a central gear (sun wheel) and a number of 'planetary' gears engaging with it and fixed on shafts carried by a circular frame. The planetary

gears also engage the inside gears on a ring. If the frame is locked, the planetary gears drive the ring, but if the ring is locked, the planetary gears travel round carrying the frame. A more recent form of speed adjustment makes use of hydraulic torque conversion, a development of the fluid-flywheel drive. In the case of rear-wheel drive which is usual at present, a propeller shaft conveys the power from the gear-box to the axle. It is provided with universal joints at both ends. The shaft drives the axle through bevel reduction gears. To allow for the fact that in driving the car on a curve the wheels follow different paths and must revolve at different speeds, a differential gear connects the two halves of the rear axle. Each half has a bevel gear at the end, the two facing each other at the middle, and the gap between them is bridged by a number of small bevel gears around the circumference, having their spindles mounted on a frame revolving around the shaft. When the road wheels, and thus the bevels on the half-shafts, revolve at the same speed, the bridging bevels do not move on their spindles but are simply carried round with the bigger bevels, but if the road wheels revolve at different speeds, the small bevels turn on their spindles and divide the load between the two half-axes.

Braking, usually acting on all four wheels, is effected in each case by two or four shoes mounted on a disk fixed to the axle, the shoes being moved outwards to rub against the inside of a drum on the hub of the wheel. The movement of the shoes may be operated mechanically or, as in the Lockheed system, by a hydraulic cylinder-and-piston arrangement. Other systems are the Girling mechanical, Hydromek and hydrostatic brakes, and the Clayton-Bowditch vacuum system. A hand brake is also usually employed.

Cooling.—Owing to the high temps. resulting from the combustion of the fuel in the cylinder, it is necessary to arrange some system of cooling the affected components. Failure to do this would lead to the breakdown of the lubrication between piston and cylinder walls, and this together with the greater rate of expansion of the former would cause seizure. The normal procedure in motor-car practice is to surround the cylinder and cylinder-head by a water-jacket. From the top of this jacket a pipe is taken to the radiator, which is a sheet-metal structure so designed as to expose a large surface area to the flow of air around it. The air-flow is assisted by a fan behind the radiator, driven by a belt from the engine. From the bottom of the radiator a pipe leads to the lower portion of the cylinder water-jacket. In some instances water circulation is maintained by means of convection (thermo-siphon system); in others by means of a pump driven by the engine. The heat of combustion passes through the cylinder walls, etc., by conduction, and heats the water in the jacket, which then goes to the top of the radiator, where it is cooled by a stream of cool air, caused by the passage of the car through

the air. Sometimes the water flow is regulated by a thermostatically controlled valve. In the case of air-cooled engines, instead of a water-jacket a number of thin fins are cast concentric with the bore of the cylinder and across the top of the cylinder-head. These have the effect of increasing the area over which heat may be lost by radiation to the air. Air-cooled engines are chiefly used for motor cycles.

Lubrication.—The object of lubrication is to reduce friction, and consequently wear, between surfaces which are in rubbing contact with each other, e.g. piston and cylinder walls, main bearings, cams, etc. Lubricating oil is carried in the sump under the engine and oil is delivered under pressure, from a pump driven by the engine, via small pipes and ducts, to all parts of the mechanism requiring it. In some cases oil is pumped only to the main bearings and to open troughs. The connecting-rod big-ends splash into the troughs and in this way oil themselves, the cylinder walls, etc.

Electrical Equipment.—All modern M.C. use electric light for headlamps, etc., whilst engine-starter, wind-screen wiper, horn, radio, etc., also need electric power supply. As both lamps and starter-motor require power while the car is standing still, a power source independent of the engine is necessary, and all cars are therefore provided with a battery of accumulators (q.v.). The usual battery consists of three or six lead-acid or nickel-alkaline accumulators. The lead-acid accumulator when fully charged has an E.M.F. of about 2.1 V. but delivers current at 2 V. Three accumulators in series thus give a voltage of 6 V., six in series give a voltage of 12 V. The nickel-alkaline accumulator delivers current at about 1.4 V. and nine cells give about 12 V., but the voltage is less steady than that of lead-acid accumulators. In the lead-acid accumulator the electrodes consist of sets of lead grid plates, the grids of the positive plates being filled with lead peroxide, the grids of the negative plates with litharge. The plates are arranged alternately positive and negative, separated by insulating plates, and at the top all the positive plates are connected together, and likewise all the negative plates. The electrolyte is dilute sulphuric acid. When discharging the accumulator, both the filling layers are gradually converted into lead sulphate; when the conversion is complete, the current ceases and the accumulator must be charged afresh. Accumulators must not be left uncharged, nor should the discharge be carried so far that the voltage 'runs down.' The storage capacity is measured in ampere-hours (A.h.) at a certain rate, e.g. 50 A.h. at 10 hrs. This means that the battery can supply 5 A. continuously for 10 hrs., but if the current is increased, say, to 10 A., the battery runs down in less than 5 hrs. The current density, or current per cm.² of plate area, must not exceed a certain value either in discharging or in charging the battery. The charging of a car

battery is done by a generator driven by the engine, generator and battery being so connected together that the voltage supplied by the combination is kept constant. In the modern compensated voltage control (C.V.C.) system, the generator voltage is kept constant by automatic field regulation and the battery automatically cut out of the generator circuit when fully charged, and also in all cases when the generator voltage falls below that of the battery, as when the engine is slowing down or stopping. Otherwise the battery would drive the generator as a motor. In earlier days a constant-current system was used, with a third-brush generator, but this scheme only works well at a definite speed, the battery acting as a buffer at other speeds, and the system is now obsolete. The windscreen wiper is nowadays usually worked by a small electric motor with a permanent-magnet field, and driven through gearing to reduce the speed. If two or more wiper blades are used they are still driven from a single motor and connected through rods or flexible cable. The electric horn consists essentially of a diaphragm acting as armature to an electromagnet. When the electromagnet is excited by pressing a push-button closing the circuit, the diaphragm is attracted to the pole of the electromagnet and in its motion breaks a contact interrupting the exciting current, in the same way as a 'buzzer.' The lighting installation comprises the head-lamps with arrangements for 'dipping' either by tilting the reflector or by providing two separate filaments in each lamp, rear lamps, sometimes small lamps diffusing light over the step when the door opens, and interior lamps for reading and for diffusing light on the dashboard.

Starting.—It is necessary to fill the cylinders with a charge and to compress it before ignition can take place. This is sometimes done by hand, using a starting-handle mounted in front of the engine, and which, by means of 'dogs,' engages with the engine shaft and gives it the necessary amount of rotation. When the engine starts, the dogs are thrown out of mesh and are held clear by means of a spring.

An electric starter is fitted to all modern cars. It consists of a small series-wound motor which operates a pinion which meshes with a toothed ring fixed round the flywheel. The electric current is supplied from the car batteries to the field magnets, and then through the armature coils, which has the effect of causing a repelling force between the armature coils and the field magnets, thus producing rotation of the armature. The small pinion is mounted on a sharp spiral on the motor shaft, and, when the latter rotates, the pinion, owing to its inertia, does not at first rotate with it. This causes the pinion to move along the shaft and to mesh with the teeth round the edge of the flywheel. When the engine starts, the pinion flies out of gear, owing to the fact that the flywheel drives it faster than the motor. Sometimes the dynamo is made to act as the starting motor. In

this case the dynamo-motor shaft is permanently geared to the engine shaft by a chain, so that when the engine has started it drives the motor, which then acts as a dynamo.

Steering and Suspension.—In steering a car the front wheels are turned, each wheel swivelling individually on a vertical axis. The design of the suspension varies in the different makes of car, but two important features are common. Firstly, with rear-wheel drive the front wheels are slightly 'toed in,' that is, the front edges are slightly closer together than the back edges, so that as the wheels are pushed along the slight play always present in bearings will allow the wheels to become parallel. The second point is

FRONT SUSPENSION (AUSTIN A 40)

- 1, Hydraulic shock absorber; 2, top wishbone arms; 3, hydraulic brake piping; 4, swivel pin; 5, steering arm; 6, steering cross tube; 7, steering double lever; 8, idler; 9, coil spring; 10, bottom wishbone arm; 11, steering side tube.

that when turning a corner all wheels describe concentric circles and the amount of swivelling must be so adjusted that no wheel skids. There are a number of different designs of springs (q.v.) in actual use, but the type at present favoured is the spiral-spring suspension, in combination with a torsion bar to prevent rolling, and usually with hydraulic shock-absorbers or suspension-dampers.

Horse-power.—Power is defined as the rate of doing work, and the unit used in connection with engines is 1 h.p., which is the equivalent of working at the rate of 33,000 foot-pounds per min. The b.h.p. is the h.p. which is available from an engine after deducting all mechanical losses in the engine itself, such as frictional and pumping losses, etc.; b.h.p. is measured by means of an apparatus called a dynamometer or brake. A common form of brake absorbs the power of the engine by friction, whilst another very important type, called the Froude hydraulic dynamometer, dissipates the energy by churning up water. The above types of brake enable the torque exerted by the engine shaft, T-lb.-ft., to be measured, and, by using the

equation. $b.h.p. = \frac{T2\pi N}{33,000}$, where N is

the number of revs. per min. of the shaft, the b.h.p. may be calculated. The power required to drive a car at constant speed on a level depends partly on the weight of the car, partly on the air resistance, which is proportional to the square of the speed. As an example, to drive an ordinary saloon car at 50 m.p.h. requires roughly 20 h.p. In order to climb hills without undue decrease in speed, a certain amount of surplus power is needed. See also MOTOR TRANSPORT, COMMERCIAL; MOTOR TRANSPORT, MILITARY.

Smith, *The Electrical Equipment of Automobiles*, 1949; also the journals, *Autocar* and *Motor* (weekly).

Motor Cycles. For touring and transport purposes the motor cycle has become a serious competitor to the light car owing to its lower first cost, lower taxation, and reduced fuel consumption, while its modest demands on garage accommodation and maintenance are at present weighty arguments in its favour. It is indispensable for the road patrols of the A.A. and R.A.C., and is extensively used by the police and the forces. As a vehicle of sport, for races, rough-track riding, and hill-climbing, the motor cycle makes a special appeal, and the simplicity and small size of the engine enables the owner to carry out repairs and to satisfy his interest in things mechanical by daily attention to the vehicle. The astounding performance of the dispatch riders at the Royal Tournament is an exhilarating exhibition of the possibilities of a motor cycle when perfectly mastered.

The term includes a variety of designs, from the three-wheel runabout car, the motor cycle and sidecar outfit, and the ordinary 'solo' machine to the scooter and the 'push-bike' with attached motor, though the latter is usually referred to as the autocycle. The h.p. varies from about 1 to 10 or 12, but the size of engine is usually indicated by the cylinder cubic centimetre (c.c.) capacity, i.e. the volume swept by the piston in one stroke, 100 c.c. corresponding roughly to 1 h.p. The light-weight 98-150 c.c. solo machine for light touring will do up to 120-140 m.p.g. and has a maximum speed of 40-45 m.p.h. For carrying a pillion passenger the 250 c.c. is usual, and this has a maximum speed of 50-70 m.p.h. and at 25 m.p.h. the fuel consumption is at the rate of 110 m.p.g. The smallest size for a sidecar combination is the 350 c.c., doing

75-100 m.p.g., but the 500 c.c. is the more popular type. The larger sizes up to 1000 c.c. and more have more reserve power and are more flexible in working.

Engines are at present invariably of the light-oil (petrol) internal-combustion type, working on either the two-stroke or the four-stroke cycle (see INTERNAL-COMBUSTION ENGINES). The simplest of all is the one-cylinder, two-stroke engine, and owing to its smooth running (one power stroke in every two) and the absence of valves and tappets requiring attention it is still favoured on many cycles, especially for touring. The four-stroke engine is, however, slightly more efficient. In some four-stroke engines the valves are placed in a pocket at the side of the cylinder, which simplifies decarbonising and adjustment. In the more modern design the valves are placed in the roof of the cylinder (overhead, o.h.v.) and operated by levers and long pushrods from the camshaft, or by an overhead camshaft (o.h.c.) driven by bevel gear at the top of a long rod which carries another bevel gear at its lower end engaging with a gear on the main shaft. The one-cylinder engines are spoken of as 'singles,' as distinct from 'multi.' Both two- and four-stroke engines are used with two or four cylinders in various arrangements, such as the 'twin-flat' or horizontal opposed-motion, the twin-vertical, two or four cylinders in V-form, four vertical in line or in square formation. The main consideration is that of fitting the cylinders into the frame and at the same time ensuring adequate access of cooling air. Most engines are air-cooled and the cylinders are fitted with cooling ribs.

Carburetors (q.v.) are similar in principle to those used in motor cars and consist of a float-chamber, which may be top- or bottom-fed, and a mixing chamber which contains the jet or jets, air inlet, and the throttle adjusting the rate of delivery of the air-petrol mixture to the cylinder, and controlled from the handlebars. As the fuel tank is always uppermost on the frame, the carburettor is gravity-fed. The Amal carburettor has a main jet and a pilot jet which comes into action at small throttle openings. In the larger types the mixing chamber is vertical and the float-chamber is fitted with a small plunger ('tickler'), which is used for depressing the float and thus flooding the chamber when starting from cold. An air slide controls the amount of air admitted. The Bowden carburettor has two submerged jets and two above petrol level, and is completely automatic in action. The Villiers carburettor has the float-chamber fixed immediately below the mixing chamber and there is no pilot jet. **Ignition** of the fuel is by an electric spark produced either by a high-tension magneto or by a coil. The latter is the cheaper arrangement, requires less attention, and gives easier starting (see under MOTOR CARS).

Transmission.—The internal-combustion engine used in M. C. develops maximum power at about 5000 r.p.m. and with the normal size of road wheels

this speed must be geared down in the ratio 5 : 1, this top gear corresponding to maximum speed on a level road. To enable the machine to travel at reduced speeds while still keeping the engine running at its optimum speed, the transmission ratio can be further reduced by a set of gears (two, three, or four) in the gear-box. The top-gear reduction is effected in most cycles by two chains, one (primary) connecting a small sprocket on the engine shaft with a large sprocket on the gear-box main shaft (gear ratio 2:1), the other (secondary) connecting a small sprocket on the gear-box main shaft with a large sprocket on the rear wheel shaft (ratio 2½:1). The chains are usually provided with a spring link and run in an

main shaft by dog clutches operated by the gear lever.

Electrical Equipment.—This consists of a generator with automatic voltage control, driven from the engine, connected through a battery-controlled charging circuit to a 6-V. accumulator battery, three lead-acid cells or five nickel-iron cells. A very simple system is the Villiers alternating-current generator and dry rectifier set with a dry battery for parking purposes.

Lubrication.—Castor oil is sometimes used as lubricant for racing purposes, but is unsuitable for ordinary use as it is likely to cause clogging and, like other vegetable oils, corrosion, unless the engine is frequently cleaned. Mineral oils are

oil bath. In some machines the primary chain is replaced by gear drive, and in some the secondary drive is by shaft and bevel gears. The engagement of the engine is effected by a friction clutch usually consisting of two plates, fixed on the gear-box shaft, one on either side of the large sprocket, the sprocket being surfaced with friction material, usually asbestos. When the plates are separated the sprocket revolves idly on ball bearings without transmitting any power to the shaft; when the plates are pressed against the sprocket, both plates and sprocket revolve together driving the shaft. The clutch is operated from the handlebar lever. Below the main shaft in the gear-box is the layshaft with its set of gear-wheels engaging with a corresponding set of wheels which can be clamped on the

now available which are fully as efficient and have none of the defects of vegetable and animal oils. The oil was formerly supplied to the crankcase by a hand-pump and there distributed to the engine by splashing. Hand-pumping is now largely superseded by automatic pumping, and the splash system is in four-stroke engines replaced by the dry-sump system in which oil is supplied by special feeds to the working parts of the engine. In two-stroke engines the 'petrol' system is sometimes used, the oil being added to the petrol, or the Villiers automatic drip feed, in which oil is forced by pressure to the engine.

Brakes are usually of the expanding type, two brake shoes—usually of aluminium with woven asbestos lining—being pressed outwards to rub against the

inner surface of a drum attached to the wheel hub by the movement of a cam operated from the brake pedal.

Frames are usually made of pressed steel or built up of steel tubes joined by brazed steel lugs, and so shaped as to house the tank and engine and provide adequate lateral stiffness to keep the various parts, especially of the transmission, in true alignment. The rear wheel is usually spring-suspended and the front fork is always fitted with some spring device, either compression springs or rubber suspension. The modern telescopic front fork uses hydraulic or air-oil cushioning.

Temple Press Ltd., *Tuning for Speed* ('Slide Rule'), and *Modern Motor Cycle Maintenance* (B. Osborne). *Motor Cycling* and *The Motor Cycle* (weekly) contain valuable information on modern developments.

Motoring. The first exhibition of motor cars was held in England at Tunbridge Wells in 1895, being organised by Sir David Salomons. Since 1932 ann. exhibitions have been held at Olympia, London, in Sept.-Oct. The Automobile Club de France, founded in 1896, with headquarters in Paris, was formerly the chief controlling force in international events and racing. To-day the controlling body is the International Association of Recognised Automobile Clubs, with its headquarters in Paris. This body consists of representatives of automobile clubs from the various countries, and not only governs all questions of motor sport, but all international touring affairs. In each country the recognised automobile club—for instance, in England, the Royal Automobile Club—is the governing body of sport so far as that country is concerned, subject to any international regulations made by the international body.

Brooklands, on which the accepted world's records were formerly made, has been out of use since 1939. It was constructed in 1906-7 at Weybridge, Surrey. The chief track in Great Britain is now the Silverstone circuit at Towcester, Northamptonshire. It consists roughly of two semi-rectangular portions at an angle of about 140° with one another. The full circuit is 3.8 m. but a cut reduces the length to 2.75 m.

The chief track in the U.S.A. is at Indianapolis, rectangular, curved ends, with two straights of 3301 ft. and two of 610 ft. Other tracks: France, Miramas (Provence), oval, 3½ m. to the lap, and Monthéry, S. of Paris, 1½ m. to the lap; Germany, Nurburg Ring, near Koblenz, constructed in 1927, in the mts., with two loops 13½ m. and 1½ m.; Italy, Monza, Milan, two rectangular tracks, curved ends, entire circuit, 6½ m.; Spain, Sitges, near Barcelona, 1½ m. to the lap; Argentina, San Martín, Buenos Aires, constructed in 1927, oval, 1½ m. to the lap. Beach tracks: Great Britain, Pendine Sands (Carmarthen Bay), Saltburn-by-the-Sea, Skegness, Southport, and Wallasey;

U.S.A., Ormond-Daytona Beach, Florida, 20 m. long, with a 6-in. level stretch from 400 to 600 ft. wide at low water of smooth beach nearly as hard as asphalt.

The earliest competitive event for motor vehicles is commonly held to have been the Concours des Voitures sans Chevaux, organised by *Le Petit Journal* in France in 1891. The fastest time was that of Lemaître on a Peugeot averaging 11.5 m.p.h. Then came the race from Paris to Bordeaux and back, 1895, Levassor being the first winner (time, 2 days and 48 mins. at an average speed of 15 m.p.h.); from Paris to Marseilles and back, in 1896, organised by the Automobile Club de France, an average speed of 15½ m.p.h. being attained; many road-racing events, such as the 'tour de France,' over a distance of 1350 m. at an average speed of 35 m.p.h.; the Gordon-Bennett race, first held in 1899, over a course of 353½ m., and first won by Charron on a Panhard at 38.6 m.p.h. In 1898 came the first of a series of attempts to establish records over a flying kilometre. In the next few years manufacturers, generally, subordinated racing to the production of reliable cars for sale to the public, but sev. notable records were set up, including the now classic Indianapolis 500 m. record (since beaten) by Thomas on a Delage at 82.47 m.p.h.; the Tourist Trophy, 600 m. by K. Lee Guinness on a Sunbeam at 56.4 m.p.h. But after 1918 numerous important road races were held annually and many record-breaking races were accomplished over distances up to 1500 m., these being run to the earlier years over closed circuits, and later over newly constructed concrete racing tracks on the Continent. From 1924 came the series of flying-mile attempts at Pendine and Florida Beach, and in the same period board-track racing, a favourite form of the sport in America, the great event being the 500 m. race in Indianapolis. It was not until 1926, however, that Amer. speed records were recognised by the International Association of Recognised Automobile Clubs, so that many speed performances before that date in Europe were held as official world's records, irrespective of higher speeds reached in America. The fastest speed ever attained by man on land is that of John R. Cobb, who was timed at 403.135 m.p.h. on one of the runs at Bonneville (Salt Beds), Utah, Sept. 16, 1947.

Opposite is (a) an abridged list of world's land speed records for the flying-kilometre or the flying-mile, giving an impressive picture of the development of racing cars in fifty years; since 1922 the figures are averages of two runs; and (b), pages 426 and 427, lists of world's records for varying distances. These, and other data, are courteously supplied by the Royal Automobile Club and the Contest Board of the Amer. Automobile Association.

The outstanding foreign events are the 500-m. race at Indianapolis, in May; the Fr. Grand Prix, Le Mans Grand Prix, and the Grand Prix de l'Endurance, in June; the Belgian Grand Prix, in July; and the It. Monza Grand Prix in Sept.

Motor Launch. *see* MOTOR BOATS.

Motor Law.—The Motor Car Act, 1903, and the Locomotives on Highways Act 1896, are the charter of the modern motor car, and the law as to registration of cars, licensing of drivers, regulation of lighting, and penalties for dangerous driving are to be found in those Acts, as amended by later Acts, and by regulations and by-laws made under the various Acts. A new system of licensing vehicles was introduced by the combined operation of the Roads Act, 1920, the Finance Act, 1920, and the Order in Council and Regulations made under the Acts. The issue of licences and the collection of excise duties are carried out by the co. councils and councils of co. bors. In the case of all first applications; but renewals can be effected by the councils or by any post office in the area of the first issuing council. Besides ordinary licences there were under the Roads Act, 1920, general and trade licences for manufacturers of, and dealers in, and repairers of mechanically propelled vehicles. These are replaced by 'A' and 'B' licences under the Transport Act, 1947 (*q.v.*). The ordinary car tax is 25s. per unit of h.p., but in the case of cars first registered after Jan. 1946 there is a flat rate tax of £10, whatever the h.p.

The licences are usually issued for a calendar year, but ordinary licences may be obtained for shorter periods, and the duty varies with the length of the period. Special terms are made for motor cycles, and cyclists may take out licences either for a single quarter or for any period less than a year, but greater than a quarterly period. The duty for general or limited trade licences varies according to the class of vehicle, but these may never be used when passengers are being carried for reward. Manufacturers may apply for a general licence applicable to all the vehicles used by them, the rate of duty being £10, except in the case of bicycles, for which the duty is 30s.; such licences are valid only for the use of one vehicle at a time. The licence card must be fixed to the vehicle so as to be clearly visible at all times by daylight. Registration is governed by the Registration and Licensing Order, 1921, and the regulations of 1924. The mark indicating the registering council and number must be fixed on every vehicle and its trailer (if it has one). The identification mark required by the Roads Act, 1920, is the index mark and regulation number assigned to the vehicle, and must be shown on a flat rectangular plate or similar surface forming part of the vehicle. Under the Road Traffic Act, 1930, it is an offence to drive or attempt to drive or to be in charge of a motor vehicle when under the influence of drink or a drug to such extent as to be incapable of having proper control, and the first offence is punishable by fine up to £50 or four months' imprisonment, or both, and the second by fine up to £100 and (or) four months' imprisonment, or, if the proceedings are by indictment, by imprisonment up to six months. The defendant if convicted is automatically disqualified from driving for twelve

months and there is no power to defer the operation of the disqualification pending appeal. Particulars of the conviction must be endorsed on the licence. A person so disqualified may, within three months, apply to the same court to remit the penalty. Regulations were issued by the transport ministry in 1929 forbidding the use of cars on the highway which caused an excessive noise by reason of structural defect, faulty adjustment, etc. No one may drive a motor vehicle unless he holds a driver's licence, the fee for which is 5s. This licence must be produced to any police officer on request, but failure to do so does not mean conviction for an offence if the driver is subsequently able to do so within five days at a police station named by him. But the police officer has no power to take note of any endorsement or conviction appearing on the licence. No one under sixteen years of age may be granted a driver's licence, whether for a motor car or for a motor cycle.

The speed limit was abolished in 1930, but was restored by the Road Traffic Act, 1934, which provided for a limit of 30 m.p.h. in built-up areas. Reckless or dangerous driving, which is a statutory offence as well as an offence at common law, consists in driving 'recklessly or at a speed or in a manner which is dangerous to the public, having regard to all the circumstances of the case, including the nature, condition, and use of the road, and the amount of traffic which is actually at the time or which might be reasonably expected to be on the road.' The maximum fine is £50 or four months' imprisonment or, for a second offence, £100 or four months' or, on indictment, six months'. Disqualification from driving follows on a second offence automatically but is discretionary in the case of the first offence. A police constable may, when the offence is committed within his view, demand the name of the driver and the production of his licence and, in default, arrest him without a warrant. The Act of 1930 created the new offence of 'careless driving,' i.e. driving 'without due care and attention or without reasonable consideration for other persons using the road.' The penalties are £20 for the first and £50 or three months' imprisonment for a second offence, but disqualification from holding or obtaining a licence does not follow from either first or second offence. It is permissible to carry a pillion rider on a motor cycle provided such passenger sits astride upon a proper seat fixed to the machine behind the driver; but only a single passenger may be so carried. Other offences included in regulations are ignoring one-way street signs; parking for longer than the permitted time or in prohibited areas; ignoring traffic lights, police gongs, and 'bellshave beacons' (these beacons were removed during the Second World War, in order to use the metal for munitions, but have since been restored). Another innovation was the driving test for new drivers, to be taken during the first three months of driving, drivers being issued a 'Learner's Licence' and being compelled

to carry 'L' plates on their cars until they have passed the test. The Road and Rail Traffic Act, 1933, regulates the carriage of goods on roads by motor vehicles, and grants power to railway companies to arrange agreed rates. It also contains provisions as to the restriction of the use of roads and bridges. For taxation of motor cars see also CARRIAGE LICENCES. See INSURANCE, *Casualty and Contingency Insurance*; TRANSPORT ACT, 1947; MOTOR VEHICLE INSURANCE.

Motor Signs.—For 10 m.p.h. or lower limit, a round white ring, speed in figures underneath. Prohibition, red solid disk. Caution, dangerous corners, cross-roads, steep gradients, hollow red equilateral triangle. All other notices to be on diamond-shaped boards.

See B. K. Parry, *Motorists and the Law*, 1931; E. Terrell, *Running Down Cases* (2nd ed.), 1936; H. Hughes, *Law relating to Road Users' Rights, Liabilities, and Insurance*, 1938; D. Potter, *Law relating to Garages and Car Parks*, 1939; L. Bingham, *Digest of Motor Claims Cases*, 1946; and A. D. Gibb, *Trial of Motor Car Accident Cases: their Preparation and Conduct* (3rd ed.), 1947.

International Convention on Motor Traffic, 1949.—Supersedes the obsolete 1926 convention on road and motor traffic and that on the unification of road signals of 1931. The new code is a comprehensive convention, worked out by a United Nations conference, and was signed in Geneva by delegates from thirty-six nations. The delegations, mostly composed of technicians and experts connected with motor transport and road usage, devised the new convention, starting from a draft prepared by the road transport section of the Economic Commission for Europe. The convention touches on almost every aspect of the motor car on the road and contains provisions which will affect car drivers, their registration, licences, and permits; manufacturers of private cars, lorries, omnibuses, trailers, motor cycles, and auxiliary cycles, cyclists and motor cyclists; road and bridge builders; and manufacturers of road signs and signals. It is intended for the guidance of govs. in planning their internal and international road systems. There is a main convention and a series of annexes, the latter divided into obligatory and optional undertakings. The provisions of the main convention are intended to be fixed provisions, whereas the annexes can be amended to keep them abreast of technical development. It is not proposed to set up a special international organisation for motor traffic. In most of its provisions the convention is intended to apply to international traffic only. Countries retain full jurisdiction over their own roads but agree to the use of certain highways for international traffic under the terms of the convention. The international road network is to be achieved gradually by regional arrangements. Although roads in the United Kingdom are scheduled as part of the system of European roads and are so marked on the road map, the Brit. delegation stated

that Brit. roads would not be designated as international highways nor would vehicles be permitted which did not conform to domestic regulations. In some cases acceptance of the convention will implicitly require states to enact new laws and alter national regulations to bring them into conformity with its requirements. The convention gives much consideration to its recommendations on the visibility, distance, and placing of road signs, especially in built-up areas. The convention accepts the customary traffic regulation lights of red, amber, and green. Rules are also laid down for overtaking, turning, entering priority roads, and traversing cross-roads. The motorists on the international highway in a foreign country will be familiar with much that is common ground; but he will still have a good deal to learn when these provisions come into force.

Motor Licensing, see MOTOR LAW.

Motor Ships. The term includes ocean-going craft usually of over 100 tons, powered mainly by internal-combustion engines. The advantages of the internal-combustion engine for marine propulsion are (1) the absence of boiler and attendant feed-pumps, feed-heaters, and filters, with consequent reduction in space occupied by machinery and in staff; (2) easy bunkering, as the fuel (oil) can be stored in double-bottom tanks; (3) higher thermal efficiency, resulting in lower fuel consumption and therefore increased range of operation and saving in time and money.

Engines.—The engines used in modern M. S. are almost exclusively vertical reciprocating oil engines (q.v.) of the compression-ignition (Diesel) or the semi-Diesel type. Gas engines have been tried in smaller ships, but the space occupied by the gas producer offsets the advantage of the absence of boiler, but even so the gas engine is more efficient than the steam engine. Marine engines working on the four-stroke full Diesel cycle may be either single- or double-acting and are usually built in four-, six-, or eight-cylinder units. The best known are the following: the Hurmeister & Wain (Copenhagen) double-acting eight-cylinder type developing 1000 b.h.p. per cylinder, for large passenger liners, and the long-stroke six- or eight-cylinder unit for cargo boats. These types are built in Great Britain under licence by Harland & Wolff (Belfast) and John G. Kincaid & Company (Greenock). The Tosi single-acting engine, designed by Franco Tosi (Legnano) has a combined air-inlet and exhaust valve which is coupled to director gear, the heat stresses of the valve being relieved by the cool air. It is manufactured in Great Britain by Wm. Beardmore & Company (Glasgow) and Richardsons, Westgarth & Company (W. Hartlepool). The Werkspoor (Amsterdam) single- or double-acting engine has a 'balanced-bottle' gravity fuel feed, dispensing with fuel pumps on the engine; it is built in Great Britain by the North-Eastern Marine Engineering Company (Wallsend-on-Tyne) and by Hawthorn, Leslie & Company (Newcastle-on-Tyne). The Vickers

(Barrow-in-Furness) single-acting engine uses solid injection. Of engines working on the two-stroke cycle, the Sulzer (Winterthur) port-scavenging supercharging engine is the best known. It is built in Great Britain under licence by Vickers-Armstrong (Armstrong-Sulzer type), Fairfield Shipbuilding and Engineering Company (Glasgow, Fairfield-Sulzer type), A. Stephen & Sons (Linthouse, Stephen-Sulzer type), and John Brown & Company (Clydebank, Brown-Sulzer type). The Neptune engine, designed and built by Swan, Hunter & Wigham Richardson (Wallsend) is notable for the special design of cylinder covers and liners which reduces heat stresses. The North Brit. double-

hot-bulb engine is simpler and more compact, but owing to the low compression ratio the power developed per cylinder is much less than in the full Diesel engine, the maximum being of the order of 100 b.h.p. per cylinder, whereas the engine working on the full cycle may develop up to 1000 b.h.p. per cylinder. Semi-Diesels usually work on the two-stroke cycle with crankcase compression. The semi-Diesel is best suited to smaller craft and is usually manufactured in units of 50-500 h.p. A remarkable development is the Scott-Still engine, in which the exhaust gases from the engine are used to generate steam in a boiler and the boiler water circulates in the cooling-water jacket of

R.M.S. 'AORANGI' OF THE CANADIAN AUSTRALASIAN LINE (17,491 TONS)

acting engine, built by the North Brit. Diesel Engine Works (Glasgow), has reciprocating (sliding) cylinders. The scavenge inlet ports are uncovered by the movement of the cylinder, the covers being fixed, and exhaust ports are uncovered by the piston. A special type of two-stroke engine is the Cammellaird-Fullagar opposed-piston air-injection engine, in which two cylinders are arranged side by side, each having two pistons, the top piston in one cylinder being connected externally to the bottom piston in the other. Combustion in one cylinder, between the pistons, drives these apart, the bottom piston transmitting the power to the crank, while the external connections pull the pistons in the other cylinder together and an opposite impulse is given by the bottom piston to the other side of the crankshaft. A different principle is used in the Oxford opposed-piston engine, which uses solid injection. The bottom piston acts directly on the crankshaft through the connecting rod and the upper piston acts on a crosshead at the top of the engine. The semi-Diesel or

the cylinder, being converted into steam. The steam is supplied to the cylinder of the engine under the piston, whereas the combustion of the oil fuel takes place as usual above the piston. The engine thus works as a two-stroke solid-injection internal-combustion engine above and as a steam engine below the piston. Extra steam can be generated by oil burners under the boiler, and the engine may run as a steam engine only, or as an internal-combustion engine only, at reduced speed. The first Scott-Still engine was used (1924) on the 11,650-ton cargo liner *Dolius*, powered by two four-cylinder units (2500 b.h.p., 120 r.p.m.).

Drive.—As the most efficient speed of a propeller is below 100 r.p.m., direct coupling of the internal-combustion engine to the propeller shaft implies a long-stroke engine occupying a large space vertically. This is not important in a cargo vessel, but in passenger ships the deck space is needed for accommodation, and in any case the internal-combustion engine is most efficient at high speeds; a high-speed engine develops more power

than a slow engine of the same size and, for a given power required, costs less. It is therefore often expedient to use some form of indirect coupling. Indirect or transmitted drive may be mechanical, hydraulic, or electric. In mechanical transmission two or four engines are used, coupled to the main propeller shaft through gear wheels. In the hydraulic drive the energy is transmitted from the engine to the main shaft through impeller pumps with lubricating oil as working fluid. In electric transmission the engines are directly coupled to electric generators which supply power to separate motors driving the shaft. Both hydraulic and electric drive give freedom of manoeuvring and reversing independently of the prime mover, and electric transmission allows complete flexibility in arrangement and working of the engines. The engine room becomes in fact a power station supplying power to main and auxiliary motors and for heating, lighting, cooking, refrigerating, and other purposes, and since motors as well as other supplies can be easily and independently controlled from any distance, it becomes possible to concentrate the control of movement, speed, steering, and all other functions on the bridge.

Auxiliaries.—For driving the deck machinery and other auxiliaries steam is often used, generated in oil-fired boilers, especially in tankers where steam is required in any case for cleaning the tanks before filling and as the best means for driving the pumps. Where electric transmission to the main shaft is used, it is natural to employ electric power for driving the auxiliaries as well. Sometimes both steam and electricity are used. The choice of drive depends mainly on cost of equipment.

Motor Spirit, see **PETROL**.

Motor Transport, Commercial. The term covers the conveyance of goods or passengers by mechanically driven trucks, tractors, or hackneys (buses or cabs plying for hire) on the public road (not on rails). As early as 1833 Goldsworthy Gurney tried to run a passenger steam coach on the Birmingham road, and although experts such as Telford and Bryan Donkin reported favourably on the trials, and there were plans for establishing a steam omnibus on the Holyhead road, the experiment was soon abandoned owing to lack of public support. In 1865 an Act was passed with the intention of protecting horses and cattle on the roads by prescribing that road locomotives, such as were used for hauling threshing machines and rollers, should be preceded by a man carrying a red flag and should not exceed a speed of 4 m.p.h. As the term 'road locomotives' was found to apply to any mechanically propelled vehicle, the Act was practically a ban on motor traffic, although the law was often broken in the early days of motoring,

until it was finally repealed in 1896. The steam lorry soon made its appearance and continued to hold an important place for the conveyance of heavy goods up till about 1930, but is now almost completely replaced by the motor lorry. Some steam buses were used in London in 1905-6, and there were in all about 100 in the country. Meanwhile the internal-combustion engine had been developed to a stage where its application to large vehicles became practicable and in 1903-4 Thomas Tilling & Company introduced the motor bus in London. Though the earliest of these buses were built and engined by foreign makers, notably Daimler, the Eng. firms, Leyland, Crossley, Maudslay, and others, soon entered and finally conquered the market. The delay in development of tramway systems, partly if not wholly due to the fact that the busiest thoroughfares in many Eng. cities are unsuited to railroad traffic, has its counterpart in the quick adoption of an extensive bus service with vehicles of superior design. In 1904 the motor law was overhauled, and in 1910 the Road Board was set up to co-ordinate research and to administer the Roads Improvement Fund arising out of motor-car licences and the tax on motor spirit. Already in 1902 a private Road Improvement Association had been formed, supported by cyclists and car owners for carrying out research on dustless roads and road surfaces. The new board now applied the results of these investigations, and by 1913 England had a greater mileage of excellent dustless roads than any other country. By that time extensions of London's bus route reached Windsor and Barnet, and local country services linked vills. to the larger tns. and railway stations, but large-scale developments and estab. of long-distance routes belong to the years 1920-35.

A select committee of the House of Commons was set up in 1904 to inquire into the licensing of cabs in London, and when the report was presented in 1906 there were fifty-two motor hackney carriages. By 1913 the horse-drawn cab had almost vanished from the streets.

The development of the network of bus routes which now covers nearly the whole country had had a marked effect on the distribution of population. City workers have been enabled to live on the outskirts of large tns., travelling to and from their office or other place of work in comfort, and to benefit from the better housing conditions available, and the tns. have been relieved of some of the overcrowding. At the same time, the replacement of horse-drawn vans by motor vans and lorries of vastly increased range of operation has had repercussions on business organisation and the distribution of goods. Direct delivery from the factory, in a single journey without reloading on to trains, has become possible over long distances and has led to estab. of branch factories and distribution centres. As far as passenger transport is concerned, the modern tendency is to use double-deck buses with up to sixty seats for

local traffic, with frequent stops and change of passengers, and single-deck buses for twenty to forty passengers for long-distance express journeys with less frequent stops. The wheel-base is about 14-20 ft. and there may be four or six wheels, with twin rear tyre equipment. The Bedford twenty-six to thirty-seat single-decker still uses the petrol engine, but the six-cylinder oil engine (compression-ignition) is generally favoured. The B.M.O. single-deck forty-seater has a six-cylinder compression-ignition engine mounted flat between the two axles, but usually the engine is mounted in front, next to the driver's seat. A four-speed gear-box, a 24 V generator and starter motor, and a 185 Ah battery is usual. On some Crossley models, the Brookhouse turbo-transmitter is a hydraulic torque converter replacing the flywheel, clutch, and gearbox.

For delivery of goods of small bulk the cycle-and-siderack outfit is sometimes used. The electric van, with battery-driven series motor, is ideal for in. deliveries; it has excellent starting and control characteristics, a speed of about 16 m.p.h., and a range of 40 m. before recharging the battery. The Karrier 'Bantam' is a 2-ton vehicle with a four-cylinder petrol engine. The Austin 'Ten' and the Morris, also with four-cylinder engines, of about 25 h.p., are closed vans of about 120 cu. ft. capacity. The large six- or eight-wheel lorries usually have six-cylinder oil engines and are often provided with drop-sides or drop-back for loading and unloading, while some have hydraulically operated tipping arrangements. Tankers of 2500 gal. capacity can be mounted on A.E.C. 'Mammoth Major' chassis. The articulated or trailer type

of lorry consists of a three- or four-wheel short section carrying the engine and driver's cabin, the rear wheels being driven—sometimes called the mechanical horse—and with arrangements for coupling to a trailer, which may be a closed van or an open lorry, with two or four wheels, or sometimes a tank. The production of commercial motor vehicles in Great Britain, which had reached 100,000 per annum in 1935, dropped considerably when military requirements became urgent, but is now (1948) at the rate of 170,000 per annum. In 1916 the number of current licences was: goods vehicles, 563,000, including 8000 electrically propelled and 1000 steam and gas vehicles; agric. tractors and engines, 146,000. In addition to the above there are certain cars that fall under the description 'commercial,' which are connected with public services and pay no taxes. These are chiefly ambulances, fire-engines, road rollers, and cars attached to the gov. depts. In 1916 they were numbered in Great Britain at 61,000. The total number of goods vehicles increased from 463,000 to 563,000 between 1936 and 1946. Much of this development has been due to the increasing use of motor vans by retail distributors and to the improvement in the upkeep of roads and the construction of wide arterial thoroughfares. Local authorities received £13,842,000 from the state for highways and bridges in the year 1938-39, and expended £50,392,000. It is stated that unsuitable bridges now constitute a greater barrier to further developments than the strain upon road accommodation. In 1944-45 the gross receipts from taxation were £35,409,796 (including miscellaneous receipts of £1,061,498). The numbers of

BEDFORD 2-3 TON TIPPING LORRY

28 h.p. six-cylinder truck engine; maximum angle of tip, 45–50°

vehicles and gross taxation were as follows: cars taxed on h.p., 1,473,712, £16,235,930; motor cycles, 307,787, £640,196. * Goods vehicles, (a) agric. vans and lorries, 28,102, £347,508; (b) showmen's special vehicles, 1962, £72,380; (c) other kinds of goods vehicles, 447,992, £12,353,788. Agric. engines, 130,507, £32,236. Traders, (a) agric., 512, £3272; (b) general haulage, 2506, £97,060; (c) motor hackneys, 98,198, £4,201,736; (d) framers, 6203, £1669. Gross tax receipts in 1945–46 on mechanically propelled road vehicles were: goods vehicles, £14,038,000; tractors, £125,150; motor hackneys, £4,524,290. The total gross tax receipts in 1945–46 for mechanically propelled vehicles were £15,263,576, of which motor cars and cycles accounted respectively, for £23,615,305, and £1,200,889.

Motor Transport, Military. Not only has the petrol motor van superseded the horse-drawn vehicle for conveyance of ammunition and supplies in modern armies, but the possibilities of transporting large numbers of men rapidly over long distances, while keeping them supplied, and maintaining contact with headquarters through telecommunication installations and by means of motor-cycle dispatch riders, have had far-reaching effects on strategy and tactics. At the same time, the use of the tank, Bren-carrier, and other combat vehicles, not considered here, has necessitated provision of mobile workshops, fuel supplies, and the like, only feasible by motor transport. The mechanisation of armies is still in the process of development, but certain types of motor vehicle have become standardised in the Brit. Army, at least for the time being. The motor cycle (*q.v.*) is used both in the Army and the air force for dispatch-riders, for scouting, etc., often with sidecar, especially in action, as three wheels are safer than two. The combination is known in the army as a 'three-motor-bike.' The staff car is an ordinary motor car seating five officers and used for maintaining personal contact between head-

quarters and the troops. The following types are used as open or canvas-enclosed vehicles. The 'dimple' is a small light car with room for one beside the driver and six men seated (sideways) at the back. The 15 cwt. can carry twenty men at the back, ten seated and ten standing down the middle; the 30 cwt. carries thirty men. The 3-ton Leyland also carries thirty men, and drive can be applied to all four wheels when in difficulties. The 10-ton lorry has six or eight wheels and the drive can be applied to six wheels. It can be automatically coupled to a trailer carrying a tank, an aeroplane, or other heavy and bulky object. Besides these there are special vehicles carrying telecommunication installations, workshop equipment, cranes, etc., and a large fleet of ambulances. See also MECHANISATION.

Motor Vehicle Insurance may be effected to cover loss of or damage to cars, for the death of or injury to other persons, and for damage to property when the car is driven by the owner or by another, but insurance against third-party risks is compulsory under the Road Traffic Act, 1930. Under this Act a person may not use or permit any other person to use a motor vehicle on the road unless such use is covered by insurance (or security) against third-party claims, in respect of death or bodily injury. Damage to property is excluded. This does not require the owner to cover a person in his employ against death or bodily injury arising out of, and in the course of his employment, a liability which is covered by other statutes. In this connection it is important to note that some insurance policies are invalidated if the driver is unlicensed at the time of an accident. Where compensation is paid under the provisions of compulsory insurance, and where to the knowledge of the insurer a third party has received hospital treatment, the insurer shall also pay to the hospital the 'expenses reasonably incurred' for the person treated.

When applying for a car licence the car owner must satisfy the licensing authority either that he is, or will be by the time the car licence becomes operative, covered against third-party risks. Under the terms of a policy relating to a specified motor car, the owner is entitled

to drive any other motor vehicle than that specified and the insurance company shall on demand issue to him a further certificate of insurance. A person engaged in the business of letting motor vehicles on hire is not required to produce his certificate if the vehicle is intended to be used solely for the purposes of hire and driven by the person by whom the motor vehicle is hired. Drivers must produce insurance certificates when requested by the police. Compulsory insurance does not apply to vehicles owned by local authorities; the police; a person who deposits £15,000, as cover by security, with the accountant general of the supreme court. This exemption is confined to the vehicle driven by the owner, or by a servant or another subject to the control of the owner. In America insurance of motor vehicles is conducted on similar lines to those adopted in England, but in the case of insurance against third-party risks the liability of the insurance company does not usually exceed \$5000. See also under *INSURANCE, Casualty and Contingency Insurance*.

Motril (anc. *Firmium Julium*), tn. of Granada prov., Spain, 1 m. from the Mediterranean. It was the anc. port of Granada. Silk, sugar, wine, and fruits are produced; lead and antimony are mined. Zinc and copper are also found, and there are iron foundries. Moorish ruins remain. Pop. 17,000.

Motte, Jeanne Marie Bouvier de la, see GUYON, MME.

Mottéux, Peter Anthony (Pierre Antoine) (1660-1718), Fr. *littérateur*, settled in London as a Fr. Huguenot merchant on the revocation of the edict of Nantes (1685). He wrote dramas, including *Novelty* (1697) and *The Amorous Miser* (1705). M. trans. *Don Quixote* into Eng. and Rabelais's works with Urquhart and Ozell. See T. Cibber, *Lives of the Poets*, 1753, and D. Baker, *Biographia Dramatica* 1812.

Mottistone, John Edward Bernard Seely, first Baron (1868-1947), Brit. politician. Educated at Harrow and Trinity College, Cambridge; called to the Bar in 1897. After service in the S. African war he became an M.P., changing from Conservative to Liberal. By 1912 he was secretary of state for war, losing the post in 1914 over the 'Curragh incident.' During the First World War he reached the rank of major-general. Under-secretary for air in 1919, he resigned over the gov. refusal to separate the air service from the War Office, a step taken later. His publs. include *Adventure* (1930); *Fear and be Slain* (1931); *For Ever England* (1932); and *Oaths of Happiness* (1938).

Motttram, Ralph Hale (b. 1883), Eng. novelist, b. at Norwich, Oct. 30. He was educated in Norwich and London; employed in Barclay's Bank and then served on the W. front. His war experiences in Belgium inspired the admirable novel or quasi-novel entitled *The Spanish Farm* (1924, later issued with other related novels as *The Spanish Farm Trilogy*), the chief female character in which may be said to personify Belgium through the ages

In this work M. may be said to have set the standard for war books of a pseudo-fictional type, as literature. *Sixty-four*, *Ninety-four*, and *The Crime at Vanderynden's* combine with *The Spanish Farm* to form a trilogy. Other books are *Our Mr. Dormer* (1927); *The English Miss* (1928); *Ten Years Ago* (1928); *The Boroughmonger* (1929); *A History of Financial Speculation* (1929); *Europa's Beast* (1930); *Poem's Old and New* (1930); *Castle Island* (1931); *The Headless Hound* (1931); *Home for the Holidays* (1932); *Early Morning* (1935); *Old England* (1937); *Traders' Dream* (1939); *The World turns Slowly Round* (1942); *Ruston the Liberator* (1946); and *The Gentleman of Leisure* (1947).

Motul, vil. of Yucatan state, Mexico, 30 m. E.N.E. of Mérida. Pop. (com.) 21,000.

Mouflon, species of wild sheep (*Ovis musimon*), formerly common in Spain, but now restricted to Corsica and Sardinia. It is some 28 in. high at the withers, or about the size of a common sheep, and the wool of the upper parts is brownish-grey with a dark dorsal streak and white on the legs and face. Horns are present in the males only and the tail is very short. The ram's curved horns are sometimes as much as 3 ft. in length. The M. breeds freely with the domestic species. See also under *SHEEP*.

Moukden, see MUKDEN.

Mould, see SOIL.

Mould, general unscientific name for a variety of thread-like fungi, which in the presence of damp attack many kinds of

MOULDS

Drawn to ten times their natural size.

animal and vegetable substances. *Penicillium glaucum* and *Pitalicum*, the blue, green, or brown M. of oranges and other fruit, can only gain a hold when the skin or rind of the fruit has been slightly damaged.

Moulding, or **Die-casting**. Die-casting may be applied to any casting produced from a metal mould or die. 'Pressure' die-casting is employed to advantage when the component to be manufactured is in large quantities and of the thin wall

section. It consists chiefly of pumping molten metal into a steel die or mould under carefully regulated conditions. There are two types of pressure die-casting machines, i.e. hot chamber and cold chamber. The former has an integral furnace, and the metal is injected automatically, usually by air pressure. This method is generally used for zinc and other low-temp. melting metals. In the cold chamber machine the molten metal

Educational Supply Association

A MOULDED SCHOOL DESK

Pressure die moulded in light alloy.

is ladled from a separate furnace into the machine, which injects it into the dies at great pressure. This process is repeated approximately every minute. The castings produced by this method are of such accuracy as to require little further treatment prior to being finished before final assembly. This method is generally used for aluminium, brass, and other high-temp. melting metals. Gravity die-casting is employed if the casting is large and beyond the range of the die-casting machines; in this method the metal is poured into the mould, and not injected under pressure. Practically all types of non-ferrous metals can be die-cast, the four main metals in use to-day, in order of castability, being zinc, magnesium, brass, and aluminium. The die-casting industry is rapidly expanding, and is widely used in the motor, radio, and electrical trades, and more recently in the manuf. of furniture components.

Mouldings, in architecture, any assemblage of narrow surfaces projecting from the face of a wall or other surface and advancing one beyond the other. They are bounded by straight lines, either hori-

zontal or vertical, according to their situation, but the surfaces themselves are plane or curved, and if the latter, concave or convex, or else compounded of both forms; and again are either plane or curved. M. are distinguished by different names, according to their profiles, their sizes, or their situations. Thus the *fillet*, *taenia*, and *band* are all plane or flat mouldings. The *corona* is also a mere plane band, except that it is occasionally enriched in Roman architecture. Lesser convex M. are termed *beads*, but the longer M. of the same kind in the bases of columns are termed *tori* or *torusses*. The *cyma recta*, or *cymatium*, is a compound moulding, concave above and convex below; while the *cyma reversa* is convex above and concave below. The *cavetto* is a mere hollow or sweep intervening between and serving to connect two M., one of which projects beyond the other. The *ovolo* is a simple convex moulding, so called because it is generally carved into *ora*, or ornaments in the shape of egg, within hollows. All the other M. may be carved or enriched, except the *cavetto* and *fillet*, the pattern being accommodated to the surface of the M. The *cyma recta*, or *talon*, as it is sometimes called, is cut with a peculiar kind of tongued or arrow-headed ornament. In regard to Grecian M., it remains to be observed that many of those which are uncarved were painted with some ornamental pattern, and not unfrequently in the most brilliant colours.

Moule, Le, tn. in the Fr. colony of Guadeloupe, W. Indies, with a port on the N.E. coast of Grande-Terre. Sugar, coffee, rum, and logwood are exported. Pop. (com.) 11,000.

Moulin Rouge, Parisian place of entertainment, opened in the Boulevard de Clichy, Oct. 3, 1889, destroyed by fire Feb. 28, 1915, and rebuilt in 1921. It received its name from the windmill over the entrance, the sails of which were illuminated by red lights.

Moulins, Giants' Kettles, or Cauldrons, the popular names for a glacial pot-hole. These cylindrical holes were caused in rocks by subglacial streams, laden with gravel. There are examples in the Alps and Germany.

Moulins (anc. *Molinæ*), cap. of the dept. of Allier, France, on the Allier, which has an arched bridge (1750-63) at this point. It contains the ruined castle of the Bourbon dukes, and a cathedral (founded fifteenth century, completed nineteenth century). M. forms a suffragan bishopric of Sens. Manufs. textiles, hats, cabinets, and machinery. Pop. 23,300.

Moulmein, seaport and the cap. of the Amherst dist., Lower Burma, 30 m. N. of Amherst. Exports include rice and cotton, and shipbuilding is carried on. It suffered heavy Jap. air attacks on Jan. 10 and 17, 1942, and was evacuated on Jan. 31 by the Brit. garrison after fierce Jap. assaults of the previous day. Pop. 63,500.

Moulting, general term for the habit in a large variety of animal types of shedding, periodically, the outer covering of feathers, hair, skin, cuticle, etc. In common usage it refers to the ann. renewal of birds'

feathers, which usually follows the completion of parental duties.

Moulton, Mrs. (née Ellen Louise Chandler) (1835-1908), Amer. novelist and poet, married to W. Moulton, a Boston publisher (1855). She was for long Boston correspondent on literary topics for the *New York Tribune*. Her works include *This, That, and the Other* (1854); *Junio Clifford* (1855); *Bed-time Stories* (1873); *Some Women's Hearts* (1874); *Firelight Stories* (1883); and *In the Garden of Dreams* (1890). See life by Lilian Whiting, 1910.

Moulton of Bank, John Fletcher Moulton, Baron (1844-1921), Eng. lawyer, b. at Madeley, Shropshire. Graduating as senior wrangler and Smith's prizeman in 1868 at Cambridge, he was called to the Bar in 1874, establishing the leading practice in patent law, on which he was recognised as a supreme authority. He took silk in 1885 and sat as a Liberal member of Parliament for Clapham, 1885-86, S. Hackney, 1894-95, then Launceston until 1906, when he became a lord justice of appeal. In 1912 he became one of the lords of appeal in ordinary and received a life peerage. Being expert in science as well as in law, he was, in the First World War, director-general of explosive supplies to the Ministry of Munitions.

Moultrie, John (1799-1874), Eng. poet, b. in London. He entered the Church and was rector at Rugby from 1825 to his death, during the time Thomas Arnold was headmaster. In 1864 he became canon of Worcester. His collected works were pub. in 2 vols. in 1876. His best poems were *My Brother's Grave* (1820) and *Godiva* (1820), and he also wrote *The Dream of Life* (1843); *The Black Fence* (1850); *St. Mary* (1850); and *Altars, Hearths, and Graves* (1854). See J. Julian (ed.), *A Dictionary of Hymnology*, 1892.

Moultrie, co. seat of Colquitt co., Georgia, U.S.A. It is the centre of an agric. area, has meat-packing plants, saw mills and cotton mills, as well as manufs. of clothing and turpentine. Pop. 10,200 (about 40 per cent. Negroes).

Mound Birds, or Mound Builders (*Megapodes*), remarkable family of gallinaceous birds, which are so called on account of their habit of throwing up large mounds of vegetable matter in which they deposit their eggs, which they cover up and then leave to be incubated by the heat produced by fermentation. In some cases the mounds are co-operative. The species number only about twenty, and are characterised by very large feet, short tail, and crested head. A familiar example is the brush-turkey (*q.v.*).

Mound Builders, prehistoric inhab. of N. America, who lived mainly in the valleys of the Mississippi and Ohio. There are various opinions about their identity, but the generally accepted view now is that the Indians are their descendants, and that they belong to the Stone Age. They appear to have surpassed the Indians (when first met by the whites) in civilisation, and made very beautiful objects of stone, shell, bone, and beaten metals. But the most wonderful works of their hands were the earth mounds from which

they receive their name. These vary in shape, being round, conical, or in the shape of animals, and are scattered all over the country between the Alleghany and Rocky Mts., but chiefly in Ohio, Illinois, Indiana, and Missouri. The most famous mound in Ohio is the Great Serpent in Adams co., near Bush Creek. This, a gigantic serpent made in earth, measures 1348 ft. in length and is 5 ft. high. Wisconsin, too, contains some mounds in the shape of animals, some of which are of gigantic size. These, generally known as effigy mounds, were probably objects of worship as guardians of the vils. In Tennessee other kinds of mounds found contain one or more graves, varying in size, made of slabs of stone set on edge.

MOUNTAIN ASH, OR ROWAN

Mound Dwellings, underground or semi-underground dwellings, which were at one time very widespread. Certain M. D. are of prehistoric date, while others were occupied even in recent times. In Scotland there are many varieties, numerous instances being found on the coasts of almost all the Orkney Is. On the Arctic shores of N.E. Siberia, the hyperborean race of the Onkilon dwelt in earth huts, half sunk into the ground, in the form of small mounds covered with a thick layer of earth. Similar to these were those used by the former natives of Kamchatka and the Aleutian Is., and the winter dwellings of the Greenland Eskimos were practically identical. M. D. were usually circular or oblong in shape, had the appearance of a large rounded hillock, and were entered by a low narrow passage.

Moundsville, co. seat of Marshall co., W. Virginia, U.S.A., on the Ohio at the mouth of Grave Creek, 12 m. S.W. of Wheeling. Manufs. include glass, bricks, enamel ware, whips, and cigars. Pop. 14,200.

Mountain, tn. of Dundas co., Ontario, Canada, 30 m. S.S.E. of Ottawa.

Mountain Ash, tn. of Glamorganshire, Wales, 4 m. S.E. of Aberdare. It is included in the parl. bor. of Merthyr Tydvil.

There are iron foundries, water and gas works, and collieries near. Pop. 10,500.

Mountain Ash, or Rowan (*Pyrus aucuparia*), handsome flowering tree of the family Rosaceæ, with pinnate leaves and large corymbose cymes (see INFLORESCENCE) of small cream flowers, which are followed by small fleshy scarlet berries with yellow flesh; these have a bitter acid flavour, and are much eaten by birds. They have been dried and ground into a kind of flour. The tree reaches a height of from 10 to 30 ft., and its tough wood has numerous uses.

Mountaineering. The awe and inspiration associated with mts. are well illustrated in the O.T. and in the Gk. classics; men feared them and generally avoided them. M. in the modern sense means the ascent of high mts. for sport and adventure; it is a product of the nineteenth century, whose possibilities were discovered and developed mainly by men in sedentary occupations to whom it offered refreshment of mind and body, an escape from the social duties and restrictions and the monotony of urbanised life. Ascents of high mts. previous to the eighteenth century were rare and made by exceptional men. Trajan viewed the sunrise from Etna, Petrarch for moral inspiration on Mt. Ventoux near Avignon, Bonifacio de Rotari climbed the Rocca Melone (11,600 ft.) in 1358 on a pious mission. Leonardo da Vinci made scientific observations on a snowfield below Monte Rosa, the Mont Aiguille in Dauphiné was climbed with ladders in 1492 at the request of Charles VIII. of France, Conrad Gesner, Josiah Simler, and others wrote enthusiastically in the sixteenth century of the pleasures of walking on the mts. round Zürich. The exploring spirit of the eighteenth century and the advance of scientific knowledge began to remove the fear and reveal the attractions of mts. as a new field of inquiry. Pocock and Windham in 1741 appear to have set a fashion by their visit to the glaciers of Chamounix. In 1770 the Buet (10,200 ft.) was climbed by the brothers De Luc; a canon of the St. Bernard. L. J. Murith climbed the Vélan (12,350 ft.) in 1779. But the great figure in M. hist. of the eighteenth century is H. B. de Saussure. In 1760 he offered a reward for the ascent of Mont Blanc. After sev. attempts the summit was reached by a young doctor, M. G. Paccard, accompanied by the guide Jacques Balmat, in 1786. Saussure himself, with his valet and eighteen guides made the third ascent in 1787. Col. Beaufoy made the first ascent by an Englishman a few days later. For more than fifty years Mont Blanc monopolised the attention of the adventurous; those who climbed it rarely climbed other high mts. and all tried to give some scientific justification for their temerity. An exception was Mlle. Henriette d'Angeville, who made the first ascent by a woman tourist in 1838. Albert Smith's ascent (the thirty-sixth) in 1851, illustrated by a panorama in London, did much to popularise the knowledge and nothing to lessen the perils of the undertaking.

Meanwhile occasional ascents of an exploratory character had been made in other parts of the Alps. For many years a monk, Placidus à Spescha, had been exploring the peaks round Disentis and almost reached the summit of the Todi in 1824. The Gross Glockner was climbed in 1800 by a party including Horrasch, a priest, the Ortlor in 1804 (Joseph Pichler), the Jungfrau (the brothers Meyer) in 1811, the Finsteraarhorn (Lenthold) in 1829. Among early Eng. explorers J. D. Forbes and John Ball (the first president of the Alpine Club) did notable work in the decade 1810-50. M. as a sport is generally dated from the ascent of the Wetterhorn from Grindelwald by Alfred Wills in 1854. In the decade 1855-65 almost all the great peaks of the Alps were climbed. The Matterhorn defeated many attempts before its conquest by Edward Whymper in 1865; four of the party were killed on the descent, and this tragic event gave a temporary check to adventurous M. in the Alps. The Eng. Alpine Club was inaugurated in 1857, and under the editorship of John Ball pub. *Praks, Passes, and Glaciers* in 1859, a second series following in 1862. The first number of the *Alpine Journal*, with accounts of climbs and explorations by members of the club, appeared in 1863. Among its early members who pub. books and made many first ascents are T. Hinchliff, E. Whymper, Prof. Tyndall, Sir Leslie Stephens, Sir Alfred Wills, and Charles Mathews. The Austrian Alpine Club was founded in 1862, the Swiss and It. in 1863, the Ger. in 1869, the Fr. in 1874. All these early ascents of the great Alpine peaks were led by Swiss guides, many of whom found guiding a lucrative addition to chamois-hunting. Melchior Anderegg and Christian Almer were the two greatest of many fine Oberland guides of this early period; Auguste Balmat, Michel Croz, and François Devouassoud three of the best Chamounix men. The conquest of the main peaks left only minor peaks or new and more difficult routes for those who wished to combine exploration with adventure in the Alps. Equipment improved; even for the amateur the ice-axe was becoming a shorter and handier instrument that replaced the alpenstock. Climbs showing the advance in M. were: in 1876 the Matterhorn, in 1879 the Meije, both by parties of three Englishmen without guides; in 1885 the traverse of the Meije by the brothers Zsigmondy and Purtscheller; the Drn in 1878 by C. T. Dent; the Zmutt and Furgenz ridges of the Matterhorn, and the Grépon by A. F. Munimery, all three with the famous guide Alexander Burgener; the traverse of Mont Blanc via the Aiguille Blanche de Peuterey by Dr. P. Güssfeldt with Emil Rey and Christian Klücker. Men of sufficient means and leisure began the serious exploration of other great ranges than the Alps. In 1868 D. W. Freshfield, A. W. Moore, and C. C. Tucker went to the Caucasus with François Devouassoud and climbed Elbruz (18,500 ft.) and Kasbek (16,500 ft.). K. Whymper in 1879-80 climbed Chimborazo (20,700 ft.) and other

mts. of Ecuador. W. S. Green visited the New Zealand Alps in 1882, the Selkirk in 1888. In 1883 W. W. Graham with two Swiss reached a height of nearly 24,000 ft. on Kabru in Sikkim. By the end of the nineteenth century nearly every great range in the world had its M. hist.

T. Graham Brown

THE BRENUVA FACE OF MONT BLANC, FROM THE TOUR RONDE

A, Mont Blanc; B, Col Major; C, Mont Blanc de Courmayeur; S, Red Sentinel Rock (Sentinelle rouge); N, outward end of Brenva snow arete, Y, bay of Brenva glacier.

The photograph shows four routes: 1, left hand, via della Pera (Pera route), ending at C; 2, left centre, Route Mayor, ending at B; 3, right centre, Sentinel route, ending at A; 4, right hand, by N (Moore's arete), Brenva route.

E. A. Fitzgerald by a visit in 1895, and the New Zealanders Fyfe, Mannering, and Harper, continued exploration of the New Zealand Alps; Aconcagua (23,000 ft.) was climbed by Fitzgerald's guide Zurbriggen in 1897; Illimani (24,000 ft.) by Conway in 1898; Kilimanjaro (19,600 ft.) by

Meyer and Purtscheller in 1889, Kenya by Mackinder in 1899; Mt. St. Elias (18,200 ft.) in Alaska by the duke of the Abruzzi in 1897; Pioneer Peak (22,500 ft.) in the Karakoram by Conway in 1892; A. F. Mummery with two Garkhas lost their lives below Nanga Parbat in 1895. In the early years of the present century amateurs and guides continued to push up the standards of technique to the limits of what was possible without the artificial aid of hammer and pitons. With Joseph Knobel, G. W. Young and H. O. Jones climbed Mont Blanc by the Brouillard ridge, traversed two difficult ridges of the Grandes Jorasses and the Grépon from the Mer de Glace, all in 1911. In 1906 on the S. face of the Tschhorn, Franz Lochmatter saved the party containing Ryan and Young by a feat of rock-climbing unsurpassable without pitons. Guideless climbing, especially among the Austrians, Germans, and Swiss, reached the standards of all but the very best guides. Fifty years after the formation of the Alpine Club there were more than 120 M. clubs in all parts of the world. In ranges outside Europe the climbing of Mt. Robson (12,900 ft.) by MacCarthy in 1913, and of Trisul (23,350 ft.) by Longstaff in 1906, are landmarks in the exploration of the Rockies and the Himalayas. The peaks of Kuwenzori were climbed by the duke of the Abruzzi in 1906. The first years of the period between the wars of 1914-18 and 1939-45 saw a great revival of Fr. M. activity. J. and T. de Lépigny and others made new and difficult ascents in the Mont Blanc dist. and inaugurated the Groupe de Haute Montagne. In 1927-28 F. S. Smythe and T. Graham Brown began the series of new climbs on the Brenva face of Mont Blanc. Tentonic climbers made increasing use of pitons, chasping, and rope stirrups to ascend rock faces impossible without them; the Zbarsky sack and the igloo could make a night out at high altitude comparatively harmless. International rivalries and the encouragement by certain govts. of very daring feats as a stimulus to militancy and the desire for dominance led sometimes to a disregard of unavoidable risk from stonefall or bad weather, notably on long face climbs, such as the E. and S. faces of the Matterhorn (1931). The N. faces of the Eiger and Grandes Jorasses, climbed only after sev. attempts ending in tragedy, the former in 1938, the latter in 1935, Armand Charlet, Alexander Graven, André Roch, and Hermann Steuri maintained the supremacy of the best guides in speed and skill and the Swiss continue to distinguish between recklessness and courageous enterprise. In the last years of the 1939-45 war and after, a tendency to regard M. as an opportunity for self-immolation rather than a recreation has been noticeable in climbs by Frenchmen on the faces of the Grandes Jorasses and the Dru elsewhere, and even in their Alpine literature. New climbs in the New Zealand Alps by H. E. L. Porter in 1924-1925 and the ascent of Mount Logan (19,700 ft.) by MacCarthy in 1925 were incidents in continued activity in the W.

hemisphere, but the Himalaya have been the scene of greatest M. interest in recent years. A route to the highest part of Everest (q.v.) was found by the reconnaissance of 1921, but after six more expeditions, most of them elaborately equipped, in 1922, 1924, 1933, 1935, 1936, and 1938, Everest is almost certainly unclimbed. Norton in 1924, Smythe, Wager, and Wyn Harris in 1933 reached a point about a thousand feet below the summit (29,140 ft.). In 1924 G. H. Leigh-Mallory and Irvine were seen by Odell ascending close to the ridge at about 28,000 ft.; it is unlikely that they passed a very difficult step at about 28,300 ft., and they were never seen again. On Kangchenjunga Paul Bauer's party reached 24,200 ft. in 1929 and 26,000 ft. in 1931; Kamet (25,400 ft.) was climbed by Smythe's party in 1931; Nanda Devi (25,660 ft.) in 1936 by Tilman and Odell in a party led by Graham Brown with Lloyd, Houston, Loomis, and others; it is the highest summit yet reached. Nanga Parbat (26,600 ft.) defeated four Ger. attempts in 1932, 1934, 1937, and 1938. Chomolhari (23,900 ft.) was climbed by Spencer Chapman in 1936. Many ascents and much exploration was carried out by E. Shipton in the years before 1939, continuing and extending previous work by Bruce, Visser, the Workmans, and many others. M. has developed in the present century the inevitable systematic organisation of a popular sport. Experts equipped with rubber shoes and nylon ropes lead and instruct pupils on the rocks of N. Wales, the Lakes, and the precipices of the Highlands, where they learn modern technique and the correct classification of climbs by difficulty up to 'very severe.' The M. Association has been formed to provide training schools in suitable areas of Britain. The B.M.C. (Brit. M. Council) includes representatives from the other M. clubs and resembles the M.C.C. of cricket. Foreign climbers also have their schools and the Gers. have given them a more arithmetical progression of difficulty up to the 'superior sixth.' Considerable use was made in the late war of M. experts for military training in mt. warfare (q.v.). See also ROCK CLIMBING.

Mountain-flour, see BERGMEHL.

Mountain Laurel (*Umbellularia Californica*), Californian sassafras, or spice bush. It is a tall evergreen tree of the order Lauraceae, with alternate, lance-shaped leaves which give out a pungent camphor-like odour. It has greenish-yellow flowers clustered in umbels.

Mountain Limestone, compact bluish limestone of the Lower Carboniferous series which occurs in the mt. area of the Pennines. It is from 2000 to 4000 ft. thick, and is crowded with corals and crinoids.

Mountains. The mts. of the world occur chiefly in great systems forming chains or ranges of more or less parallel series, widening, narrowing, and forming nodes and radiations. There is sufficient appearance of scheme in these systems to lure geographers to formulate theories accounting for their arrangement. They border the edges of continents and appear to rise from deep oceans; the ranges are often continued out to sea and through the ocean as a series of is. suggesting subsidence of part of the system, e.g. the Aluvian Is., the E. Indies, and Pacific Is. to New Zealand, which are again continued in the recently discovered ranges across Antarctica to connect with the Andes of S. America. The depths of the Pacific Ocean are thus bordered by a complete encircling mt. system. Again the Eurasian system from the Pyrenees across to the Pamirs follows the Mediterranean, Black Sea, and Persian Gulf coastline. Such a scheme may be followed out in detail amongst all the mts. of the world, and it is impossible to exclude

FIG. 1

FOLDED MOUNTAINS

from any theory the conformation of the crust below the waters. The evidence of geological structure of the mts. goes far to explain the scheme, and it is considered that the great mt. systems are due to the shrinkage of the earth's surface consequent on cooling, a subsidence being accompanied by an elevation, parallel and more or less commensurate. Such a theory has led to somewhat of a mathematical investigation. A cooling body would shrink to smallest volume, and the smallest volume for a given surface is found in the tetrahedron (*q.v.*); the earth in cooling would, in fact, tend to the tetrahedral form, though other considerations such as its rotation would act against this. It is nevertheless true that if a volume of water, sufficient to cover five-sevenths of the surface, could be held by gravity in a tetrahedron, the arrangement would be quite similar to that on the earth, the edges forming mt. systems and continents, the faces the ocean. This theory was promulgated by Lothian Green. It would seem, however, to imply, though not necessarily, two consequences: the permanence of the great mt. ridges and that of the deep oceans. It cannot be said that either is estab.; there is a good deal of evidence for the former but considerable evidence against the latter. The present great mt. systems were uplifted in Tertiary times, at any rate to their present altitude, but this may have been only an additional thrust. On the other hand the mts. of Scandinavia, W. Scotland, and Ireland, and also the Appalachian system, are much older and were probably once much higher. As regards the formation of mts., it is possible to classify in part. The surface of the earth is subject everywhere to denudation (*q.v.*), and the elevated regions specially so. Yet there are mts. which owe their existence to the denudation alone of elevated folds in the earth's crust. Such folded mts. are illustrated in Fig. 1. The diagram also shows clearly the relation of foot-hills to their axial range. Fig. 2 shows a more complicated system, illustrating clearly the enormous contortive force, the steep angles of mt. strata, which often give rise to fantastic scenery and the impression of catastrophic forces. A special type of denudation mt. is often classed as 'relict' or 'residual' mt. (Fig. 3). In this case denudation has been prolonged, and it is quite common to find the synclines forming the ridges. There are, however, many types of relict

mts. Mts. are often the result of faulting and consequent slipping of strata; they may be classed as 'block' mts. Figs. 4 and 5 illustrate their formation. The former shows a rift valley edged by mountainous sides, which may weather into peaks, etc.; the latter, a raised block due to bilateral subsidence. When dissected by weather and streams an irregular mt. mass results; if the block is tilted a range of mts. results. An intrusion of volcanic rock may have the effect of elevating the strata into a dome-like shape, which gives rise on denudation to a group of mts.; to these the name 'domed' mt. has been applied. In all cases separate mts. owe their form to denudation. The central 'core' when highly inclined gives rise to the peaks, aiguilles, and horns. The Rockies, Andes, Pyrenees, Alps, Himalayas, and the other portions of the great connected systems of the world are young folded mts.; the Scandinavian mts., Scottish mts., Urals, Australian mts., are examples of old, residual, or relict folded mts.; the Vosges and Black Forest mts., the mts. enclosing Bohemia, and many of those in Central Africa, are block mts. Mts. have largely served to isolate or separate communities and thus determined nationality and race. The Lat. and Teutonic races have in this way been largely separated, while Switzerland and Afghanistan owe their independence mainly to the nature of their countries, and similarly, until recent times, Abyssinia; the Andes of S. America are a marked example of political div. Great range of climate is shown in elevated ranges, which gives a characteristic zonal distribution of vegetation arranged according to elevation, and, as in Uganda, Brazil, Peru, and Mexico, renders possible an energetic and progressive pop. in lts. where lowlands are encroaching. On the other hand, in Tibet, the climate forbids progress. In Norway and next, Phenicia, Greece, Spain, and Portugal mts. have largely enforced inactivity enterprise. They, further, are a great factor in local climate, as in the Mediterranean, the Ganges valley, and New Zealand. Egypt

FIG. 3. RELICT OR RESIDUAL MOUNTAIN

FIG. 4

BLOCK MOUNTAINS

FIG. 5

is a remarkable case of an estab. civilisation dependent on mts., for the Nile is fed so well from Abyssinian and Central African groups that it can traverse the desert; the Indus is a similar riv. The Fohn, Chinook, and N.-Westers of New Zealand (*q.v.*) are examples of beneficial winds due in part to mts. The form of dissection of mt. masses is often of great importance, particularly in the matter of transverse valleys, cols, saddles, and necks. Many instances occur in the Alps of Switzerland. In England the gaps in between mts., *e.g.* the Cheshire plain, saddles such as Shap Fell, and the transverse valley of the Aire, have had great influence on communication, both military and commercial (*see* R1 1392; VALLEYS). The great mt. systems are, further, the regions of most frequent earthquakes (*see* EARTHQUAKES). They are also often associated with the distribution of volcanoes. Where breaks in the continuity of the strata of mts. are, geologically, recent, and elevation, subsidence, and faulting are not quiescent or complete, earthquakes are likely to be experienced, and, if in regions near deep water, *e.g.* Mediterranean and Pacific, the intrusion of the water along faults and cracks gives rise to volcanic activity (*see* VOLCANOES). As it is largely in mountainous regions where the lower strata are exposed or near the surface, they become the centres of the mining of valuable, because somewhat rare, metals, *e.g.* the Rockies and Andes, the Australian and New Zealand Alps. *See also* RIVERS, VALLEYS, GLACIERS, etc., and GEOLOGY and its bibliography. *See* M. Reade, *Origin of Mountain Ranges*, 1886; O. Fisher, *Physics of the Earth's Crust*, 1889; Lord Avebury, *Scenery of Switzerland*, 1896; J. Geikie, *Earth Sculpture*, 1898; J. E. Mountain Sheep, *see* SHEEP.

Mountain, The (Fr. *La Montagne*), name given to the extreme revolutionary party, led by Danton and Robespierre, in the legislatures of the first Fr. Revolution.

Mountain Warfare. This type of warfare differs mainly from 'open warfare' in the fact that physical features, in the form of mts., deep valleys, swift streams,

and absence of good roads, necessitate considerable modification of the usual tactics. The nature of the country generally favours hill tribesmen, at least at the outset, until their habits of fighting become more generally known and the attackers get accustomed to moving in the mountainous country with a certain amount of ease. Transport, until modern times, was usually limited to pack animals, artillery also being carried by this method, but airborne reinforcements and supplies, as, for example in the Burmese campaigns of the Second World War, have resolved the problems of logistics in notable degree. Pack animals themselves (principally mules) were still used in forward areas in mt. campaigns 1939-1945, often being transported to the scene of action by air or motorised transport. The advent of aircraft has materially assisted reconnaissance, especially by means of aerial photography. In the foot-hills tanks and armoured cars find scope for operations. The passage of a defile through hostile mountainous country is a difficult and dangerous process. The advance guard goes forward and places pickets on the heights overlooking the entrance, and clears the country of all enemy within range. This done, other pickets pass beyond them, and perform the same duties, thus ensuring the safety of the entire route. Meanwhile the main body proceeds along the route as security is assured. As the tail of the main body passes a line of pickets, the latter close in on the route and form a rearguard. In barren hilly country digging of trenches is usually impossible, so that protection is obtained by building low walls of stones (called 'sangars'). The classic work on M. W. is P. J. de Bourcet's *Principes de la guerre de Montagnes* (1775), 1888, *see also* B. H. Liddell Hart, *The Ghost of Napoleon*, 1933. The strategic problems of M. W. are well illustrated in the campaign of Wellington in the Pyrenees in 1813. The possession of good lateral communications in the foot-hills or plains is essential. Troops placed far up the mt. defiles are liable to be isolated, and accordingly the best defensive system is to hold forward positions lightly and to concentrate upon the enemy as his columns debouch from the mts. The strength of a mt. system as a defensive line is popularly exaggerated. Its greatest use is after the enemy has left the mts. behind, thus limiting his lines of communication to a few narrow valleys, very vulnerable to air bombing.

Training in the Second World War.—Early in 1940 a battalion of volunteers incorporated in the Scots Guards was sent to Chamonix to be trained in M. W. On the disbandment of this unit a fresh start was made in Iceland, in 1941, where a number of expert mountaineers and explorers taught officers and other ranks to live in the snow, to ski with heavy loads, and general mt. craft. The training cadre returned to Great Britain early in 1942 and training was continued in Scotland, in the Cairngorm Mts., where selected personnel from the 52nd (Lowland) Div. were given courses in M. W.; winter training was severely limited by lack of snow. More ambitious plans were put into effect in 1943, with the object of training mountaineer battalions to operate under all conditions on high mts. The Lovat Scouts, one of the units selected, were given a three-month course in intensive rock climbing in N. Wales and then sent to the Canadian Rockies, under Brit. and Canadian instructors, to complete their training under severe winter conditions. They learnt to face all types of weather, reaching a high standard and making a number of first winter climbs, including Mt. Columbia. Later when the unit was sent to Italy, training of reinforcements was carried out in the Abruzzi Apennines. Similar training of mountaineer battalions was conducted in Syria.

See also ITALY, FIRST WORLD WAR, and GREECE, SECOND WORLD WAR, CAMPAIGN IN; BURMA, SECOND WORLD WAR, CAMPAIGNS IN.

Mountain Wine, sweet, luscious variety of the white Sp. wine of Malaga, made from white grapes picked when quite ripe.

Mount Athos, *see* ATHOS.

Mount Barker: 1. Tn. of Hindmarsh co., S. Australia, 18 m. S.E. of Adelaide, at the foot of Mt. Barker. Much fruit is grown, and there are tangerines. Pop. 2800. 2. Postal centre of Plantagenet co., W. Australia, 30 m. from Albany. Pop. 2000.

Mountbatten of Burma, Rear Admiral Louis (Francis Albert Victor Nicholas), first Viscount (b. 1900), younger son of Admiral of the Fleet the first marquess of Milford Haven and Princess Victoria, daughter of Louis IV., grand duke of Hesse, was known as Prince Louis Francis of Battenberg until, in 1917, his father relinquished the title and took the surname of M. Educated at Osborne, Dartmouth College, and Christ's College, Cambridge, he entered the R.N. as a naval cadet, 1913. He became midshipman 1916, Lieutenant 1920, lieutenant-commander 1928, commander 1932, captain 1937, commodore 1941, rear-admiral 1946. He served in H.M.S. *Lion* 1916, in H.M.S. *Elizabeth* 1917, in H.M.S. *Repulse* 1921, H.M.S. *Renown* 1921, H.M.S. *Revenge* 1923. He was senior wireless instructor, Signal School, Portsmouth, 1929-31; fleet wireless officer, Mediterranean fleet, 1931-33; in command of H.M.S. *Daring*, 1934, and of H.M.S. *Wishart*, 1935; in Admiralty (Naval Air Div.), 1936. He commanded H.M.S. *Katy* and the 5th Destroyer Flotilla, 1939, and H.M.S.

Illustrious, 1941. He was chief of combined operations, 1942-43; honorary lieutenant-general, 1942. Appointed supreme allied commander, S.E. Asia in 1943, he was still in command at the victorious conclusion of the war in Burma. For details of the military operations under his command *see under* BURMA, SECOND WORLD WAR CAMPAIGNS IN. In 1946 he was appointed to command the first cruiser squadron, reverting from acting rank of admiral to his substantive rank of rear-admiral. His substantive naval rank in 1941 when he left the *Illustrious* to succeed Adm. Sir Roger Keyes (*q.v.*) in charge of combined operations headquarters was that of captain. As chief of combined operations he reached acting rank of vice-admiral and held at the same time acting rank of lieutenant-general and air marshal. On becoming supreme allied commander S.E. Asia Command he was advanced to acting admiral, but on relinquishing that command he reverted to his proper naval rank which by then was rear-admiral. He succeeded Lord Wavell as governor-general of India, 1947. He took a prominent part in the procedural plan for the transfer of power to India on a dominion status basis in Aug. 1947 in anticipation of the earlier offer by which the transfer would have taken place in 1948. On the Indians agreeing among themselves to partition the country into the two states of India and Pakistan, M., by the choice of the Indian Congress, became governor-general of the new dominion of India, and held office until June 1948. *See* R. Murphy, *The Last Viceroy. The Life and Times of His Excellency Rear-Admiral the Earl Mountbatten of Burma*, 1948.

Mountbatten, Lieutenant Philip, *see under* EDINBURGH, DUCEDOM OF.

Mount Carmel (Palestine), *see* CARMEL, MOUNT, CARMELITES, ORDER OF.

Mount Carmel: 1. Co. seat of Wabash co., Illinois, U.S.A., on the Wabash R., 24 m. S.S.W. of Vincennes. There are mills, railroad shops, and manufs. of bricks. Pop. 7000. 2. Bor. of Northumberland co., Pennsylvania, U.S.A., 6 m. from Shamokin. Coal is mined, and mining machinery and miners' supplies are manufactured. Pop. 17,800.

Mount Clemens, health resort, co. seat of Macomb co., Michigan, U.S.A., on Clinton R., 20 m. N.N.E. of Detroit. There are noted mineral springs. Beet-sugar, lumber, and wagons are manufactured. Pop. 14,100.

Mount Desert, is. of Hancock co., Maine, U.S.A., in the Atlantic, W. of Frenchman's Bay. The surface is mountainous; highest peak, Green Mt. (1762 ft.). There are numerous lakes and mt. tarns. Bar Harbor is a favourite summer resort. Fishing and shipbuilding are carried on. Pop.: Ben Harbor 5000; M. D. (tn.) 2200.

Mount Eden, bor. and a suburb of the city of Auckland, New Zealand, dominated by M. E. (Maori name *Maungauhiwa*), a volcanic cone with a large crater from which a fine view can be obtained of the city and harbour of the ocean on both

coasts. The bor., which is a separate municipal entity from Auckland, is primarily a residential suburb of Auckland, but has a number of important industries: ammunition, timber, wall-board, and furniture factories, etc. Pop. 22,000.

Mountevans, Baron, see EVANS, SIR EDWARD RANCLIFFE GARTH RUSSELL.

Mount Gambier, tn. of S. Australia, near the Victorian border. It is the centre of a grain-growing dist. Pop. 8,000, with a further 4,000 living in the nearby area.

Mountmellick, mrkt. tn. of Queen's co., Eire, 6 m. N.W. of Maryborough. Pop. 2,500.

Mount Palomar Observatory, in California, U.S.A., houses the largest astronomical telescope in the world, at an altitude of 5,600 ft. The telescope is of the reflector type; its mirror, made of glass with a film of aluminium, has a diameter of 200 in. and weighs 14½ tons. It will collect about half a million times as much light from a celestial object as does the human eye, and reveal stars 1,000,000,000 light-years away. It will thus give a new impetus to the study of cosmography and astrophysics of phenomena outside our stellar system.

Mount Pleasant, bor. of Westmoreland co., Pennsylvania, U.S.A., 32 m. S.E. of Pittsburgh, in a rich agric. dist. Coal is mined, and manufs. include lumber and flour. Pop. 5,900.

Mountsorrel, tn. of Leicestershire, England, on the Soar, 7 m. from Leicester. The chief industry of M. is the mining of granite from the extensive quarries. Pop. 3,000.

Mount Stephen, **George Stephen, Baron** (1829-1921), Canadian financier, b. at Dufftown, Banffshire, Scotland. He emigrated to Canada in 1850, and went into business in Montreal, where his abilities soon secured him an excellent position and he became director and president of the Bank of Montreal. In partnership with his cousin, Donald Smith (later Lord Strathcona), he purchased the St. Paul and Pacific Railway, and they then started the construction of the Canadian Pacific Railway, which was completed in 1885. The following year he was made a baronet, and raised to the peerage in 1891, taking his title from a peak in the Rocky Mts., named after him while the railway was in course of construction. He left Canada in 1888, and lived in Scotland and England, chiefly at Brocket Hall, Hertfordshire. A great philanthropist, he gave generously to hospitals in London, Montreal, and Aberdeen, distributing, in his lifetime, more than £1,000,000 and leaving the residue of his estate to the King Edward Hospital Fund. A portrait of M. S., painted by Sir George Reid in 1894, is in the C.P.R. offices, Toronto. See K. Morris, *The Story of Lord Mount Stephen*, 1922.

Mount Vernon: 1. City of Westchester co., New York, U.S.A., on the Bronx R., 18 m. N.N.E. of New York. Pop. 67,400. 2. Co. seat of Jefferson co., Illinois, U.S.A., 74 m. E.S.E. of St. Louis (Missouri). Pop. 14,800. 3. Tn. of Fairfax co., Virginia,

U.S.A., on the Potomac R., 15 m. S. of Washington. Washington's mansion was purchased for the nation in 1859. Pop. M. V. dist. 6,000. 4. Co. seat of Knox co., Ohio, U.S.A., on the Vernon R. and Owl Creek, 40 m. N.E. of Columbus. Pop. 10,200. 5. Co. seat of Posey co., Indiana, U.S.A., on the R. Ohio, situated 13 m. from the S.W. corner of the state. Pop. 5,700.

Mount Wilson Observatory, near Pasadena, California, U.S.A. The reflector of its telescope, 100 in. in diameter, was the largest in the world until the mounting of the 200-in. reflector of the Mt. Palomar telescope, also in California (designed to photograph objects 1,000,000,000 light-years distant, or twice as far as the M.W. telescope). The pre-eminent part played in recent years by the M. W. O. has tended to overshadow astronomers and observatories doing essential but less spectacular work. While the observations have been so largely made at M. W. O., the theorising has been done more in Europe, particularly in Britain. Among the discoveries of astronomers of M. W. are those of dwarf stars and of the movement of distant universes away from our galaxy. Other astronomers had found in the heavens dwarf stars no larger than the earth yet glowing with white heat of a stellar maturity. The smallest of them was discovered by Dr. G. P. Kuiper at the M. W. O. He found that this star was only 4,000 m. in diameter and so dense that 1 cu. in. of its material would weigh 630 tons on the earth. In 1925, by means of spectroscopic studies of more than forty distant universes, V. M. Slipher of the Lowell Observatory found that these were moving rapidly away from the galaxy. This led E. P. Hubble and M. L. Humason of the M. W. O. to make an exhaustive study of island universes and, using the finest instruments, they discovered that not only do the distant nebulae move away from our own system, but the speed of recession is in direct proportion to the distance of the nebulae from us. With the pub. of the general theory of relativity by Einstein, it was predicted that the lines in the spectrum of a star would be displaced by an amount depending upon the mass of the star. Some years later the discovery was made that the companion to Sirius must have a mass altogether out of proportion to its luminosity. This provided a fortuitous opportunity of testing the prediction, inasmuch as the effect in the spectrum of the star would be much greater than in the sun or in an ordinary star. The observation could be made only with the 100-in. reflector at M. W. O., but it was successfully accomplished by Pease. It was one of the greatest feats of modern observation to realise the method, proposed by Michelson, of measuring the diameters of stars with the 20-ft. interferometer made for the purpose at M. W. O. by Pease and mounted on the 100-in. reflector.

Mourne Mountains, range in the S. of Down co., Ulster, N. Ireland, extending 11 m. from S.W. to N.E. between

Newcastle on the Irish Sea and Carlingford Bay. Slieve Donard is the highest peak (2796 ft.).

Mousseron (Flemish *Moeskroen*), tn. of W. Flanders, Belgium. 7 m. S.S.W. of Courtrai, near the Fr. border. Manus. include woolsens, cottons, tobacco, and soap. It was at the hamlet of Risquons-Tout that in 1848 the Belgian Army had to repulse the Fr. revolutionists, who tried to enter the young kingdom by force. Pop. 36,000.

Mouse, name popularly applied to a great number of small rodents of various genera, but correctly only to the smaller species of the genera *Mus*, *Micromys*, and *Apodemus*. The three Brit. species are the house *M.* (*Mus musculus*), the harvest *M.* (*Micromys minutus*), and the long-tailed field *M.* (*Mus sylvaticus*). The *M.*, whatever its origin, is now common in every continent, and takes serious toll of man's food stores and causes no little damage to his architecture. The fur varies greatly in tint and markings when the animals are bred in captivity. The whistling bird-like song of certain mice at dusk is an estab. fact. The harvest *M.* is unique among Brit. mammals in having a prehensile tail. Its spherical breeding nest, built on corn-stalks used as scaffolding, is an exquisite structure. The long-tailed field *M.* is a handsome, bold creature, and does much damage to farm and garden crops, hunting for food at night. It is one of the most prolific of mammals. For the short-tailed field *M.*, which is not really a *M.*, see **VOLE**.

Mouse-deer, see **CHEVROTAIN**.

Mouse River, Canadian riv. (500 m. long), rising in Saskatchewan, flowing S. into N. Dakota, then E., turning sharply N., recrossing the frontier, and finally joining the Assiniboine near Brandon.

Mousquetaires, Fr. word meaning soldiers armed with a musket. Such soldiers were at first included in companies of pikemen in the proportion of one to three, whilst the muskets used were so heavy that valets were employed to carry them, until abolished by Charles IX. In 1600 22 *M.* were called carabineers, but resumed their old name under Louis XIII. After the king's *M.* had been suppressed, from 1616 to 1657, Mazarin presented his personal guard to Louis XIV. in 1660, and there were thus from 1664 two separate forces known as 'white' and 'black' *M.* Under Louis XIV. these companies formed in large measure a school for youthful nobles. *M.* were suppressed in 1775, reorganised in 1789, disbanded in 1792, reappeared in 1814, and finally abolished in 1815.

Moustierian, name given to the closing period of the lower Palaeolithic age in Europe and derived from the cave of Le Moustier in Dordogne. Here were found flint implements as well as bones of the mammoth, woolly-haired rhinoceros (*Rhinoceros mercki*), musk-ox, and cave-bear. These discoveries show that when the last or Würm glaciation set in, W. Europe was peopled by men of the Neanderthal type—*M.* culture has also been

found along the African shores of the Mediterranean. The *M.* culture is regarded by Sir Arthur Keith as beginning about 40,000 years ago and coming to an end about 20,000 years later. The last great ice age is presumed by geologists to have affected Europe for a period of about 25,000 years; but Arctic conditions did not reach a climax and then gradually yield to our milder climate. There was a long inter-glacial interval when cold conditions prevailed, but of a kind which permitted Europeans to camp in the open. It was in this interval that the Cromagnon man appeared in Europe, bringing with him the Aurignacian culture and it was then, or before then, that the Neanderthal type disappeared from Europe together with the *M.* culture. See also **DORDOGNE**. See H. J. Sollá, *Ancient Hunters*, 1915; H. F. Osborn, *Men of the Old Stone Age*, 1918; M. C. Burkett, *Prehistory*, 1921; R. A. S. Macalister, *A Textbook of European Archaeology*, 1921; J. L. Myres, in *Cambridge Ancient History*, vol. I., chap. I., sec. 7, 1924, with list of references, pp. 620-21; Sir Arthur Keith, *Antiquity of Man* (2nd ed.), 1925, and *New Discoveries relating to the Antiquity of Man*, 1931.

Mouth, entrance to any cavity or canal; in particular, the entrance to the alimentary canal between the lips, including the cavity in which mastication takes place. The lips are folds of flesh composed of skin, areolar tissue, or superficial fascia, the orbicularis oris muscle, submucous tissue, and mucous membrane. The cheeks are similar in structure, except that they are actuated by the buccinator muscle, which compresses the cheek and retracts the angle of the lips. The opening of the duct from the parotid gland is situated on the *M.* side of the cheek opposite the second upper molar tooth, while other salivary ducts are situated on the same surface. The gums are composed of mucous membrane superposed upon fibrous tissue connecting with the periosteum of the jaw-bone. The teeth are fixed in the gum and jaw-bone, and the mucous membrane of the gum rises up round each tooth. The roof of the *M.* is formed by the hard and soft palate. The hard palate consists of mucous membrane and fibrous tissue connecting with the superior maxillary and palatal bones; the soft palate is composed of an aggregation of muscles. Diseases of the *M.* include caries and other affections of the teeth; stomatitis, or inflammation of the *M.*, characterised by swelling, salivation, pain, and ulceration; salivary calculus, or stony concretions in the salivary ducts; and mumps, a highly infectious disease of the parotid gland, characterised by swelling and difficulty in swallowing.

Mouvement Républicain Populaire, see **FRANCE, History**.

Mowing Machines are of two main kinds, viz. those used for cutting ornamental lawns, where the object is to give the grass a neat appearance, and those used in agriculture, where the object is to gather the hay or fodder crop. The former, commonly called lawn mowers, vary in size from those for small lawns

that can be pushed by a child to large machines driven by a motor. Cutting is performed by steel blades arranged spirally on a cylinder which revolves near the ground. The agric. implement has a long cutting-bar in which a series of knives works scissors-fashion from gearing attached to the carriage wheels. *See also* REAPING.

Mowla, *see* MOLLAI.

Moyen-Congo, *see* MIDDLE CONGO.

Moyeuvre-Grande, tn. of the dept. of Moselle (Lorraine), France, in the arron. of Thionville, on the R. Orne, 104 m. from Metz. Iron-ore is mined, and there are smelting works. Pop. 10,200.

Moyné, Charles Le, *see* LE MOYNE.

Moynihan, Berkeley George, first Baron (1865-1936), Brit. surgeon; Hunterian prof. at Royal College of Surgeons, 1924; president from 1927. He was an expert in treatment of abdominal complaints, on which he wrote sev. treatises. He served with R.A.M.C. in the First World War, becoming major-general. M. founded the *Journal of Surgeons*; his pubs. include *Abdominal Operations* (4th ed. 1925).

Moyobamba, cap. of San Martín dept., Peru, S. America, 140 m. from Jaen, on a trib. of the Huallaga. Panama hats are manufactured. Pop. 14,500.

Mozambique, or **Mocambique**: 1. Portuguese colony in E. Africa, lying between 11° and 27° S. lat., bounded on the N. by the Rovuma R., S. by Natal, E. by the Indian Ocean, and W. by Lake Nyasa, S. Rhodesia, Nyasaland, Transvaal, and Swaziland. The prin. rivs. are the Rovuma, Pungwe, Save, and Limpopo. The flora is rich, there being forests of precious woods and coco-nut palms, orange, lemon, pepper, banana, cashew, coffee, cotton, and tobacco. The fauna includes all the wild and domestic species of the African continent, elephants being plentiful. There are coal deposits in the Tete Region, and some gold on the Upper Zambezi. Exports: sugar, cotton, coal, mango bark, fruits, wax, ivory, timber, maize, aloes, tobacco, ground-nuts, and palm oil, valued in 1937 at £3,330,000. Imports: fermented flour, rice, cloth, alcoholic liquors, agric. and industrial implements, fuel oils, valued at nearly £1,000,000. There are some 1200 m. of railways and 19,000 m. of roads. There is an agreement between M. and S. Africa regarding the ann. recruiting of M. labourers for employment in the Witwatersrand mines. Chief tns. are Lourenço Marques (cap.), Beira, M., Inhambane, Quelimane, Antonio Enes, Porto Amélia, Chinde, Pebane, Moma, Vila João Belo, Tete, Ibo, and Macuse. The Companhia de Mocambique was wound up in 1912, on the expiration of its charter. Area 297,731 sq. m. Pop. 5,085,630. 2. Once the chief tn. of M., situated on a coral is. It has considerable shipping trade. Pop. 8000. 3. Channel between the E. coast of Africa and Madagascar. Length (about) 1000 m., breadth from 280 to 600 m. At the N. entrance lie the Comoro Is. *See also* PORTUGUESE EAST AFRICA. *See R. N. Lyne, Mozambique: its Agricultural De-*

velopment, 1813, and I. Martins, *Portugal in Africa*, 1891.

Mozarabes, Christians who lived under Moorish rule in Spain, being allowed at the same time to retain their religion. They conformed almost entirely to the customs of their conquerors, even to the extent of using Arabic characters in the writing of Sp. They were well treated, and continued to retain the Mozarabic liturgy, which is still used in a chapel of Toledo cathedral, and at Salamanca.

Mozart, Wolfgang Amadeus Chrysostom (1756-91), Austrian composer. b. at Salzburg, son of Leopold M., a professional musician. At the age of six he made his debut in Vienna as a prodigy violinist and pianist. His remarkable memory enabled him as a boy to perform a feat which caused a sensation; he went to

WOLFGANG MOZART

the Sistine Chapel, listened carefully to a misereur sung only twice yearly, and at home wrote it out from memory. At the age of seven he had pub. his first sonatas, and at the age of twelve, besides having the reputation of being able to play at sight any composition for organ, clavier, or violin, he had written an opera, a symphony, and a large number of smaller works. By the time he was twenty-five he was well known in Vienna, Munich, London, Paris, and Milan as one of the world's greatest composers; everywhere he met with excellent receptions, not only by reason of his wonderful playing and brilliant genius as a composer, but also on account of his great personal charm and vivacious disposition. Leaving home finally in 1781, he took up his abode in Vienna, where, in 1782, he married Constanze Weber, whose sister, Aloysia, had not long previously refused him. The marriage, though happy enough on purely mutual grounds, was hardly a success in other respects. M. was none too wealthy, generous to a fault, and devoid of business capacity, and the ten years or so which yet remained to him were consequently

passed in a hard struggle against poverty and debt. As a composer M. is remarkable as the possessor of a gift of extraordinary fluency; as a melodist he showed the same limpid beauty as his friend Haydn; in the richness of his harmony and colouring he anticipated Beethoven, and he was as skilled in counterpoint as Handel, if not as Bach himself. His orchestral music is an advance on anything previously written, and many of his symphonies, especially the last three, in E flat, in G minor, and in C, the *Jupiter* (all 1788), and some of his piano and violin concertos, are favourites with modern audiences. His operas are perhaps his most characteristic works, showing as they do his superb technical mastery and inventive skill in the most felicitous combination, although his libretti are often preposterously bad. In musical delineation of character he is unsurpassed, and he is the first truly great master of the concerted number (trio, quartet, etc.), in which conflicting emotions are expressed simultaneously, an achievement rendered possible only by polyphony. His last work was his unfinished *Requiem*. His chief operas were *Bastien und Bastienne* (1768); *La Finta Giardiniera* and *Il Re Pastore* (1775); *Idomeneo* (1781); *Die Entführung aus dem Serail* (1782); *Le Nozze di Figaro* (1786); *Don Giovanni* (1787); *Così fan Tutti* (1790); and *Die Zauberflöte* (1791). M. also wrote much church music, a large number of instrumental sonatas and vocal works, both solo and concerted, and a quantity of chamber music, his total compositions being carefully catalogued by Koehel and numbering 626 items. See lives by O. Jahn (Eng. trans.), 1882, and E. J. Bruce-Speare, 1902. See also E. Dent, *Mozart's Operas*, 1913; F. Kerst, *Mozart in his Own Words*, 1926; E. Blom, *Mozart* (Master Musicians), 1935; A. Einstein, *Mozart: His Character, his Work* (trans. by A. Mendel and N. Broder), 1947; and E. Moenke, *Mozart on the Way to Prague* (trans. by W. and C. Alison Phillips, 1947). M.'s characteristic and spontaneous *Letters*, ed. by H. Mersmann, were trans. into Eng., 1928.

Mozdok, tn. in the N. Caucasian area of the R.S.F.S.R., 50 m. N. of Vladikavkaz, on the Terek. It trades chiefly in fruit, wine, and silk. M. marked the limit of the Ger. advance into the Caucasus in 1941 and it was the scene of most bitter fighting for sev. weeks. Its loss would have placed the famous Grozny oilfields at the mercy of the enemy; but the turn of the tide came at the end of the year. See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Mstislavl, tn. in the Mogilev Region of the Byelorussian S.S.R., 66 m. N.E. of Mohilev, with trade in hemp.

Mzensk, or **Mvansk**, tn. in the Kursk Region of the R.S.F.S.R., on the navigable Zusha R., 30 m. N.E. of Orel. There is trade in cereals, hemp, oil, etc. Candles, soap, tallow, and lace are manufactured. The cathedral contains a miraculous image of St. Nicholas, and there is a

spring near by which is reputed to cure diseases.

Mtzkhet, **Mtskheta**, or **Mtskhet**, vil. of the Georgian S.S.R., anct. cap. of Georgia, at the confluence of the Aragva and the Kura. It contains a fine cathedral, and the tombs of many Georgian rulers. Pilgrims from the Caucasus still visit M. Pop. 800.

Much Wenlock, Shropshire, England, see WENLOCK.

Much Woolton, see WOOLTON.

Mucilage, aqueous solution of a gum: some gums form a clear solution in water, while others swell up to form a sticky viscous liquid, more properly called M. *Mucilago Tragacanthæ* is prepared from the gum which exudes from the stem of *Astragalus gummifer*. Cherry-tree gum also forms a thick M. Gum kuteera and gum of Buserah are often imported as adulterants of gum tragacanth; their properties are somewhat similar to those of gum tragacanth. *Mucilago acaciæ* is formed by adding 34 parts of acacia to water to make 100 parts; it is used as a substitute for *M. Tragacanthæ*. *M. Amyli*, or starch M., is used for making ememas. A M. formed from the pith of saffron is used as a soothing application for inflamed eyes, and also as a demulcent drink for inflammation of the mucous membranes and of the kidneys. *M. Umi* is formed from elm gum; other Ms. are produced by infusing seeds, roots, etc., in boiling water.

Mucin, viscid substance, capable of being split up into a proteid, and a carbohydrate found in the human body in the bile, urine, feces, saliva (in which it acts as a lubricant), and gastric juice, but most abundantly in intercellular substance. See also GUM.

Mucis, see MOSSES.

Muckers, name given to a sect which arose at Königsberg, Germany, in 1835, its chief leaders being J. W. Ebel and G. H. Diestel. The opinions of the sect were so expressed as to cause an uproar directed against their sensuality. For a defence see J. I. Mombert, *Faith Victorious*, 1882.

Mucoid, substance resembling mucin (q.v.) in many ways, but differing from it in some chemical reactions. M. is not precipitated from solution by acetic acid. Sometimes it precipitates slightly, but is then soluble in excess of acid. It is thus distinguishable from mucin.

Mucous Membrane, see EPITHELIUM.

Mud, term employed for the impalpable argillaceous matter which settles in quiet waters. When consolidated and devoid of lamination it is known as mudstone. The dark blue Ms. of the sea bottom derive their colour from decomposing organic matter and sulphide of iron, while the green Ms. are so coloured from the glauconite grains which they contain. Near coral reefs the sea floor is covered with white M. due to the abrasion of coral, while round volcanic is. a grey M. formed from degraded volcanic rocks is found.

Mudar, name given in parts of India to an evergreen asclepiadaceous plant, *Calo-*

tropis gigantea. It has large wedge-shaped leaves and fine purple flowers clustered in umbels. There is a smaller Persian species (*C. procera*) with white flowers. The M. yields an acrid milky juice, found useful in India for elephantiasis, intestinal worms, and skin diseases.

Mud Devil, see MENOPOME.

Mudfish, or **Bowfin** (*Amia calva*), fish occurring in the N. Amer. lakes and rivers, which has the air-bladder highly developed as a lung so that it can live out of water for a long time. It is about 30 in. long, and a dark mottled green.

E.N.A.

ALGERIA: MUEZZIN CALLING THE FAITHFUL TO PRAYER

It feeds voraciously upon crustaceans and insects, and its flesh is soft and ill-flavoured.

Mudie, Charles Edward (1818-90), founder of M.'s Library in London, b. at Chelsea. In 1842 he opened a circulating library in Southampton Row. Ten years later he moved into the premises in New Oxford Street (later removed to Kingsway). At the peak of its prosperity the company had 40,000 subscribers (1888), but it gradually declined in competition with other concerns and was closed down in July 1937. M. was deeply religious and a great philanthropist. He pub. *Stray Leaves*, a collection of hymns, in 1872.

Mudki, small tn. of the W. Punjab, Pakistan, 70 m. S.E. of Lahore, on the Ravi. Here the first battle in the Sikh war was fought (1845), when the Brit., under Sir Hugh Gough, repulsed the Sikhs. Pop. 3000.

Mudros, tn. on the S. coast of Lemnos, in the Gk. Archipelago. It was a Brit. base of operations against the Turks in the Gallipoli campaign, 1915. The armistice

between Turkey and the Allies was signed here in 1918.

Mud Volcanoes are of two kinds: (1) where the source of movement is the escape of gases; (2) where the active agent is steam. The former are conical hills formed by the accumulation of fine saline mud which is given out with various gases (marsh-gas, carbon dioxide, etc.) from an orifice or crater in the centre. The latter occur in volcanic regions, and are due to the escape of water and steam through beds of friable rock.

Muezzin, or **Mueddin**, Muslim official whose duty it is to announce the hours of prayer to the faithful. This he does from the minaret or side of the mosque in a nasal chant. His call is as follows: 'Allah is great (three times). I testify that there is no God but Allah (twice). I testify that Mohammed is the apostle of Allah (twice). Come to prayer (twice). Come to the best of works (twice). There is no God but Allah.'

Muffle, arched vessel, used in metallurgy, which is constructed to be placed over cupels and tests in the operation of assaying. It preserves them from contact with ashes, smoke, etc., but does not hinder the action of the fire on the metal nor prevent inspection. For the M. furnace for firing porcelain, etc., see FURNACES.

Mufti (Arabic, expounder of the law). The Turkish Grand M. was the supreme head of the Ulemas (servants of religion and laws), and with the grand vizir had the supreme guidance of the state. The Turkish laws being based on the Koran, the M. was head of the judges, the chief spiritual authority, and therefore sometimes known as Sheikh-al-Islam (Lord of the Faith). The office was abolished by the Turkish Republic in 1924. At an election of the president and members of the Supreme Moslem Council in Jerusalem in 1922 Haj Amin E. Husseini, an ex-officer of the Turkish Army, was chosen president and combined that office with the office of M. of Jerusalem. Bitterly anti-Brit. on account of the Balfour Declaration (q.v.), he headed the revolt of the Higher Arab Committee in 1936, and when the revolt was ended fled the country, and after the Second World War broke out eventually found his way to Iraq and thence to Italy.

Muggletonians, Eng. sect originating in 1651, and founded by John Reeve and Ludovic Muggleton (1607-97), both of whom claimed the possession of the spirit of prophecy. Muggleton, who was a journeyman tailor, professed to be the 'mouth' of Reeve as Aaron was of Moses. They further claimed to be the two witnesses of Rev. xi. and to be empowered to curse their opponents. An exposition of their very unorthodox doctrines was pub. in 1656 under the title of *The Divine Looking-Glass*. Wm. Penn's book, *The New Witnesses proved Old Heretics* (1672), was greeted again by the M., and in 1676 Muggleton was tried at the Old Bailey and convicted of blasphemy. See *Complete Collections of the Works of Reeve and Muggleton*, 1756, reprinted 1832.

Mughal, see **MOGUL**.

Mugia: 1. Is. of Asiatic Turkey, lying along the Mediterranean coast opposite the Dodecanese Is. Pop. 219,500. 2. Cap. of the above, about 10 m. N. of the Kenne Gulf. Pop. 15,000.

Mugwort, or *Artemisia vulgaris*, tall bushy plant (order Compositae) with pinnatifid leaves, green above, and white and woolly beneath, and red and brownish-yellow flower heads. Unlike wormwood (*A. absinthium*) M. is odourless, but it was formerly infused to make a remedy for rheumatism.

Mugwump, originally an Amer. political slang word (from the Algonquin word meaning 'big men') applied, in 1889, to those of the Republicans who would not vote for the candidature of J. G. Blaine for the presidency. It was used in Massachusetts of those who considered themselves great and independent and above mere party politics. It now signifies an independent voter, or one who will not attach himself to any party.

Muhla, see **MOLLAH**.

Mühlberg, tn. in the prov. of Saxony, Germany, on the Elbe, 35 m. N.W. of Dresden, was the scene of the defeat of the Protestant Elector of Saxony by the Emperor Charles V. in 1547. Pop. 3687.

Muhlenberg, John Peter Gabriel (1746-1807), Amer. preacher and soldier, b. in Trappe, Pennsylvania, son of the Ger.-born Henry Melchior M. (1711-87), a clergyman who in 1748 organised the Lutheran synod in America. He entered the Lutheran ministry, but gave up his clerical career when the War of Independence broke out. He raised the 8th Virginia regiment (Ger.), saw a great deal of service, and became brigadier-general in the continental army, 1777. He became vice-president of the Supreme Council in 1789, and was elected as a Democratic-Republican to the U.S. Senate in 1801, but resigned to become supervisor of revenues for the dist. of Pennsylvania.

Muhlenberg, William Augustus (1796-1877), Amer. clergyman, b. in Philadelphia. He founded the first Protestant episcopal school in the U.S.A. Pub. *A Plea for Christian Hymns* (1821) and *Church Poetry* (1823).

Mühlhausen, tn. in Saxony, Germany, on the Unstrut, 30 m. N.W. of Erfurt. The church of St. Blasius dates from the twelfth century. There are manufs. of woollen and linen goods, carpets, and leather. M. was a free city in the fourteenth century, and was the headquarters of Thomas Munzer in the Peasants' war (1525). Pop. 39,360.

Mühlheim, vil. of Hosse, Germany, 6 m. E. by N. of Frankfort-on-Main. Pop. 6000.

Mühlinghausen, com. and vil. of Westphalia, Germany, 7 m. E. of Wuppertal. Pop. 7000.

Muir, Edwin († 1887), Scottish poet and novelist, b. in Orkney. His autobiographical *The Story and the Fable* (1940) describes his early life on a remote Orkney Is., and has achieved a high place. In his poetry he represents a significant

trend in modern verse, the return to contemplation of the primitive facts of humanity on earth, death, time, and love. His poetic works include *First Poems* (1925); *Chorus of the Newly Dead* (1926); *Six Poems* (1932); *Variations on a Theme* (1934); *Journeys and Places* (1937); and *The Narrow Place* (1943). He is also well known as a translator of Kafka, whose *The Trial* he trans., with Willa M., in 1937. His prose includes a trans. of Hermann Broch's *The Sleepwalkers* (1932); a work of criticism, *Transition* (1926); as well as *The Structure of the Novel* (1928); *John Knor* (1929); *Scottish Journey* (1935); and *Scott and Scotland* (1936). His novels include *The Marionette* (1927); *The Three Brothers* (1931); and *Poor Tom* (1932).

Muir, John (1810-82), Scottish orientalist, b. in Glasgow. In 1844 he was appointed prin. of Victoria College, Benares. In 1853 he returned to Edinburgh and endowed the chair of Sanskrit in the Edinburgh Univ.; he was the chief agent in founding the Shaw fellowship for moral philosophy. His *Original Sanskrit Texts* (5 vols., 1858-70) is a valuable source of information on the Hindu scriptures of the Veda.

Muir, John (1838-1914), Amer. naturalist, b. at Dunbar, Scotland, and educated at Wisconsin Univ. His journeyings in California, Alaska, and elsewhere in America are described in *My First Summer in the Sierra* (1911); *A Thousand-mile Walk to the Gulf* (1916); *The Cruise of the 'Corwin'* (1917); and *Sleep Trails* (1918). See S. H. Young, *Alaska Days with John Muir*, 1915.

Muir, John Ramsay Brice (1872-1941), Brit. historian and Liberal politician; He was educated at Univ. College, Liverpool, and at Balliol College, Oxford. After a lectureship in modern hist. at Owen's College, Manchester, he accepted a similar appointment at Liverpool in 1900, becoming prof. 1906. From 1913 to 1921 he was prof. of modern hist. at Manchester Univ. His chief work is his monumental *Short History of the British Commonwealth* (vol. I., *The Islands of the First Empire: to 1763*; Vol. II., *The Modern Commonwealth: 1763 to 1919*), 1922, a work which does not treat the overseas empire in isolation but in which such major topics as the gov. of India, the race for colonial possessions, the birth and development of imperialism, and of autonomy in what now are the dominions, take their due place in the vast setting of Brit. hist. His other works include *The Expansion of Europe* (1917); *British History: a survey of the history of all the British Peoples* (1936); *The Record of the National Government* (1936); *Future for Democracy* (1939); and *The British Empire: How it grew and how it works* (1940), a pamphlet written to counteract the idea that the Brit. Empire was acquired by aggression and that it depends on great military power for its maintenance. M. was also a distinguished Liberal politician, and was Liberal M.P. for Rochdale from 1923 to 1924, though the House of Commons was not really his sphere so much as

party organisation. He was chairman of the organisation committee of the Liberal party, 1930-31; of the National Liberal Federation, 1931-33, president, 1933-36; and vice-chairman of the Liberal Party Organisation, 1936.

Muir, Sir William (1819-1905), Scottish orientalist, brother of John M. He entered the Bengal civil service in 1837, was appointed secretary to the governor of the N.W. Provs., and was in charge of the intelligence dept. during the mutiny. In 1868 he became lieutenant-governor of the N.W. Provs. In 1874 he was appointed financial minister for India. He retired in 1876 and was elected a member of the Council of India in London. He was also elected prin. of Edinburgh Univ. Through his influence the M. College at Allahabad was built and endowed. He was a keen student of Arabic. He wrote *Life of Mahomet and History of Islam* (1858-61); *Annals of the Early Caliphs* (1883); and *The Koran: its Composition and Teaching* (1885-87), etc.

Muiravonside, par. of Stirlingshire, Scotland, on the R. Avon, 3½ m. S.W. of Linlithgow.

Muir Glacier, large ice-sheet of Alaska, N. America, with 350 sq. m. of surface area, discharging into Glacier Bay. The trunk is formed of about nine main streams of ice. Earthquake disturbances dislodged part of it (1899). Its most rapid summer movement is about 7 ft. per day, and some 200,000,000 cu. ft. of ice are daily thrown off into the bay. Since 1794 it has receded about 25 m.

Muirhead, John Henry (1855-1940), Brit. philosophical writer, b. in Glasgow. He was educated at Glasgow Academy and Univ., and at Balliol College, Oxford. Sometime assistant to prof. of Lat., Univ. of Glasgow, he became prof. of philosophy and political economy at the univ. of Birmingham. His books include trans. from Cicero and Aristotle; also *Elements of Ethics* (1892-1911); *Philosophy and Life* (1902); *The Service of the State* (1908); *German Philosophy in Relation to the War* (1915); *The Use of Philosophy* (1928); *Modern Idealism* (1930); and *The Rule and End in Morals* (1932). His greatest services to thought were rendered as editor of the *Library of Philosophy*, and of the series of personal statements in *Contemporary British Philosophy*.

Muirkirk, tn. of Ayrshire, Scotland, on R. Ayr. There are mines of coal, limestone, and ironstone, and blast-furnaces. Pop. 4400.

Mui Tsai, Chinese system of domestic servitude, the M. T. being little girls sold, either directly or through middlemen, to their employers. The system, though modified, still (1940) prevails in Hong Kong, there being some 9000 M. T. in that colony. An inquiry was opened in Hong Kong in 1878, but the Chinese succeeded in confusing the system with adoption, though in reality a M. T. was seldom, if ever, regarded as a daughter and had no legal rights. One consequence of this otherwise abortive inquiry was the

formation of an officially recognised committee, known as the Po Leung Kuk, which conducted homes for women and children rescued from kidnappers. Sir John Hennessy (appointed governor of Hong Kong in 1877) also appointed a committee of investigation, but nothing was done to improve the lot of the M. T. as a result of its activities. In 1925 the Female Domestic Servants Ordinance was passed in Hong Kong, making it a criminal offence for any more M. T. to be taken into service or for an existing M. T. to be transferred from one person to another. The system is of course repugnant to all traditional ideas of Brit. liberty and is moreover conducive, though not necessarily so in Hong Kong, to immorality. It has sometimes been excused on the plea that it is no more than a Chinese custom of adoption; but there is no adoption of girls in the social customs of China. The system is deeply rooted; an attempt by Mr. Winston Churchill in 1922 to sweep away the abuse within a year failed. A Colonial Office Commission of inquiry into the whole question of M. T. and of any surviving practices in Hong Kong and Malaya of transferring women and children for consideration showed no unanimity in its recommendations. Acceptance of the main recommendation of the majority report would have postponed abolition of the system for years. Miss Picton Turbervill's able minority report saw in the widespread custom of transferring children a loophole for evasion of the laws and she recommended the repeal of the M. T. law of Hong Kong of 1923 and that of Malaya of 1932 (both being mere registration laws) and the substitution of a new law to abolish the legal status of M. T., to protect children who have left their parents before the age of twelve, to settle the status of wards, and to continue registration for all these purposes indefinitely (see Colonial No. 125, 1937).

Mukacávo, see MUNKACS.

Mukaddasi, see MOKADDASI.

Mukden, or **Moukden** (Chinese *Shên-yang*), largest city of Manchuria, cap. of Liaoning, the S. prov. of Manchuria, and terminus of the Peiping-Mukden railway (532 m.); 110 m. N.E. of Nin-chwang, on a branch of the Siberian railway. The S. Manchuria railway connects it with Port Arthur and Dairen. The tn. is regularly built, surrounded by a solid brick wall and divided into nine parts. In the centre are the former imperial palace and the administrative buildings. It is an important tn. on the trade routes between the N. provs. and the rest of China. The chief exports are agric. produce and furs. There are railway workshops. The Fushun generating station, which provides M.'s light and power, has an output which has varied from 230,000 kilowatts before the Communist invasion to 40,000 kilowatts in 1948. Here too is the arsenal built after the First World War for Marshal Chang Tso-lin, the Manchurian war lord, by the Englishman, 'one-armed Sutton'. The Jap., during their occupation of the puppet state of Manchukuo, created an extensive factory quarter, but by 1948 it

had become a wilderness of disused plant. M. suffered from fire during the Boxer rising of 1900. It was the scene of a Jap. victory over the Russians in March 1905 (see K. von Donat, *The Battle of Mukden*, Eng. trans., 1906). In 1948, prior to the Communist irruption, there were twenty-five Scottish and Irish Presbyterian missionaries who had a hospital, a medical school famous throughout Manchuria, and various schools and churches. M. was besieged by Chinese Communists for a year from the summer of 1947 and then by-passed, falling ultimately to them at the end of Oct. 1948. The pop. in July 1946 was 863,500; in 1948 it was estimated at 1,200,000, swollen by refugees; many of the inhab. endured great privations during the Communist investment, subsisting on a staple diet of grain made from soya-beans. See CHINA, *History*.

Mula, tn. of Murcia, Spain. There are warm mineral baths near, and trade in agric. produce, wine, and oil is carried on. Pop. (com.) 14,300.

Mulatto (Sp. and Portuguese *mulato*, a dimin. of *mulo*; Lat. *mulus*, a mule), the offspring of a white person and a Negro. The true M. is characterised by woolly black hair, and flat features, and is more usually the child of a black mother and white father. The degrees of Negro blood are, or were, indicated by *quadroon*, three-fourths white and one-fourth black, and *octoroon*, seven-eighths white, and one-eighth black, etc. But special countries have different terms for M. In Lat. America they are sometimes called *metizos*, and in Brazil a M. is a *pardo*.

Mulberry (*Morus*), genus of fruit-bearing trees of which the best known is the black M. (*M. nigra*), a native of Persia, and introduced to Britain in the sixteenth century. It is hardly only in the S. of England, and elsewhere needs to have the shelter of a high sunny wall. The sub-acid characteristically flavoured fruit, though it resembles a blackberry or raspberry, is of quite different structure, corresponding rather to a bunch of currants. The leaves are used as food for silkworms, but those of the white M. (*M. alba*), which is not so hardy, make the finest silk.

'**Mulberry**' Harbour, see under ARMO-MANCHES, HARBOUR OF.

Mule, name given to any hybrid, but commonly the offspring of the male ass and the mare. The produce of a stallion with a female ass is called a 'hinny,' and is smaller and weaker than the M., and therefore less valuable. M. have the general shape of the horse, and sometimes measure as much as sixteen hands high, but from the ass they get its obstinate disposition, the head features, and the less sensitive, weatherproof coat. As a rule they are extremely hardy and practically free from disease. They are as sure-footed as a goat, and almost invariably possess great intelligence. They are bred in large numbers for use in countries where roads are bad and extremes of weather have to be survived. They are useful as pack animals.

Mule (spinning machine), see under COTTON SPINNING AND MANUFACTURE.

Mulgrave, Earl of, see SHEFFIELD, JOHN.

Mülheim: 1. Am-Rhein, tn. in the Rhine prov., Germany, on the Rhine, nearly opposite Cologne, of which city it is now a part. It has breweries, tanneries, and dye-works, and manufs. of silk, velvets, chemicals, machinery, and carriages. Pop. 60,000. 2. Am-Ruhr, tn. in the Rhine prov., Germany, on the Ruhr, 16 m. N. of Düsseldorf. Coal and iron are mined in the dist., and there are manufs. of machinery, textiles, leather, and glass. Pop. 137,000.

Mulhouse, city in the Haut-Rhin dept., France, on the Ill and the Rhine-Rhône canal, 67 m. S.S.W. of Strasbourg by rail. It is divided into the old tn., dating from the sixteenth century, and the new tn., built in the nineteenth century, and containing the workmen's colony founded by Mayor Dollfus in 1853. It is an important centre of the textile industry; other manufs. are machinery and chemicals. M. became Ger. in 1871, but reverted to France after the First World War. It was occupied by the Gers. in 1940, and liberated by Franco-Amer. forces on Nov. 22, 1944, having suffered severe damage. Pop. 97,000. See further under WESTERN FRONT in SECOND WORLD WAR.

Mulinari, or **Molinari**, Stefano (c. 1741-1796). It. engraver, b. in Florence. Little is known of his life, but his reputation rests on his numerous prints of early It. masters, from Cimabue to Francesco Rustici, which he pub. in 2 vols., under the titles *Isotria pratica dell' Incominciamento e Progressi della Pittura* (1775) and *Saggio delle cinque Scuole di Pittura Italiana* (1780).

Mull, after the Isle of Skye the largest of the Inner Hebrides, Argyllshire, is washed on the W. and S. by the Atlantic. It is 7 m. W. of Oban and is separated from the mainland by the firth of Lorne and the sound of M. Its coast is indented by numerous sea lochs, of which the prin. are Loch-na-Keal and Loch Sreodan. Area 351 sq. m. Its surface is mountainous, rising in Ben More to 3185 ft. Chief tn. Tobermory. Pop. about 4000.

Mullah, see MOLLAH

Mullein, genus *Verbascum*. *V. thapsus* is the great or common M., a biennial herb, with a cluster of large, woolly leaves 12 to 18 in. long, in its first year. In the second year's growth it has a stout woolly leafy stem, 3 ft. high and terminating in a spike of yellow flowers. The wool from stem and leaves was at one time used for lamp-wicks. *V. lychnitis* is the white M., *V. pulchellum*, the yellow hoary M., and *V. nigrum*, the dark M. All these and *V. thapsus* grow wild in some places in Britain.

Müller, Sir Ferdinand von (1825-96), Ger. botanist and explorer, b. in Rostock. From 1846 to 1857 he studied at Kiel Univ., also botanising in Schleswig and Holstein, and then emigrated to Australia through ill health. From 1848 to 1852 he travelled some 4000 m. botanising, in

1852 was appointed chief botanist to Victoria, and in 1855-56 he was botanist in A. C. Gregory's scientific expedition in N. and Central Australia. On his return he was made director of the botanical gardens in Melbourne. He introduced and exchanged plants with countries all over the world, and he will be chiefly remembered for introducing the eucalyptus-tree into different countries, especially Algeria; he also raised the famous Victoria Regia water-lily. M. wrote valuable works on the eucalyptus, various botanical subjects, and *Fragmenta phytographica Australae* (11 vols., 1862-81), also *Flora Australiensis* (with G. Bentham, 1860-65) and *The Plants indigenous to the Colony of Victoria* (1860).

Müller, Friedrich Max (1823-1900), Anglo-Ger. philologist and orientalist, b. at Dessau, where his father, Wilhelm M., was librarian of the ducal library. He studied at Berlin and Paris. The E. India Company commissioned him to edit the *Rig-Veda* at their expense, and this work brought him to England in 1846 to consult the MSS. in the E. India House and the Bodleian Library. He settled at Oxford in 1850 upon his appointment as deputy Taylorian prof. of modern languages. Four years later he succeeded to the professorship. He became connected with the Bodleian Library in 1856, and from 1865 to 1867 was curator of oriental works. In 1866 he was made prof. of comparative philology. He was made a member of the Privy Council in 1896. His works include *Comparative Philology* (1856); *A History of Ancient Sanskrit Literature* (1859); *Lectures on the Science of Language* (1861-64); *Handbooks for the Study of Sanskrit* (1865-70); *Chips from a German Workshop* (1868-75), etc. He ed. the *Sacred Books of the East*, and pub. trans. of various oriental works, and of Kant's *Critique of Pure Reason*. His collected works were pub. in 20 vols., 1898-1903. See his *Auld Lang Syne* (1898).

Müller, George (1805-98), Brit. preacher and philanthropist, b. near Halberstadt in Germany. He became minister of a church in Teignmouth, Devonshire, where he remained for two years and then went to Bristol. He estab. a large orphanage for 2000 children at Ashley Down, just outside Bristol. His book, entitled *The Lord's Dealings with George Müller*, had an immense circulation, and roused much sympathy with his scheme. See A. T. Pierson, *George Müller of Bristol*, 1899.

Müller, Hermann (1876-1931), Ger. Socialist statesman, b. May 18 at Mannheim. He ed. the Socialist paper *Görlitzer Volkszeitung* and was sent abroad by Ger. Socialists, 1911, to see whether foreign Socialists would join Ger. Socialists in a no-war movement. For some time he ed. *Vorwärts*. He was minister for foreign affairs in the Bauer Cabinet, 1919, and signed the treaty of Versailles. On the failure of the Kapp putsch, he became chancellor for a few months, 1920. In June 1928 he was chancellor again, and formed a Grand Coalition, which lasted till March 27, 1930.

Müller, Hermann Joseph (b. 1890), Amer. geneticist, b. in New York city. He was prof. at the univ. of Texas, 1925-36; on the staff of the Institute of Genetics and of the Medico-biological Institute, Moscow, 1933-37; and of the Institute of Animal Genetics, univ. of Edinburgh, from 1938. He was prominent in experimental work in mutation and radiation genetics, and a strong supporter of the neo-Darwinian theory. His chief experimental work has been carried out with the culinary plants of the order Drosophila. M. discovered the action of X-rays on chromosomes and genes (1927), giving proof that the rays cause mutations. Others had worked on similar lines before 1927 though without definite success, and in 1928 Stadler announced positive results of independent X-ray experiments with plants. Hence it was not the mere discovery of metagenic action of X-rays which revolutionised genetics, but the manner in which M.'s previous labours had prepared the way for the use of it, and the skill with which he exploited it. He was awarded the Nobel prize for physiology and medicine in 1946. Pub. papers on *Reversibility in Evolution* and *The Role of Isolation and Temperature in Evolution*.

Müller, Johann (1801-58), (Ger. physiologist, b. at Koblenz. He began to study with a view to orders in the Rom. Catholic Church, but in 1819 he abandoned his theological studies, and devoted himself to medicine. Whilst yet a student he wrote for a prize the treatise *De Respiratione Fetus* (1823). He became in 1830 prof. of physiology and anatomy at Bonn, and in 1833 succeeded Rudolphi as prof. of anatomy at Berlin. His works are occupied with zoology and comparative anatomy. His investigations on infusoria were pub. in 1860.

Müller, Johann, Ger. astronomer, see REGIOMONTANUS.

Müller, Johannes von (1752-1809), Swiss historian, b. at Neukirch, near Schaffhausen. In 1772 he became prof. of Gk. at the Collegium Humanitatis at Schaffhausen. During 1778 and 1779 he delivered a set of lectures on hist. which were pub. many years later under the title *Vierundzwanzig Bücher allgemeiner Geschichte* (1839). In 1780 he pub. the first vol. of his *Geschichten der Schweizer*, and the following year his *Essais historiques* appeared. The same year he was made prof. of hist. by the landgrave of Hesse-Cassel, and in 1782 he pub. *Reisen der Papste*. In 1786 he became librarian to the elector-archbishop of Mainz, and the first vol. of his Swiss hist. appeared, and further vols. appeared between 1788 and 1808. In 1877 he pub. a political tract, *Zur Darstellung des Fürstenbundes*. In 1806 he espoused the cause of Napoleon, and the latter made him secretary of state for Westphalia, and later a privy councillor and director of public instruction. See lives by Hoeren, 1809; Döring, 1835; Monnard, 1839; K. Henking, 1909, 1928; and W. Stokar, 1938. See also A. Jaksch, *Müllers Geschichtsauffassung*, 1922.

Müller, Karl Otfried (1797-1840), Ger. archaeologist, b. at Brieg in Silesia, educated at Breslau and Berlin. He pub. *Aegineticorum liber* (1817), after which he soon received an appointment to the Magdaleneum in Breslau. In 1819 he obtained an archaeological chair in Göttingen. His great design was to embrace the whole life of auct. Greece, its art, politics, industry, religion, in one vivid conception. He obtained permission to travel, and made tours in Greece and Italy, but d. of an intermittent fever at Athens. We are indebted to him for many striking elucidations of the geography and topography, literature, grammar, mythology, manners, and customs

MULLETS

Above, grey mullet; below, red mullet.

of the ancients. His works include *Prolegomenen zu einer wissenschaftlichen Mythologie* (1825); *Über die Wohnsitze, Abstammung und ältere Geschichte des Macedonischen Volks* (1825); *Die Etrusker* (2 vols., 1828); *Handbuch der Archäologie der Kunst* (1830, Eng. 1850); *History of the Literature of Ancient Greece* (trans. by Sir G. C. Lewis and Dr. Donaldson, 1840); and *Geschichte hellenischer Stämme und Staaten* (1844). The facts of his life were recorded in Lücke's *Erinnerungen an Otfried Müller*, 1841. See also study by O. and E. Kern. His letters were pub. in 1936.

Müller, Wilhelm (1794-1827), Ger. lyric poet, b. at Dessau. In 1817 he went to Italy, and his first pub. work was *Rom, Römer und Römerinnen* (1820), which gave his impressions of his visits. The same year he was made librarian of the ducal library. His best work is contained in the vols. entitled *Gedichte aus den hinterlassenen Papieren eines reisenden Waldhornisten* (2 vols., 1821-24) and *Lieder der Griechen* (1821-24), the latter sympathizing with the Gks. in their struggle with the Turks. His earliest lyrics will be found in a vol. of poems entitled *Bundesblüten* (1816), containing work by sev. authors. His other works are *Homeriche Vorstudien* (1824); *Neu-*

griechische Volkslieder (2 vols., 1825); and *Lyrische Reisen und epigrammatische Spaziergänge* (1827). He also trans. Marlowe's *Faustus*, and ed. *Bibliothek der Dichtungen des 17. Jahrhunderts* (10 vols., 1822-27). Many of his poems were set to music by Schubert, and have become extremely popular. See ed. of his *Gedichte*, by his son, F. Max-Müller, 1868.

Mullet, term for two distinct fish types: (1) The grey M. (*Mullus*) comprises about seventy species, of which three are found off the Brit. coast. They are valued as food, especially when taken from fresh water, and they are cultivated in M. ponds in Italy and also in Honolulu. (2) The red M. (*Mullidae*) comprises about forty species, many of which are tropical. The common red M. (*M. barbatus*) has been famed since classical times for its delicately flavoured flesh. Its average length is about 15 in. and weight 2½ lb. Its skin is a brilliant red. Red Ms. have a pair of erectile barbels which project downwards and forwards when the fish is feeding on the sea bottom and which lie back in grooves at other times.

Mullingar, mkt. tn. of Eire, cap. of the co. of Westmeath, is situated on the Brosna, 48 m. W. by N. of Dublin. It has a Rom. Catholic cathedral. Tanning and brewing are carried on, and it has ann. cattle and horse fairs. Pop. 5237.

Mullion, term in Gothic architecture applied to the upright bars, or stone shafts, dividing the general aperture of a window into secondary openings, which are again frequently subdivided vertically by similar shafts crossing the Ms. horizontally, and are therefore called 'transoms'.

Mullion, vil. of the Lizard dist., Cornwall, England. Its church is dedicated to St. Melan; the interior has some very fine carved bench-ends, perhaps the best in the whole co. There are splendid views across Mount's Bay to Penzance. The scenery of M. Cove, which is about a mile from the vil., rivals that of any cove in Cornwall. Above rise on all sides, lichen-covered cliffs, rocks piled on rocks, vaulted and ribbed, with chasms and natural arches like the ruins of a vast fane. The cove or harbour, with its jetties and fish cellars and the nearby M. is., were presented to the nation in 1945. About 1 m. W. of M. is the Marconi memorial, set up in 1937 to commemorate the fact that on Dec. 12, 1901 at 12.30 midday, Marconi, in Newfoundland, received a morse signal sent from this spot, the first ever heard across the ocean. Here also, twenty-two years later, the short-wave beam system, which revolutionised long-distance communications, was successfully tested.

Mulock, Dinah Maria, see CRAIK, MRS. **Mulready, William** (1786-1863), Irish genre painter, b. at Ennis, in co. Clare. His father removed to London soon after Wm. was born, and here Wm. had the help of Banks, the sculptor. In 1800 he was admitted as a student of the Royal Academy, and in 1815 an associate. His pictures are noted for their rich colouring and their perfection in details, and the

most important are in the S. Kensington Museum and the National Gallery, London, e.g. 'Choosing the Wedding Gown,' 'Crossing the Ford,' 'A Roadside Inn,' 'The Barber's Shop,' and 'Punch.' He was well known for his illustrations for *The Vicar of Wakefield*.

Mulso, Hester, see CHAPONE.

Multan, or **Mooltan**, anct. and important city of Pakistan in the Punjab, 200 m. S.W. of Lahore, on a mound consisting of the ruins of anct. cities that occupied the same site, 3 m. from the l. b. of the Chenab, the inundations of which sometimes reach M. It is also the headquarters of a dist. and of a div. of the same name. Pop. 142,800.

Multatuli, see DEKKER, EDUARD DOUWES.

Multiplepointing, in Scots law, denotes an action, apparently first mentioned in an Act of Sederunt, 1677, as the proper process for settling the preferences of different arresters (see ARRESTMENT), whereby any number of different claimants to the same money, effects, or property can obtain the decision of the court on the question of which is entitled, or, if more than one, in what proportions they are entitled. The subject-matter, however, is generally a sum of money, and must be such as the debtor may be obliged to pay; hence rents to become due cannot be the subject of M. Usually M. is only competent where conflicting claims have been made, or where conflicting interests exist which may mature into claims. See G. J. Bell, *Commentaries on the Laws of Scotland*, and *Green's Encyclopedia of Scots Law*.

Multiple Proportions, see CHEMISTRY.

Multiple Stars. The name 'binary' or double star is given to a family of two stars relatively isolated in space, and the name 'multiple' is given to such an isolated family consisting of three or more individual members. Although large numbers of binaries have been discovered the number of known M. S. is not very great. The present theory of the origin of M. S. begins with binary stars (see ASTRONOMY). The sequence of events that leads to the formation of M. S. from a binary star is as follows. The components lose weight by radiation and the progressive shrinkage is accompanied by increased speed of rotation (Law of conservation of angular momentum). This rate of increase is no doubt diminished by the effect of tidal friction caused in the liquid star by the gravitational attraction of its neighbour; but if development takes place the time arrives when the speed of rotation of the liquid mass is so great that the now oblate spheroid develops a 'neck' so that it virtually consists of two portions—the major part being the body and the smaller part the head. The fission takes place at this neck when the speed of rotation has further increased and the final result is a small star revolving round its parent. The N. Pole star is an example of a multiple star. It is known as a spectroscopic triple and consists of two stars revolving round a third star that is invisible to us. Castor is a multiple

star; originally a visual binary, each component has been subdivided in the way described above and it now consists of two spectroscopic binaries. In every case the 'parent' star is much larger than its 'child,' and the period of the sub-system is much smaller than that of the original binary, the distance between the components of the sub-system being again considerably less than the distance between the components of the binary. Further sub-division of the M. S. may take place, though few examples of this occurrence are known. The above theory is purely tentative. See H. Spencer-Jones, *General Astronomy*, 1922; H. Macpherson, *Modern Astronomy*, 1926; and Sir J. Jeans, *The Universe Around Us*, 1929.

Mumbii, see IITERPOLIS.

Mumbles, or **Oystermouth**, seaside resort in Glamorganshire, Wales, on Swansea Bay, 5 m. S.W. of Swansea, noted for its oyster fisheries. There is a lighthouse on a small is. off M. Head.

Mummius, **Lucius**, surnamed **Achaicus**, Rom. general, was consul in 146 B.C., and after the conquest of Darius in the Achaean war captured Corinth. All the inhab. were slain, the artistic treasure sent to Rome, and the city burnt. It is probable that these cruel proceedings, which were foreign to M.'s nature, were carried out by order of the Senate. He was censor in 142 with Sulpio Africanus the Younger.

Mummy (Arabic, *mumiya*, bitumen). Name given to a dead body preserved by a process of embalming. It has been suggested that the origin of embalming in Egypt was to be traced to a dearth of fuel for cremation purposes, or to the impracticability of burials in a soil that was annually disturbed by the inroads of the Nile. It is more probable, however, that the custom originated in a desire to preserve the body for the needs of a future life. The anct. Egyptians embalmed not only human beings, but also sacred animals such as cats and crocodiles. To postpone natural decay, the body was at first steeped in natron; later methods involving the use of bitumen, spices, drugs, and honey were introduced. From the twenty-first dynasty onwards, brain and viscera were removed, the body-cavities repacked, the whole enswathed in smeared linen bandages inscribed with ritual texts and enclosed with amulets and talismanic statuettes in a mummy-case. The practice ceased about A.D. 700. Modern embalming dates from the eighteenth century, and various methods have been used. The famous anatomist, Wm. Hunter, used essential oils, camphor, saltpetre, pitch, or resin. Later fluids were injected, composed of sodium chloride, alum, potash, glycerine, or composed of alkalis, arsenic, and alcohol. The earliest attempt at mummification so far discovered came from a second dynasty tomb at Sakharah. (See illustration, p. 454.)

Mumps, infectious disease characterised by inflammation of the parotid glands, and at times of the other salivary glands. Other names for the disease are *parotitis*, *cyanche parotidæ*, and, in Scotland, the 'braukie.' The infection is presumably

THE MUMMY OF RAMESES II. IN
GIZEH MUSEUM

E.N.A.

caused by a virus. After a period of incubation of from two to three weeks, the disease shows itself by a swelling in the region of the parotid gland, which is situated in front of and below the external ear. There is also usually some degree of catarrh, with slight febrile symptoms, but these are seldom pronounced enough to occasion discomfort. As the disease proceeds the swelling becomes increased in size and spreads downwards to the neck and round the angle of the jaw, causing comparatively little pain but considerable disfigurement. The patient is otherwise quite well, except for some amount of discomfort attached to the actions of masticating and swallowing. It takes about four or five days for the swelling to reach its height, after which it gradually abates to a normal condition. Suppuration of the gland is a very uncommon occurrence. The disease does not call for much treatment. The diet should be that proper to a febrile condition, and the food should be soft enough to avoid painful mastication. The disease is highly infectious, and sometimes spreads with great rapidity among young children. Affected persons rarely take it a second time. It occasionally happens that other glands are sympathetically affected, particularly the testicles in males, and more rarely the ovaries in females, sometimes also the pancreas, but the inflammatory condition is usually only temporary, and passes off when the parotids take on their normal size and appearance.

Mun, Thomas (1571-1611), Eng. writer on political economy. He was a member of the committee of the E. India Company. In 1621 he wrote and pub. *A Discourse of Trade from England unto the East Indies*; and c. 1630 wrote *England's Treasure by Foreign Trade*, a statement of the Mercantilist doctrine of economic self-sufficiency by the creation of an overall trade balance; this latter was pub. by his son, John M., 1664. See R. Cranchet, *L'Œuvre économique de Thomas Mun* (Angers, 1921).

München, see MUNICH.

München-Gladbach, see GLADBACH.

Münchhausen, Karl Friedrich Hieronymus, Baron (1720-97), famous for narrating marvellous stories. Born at Hanover, he served in the Russian Army against the Turks, and on his retiring to his estate of Bodenwerder, amused and astounded his friends and relations by the extraordinary tales of his adventures during the war. A man named Rudolf Erich Raspe (q.v.) collected these tales and, adding many incidents from other sources, pub. a book in 1785 called *Baron Münchhausen's Narrative of his Marvellous Travels and Campaigns in Russia*. It was pub. anonymously with a preface by G. Bürger, who was at first believed to be the author; a second ed. was printed in 1786, and two other eds. rapidly followed. A. Cruikshank illustrated one ed. (1869) and Gustavo Doré (1862) another. The book has been enlarged by the insertion of stories culled from various sources. The text of *Münchhausen's Travels*, as usually reprinted, is, as shown by John

Carswell, 'the product of a long tradition of revision and improvisation' and Raspe himself was the author of less than a sixth part of what is printed in Carswell's text. Raspe had some hand in the authorship of the second instalment, *The Sea Adventures*, produced by a London publisher named Smith. In these M. begins by embarking at Portsmouth for N. America, is stranded on a whale's back and, later, a tree, then returns to his Turkish experiences, and eventually takes off from Cornwall (where Raspe wrote *Munchhausen*) in a balloon. In this account another baron, de Tott, founded on a well-known Fr. hussar, is introduced, partly as a foil to M., partly as a convenient medium for attacking the Catholic Church. In Carswell's ed. the first and second sections, Raspe's original text and the Raspe-Smith second instalment, *The Sea Adventures*, now appear (1948) uncorrupted for the first time in Eng. since their original pub. in 1785. See R. E. Raspe and others, *Singular Travels, Campaigns and Adventures of Baron Munchhausen* (ed. by J. Carswell, 1948).

Muncie, co. seat of Delaware co., Indiana, U.S.A., 54 m. N.E. of Indianapolis, on the White R. Iron, steel, and glass goods are manufactured. Palmer Univ. is here. Pop. 49,700.

Munday, or Mundy, Anthony (1553-1633), Eng. dramatist and miscellaneous writer, b. in London. He went to Rome (1578), probably as a spy to report on the Eng. Jesuit College there. On his return to England (1579) he became an actor, and later a member of the earl of Oxford's company. He wrote anti-Catholic pamphlets and trans. romances. In 1605 he was appointed chief pageant writer for the city, and by these entertainments he won his greatest fame. There are eighteen plays ascribed to M., among them *The Downfall of Robert Earl of Huntingdon*, the second play on the Death of Robert of Huntingdon, and *John a Green and John a Cumber*, etc. He wrote sev. lyrics, some under the name of 'Shepherd Tony,' to *England's Helicon* (1600). He also wrote under the title of 'Lazarus' poet.' M. pub. an enlarged ed. of Stow's *Survey of London* in 1618. Ben Jonson nicknamed him 'Antonio Bulladino, the pageant poet.' See life by C. Turner, 1928.

Munden, Joseph Shepherd (1758-1832), Eng. actor, b. in London. After playing in strolling companies he made his mark at Canterbury under Hurst. In 1790 he came to London, where, until about 1811, he was the leading comedian. He was remarkable for the variety of characters he represented, and had a great gift of facial expression. See Charles Lamb, *Essays of Elia*.

Münden, tn. in the prov. of Hanover, Germany, at the confluence of the Fulda and the Werra, 15 m. W.S.W. of Göttingen. It has manufs. of confectionery, chemicals, cigars, carbondium, and rubbers. There are quarries and coal-mines in the dist. Pop. 12,520.

Mundesley, vil. and seaside resort of Norfolk, 7 m. from Cromer and 135 m.

from London by the E. Region railway. About 2 m. to the S. is Paston, noted for the fifteenth-century family of that name (see PASTON LETTERS). Close by is Trimmingham, said to be the highest point in Norfolk. Also near it and to the S. is Bacton, noted for its abbey ruins. Pop. 890.

Mundurucos, or **Mundurucos**, tribe of Brazilian Indians, S. of the Amazon, on the R. Tapajos, generally classified with the Tupi stock.

Mongoose, see MONGOOSE.

Mungo, Saint, see KENTIGERN.

Munich (Ger. *München*), the cap. of Bavaria, is situated in the midst of a barren and flat elevated plain at a height of about 1700 ft. above the level of the sea. It is also the prin. city of the prov. of Upper Bavaria and lies on the l. b. of the Isar. Its cathedral, which is the seat of the archbishopric of Munich-Freising, was built between 1168 and 1494, and is remarkable for its two square towers, with their octagonal upper storeys, capped by cupolas, and its thirty lofty and highly decorated windows. Among the notable buildings were the royal residence, the Pinakothek, the Glyptothek, the National Theatre, the National Museum, and the Court of Justice. Its public library contains over 1,300,000 vols., and is rich in art collections. M. is noted for its enormous breweries of Bavarian beer, and has factories for cotton, wool, and damask goods, jewellery, silver articles, mathematical instruments, machinery, leather goods, wax-cloth, paper-hangings, carriages, pianos, gold, silver, and steel wares, etc. Lithography is extensively engaged in. Like most other industrial cities of Germany, its activities in the years immediately preceding and during the Second World War were chiefly concerned with the manuf. of munitions. The present name of this city cannot be traced further than the twelfth century, when Henry the Lion raised the Villa *Munchen* from its previous obscurity by establishing a mint within its precincts, and making it the chief emporium for the salt which was obtained from Halle and the neighbouring dists. In the thirteenth century the dukes of the Wittelsbach dynasty selected M. for their residence, built the Ludwigsburg, some parts of whose original structure still exist, and surrounded the tn. with walls and other fortified defences. In 1327 the old tn. was nearly destroyed by fire, and rebuilt by the Emperor Ludwig of Bavaria very much on the plan which it still exhibits, but it was not till the close of the eighteenth century, when the fortifications were razed to the ground, that the limits of the tn. were enlarged to any extent. The city capitulated to Gustavus Adolphus in 1632, and in 1742 it fell into the hands of the Austrians. King Maximilian II. (1848-64) did much to further the arts and sciences by founding the National Museum. Here, in June 1940, Hitler summoned Mussolini to discuss the terms of the armistice with France. It was first raided by the R.A.F. on Sept. 1, 1940. In a speech to old members of the

Nazi party in the Lowenbrau cellar, on Nov. 8, 1940, Hitler declared himself to be the 'hardest man the German people have had for decades, perhaps for centuries.' On the same day the I.A.F. raided M. for two hours, and one of their bombs hit the beer cellar where the anti-Nazi celebrations were held, but Hitler had escaped. More than 500 tons of high explosive and incendiary bombs were dropped by the I.A.F. on the industrial and railway centres of M. on the night of March 9, 1943. In this raid the Glyptothek, Pinakothek, and Schack art galleries were destroyed, but their contents had been removed to places of safety. The galleries were close to the group of buildings which constituted the Nazi headquarters. M. fell to the W. Allies in the course of the final thrust by Gen. Devers's Seventh Amer. Army, which began on April 22, 1945, two days after the fall of Nuremberg. On the right flank the 15th Corps moved down the Danube and then struck S. to M., which was captured, in the face of some opposition, on April 30. Pop. (1939) 828,325, (1947) 760,929. See also MUNICH PACT.

Munich Pact, agreement made at Munich between Hitler, Neville Chamberlain, Mussolini, and Daladier on Sept. 29, 1938, providing for the cession of the Sudetenland to Germany. War was imminent owing to Fr. guarantees of Czech independence and Chamberlain flew to Berchtesgaden, Hitler's residence, to dissuade Hitler from war. As a result he agreed with Daladier to recommend the Czech Gov. to surrender all dists. containing more than fifty Gers. This did not satisfy Hitler, and Chamberlain flew a second time to Germany, meeting Hitler at Godesberg. Hitler now increased his demands for the surrender of a much larger zone, with the result that Franco and Britain mobilised and recommended Czechoslovakia to do the same. At this point Mussolini suggested that another conference should be held, and Chamberlain and Daladier accordingly met him and Hitler at Munich on Sept. 28, 1938. Although Hitler's terms were only slightly modified, they were accepted, Chamberlain returning to London with the worthless agreement in his pocket and the belief, evidently sincerely entertained, that he 'had brought back peace in our time.' The pact provided for a guarantee of the new frontiers created after the Ger. Army had marched into Czechoslovakia (Oct. 1) by all the signatories. Chamberlain and Hitler also signed a joint declaration ruling out war between their two nations. In France as well as in Britain the agreement was welcomed with popular relief; but soon voices were raised criticising it as a mere surrender, and it gradually became totally discredited as the last stage of the futile policy of 'appeasement.' Further light is thrown on the hist. of the M. crisis by the pub. (Sept. 1949), by the U.S. Dept. of State, under the title *Germany and Czechoslovakia, 1937-1938*, of a vol. of documents from the captured archives of the Ger. Foreign Office. (A vol. entitled *From*

Neurath to Ribbentrop, Sept. 1937-1938 was pub. earlier.) The later vol. shows that the Ger. state secretary, Baron von Weizsäcker, at the end of Aug 1938 remained opposed to a Czech war, but that *The Times* leading article of Sept. 7, suggesting that Czechoslovakia should cede the border areas to Germany, and Chamberlain's offer to fly to Germany, so far from facilitating a pacific solution, evidently helped to stiffen the Ger. attitude. It was the entirely mistaken conjecture of the Ger. *chargé d'affaires* on Sept. 8 that *The Times* article may have 'reached *The Times* editorial staff from the

NEVILLE CHAMBERLAIN
AT BAD GODESBERG

The Prime Minister leaving the Hotel Dreesen after his meeting with Hitler on Sept. 29, 1938. On the left is von Ribbentrop.

Prime Minister's entourage.' However that may be, it is hardly surprising that after a further meeting between Chamberlain and Hitler had been arranged for Godesberg on Sept. 22-23, Hitler declared that he would present the Ger. demands 'with brutal frankness.' In another document it is stated that on the day of the conference at Munich, Count Schulerburg, Ger. ambas. in Moscow, called upon Potemkin, acting chief of the Soviet Ministry of Foreign Affairs. Potemkin showed visibly his annoyance at the course events had taken. Commenting on Hitler's declaration that Germany had no further territorial claims in Europe, he said 'it was not certain whether Nazi doctrine regarded the Soviet Union and Soviet Ukraine as being in Europe.' See further under CZECHOSLOVAKIA and EUROPE, *History during the Second World War*.

Municipal Corporations, see LOCAL GOVERNMENT.

Municipality (derived from Lat. *municipium*), term which came subsequently to denote the duties (*munus*, duty or privilege) undertaken, and the privileges accepted, by the various It. tns. and other communities which stood in dependence on the city of Rome. Later the term *municipia* was applied to all urb. communities of Rom. citizens in Italy with a definite organisation and a more or less complete system of self-government. The term *M.* thus became the appropriate generic name both for cities or tns. which enjoyed a measure of local autonomy, and for the conventional governing body of such cities or tns. In England the most anct. Ms. are those bors. which can show an unbroken hist. back to the Middle Ages or earlier, when, in consideration of certain payments (like the *firma burgi*) they received royal charters of self-taxation and self-government. Other and later municipal corporations include principally large manufacturing tns., which have acquired the status of co. or non-co. bors. by charter or private Act of Parliament. (See BOROUGH; BURGESS; CORPORATION; LOCAL GOVERNMENT.) In most cases of anct. bors., hist. justifies the assumption that the municipal corporation of mayor, aldermen, and burgesses, or at least the common council, arose out of the Merchant and Craft Guilds, for these latter possessed a common stock and corporate trading ventures which gave them both the wealth and the local organisation essential to the conduct of corporate affairs. Ms., not dissimilar in some of the essentials of Eng. municipal corporations, exist in many countries; but those in the U.S.A. differ in one important respect in that the various grades of members of the commonality form distinct chambers under a bicameral system which reveals, as it were, the microcosm of a national or state legislature. In Germany tn. constitutions varied very considerably. In Prussia the executive council (*magistrat*) of a municipal com. was elected by the representative assembly of the citizens out of their own body; but in other parts of Germany the executive was elected by the entire body of municipal electors.

Hist. shows that the *M. com.*, or other urb. corporate entity endowed with local autonomous privileges has at various times arrogated to itself such formidable political ascendancy as to render itself practically independent. N. Italy, at the time of the Lombard kings, and long before the hegemony of the last century, was essentially a region of independent city republics, each with an organisation not markedly dissimilar from that of the city state of anct. Greece, and owing its anomalous position to the opportunities for the local tyranny of dukes and counts afforded by the feudal system. This

aristocratic or caste tyranny was undermined only by the rival spiritual power set up under the aegis of the Christian empire by the grant of episcopal immunities, with the result that the It. city republics presented the curious political phenomenon of a dual system of control, the religious and democratic acting as a counterpoise to the temporal and ducal. By much the same process of evolution rose and waned the free tns. of Germany (see FREE IMPERIAL CITIES) and the cities of the Swiss cantons. The Eng. bors. or chartered tns. had a different hist. As the natural centres of trade they were early in a position to exact from necessitous overlords or needy monarchs fiscal and judicial immunities which soon enabled them to develop themselves into compact strongholds, with resources that in times of civil war or social upheaval were enough of themselves to decide the fate of contending factions in the state. The municipal corporation of England during the nineteenth century acquired by legislation and custom wide powers of self-government, but as the power of the central gov. increased and the services undertaken by municipal corporations became of increasing national importance their powers were curtailed so that now there is extensive control, especially from the financial aspect, of their powers by the central gov. See H. J. Laski (ed.), *A Century of Municipal Progress*, 1935; J. Tait, *The Medieval English Borough*, 1936; G. M. Harris, *Municipal Self-Government in Britain*, 1939; Helen Camm, *Liberties and Communities in Medieval England*, 1944; Lord Macmillan (ed.), *Local Government Law and Administration*, 1945; and J. H. Warren, *Municipal Administration*, 1948.

The Eng. system of municipal administration was the model on which the early cities and tns. of the U.S.A. were formed, but the system has now little in common with that of the U.S.A. system. Few or no Ms. in the U.S.A. are created by charter. A municipal body in the U.S.A. is a corporation created by the state for state purposes as well as for local administration. This involves a certain distinction between Ms. created at the request of the people and those created for the convenience of state administration. Ms. come into being under general laws, and are not created by special act. See CITY.

Municipal Trade. Municipal trading is neither an old nor a new activity in social conditions, though in its present form and administration it may find no genuine parallel in the anct. or mediæval communal life of the Eng. burgesses. So far as there was in the last century and later any conscious intellectual operation involved in its promotion as distinct from the unsystematic extension of municipal operations arising out of, and rendered necessary by, the ever-widening range of duties imposed by the legislature on local governing bodies in relation to public health, the maintenance of highways, housing, education, and welfare it might be taken to have been the expression

of the growing belief that it was incumbent on the social or civic conscience to supply the obvious omissions of individual enterprise. The real beginning of modern M.T. was in the middle of last century, when the Baths and Wash-houses Act, 1846, enabled local authorities to erect municipal baths and laundries, while later various Acts empowered them to control and manage harbours and docks, piers, quays, and gas concerns. According to Mill, it was conclusively established, however, that gov. agency in any of the common operations of industry or commerce was never able to maintain itself in equal competition with individual agency where the latter had sufficient capital and enterprise. But M. T. nevertheless thrived in spite of the arguments of political economists, especially when tn. or dist. councillors promised to secure the profits for the benefit of the general body of ratepayers. During the last quarter of the last century a number of local authorities obtained private Acts of Parliament enabling them to establish gasworks, but only in those places where there were no existing private companies; and later, they were given the right to purchase the undertakings of electric and tramway companies after the lapse of a fixed period of time. In 1890, Part III. of the Housing of the Working Classes Act empowered local authorities to build dwellings for the working classes (see HOUSING); and urb. dist. councils have in more recent years availed themselves of these powers to an ever-increasing extent. At the present day the prin. municipal undertakings comprise waterworks, motorbus services, and tramways (whether owned and worked by the municipality or owned by the municipality and worked by private companies), baths and wash-houses, burial-grounds, harbours, piers,

ferries, working-class dwellings, and markets, most of these being known as 'public utilities.' The supply of gas and electricity were important trading undertakings but these have now been nationalised. Many councils have estab. milk depots to supply sterilised milk for children; many prov. tns. availed themselves of an Act authorising them to raise money for municipal telephones (all of which were subsequently sold to the post office); and the L.C.C. ran a steamboat service (see also under LONDON). The sum expended (otherwise than out of loans) by local authorities upon such undertakings as include the supply of gas, electricity, housing, water, tramways and light railways, harbours, docks, and piers, grew from about £49,000,000 in 1919 to £181,176,000 in 1935-36 and £201,012,000 in 1940-41. But it must be noted that the latter figure included trading activities not undertaken prior to 1919. Again, allowance must be made for the fact that the difference between the two totals, while representing a net increase in expenditure by local authorities was affected by the fact that many undertakings before 1919 belonged to commercial companies. The figures, however, serve adequately to show the great increase of the movement in recent years. An important point to be remembered in considering municipal trading undertakings is the distinction that while the provision of education, assistance, public health, etc., is a duty imposed by Parliament, M. T. facilities have, as a rule, been voluntarily undertaken by the local authorities. In 1927 Parliament gave local authorities power to borrow specified sums principally upon security of rates leviable by them or of funds under their control. The prin. methods of borrowing

Local expenditure and receipts for England and Wales in 1940-41 and in Scotland in 1938-39 were as follows:

Expenditure			Receipts		
	England and Wales	Scotland		England and Wales	Scotland
	£	£		£	£
Electricity Supply	64,693,000	4,596,000	Electric Light Undertakings	64,929,000	4,595,000
Housing and Planning	18,005,000	7,887,000	Housing	27,567,000	1,383,000
Tramways, etc.	26,946,000	5,447,000	Tramways, etc.	27,038,000	5,367,000
Waterworks	25,431,000	2,479,000	Water Undertakings	23,677,000	894,000
Gasworks	20,830,000	4,819,000	Gas	20,869,000	4,640,000
Harbours, Docks, etc.	13,056,000	1,909,000	Harbours and Docks	11,688,000	1,020,000
Cemeteries	2,051,000	276,000	Cemeteries	1,416,000	112,000

In addition to this sum there was capital expenditure on housing of the working classes of £9,146,000 in England and Wales and of £12,003,000 in Scotland. During the nine months ended Dec 31, 1947, there was capital expenditure on housing of £124,815,890 and on gas £6,956,175. In 1947 the net trading debt was £212,204,788 and the net housing debt £242,812,552 of co. bors. alone.

are (1) mortgage deeds; (2) debentures, etc., under the Local Loans Act; (3) issue of stock; (4) application of redemption and sinking funds; (5) local bonds. At the present time it is customary for the lender to receive mortgage deeds in most cases. At the end of 1926 more than £285,000,000 had been borrowed for the purposes of municipal undertakings by local authorities. These sums were raised for the provision of airports, baths, cemeteries, electricity supply, gasworks, harbours, piers, docks, canals, light railways, markets, tramways, waterways, and other purposes. By the end of the financial year March 31, 1941, there were outstanding loans in England and Wales to the amount of £1,626,443,000, against which total £61,053,000 stood at the credit of sinking funds. The amount of outstanding loans and capitalised annuities in Scotland (1939) was £206,497,000, and in N. Ireland (1937) £21,525,000.

The nationalisation of coal, electricity, gas, and transport undertakings effected by the legislation of the Labour Gov. of 1915-50 transferred to state corporations the most profitable undertakings. The Local Government Act, 1948, has provided new fields of trading activity in authorising local authorities to undertake the provision of entertainments. See J. H. Warren, *Municipal Trading*, 1924; R. Wright and H. Holthouse, *Local Government and Local Taxation*, 1926; H. Finner, *Municipal Trading*, 1941; Annual Reports of Ministry of Health and Ministry of Transport; Local Taxation Returns; and Statistical Statement of the U.S. Census Report.

Munlong Range, mts. of New S. Wales and Victoria, Australia, forming a part of the Great Dividing Chain. Mt. Kosciuszko (7308 ft.) is the highest point in the Australian continent.

Munipore, see MANIPUR.

Muni River Settlements, see SPANISH GUINEA.

Munitions, Ministry of. Following the Fr. example the Brit. Gov., in June 1915, set up a M. of M. by Act of Parliament, with the object of coping with the requirements of the First World War. Besides the secretariat, the ministry had numerous correlated depts., namely, for munitions design, munitions supply, ordnance supply, shell manuf., mechanical transport supply, mechanical warfare supply, munitions inspections, munitions labour supply, munitions labour regulation, explosives supply, trench warfare supply, and munitions invention. During its existence the ministry took over many depts. of the War Office and employed a very great number of persons. Lloyd George was at one time minister of munitions. The ministry was abolished in 1920, when for winding up purposes it was succeeded by the Disposal Board (q.v.). There was no M. of M., as such, in the Second World War, the analogous dept. being designated Ministry of Supply, the chief depts. of which dealt with guns, explosives and chemical supplies, tanks, clothing and textiles, ammunition, raw materials, and machine tools.

Munkács, or **Mukachevo**, tn. of the Ukrainian S.S.R., 30 m. N.E. of Debreczen. It is situated on the Latorca, and has manufs. of coarse cloth. Near by are noted alum and iron mines. Pop. 29,300.

Munkácsy, Mihály (1844-1900), Hungarian painter, whose real name was Lieb, was b. in Munkács. After the death of his parents he was sent by friends to the art school at Pesth. Later he went to Vienna and then to Munich, where he studied under Franz Adam. At Düsseldorf he painted 'The Last Days of a Condemned Prisoner,' which brought him fame. Soon after this he went to Paris, where he resided for many years, winning a number of honours and medals for his paintings. His chief paintings are 'Christ before Pilate,' 'The Crucifix,' 'Ecce Homo,' 'Arpad' (hung in the Hungarian parliament), 'The Apotheosis of the Renaissance' (Vienna), 'The Death of Mozart,' 'The Two Families,' 'Milton dictating *Paradise Lost* to his Daughters.' The first three paintings are now in Philadelphia. See lives by D. Maloney, 1907; B. Lázár, 1925; and K. Lyka, 1926.

Munnings, Sir Alfred (b. 1878), Eng. painter, was educated at Framlingham, and studied art at Norwich and Paris. He first exhibited at the Royal Academy in 1898, specialising in turf and horse pictures. His 'Epsom Downs' is his best-known work. During the First World War he painted a series of war pictures for the Canadian Gov. A.R.A. in 1919, R.A. in 1925, he became president of the Royal Academy in 1941. An uncompromising critic of certain tendencies in modern art.

Munro, Hugh Andrew Johnstone (1819-1885), Scottish classical scholar and critic, b. at Elgin, and educated at Trinity College, Cambridge, becoming prof. of Lat. at the univ. He ed. (1860) and trans. (1864) the Vatican and Laurentian MSS. of Lucretius, and ed. Horace in 1868. He pub. *Criticisms and Elucidations of Catullus* (1878), and wrote many Gk. and Lat. verses.

Munro, Neil (1864-1930), Scottish author and journalist, b. at Inveraray. He started his journalistic career in Glasgow, and his first story was entitled *The Secret of Heather Ale* (1893). Three years later he pub. a collection of short stories, *The Lost Fibre*. His novels are chiefly historical, and include *John Splendid* (1898); *Gillian the Dreamer* (1899); *Doom Castle and the Shoes of Fortune* (1901); *Children of Tempest* (1903); *The Daff Days* (1907); *Fancy Farm* (1910); *Ayrshire Idylls* (1913); *The New Road* (1914); and *Janny Jack* (1918).

Munro, Sir Thomas (1761-1827), Scottish soldier and governor, b. and educated at Glasgow. He was appointed infantry cadet at Madras, 1779, served in the war against Hyder Ali, 1780-84, and was then promoted to lieutenant. In 1804 M. was promoted to lieutenant-colonel, and rendered great services to Gen. Wellesley (afterwards duke of Wellington) during the war with Scindiah and the rajah of Berar. He returned to India in 1814 on a commission to reorganise the judicial

and police depts. During the Mahratta war he was brigadier-general. On the termination of this war M., whose eyesight had suffered from exposure and work, returned to England, but soon after his arrival he was nominated to the governorship of Madras, and re-embarked for India in 1819. He held the post for seven years with most marked success. He strongly favoured the wider use of native agency and the education of natives to situations of responsibility in the public service, and indeed, was revered by the natives as the protector of their rights. See lives by G. R. Gleigs, 1830, and J. Bradshaw ('Rulers of India' series), 1804.

Munsey, Frank Andrew (1854-1925), Amer. publisher, b. May 21 at Mercer, Maine. After an elementary schooling he entered a country store, and later managed the W. Union Telegraph Office, Augusta, Maine. Arriving in New York, 1882, on borrowed capital he started the *Golden Argosy*, which developed into the *Argosy*, an all-story weekly. M. wrote some of the serials, e.g. *The Boy Broker* (1888). In 1889 he began *Munsey's Magazine*, and by 1907 was a very rich man, partly through his magazines, partly through his cash grocery stores. He also bought and sold newspapers, closing down many in the process. He owned the *New York Herald*, 1920-24, selling it to the proprietors of the *Tribune*. M. had no partners in his deals, and never married.

Münster, Sebastian (1489-1552), Ger. scholar, b. at Ingelheim. He entered a Franciscan convent, but becoming a convert to the opinions of Luther, threw off his monastic habit, and was appointed prof. of Heb. at Basle in 1529. The most important of M.'s works are *Grammatica chaldaica* (1527); *Dictionarium chaldaicum* (1527); *Dictionarium trilingue, in quo Latinis vocabulis, Græca et Hebraica respondent* (1530); *Horologographia* (1531); *Biblia hebraica* (2 vols., 1534-35 and 1546); *Organum Uranicum* (1536); *Cosmographia universalis* (1541); and *Rudimenta mathematica* (1551). See study by V. Hantzsch, 1898.

Munster, prov. in Eire, comprising the cos. of Cork, Waterford, Kerry, Limerick, Tipperary, and Clare. It was originally, i.e. before Henry II.'s reign, divided into two kingdoms, Desmond and Thomond, and the title and rank of king of M. were borne by the rulers of the respective kingdoms alternately. Area 9520 sq. m. Pop. (1946) 916,750.

Münster, cap. of Westphalia, Germany, is situated at the confluence of the Aa with the Dortmund-Ems canal, 65 m. N.E. of Düsseldorf, M., which is a bishopric, was, before the Second World War, one of the handsomest tns. of Westphalia, retaining numerous remains of medieval architecture, whose quaint picturesqueness was enhanced by the numerous trees and shady *allees* by which the squares and streets were ornamented. The Gothic Rathaus (1313) was the scene of the signature of the treaty of Westphalia in 1648 (see WESTPHALIA, TREATY OF; and THIRTY YEARS WAR); paintings

of the ceremony by Gerhardt Terborch were to be found there. Little beyond the ground-floor arcade survived destruction, though the contents were safely evacuated. The cathedral, built between 1165 and 1265, though badly hit, and its W. bay destroyed, is capable of reconstruction. The Clemenskirche and the thirteenth-century Servatiuskirche were total losses. The fine towers of the Überwasserkirche, the Lambertikirche (1450), and the Ludgerikirche (1170) still remain, though the interiors are variously damaged. The patrician

THE RATHAUS (TOWN HALL), MÜNSTER, 1942

houses, built from the sixteenth to the eighteenth centuries, were almost wholly destroyed, and the Stadtweinhaus was a total loss. The univ. has lost nearly all its buildings. Schlaunshaus, the archbishop's house, and the Schloss are in ruins. This widespread destruction has in fact destroyed the auct. character of a once remarkable city. The industrial products of M. are leather, woollen fabrics, thread, starch, and sugar, besides which there are carriage works, breweries, distilleries, and printing works. The trade is limited to the produce of the country, the prin. of which is the noted Westphalian ham and sausages. M. was heavily raided by the R.A.F. on July 5 and 6, 1941, over fifty great fires being caused on the second night, and again on Jan. 28 and May 13, 1942. Prior to the massed raid on Cologne, no Ger. tn. had suffered more severely than M. There were other raids on June 11, 1943, and March 23,

1945. Brit. troops entered M. on April 2, 1945, after the tn. had been heavily shelled to compel the Ger. commander to surrender. Pop. (pre-war) 143,740.

Munster Fusiliers, Royal, famous Irish regiment, descended from the Bengal Fusiliers raised in Charles II.'s reign, when they were part of the small detachment which was sent to the E. Indies to protect the factories of the E. India Company. Robert Clive was their first recorded colonel and Plassey their first battle honour. Their familiar sobriquet 'Lurly Shirts' was 'conferred' on the regiment in allusion to their bravery at the siege of Bhurtpore (1805) where they discarded their tunics and fought in their shirts. The 104th Bengal Fusiliers, destined later to become the 2nd Battalion of the Munsters (the old 104th Foot), was embodied in 1839, and won its first great action at Chillianwallah. It was amalgamated with the 101st Foot as the R. M. F. The regiment also rendered great service in the Indian mutiny and in S. Africa. The 2nd Battalion was at Mons in the First World War, when they fought a brilliant rearguard action against a regiment of Uhlans. This battalion was almost annihilated at the Rue de Bois, near Armentières, in the subsequent winter campaign. The 1st Battalion (the old 101st Foot) was part of the 29th Div. in the Gallipoli campaign. Two of its companies were wiped out in trying to land on the 'V' beach, the third gained a footing after severe losses. The regiment was disbanded in 1922. See S. McCance, *The History of the Royal Munster Fusiliers*, 1928.

Münsterberg, Hugo (1863-1916), Ger.-Amer. psychologist. b. at Danzig. His work in psychology at Freiburg Univ. came to the notice of Wm. James, who invited him to Harvard as first director of its laboratory of psychology. President. Amer. Psychological Association, 1898. He pub. works in Ger. on psychology, and on the popular applications of psychology in Eng. When the First World War broke out, he was an untiring propagandist of Ger. culture. In this connection he pub. *The Peace and America* (1915), and even attempted by letter to influence the president. To intellectualism he opposed a theory of voluntaristic idealism, which regards the will as the essential principle. See J. H. Wigmore, *Münsterberg and the Psychology of Evidence*, 1909.

Münsterberg, tu. in Silesia, Germany, 37 m. S. of Breslau on the Odra; it has manufs. of clay products and breweries. Pop. 9000.

Munthafq, liwa of Iraq, on the S. border of the country. The Hor al Hammar lake lies in the N.W. and the R. Euphrates crosses the liwa. The chief tn. is An Nasiriya. The S. areas are largely desert. Pop. 281,647.

Munthe, Axel (1857-1949). Swedish medical practitioner and author. b. at Oskarshamn. He was educated at Uppsala Univ. and worked under Charcot at the Salpêtrière, but, disagreeing with the latter's theories on hypnosis, left him. For twelve years he was a gynaecologist

in Paris and in *The Story of San Michele*, written during periods of insomnia, he told how he adopted the term 'colitis' as a reassuring name for the imaginary ailments of his fashionable patients of the Faubourg Saint-Germain. In Rome, where he lived in Keats's house, he enjoyed an equally lucrative and fashionable practice and eventually made enough money to realise his ambition to build the villa, with bird sanctuary, of San Michele on the highest point of the Is. of Capri. *The Story of San Michele* (pub. 1929), one of the most remarkable of 'best selling' vols. of memoirs of recent times, was originally written in Eng. and trans. into forty-four languages. He was for some years physician to Queen Victoria of Sweden.

Muntjac (*Cervulus muntjac*), small deer which ranges throughout S.E. Asia. The hair is short and smooth, and bright rufous bay in colour, with a patch of white on the throat and beneath the tail. The buck's head has the V-shaped frontal bone greatly prolonged into two pedicles covered with skin and hair; short antlers grow from the tips. In the upper jaw are two sharp canine teeth which often extend below the lower lip.

Muntz's Metal, or Yellow Metal, is an alloy of three parts of copper and two parts of zinc. It is called after the name of its Birmingham inventor. Unlike brass it is malleable when hot, and can be more easily rolled than copper, which it has largely supplanted as material for sheathing wooden ships.

Münzer, or Muntzer, Thomas (1490-1525), leader of the Anabaptists (q.v.). b. at Stolberg, Harz Mts. A Hussite preacher (1520), he preached exaggerated Christian liberty, opposing civil government, religious rites, etc. (1521). He headed the Thuringian peasant revolt in 1524, but was defeated by the Elector John and Duke George of Saxony, the landgrave of Hesse, and the duke of Brunswick. He was beheaded at Mühlhausen along with Pfeifer and a number of others. See G. Bloch, *Thomas Münzer als Theologe der Revolution*, 1922, and L. G. Walter, *Thomas Münzer et les luttes sociales*, 1927.

Murad, see AMURATH.

Muradabad, see MORADABAD.

Muraena, or Moray, large eel-like fish without scales or pectoral fins, and distinguished from the true eels by the narrow slits into the pharynx. Ms. inhabit tropical and subtropical seas, and are very fierce and voracious, seizing their prey with formidable pointed teeth. *M. helena* is rich brown, marked with yellow spots. Most Ms. are richly coloured, and some attain a length of 10 ft., particularly *M. macrurus* of the Indian seas. Altogether some eighty species are included in the family Muraenidae.

Murakami, coast tn. of Hondo, Japan. 45 m. from Nukata. Pop. 10,000.

Mural Decoration (Lat. *murus*, wall), art of adorning walls by means of surface painting in fresco, oils, or encaustic, by mosaic compositions, and by carving in wood, terracotta, stone, or marble. The term is also extended

to the decorative treatment of vaults and ceilings. In early Egyptian art interior walls were covered with figure and other designs, in low relief, or deeply incised, and were gaily coloured. Wonderful examples of M. D. of the Mycenaean Age have been discovered at Cnossus. In Assyria walls were decorated with sculptured dados and coloured friezes, representing groups of figures. The sculptured friezes and metopes of auct. Greece, used as decorations for temples and public buildings, are of incomparable beauty. The early Romans employed three prin. methods of M. D.: painting in fresco, mosaic painting, and marble incrustations. Remains of mural paintings have been preserved at Pompeii. In later centuries It. artists painted in oils on plaster. Cimabue and Giotto painted in fresco, leading the way in a form of M. D. which superseded all others. During the Middle Ages mural painting was used extensively in churches until the introduction of large areas of stained glass. In modern times the art of M. D. has declined, save in special cases such as saloons of great liners, restaurants, and schoolrooms. The chief forms of M. D. employed in domestic architecture are stained leather and wall-paper. *See also* FRESCO; MOSAIC; TAPESTRY; WALL-PAPER. *See* G. White, *Practical Decorating*, 1894; A. L. Baldry, *Modern Mural Decoration*, 1902; F. H. Jackson, *Mural Painting*, 1904; J. C. Wall, *Medieval Wall Paintings*, 1911; and H. Feibusch, *Mural Painting*, 1946.

Murano, tn. in the prov. and 11 m. N. of the city of Venice, Italy, on the is. of M. in the Venice Lagoon. It has the cathedral of San Donato (tenth century). It has long been the seat of the Venetian glass industry. The is. of M. is largely occupied by vineyards. Pop. 5800.

Murat, Joachim (1767-1815), king of Naples, son of an innkeeper, b. at La Bastide-Fortunière, near Cahors, France. He entered the Fr. Army, in which he served under Napoleon Bonaparte, to whom he became greatly attached, in Italy and Egypt, distinguished himself at the battle of the Pyramids (1798). For his part in the 13th Vendémiaire he was made a lieutenant-colonel and first aide-de-camp to Napoleon, and after Aboukir was made a general of div. He dispersed the Council of Five Hundred at St. Cloud in 1799, and in the following year married Napoleon's youngest sister, Marie Antoniette Caroline. He was made governor of the Cisalpine republic in 1801, and after taking part in the battles of Jena, Eylau, Austerlitz, etc., was made grand-duke of Berg and Cleves for his share in the last named. In the invasion of Spain in 1808 he commanded the Fr. armies and aspired to the Sp. throne vacated by Charles IV. Napoleon, however, gave him the Crown of Naples instead, and he was proclaimed king of the Two Sicilies (Naples and Sicily being often so named). He styled himself **King Joachim-Napoleon** and his rule was characterised by liberality and wise reforms, especially in abolishing feudal archaisms.

but he offended Napoleon by his sumptuous court life and by the number of marshals he created. In 1812, however, he commanded the cavalry of the grand army which invaded Russia, but after the battle of Leipzig he hastened back to his kingdom and, having broken with Napoleon, made overtures to Austria and Great Britain. When Napoleon escaped from Elba M. thought he could himself win all Italy and then treat with Napoleon as an equal, but he was checked at Ferrara and routed at Tolentino. After Napoleon had refused his proffered aid, he staked his all on an expedition to Calabria, against the Bourbons, but his popularity had vanished, and he was captured and shot at

JOACHIM MURAT

Pizzo. See lives by J. Chavanon and G. Saint-Yves, 1905; H. Weil, 1909-10; A. H. Atteridge, 1911; and A. de Tarte, 1914; also L. Monnier, *Marat et le Congrès de Yverne*, 1937.

Muratorori, Lodovico Antonio (1672-1750), noted It. scholar, antiquary, and historian, *b.* at Vignola, near Modena. In 1694 he became director of the Ambrosian College and Library at Milan, and while there pub. *Anecdota Græca* and *Anecdota Latina*, previously unedited fragments. Recalled to Modena (1700), he became librarian and archivist to Duke Rinaldo I. His three chief works are *Reverum italicarum scriptores* (1723-38), dealing with the sources of medieval It. hist.; *Antiquitates italicæ mediæ ævi* (1738-1743), describing the constitution, customs, and thought of the Middle Ages; and *Annali d'Italia* (1744-49, first complete ed. 1753-56), a critical hist. of Italy from the birth of Christ down to 1750. *Delle Antichità Estensi* appeared in 1717-1740. His collected works were pub. 1767-80 and 1790-1810 and his letters, ed. by M. Gampori, 1901-22. See lives by G. F. Moratori, 1756, and G. Bertoni, 1926.

Muraviev, Count Michael Nikolaievich (1845-1900), Russian diplomatist, b. in Poltava; studied superficially at Heidelberg, and entered the chancellery of

minister of foreign affairs. He held minor positions in Stuttgart, Berlin, secretary in Berlin and first secretary in Paris. In 1863 he incurred odium through his drastic measures in dealing with the Polish insurrection. He was appointed minister of foreign affairs in 1897. Owing to the Boxer rising in Manchuria (1900) his relations with the tsar (Nicholas II.) became difficult, and M. d. suddenly of apoplexy brought on, it is supposed, by an angry interview with him.

Murchison, Sir Roderick Impey (1792-1871), Brit. geologist, b. at Tarradale, Ross-shire, Scotland. He served with Wellesley in Galicia, 1808, and later under Sir John Moore, being present at the battle of Corunna. He left the army in 1816 and devoted himself to geology. He made a number of geological surveys of large parts of England and Scotland, and later travelled in France, Italy, the Tyrol, and Switzerland, studying the geological structure of the Alps. M.'s chief title to fame was the estab. of the Silurian system and his exposition of the Permian, Devonian, and Laurentian systems. Amongst other works he pub. *The Silurian System* (1838) and *The Geology of Russia in Europe and the Ural* (1845). See life by Sir A. Geikie, 1875.

Murchison, gold-field of W. Australia, N. of Lake Austin, 21,600 sq. m. in area. Cue is the cap. of the dist., 540 m. N.N.E. of Perth. The M. R. forms the E. boundary of M. Pop. 3000.

Murchison Falls, in Uganda on the Victoria Nile about 20 m. from its exit from Lake Albert. At these falls there is a drop of the riv. of about 130 ft., the whole volume of the Nile passing through a rock-cleft only 19 ft. wide in the elevated scarp at its narrowest point and then thundering down in a series of splendid cascades. In the pool below are thousands of enormous fish and crocodiles, and at night, with the aid of a powerful lamp, the crocodiles may be watched feeding, their eyes glowing like red-hot coals. Sir Samuel Baker and his wife, taking canoes from near Lake Albert, travelled northwards and entering the Victoria Nile discovered the M. F. on April 3, 1864, but nearly a year of hardship and distress was to elapse before they once more reached their starting point, Gondokoro. Geologically, research has revealed two pluvial periods each including an oscillation towards drier conditions. About the time of the second of these periods an important earth movement occurred and brought about conditions such that the main rivs. can never again feed Lake Albert as they did in the earlier pluvial period, and it was then that the present outlet of Lake Victoria via Lake Kioga and the M. F. was estab. With the Ripon Falls (q.v.) and the rapids of the Semliki R. the M. F. are one of the main barriers against the movement of fish, and from these obstacles result the two main divs. of the fish fauna of Uganda; for below the M. F. and the Semliki rapids the fauna may be classified as of the Nile type, characterised by many genera and few species, while above these falls and in the lakes and their connected

rivs., there exist very few of the species inhabiting the lower waters and few genera are represented though some of them comprise numerous closely related species. The M. F. are reached by steamer from Butiaba. Their great attraction to the tourist is that the approach to them is by water through a game reserve, and on the journey over the 20-m. stretch of riv. between the exit of the Victoria Nile from Lake Albert and Fajao, the anchorage for the M. F., he is normally afforded the opportunity of observing from a position of security and comfort very considerable numbers of the larger animals in their natural surroundings—elephants, often in vast numbers, hippopotamuses, crocodiles, some of the lesser antelopes such as water-buck, hartbeest, and Uganda kob, and, though less frequently, lion, black rhinoceroses, and buffaloes, Colobus monkeys and baboons. During the winter season the Kenya and Uganda Railways and Harbours organises special excursions. See H. B. Thomas and Robert Scott, *Uganda*, 1935.

MURCIA. THE CATHEDRAL

Murcia: 1. Maritime prov. of Spain, forming part of the anct. Moorish kingdom of the same name between Andalusia and the kingdom of Valencia. The state is very mountainous in the S. and E., but there are fertile valleys rendered fruitful by irrigation, and the celebrated *huertas* (gardens), about 27 m. long and 3 m. broad, contain orange groves, mulberry and olive trees, vines, etc., and produce quantities of fruit and vegetables. There are large deposits of salt and minerals, especially lead and zinc. The prin. manufs. are metals and silks. M. was conquered in 713 by the Moors, and became a dependency of Spain in 1210. Area, 4369 sq. m. Pop. 772,486. 2. Walled city and episcopal see, cap. of above prov., 28 m. N.N.W. of Cartagena.

It is an important industrial centre, and has a univ. The R. Segura divides it into two portions, connected by a fine bridge. The prin. building is the cathedral, founded 1388. It has various manufs., including a saltpetre and gunpowder factory. Pop. 226,702.

Murder. The generally accepted definition of M. in Eng. law is that of Coke: 'When a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace with malice aforethought, either express or implied' (see MALICE). Paraphrased this means: (1) That within limits children and idiots, or lunatics, cannot be guilty of M. But a lunatic who kills another person may be confined in Broadmoor or some other criminal lunatic asylum during the royal pleasure (see also INFANCY; CRIMINAL LAW). (2) That the mere killing of another by whatsoever means, whether by an act or omission likely to result in death, raises

a presumption of felonious homicide which the accused must rebut by showing some justification (see JUSTIFIABLE HOMICIDE) or excuse (as, for example, in self-defence). (3) That it is not M. to kill an infant in the womb, though such act of procuring abortion is punishable as a felony with penal servitude to the extent of life. But where a child born alive (in Scots law this is proved by any one who heard the child cry; in Eng. law by medical testimony that it breathed) afterwards dies by reason of drugs or wounds received while in the womb (*a fortiori* afterwards), those who administered such drugs or wounds are, according to the better opinion, guilty of M. (4) That it is not M. to kill an alien enemy actually participating in warfare against the state, but M. committed by a Brit. subject upon a foreigner (not an enemy) abroad is an extraditable crime, and the murderer can be punished by an Eng. court. (5) That the guilty state of mind essential to M.,

TABLE SHOWING THE NUMBER OF MURDERS KNOWN BY THE POLICE TO HAVE BEEN COMMITTED IN THE UNITED KINGDOM AND THE NUMBERS OF MURDERERS CONVICTED AND EXECUTED IN EACH YEAR BETWEEN 1922 AND 1944

Year	Number of Murders			Total for Trial	Numbers for Trial						
	Murders known to Police	Murders of Infants under one year (included in previous column)	Cleared up during year		Not tried		Acquitted	Guilty but Insane	Convicted	Sentenced to Death	Executed
					No Prosecution	Insane on Arraignment					
1922	145	45	—	60	—	3	9	13	35	34	21
1923	150	51	—	58	1	14	10	12	21	21	11

†1944	166	35	147	48	—	10	6	11	21	21	13

* For the purpose of this column murders 'cleared up' refers to cases where a person has been charged with the offence or when the suspect has died, or where more than one murder has been committed by the same person.

† 1944 figures are provisional only.

though generally one of seditious and deliberate intention to kill, may be inferred from any wanton or cruel act against another likely to result in death (see also MANSLAUGHTER; MALICE). 'Constructive' M. means the killing of a person while engaged in committing another felony, e.g., if a burglar fearing capture rushes so violently past an inmate of the house as to cause his death, that will be M. however unintentional the killing. But in practice the death penalty is never inflicted in a clear case of merely 'constructive' M. There is no *crime passionnelle* in Eng. law, for no provocation, however great, will justify killing, though if there be no *express malice (q.v.)*, the charge would be reduced to manslaughter.

Attempted suicide or self-murder is a felony punishable by imprisonment, but it is a commonplace of Eng. criminal law that if two people agree to commit suicide together and one survives, the survivor is guilty of M. Accessories before the fact to M. are equally guilty and punishable with the prin. offender; and an attempt to commit M. is punishable with penal servitude up to life. The punishment for M. is death, though in A.-S. times it was redeemable by payment of *Wergild*, or blood money, to the relatives of the murdered man. In some of the United States M. is classified into degrees. For example, M. by poison or by any premeditated design is M. in the first degree, and punishable with death; all other kinds of M. are said to be in the second degree, and punishable with imprisonment.

Between 1900 and 1918 1178 persons were sentenced to death, of whom 617 (including 11 women) were executed. The capital sentence was commuted to penal servitude, or the person convicted was respite to Broadmoor, in 537 cases, of which 114 concerned women. There were two outstanding trends in this period: the decrease in the number of murders of wives, sweethearts, and mistresses (though this tendency has been reversed during recent years) and the increase during the last nine years in the number of murders of women in connection with sexual assault, and of men and women in connection with robbery.

Recent discussion on the question of the suspension or abolition of the death penalty (see CRIMINAL LAW) prompted the suggestion that Eng. law and practice should recognise degrees of M. A Home Office memorandum, submitted to the Royal Commission on Capital Punishment (Aug. 4, 1919), set out the prin. objections to dividing M. into two degrees. These were (1) the impossibility of framing a definition which did not include inappropriate cases; (2) there were not in fact two classes of M., but an infinite variety of offences which shaded off by degrees from the most atrocious to the most excusable. No simple formula could take account of the innumerable degrees of culpability, and no formula which failed to do so could claim to be just or to satisfy public opinion. The suggestion often made that deliberate pre-

meditation should be the criterion of M. in the first degree is open to the objection that premeditated M. have included some of those least deserving capital punishment, while there are also many bad M. where there is nothing to prove or disprove premeditation. An attempt to classify M. by enumerating those types of offence for which the death penalty might be considered appropriate, rather than by a general and comprehensive definition, would probably be more complicated, but it would be equally productive of anomalies and inconsistencies. A provision of this kind would mean that the prosecution would have to bear the responsibility of deciding whether to charge the accused with M. in the first or second degree, and whether to accept a plea of 'Guilty' on the lesser charge from a person charged with M. in the first degree. Cases might occur in which after a person had been charged with M. in the second degree, facts emerged during the trial to show that the case was one of M. in the first degree. Although the exercise of the prerogative of mercy would not, in theory, be affected in practice it would be difficult for the home secretary to recommend commutation in those cases in which the prisoner was found guilty of M. in the first degree and sentenced to death. If the decision on the degree of culpability rested with the individual judge, he would have to bear a heavy and difficult responsibility, and moreover there would be considerable disparity between decisions in different cases, because different judges are liable to have different standards, and because no judge has such facilities as are available to the home secretary for considering each new case in the light of comparable cases over a period of years. The law of Scotland on the working of the death penalty differs from that of England. When a prisoner charged with M. suffers from mental weakness and abnormality, though he is not insane, the charge may be reduced to one of culpable homicide. This plea of diminished responsibility has frequently been taken in recent years. The extent of mental abnormality to justify a reduction of the crime is, however, difficult to define. See also under INSANITY. See Russell, *On Crimes*; S. F. Harris, *Principles of the Criminal Law*, 1926; Edith Wharton, *Criminal Law* (in the U.S.A.); F. T. Jesse, *Murder and its Motives*, 1924; H. M. Walbrook, *Murders and Murder Trials*, 1932; and H. Simpson, *The Anatomy of Murder*, 1937.

Murdock, William (1754-1839), Brit. engineer and inventor, b. at Aulincleek, Ayrshire. In 1792 he used coal gas as an illuminant in his own house, and ten years later it was used for lighting Soho. He also experimented on a high-pressure locomotive, and in 1784 made a small locomotive steam engine. He improved greatly on Watt's steam engine, and invented apparatus by which it was possible to use compressed air, devising the first oscillating steam engine.

Mure, Sir William (1594-1657), Scottish poet, b. at Rowallan in Ayrshire. He

became M.P. in Edinburgh in 1643, the following year being wounded at Marston Moor. He wrote a poetical trans. of *Boyd's Hecatombe Christiana* (1628); *The True Crucifixe for True Catholics* (1629), a version of the Psalms; *The History and Descent of the House of Rowallan* (pub. in 1825); and sev. miscellaneous poems.

Muret, or **Muretus**, **Marco Antoine** (1526--1585), Fr. humanist, b. at Muret, near Limoges. In 1563 he went to live in Rome, where he lectured and taught civil law till 1584, when he retired. He ed. *Lat. authors* and wrote *Orationes, Epistolæ* (1838), and *Varianum Lectionum Libri XIX.* His collected works were ed. by C. H. Frotcher (1834--41).

Murfreesboro, city and co. seat of Rutherford co., Tennessee, U.S.A., 32 m. S.E. of Nashville. It lies in an agric. dist., and carries on a considerable trade in cotton, grain, live-stock, timber, etc. M. was settled in 1811, and incorporated in 1817. Near by was fought the battle of Stone R. in 1862. Pop. 8000.

Murger, **Henri** (1822-61), Fr. novelist, b. at Paris. His most popular work is his *Scenes de la vie de Bohème* (1818), portraying the irresponsible and happy-go-lucky life of artists and students in Paris. It is the basis of Puccini's opera, *La Bohème* (1898). He contributed to the *Revue des deux mondes* and wrote a number of tales and dramas. Other works are *Scenes de la vie de jeunesse* (1850); *Claude et Marianne* (1851); *Le Pays Latin* (1852); *Adeline Protat* (1853); *Les Buveurs d'eau* (1855); *Le Sabot rouge* (1860); *Madame Olympe* (1852); and other prose tales, and a collection of poems entitled *Les Nuits d'hiver* (1864). Andrew Lang trans. sev. of his songs in *Ballads and Lyrics of Old France*, 1872. See lives by A. Delvan, 1866; R. d'Héricault, 1896; and G. Montorguelli, 1929.

Murghab: 1. Riv. of Central Asia, rising in Afghanistan and flowing W. and N.W. into Russian Turkestan through the oasis of Mero. It is lost in the sands 150 m. below Mero, after a course of about 370 m. 2. Riv. rising in the Pamirs, W. Asia, at an altitude of 13,720 ft., and flowing N.E., N.W., and W. to its junction with the Panj, or S. head-stream of the Oxus, at Wakhan. Length 260 m.

Muri: 1. Area of the emirate of Adamawa, N. Nigeria, traversed by the Benue R. Products: oil palm, rice, and citrus fruits. Pop. about 200,000. 2. Tn. of N. Nigeria, W. Africa, in Sokoto, 15 m. from the r. b. of the Benue, 300 m. E.N.E. of Lokoja.

Murillo, **Bartolomé Estéban** (1617-82), Sp. painter, was b. at Seville, and after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by hawking pictures at fairs and by painting religious pictures for exportation to S. America, he went to Madrid in 1641, being then in his twenty-fourth year, was favourably noticed by Velasquez, who treated him with the greatest kindness, and through his influence was enabled to study the master-

pieces of It. and Flem. art in the royal collections. In 1645 he determined to return to Seville, after an absence of three years, though advised to proceed to Rome by Velasquez, who offered him letters from the king. After settling in Seville he received numerous important commissions, including one from the friars of the Franciscan convent to paint a series of pictures for their cloister, and was soon acknowledged as the head of the school there in succession to Pacheco. In 1648 M. married a lady of fortune; he now maintained a handsome estab., and his house was the resort of people of taste and fashion. The Academy of Seville was

MURILLO

Engraving after a self-portrait.

founded by him in 1660, but he filled the office of president only during the first year. In early life he painted many pictures illustrative of humble life; in these the manner was less refined than that of his later pictures, which are mostly religious pieces. Amongst various altarpieces which he painted for the churches and convents in Madrid, Seville, Cordova, Cadiz, and Granada, is one representing the 'Marriage of St. Catherine,' and it was on the eve of his finishing this work that he met with an accident in the scaffolding, wounding himself so badly that he continued to feel the effects until his death at Seville in April 1682. He was buried in the church of Santa Cruz. In the Louvre, and in England, there are about forty of his works. The most celebrated of M.'s pictures are 'Moses striking the Rock,' 'Christ feeding the Five Thousand,' 'St. Anthony of Padua,' 'The Prodigal's Return,' and 'St. Elizabeth of Hungary' (Prado). The

picture M. preferred to all his other works was that of 'St. Thomas de Villaneuva distributing Alms to the Sick and Poor.' His *chef-d'œuvre* is the 'Immediate Conception,' which was purchased for the Louvre at the sale of Marshal Soult's collection in 1852 for £26,612. (There are fifteen examples of the 'Immaculate Conception,' in the Louvre, Seville Museum, Prado, etc.) Sir David Wilkie, who greatly admired and carefully studied the Sp. school, remarked in reference to it: 'Velasquez and Murillo are preferred, and preferred with reason, to all the others, as the most original and characteristic of their school. These two great painters are remarkable for having lived in the same time, in the same school, painted for the same people, and of the same age, and yet to have formed two styles so different and opposite that the most unlearned can scarcely mistake them. Murillo being all softness, while Velasquez is all sparkle and vivacity.' M. is known especially as a master of colour contrast. In the National Gallery, London, are 'A Spanish Peasant,' 'The Holy Family,' 'St. John and the Lamb,' and 'A Boy Drinking.' Other works include 'Founding of Santa Maria Maggiore' (four pictures in Santa Maria Blanca, Seville), 'La Purísima' (Seville Cathedral), 'St. John at God attending the Sick' and 'Miracle of the Loaves and Fishes' (Church of St. George, Seville), 'Adoration of the Shepherds' (Prado), 'Birth of the Virgin' (Louvre), and 'St. John at Patmos' (Metropolitan Museum of New York). See monographs by H. Knackfuss, 1896, 1923; P. Lafont, 1907; S. Montoto, 1923; and A. Muñoz, 1943. See also A. Calvert, *Murillo: Biography and Appreciation*, 1907; A. G. Hill, *Christian Art in Spain*, 1913; and C. R. Post, *A History of Spanish Painting*, 1933.

Murins, kind of bat divided into two species, *Murina* and *Minioptera*. The former are very large with a nose like a fox, big ears, and a wing span of as much as 16 in. The *Minioptera* are small creatures weighing barely one-third of an ounce; the nose is flattened like a pug's, and the wings are tapered, enabling them to fly with amazing rapidity.

Murmansk: 1. Formerly **Ekateriniusk**, port and naval station on the Kola Inlet of the M. coast of the Barents Sea, cap. of the M. Region of the R.S.F.S.R. Its development since the 1917 revolution has been phenomenally rapid and the increase in pop. from 10,000 in 1917 to 117,051 to-day was due largely to the construction of the railways joining it with Leningrad, and to the fact that it is the only ice-free port all the year round, a fact of great strategic importance to the allied nations in the Second World War. Its industries are mostly related to its fisheries and include the production of cod-liver oil and shagreen. In 1918-19 an allied force operated from M. as a base against the Bolsheviks. On Oct. 23, 1939, the American-owned ship *City of Flint* arrived at M. with a Ger. prize crew. She was sailing from New York to Manchester when the Ger. battleship *Deutschland* put the prize crew on board (see further under

NAVAL OPERATIONS IN SECOND WORLD WAR). The first Ger. bombers over M. appeared on July 3, 1941. Russian bombers attacked the Finnish-Ger. forces near M. in Nov. 1941. The Gers., however, never succeeded in taking the tn. 2. Region of the R.S.F.S.R., with an area of 53,630 sq. m., bordering on Finland and formed by the Kola peninsula. Its coasts are important fishing areas, especially for cod, and the region round Lake Imandra has been developed as an industrial area. Copper, nickel, and iron are found near the lake, and mica in the E. of the peninsula. Power is supplied by hydro-electric stations utilising the rivs. flowing from the Finnish border to the sea. Near M. tn. the bogs have been drained and produce a large supply of vegetables. Pop. 291,000.

Murner, Thomas (1475-1536), Ger. satirist and opponent of the Reformation. He was b. at Obernheim in Alsace. In 1505 he was made poet laureate by Maximilian, and in 1513 became guardian of the Franciscan monastery at Strasburg. His satirical works, directed against the Reformation and Luther, include *Die Narrenbeschwörung* (1512); *Die Gauchmatt* (1519); and *Von dem grossen lutherischen Narren* (1522). See W. Kawerau, *Murner und die deutsche Reformation*, 1891, and *Murner und die Kirche des Mittelalters*, 1890, and W. Pfeiffer-Belli, *Thomas Murner im Schweizer Glaubens Kampf*, 1939.

Muro Lucano, tn. in the prov. and 20 m. N.W. of the tn. of Potenza, Italy. Pop. 8,500.

Murorn, tn. in the Gorky region of the R.S.F.S.R. on the l. b. of the Oka R., 81 m. S.E. of Vladimir; has an old cathedral. There are iron-ore mines near by, and the tn. trades in timber, cereals, metals, salt, sugar, and tea. Pop. 23,000.

Muroran, port and naval station in the prov. of Iburi, Yezo, Japan; has large steel works, and exports timber and coal. Pop. c. 12,000.

Muros, com. in the prov. of Coruña, Spain, 29 m. W.S.W. of Santiago. Pop. 3,000.

Murphy, Arthur (1727-1805), Brit. actor and playwright, b. near Elphin, Roscommon. In 1751 he made his début as an actor in *Othello* at Covent Garden. He wrote numerous farces and dramas, amongst them *The Apprentice* (1756); *All in the Wrong* (1761); *What we Must all Come to* (1761), played in 1776 as *Three Weeks after Marriage*; *Know Your Own Mind* (1778), etc., some satires, and a trans. of Tacitus (1793).

Murphysboro, city and co. seat of Jackson co., Illinois, U.S.A., 87 m. S.E. of St. Louis by rail. Coal and iron are mined. Pop. 9,000.

Murray, foot-and-mouth disease (q.v.). **Murray, Sir David** (1849-1933), Scottish artist, b. in Glasgow, gave up a commercial career to study painting. Elected A.R.A. in 1891 and R.A. in 1905. In 1917 he was made president of the Royal Institution of Painters in Water Colours. His pictures are mostly realistic landscapes and among the best are 'In the

Country of Constable,' 'River Road,' 'Marigolds,' 'Young Wheat,' 'Gorse,' and 'Hampshire.' Two of them are in the Tate Gallery.

Murray, David Christie (1847-1907), Eng. novelist, b. at W. Bromwich, Staffordshire. In 1876 he was special correspondent for *The Times* during the Russo-Turkish war. He wrote numerous novels, the best of which are *Joseph's Coat* (1881); *One Traveller Returns* (with H. Herman) (1887); *Bob Martin's Little Girl* (1892); *In Direst Peril* (1894); and *Verona's Father* (1903).

Murray, George Gilbert Aimé (b. 1866), Eng. scholar, poet, and author, b. at Sydney, New S. Wales, son of Sir Terence Aubrey M., president of the Legislative Council, New S. Wales. Educated at Merchant Taylors' School and St. John's College, Oxford. A fellow of New College, Oxford, in 1889 he became prof. of Gk. at Glasgow Univ., and from 1908 to 1936 was regius prof. of Gk. at Oxford. In 1889 he married Lady Mary Howard, daughter of the ninth earl of Carlisle. He became prof. of poetry at Harvard Univ. in 1926, and from 1914 was a trustee of the Brit. Museum. From 1923 to 1938 he was chairman of the League of Nations Union (co-president from 1938), and president of the International Committee of Intellectual Co-operation from 1928. He pub. a *History of Ancient Greek Literature* (1897). His verse trans. or free renderings of Gk. plays, e.g. of Euripides: *Hippolytus*, *Trojan Women*, *Electra*, *Medea*, *Iphigenia in Tauris*; of Sophocles: *Œdipus Rex* (1902-13); and of Æschylus: *Agamemnon*, *Eumenides*, and *Persians*, are of the highest quality and reintroduced Gk. drama to the stage, becoming known during the Vedrenne-Barker management at the Court Theatre, 1904-7, and new ones appear occasionally. O.M., 1941. Of his other pub. may be mentioned, *The Rise of the Greek Epic* (1907, 1911, and 1924); *The Origin of Tragedy* (1912); *Five Stages of Greek Religion* (1913, 1925); *Stoic Philosophy* (1915); *Faith, War, and Policy* (1918); *Problem of Foreign Policy* (1921); *The Order of this Generation* (1929); *Aristophanes* (1933); *Liberality and Civilisation* (1938); *Æschylus, Creator of Tragedy* (1940); *Stoic Christian and Humanist* (1940); and *From the League of U.N.* (1948).

Murray, Sir Hubert (1861-1940), Brit. administrator, b. at Sydney, New S. Wales, son of Sir Terence Aubrey M., president of the Legislative Council, New S. Wales, and a brother of Gilbert M. He was educated at Sydney Grammar School, Univ. College, London, and Oxford Univ., and served with the Australian Bush Rifles in the S. African war. After holding a Crown prosecutorship (he had been called to the Bar in 1886) at the New S. Wales Bar, he accepted the appointment of lieutenant-governor of Papua, and in his long tenure of office made the administration of Papua a model. He developed in his staff an extraordinary power to understand the outlook and minds of the natives and a unique way of dealing

with them. Some account of his methods may be found in his various writings, including *Review of the Australian Administration in Papua* (1907-20); *Papua or British New Guinea* (1912); and *Papua To-day* (1925). See T. G. Hides, *Papuan Wonderland*, 1936, and L. Lett, *The Papuan Achievement*, 1943 (an account of his thirty-two years' administration).

Murray, Sir James Augustus Henry (1837-1915), Brit. philologist and lexicographer, b. at Denholm, near Hawick, Roxburghshire. He graduated at London and Oxford, and received the degree of LL.D. (Edin.) in 1874. He commenced teaching at Hawick Grammar School in 1855; became master at Mill Hill School, 1870; assistant examiner in Eng. to the univ. of London, 1875-79; and in 1885 went to Oxford. For many years he was engaged in editing the *New Oxford English Dictionary* (pub. 1884-1933), of which he was the chief creator, though his editorial responsibility covered only A-D. H. K. O. P. and T. In 1878 he was appointed president of the Philological Society, London, for which he wrote various papers. He was also the author of articles on the *History and Language of the Border Counties*, and *The Dialect of the Southern Counties of Scotland*. See memoir by H. Bradley in *Proceedings of the British Academy* (vol. viii, 1919); the life by C. T. Onions in the *Dictionary of National Biography*; and S. Baldwin, *The Oxford English Dictionary, 1881-1928. An Address*, 1928.

Murray, or Moray, James Stuart, Earl of, see MORAY.

JOHN MURRAY (1778-1843)

Murray, John, name of sev. generations of Eng. publishers, and one that will long remain associated with many a classic writer of Eng. literature. John M. (1745-93), the founder, b. in Edinburgh, first served as an officer in the Royal Marines. In 1768 he purchased the bookselling business of Wm. Sandby, and thenceforth became a bookseller and publisher at 32 Fleet Street. His most notable pub. were Mitford's *History of*

Greece (1784-1810), J. and W. Langhorne's *Plutarch* (1770), and the first part of Isaac D'Israeli's *Curiosities of Literature* (1791-1823); and he also started the monthly *English Review*. At his death he was succeeded in due time by his son John M. (1778-1843), who was left an orphan of fifteen at his father's death. The second John M. began by himself editing many medical and other works, and founded in 1809, as a counterblast to the *Edinburgh Review*, the renowned *Quarterly Review*. The enormous financial success of the *Quarterly* enabled M. to extend his activities. His premises at Albemarle Street became the resort of *littérateurs*, including Walter Scott, of whose *Marmion* and some other works M. was part publisher. Southey, Byron, Jane Austen, Borrow, Crabbe, Moore, Campbell, Washington Irving, and the critic Gifford. In deference to the wishes of Byron's family he burned his memoirs of which he (M.) became possessor on B.'s death. In collaboration with Scott, Southey, and others, he pub. his Family Library of 80 vols., a work which is further notable by reason that M. lowered the conventional price to reach a wider circle—a movement which was developed in later years by Dept's Everyman's Library. Another large series was M.'s Guide Books. John M. (1808-92) succeeded his father and himself wrote numerous vols. of the Handbooks for Travellers, travelling extensively on the Continent for the purpose. The works of Grote and Darwin, as also those of Hallam, Dean Stanley, Livingstone, Gladstone, and Lyell, J. Campbell's *Lives of the Chancellors*, 1845, and Wm. Smith's classical dictionaries were pub. by him. He ed. Gibbon's autobiography and Byron's *Correspondence*. The fourth John succeeded in 1892 and for sixteen years had his brother Hallam as partner. An outstanding event of his time was the pub. of the *Letters of Queen Victoria*. He also pub. many notable works of hist., biography, travel, fiction, etc., and in 1917 absorbed the well-known firm of Smith, Elder & Company. He was made a K.C.V.O. in 1926 and d. in 1928. He was succeeded by John the fifth (b. 1884), under whom the *Letters of Queen Victoria* were completed and Axel Munthe's famous *San Michele* pub. The firm still continues in the historic premises in Albemarle Street to carry on the traditions of sound literature. J. M. (fifth) was awarded a D.S.O. and bar in the First World War, and was made a K.C.V.O. in 1932. See S. Smiles, *A Publisher and his Friends: Memoir and Correspondence of John Murray*, 1891, 1911; John Murray (fourth), *John Murray III., 1808-92*, 1919; and George Paston (E. M. Symonds), *At John Murray's: Records of a Literary Circle, 1843-1892*, 1932.

Murray, Sir John (1841-1911), Canadian naturalist and geographer, b. at Coburg, Ontario, and educated in Ontario, the High School, Stirling, Scotland, and at Edinburgh Univ. He was one of the naturalists who made the famous voyage in the *Challenger*, and was appointed editor

of the reports of the expedition. He also took part in the explorations in the *Triton* and *Knight Errant* to the Farøe Channel. Besides the above reports he was one of the authors of *The Narrative of the Cruise of the 'Challenger'* (1866); of *A Report on Deep-sea Deposits* (1891); and of *A Report on the Survey of the Locks of Scotland* (1910). He also wrote numerous articles on geographical and marine subjects.

Murray, Lindley (1745-1826), Anglo-Amer. grammarian, b. at Swatara, Pennsylvania. He was called to the Bar in 1765. In 1784 he settled in England and devoted himself to literature. His first book was *Power of Religion on the Mind* (1787). Later he wrote *English Grammar* (1795, and 200 eds. before 1850), long a standard work and his chief claim to a place in literature. These were followed by various works, such as *Eng. readers*, etc. See *Memoirs in Letters written by Himself*, 1826.

Murray, William, see MANSFIELD, EARL OF.

Australian News and Information Bureau

MURRAY RIVER
The Concrete Wall.

Murray, or Hume, prin. riv. of Australia, rising in the Australian Alps and flowing W. to the sea through the shallow Lake Alexandrina. For the greater part of its course it forms the boundary between New S. Wales and Victoria. In conjunction with the Darling it drains almost the entire S.E. quarter of the continent. Its total length is about 1500 m. Owing to sandbars at its mouth it is inaccessible for large vessels but navigable for small steamers. Its chief tribs. are the Murrumbidgee, Lachlan, and Darling. The water of the M. is used for irrigation purposes, being dammed at the Hume reservoir where the Mitta Mitta joins it, so that it is available in the dry season. The Hume Reservoir stores 1,250,000 acre feet of water which runs off a catchment area of

about 6000 sq. m. of mountainous country on the border of Victoria and New S. Wales. It is composed of an earthen embankment 111 ft. long and a massive concrete wall, forming the spillway and outlet works, across the riv. for 1042 ft. on the New S. Wales side. On the Victorian side, an earthen embankment 3827 ft. long, brings the total length to one mile. The reservoir forms a vast inland lake of 33,000 ac.—three times the size of Sydney Harbour. The large volume of water stored in it ensures an adequate flow of water in the irrigated areas in the lower reaches of the M. R. In 1949 the govs. of New S. Wales and Victoria agreed on a scheme for the diversion of the headwaters of the Snowy R. (q.v.) across the Australian Alps into the Upper M. and Tumut Rs. in connection with a vast hydro-electric irrigation project estimated to cost £A170,000,000. The scheme, which will take many years to complete, will, it is estimated, yield 1,300,000 kilowatts, about one-half more than the current total consumption of electricity in the two states. It is expected that in about eight years the water available for irrigation in the Murrumbidgee valley will be twice the volume now available and that soon afterwards large-scale generation of power will begin. See J. M. Holmes, *The Murray Valley*, 1948.

Murray Bay, or **Malbaie**, watering-place and bay of Charlevoix co., Quebec, Canada, on the Lower St. Lawrence R. Pop. 4300.

Murray Bridge, tn. of S. Australia. On the R. Murray, 50 m. S.E. of Adelaide, on the Adelaide-Melbourne road and railway line. Centre of an extensive dairying industry, its other pursuits are agriculture and pastoral. It is a popular tourist resort. Pop. 4000.

Murraysburg, vil. and div. of Cape of Good Hope, S. Africa. The vil. is 50 m. W.N.W. of Graaf-Reinet. Pop. (vil.) (white) 1200, (others) 3700.

Murree, or **Marri**, hill station and sanatorium of Pakistan, about 10 m. N.E. of Rawal Pindi (altitude 7520 ft.). Pop. (winter) 2000, (summer) 20,000.

Mürren, vil. of the Bernese Oberland, Switzerland, 3 m. S.W. of Lauterbrunnen. It affords a fine view of the Jungfrau. Pop. 1600.

Murrhine, or **Myrrhine Vases**, celebrated vessels of antiquity, brought from Asia to Rome by Pompey, after his victory over Mithridates.

Murrumbidgee, riv. of New S. Wales, rising on the N.E. of the Australian Alps, and flowing 1350 m. westwards to join the Murray, 90 m. S.E. of the mouth of the Darling. It is navigable for 500 m. during the wet season.

Murry, John Middleton (b. 1889), Brit. writer, b. in Peckham, London. He was educated at Christ's Hospital and Brasenose College, Oxford, was on the staff of the *Westminster Gazette*, 1912-13, being art critic 1913-14. During the First World War he served in the political intelligence div. of the War Office. Editor of the *Athenum*; 1919-21, and of the *Adelphi*, 1923-30. He became Clark

lecturer at Cambridge Univ. in 1924. He ed. *Peare News* from 1940, and, in this connection, wrote *The Necessity of Pacifism* (1937). His writings largely consist of literary criticism and criticism of existing social institutions. Among his many works are *Aspects of Literature* (collected essays in the *Athenum*, 1920); *The Things we are* (1922); *Things to come* (1928); *God* (1929); *Son of Woman* (on D. H. Lawrence, 1931); *The Necessity of Communism* (1932); *Between Two Worlds* (autobiographical, 1934); *Shakespeare* (1936); *The Defence of Democracy* (1939); *The Betrayal of Christ by the Churches* (1940); *Christocracy* (1942); *Adam and Eve* (1944); *The Free Society* (1947). Also a collection of *Poems* (1919). He collaborated with Ruth E. Mantz in a biography of his wife, Katherine Mansfield (q.v.) (1933). He rejects criticism which lacks that reference to life as a whole which, in his later years, he has come to regard as essential to all criticism, and considers that 'the function of true criticism is to establish a definite hierarchy among the great artists of the past, as well as to test the production of the present: by the combination of these activities it assists the organic unity of all art' (*Aspects of Literature*). It is said that the character of Denis Burlap in Aldous Huxley's *Point Counterpoint* is founded on M.'s personality. See study by R. Heppenstall, 1934.

Murshidabad, city and dist. of Bengal, India. The city lies 115 m. N. of Calcutta, and extends along both sides of the sacred R. Bhagirathi. During most of the eighteenth century it was the Muslim cap. of Bengal, and was a flourishing and an important city. It contains the palace of the nawab, a handsome structure. The industries include the manu. of silk and other fabrics, embroidery, and articles of carved ivory, gold, silver, etc. The entire dist. covers an area of 2143 sq. m., and the pop. numbers about 1,500,000. Pop. of tn. 20,000.

Mursia, see ESZEK.

Murten, see MORAT.

Murtoza, fishing centre of Aveiro, Portugal, 30 m. S. of Oporto. Pop. 10,000.

Murviédro, see SAGUNTO.

Mus, **Mush**, or **Moush**, prov. (il) of Turkey, 55 m. W. of Van Golu Lake, and largely peopled by Armenians. Pop. 82,518.

Musa, **Abu Abdallah Mohammed Ben**, Arabian mathematician, the first of his countrymen to write on the science of algebra, and to whom Europe is indebted for its introduction.

Musa, **Antonius**, Rom. physician and a brother of Euphorbus. He said to have been the first to recommend the use of cold baths, and treated the Emperor Augustus by this means. Was also of a literary bent and acquainted with Virgil and Horace.

Musa, **Ibn Nosseyr**, or **Nosair** (A.D. 640-715), Arab conqueror of N. Africa in 699-709. In 712 he formed an alliance with Count Julian and crossed to Spain, taking sev. important tns., amongst them Seville.

On his return he fell under the displeasure of the caliph of Damascus, who exiled him.

Musæus, Gk. grammarian who fl. about the fifth century A.D. He wrote an erotic poem describing the loves of Hero and Leander, which has been trans. into Eng. more than once, notably by Christopher Marlowe (Dilthey's ed., Bonn, 1874), and into Ger. by A. Zimmermann (1914).

Musæus, Johann Karl August (1735-1787), Ger. novelist, b. at Jena. His first work, entitled *Grandison der Zweite*, was pub. in 1762 and rewritten about twenty years later under the title of *Der deutsche Grandison*, its object being to satirise the Eng. novelist Richardson's hero. His most important work was *Folksmärchen der Deutschen*, a series of satirical tales (1782-86). See M. Müller, J. K. A. *Musæus*, 1867; also Carlyle's trans. and biographical notices.

Musca (Lat. the fly), constellation situated E. of Chamæleon and S. of the Southern Cross, also sometimes known under the name of Apis (the bee), and formerly used to designate a constellation N. of Aries. It contains nine stars, visible to the naked eye, one of the third and three of the fourth magnitude.

Muscardine, or **Silkworm Rot**, disease which causes much loss among silkworms. It is caused by a fungus, many allied species of which are parasites on Lepidoptera, both in the caterpillars and the perfect insects.

Muscat, tn. and seaport on the S.E. coast of Arabia, cap. of the sultanate of Muscat and Oman. It is under Brit. political influence. The climate is hot and unhealthy. Dates are the prin. export. M. was taken by the Portuguese in 1508 and remained under their rule till 1650, when they were finally expelled. M. was once an important, prosperous tn., but has been falling into decay for many years and most of its former trade now goes to the sister port of Muttrah, which is the starting point of the trade route to the interior, but M. still remains the seat of government. Pop. about 4500.

Muscadel, **Muscatele**, **Muscadel**, or **Muscade** (It. *moscato*, musk), white wine produced in Languedoc, France, both strong and sweet. The name is generally applied, however, to most Fr. and It. wines made from the muscadine grape, either of the red or white variety.

Muscatine, city of Iowa, U.S.A., on the r. b. of the Mississippi. Manufs. include pearl buttons, terra-cotta, pottery, etc. Pop. 18,000.

Muscle, structure of the body capable of causing motion by the contraction of its fibres. Muscular tissue consists of elongated cells or fibres. The fibres making up some of the Ms. consist of protoplasmic material with transverse stripes; these are called striped or striated fibres. Others possess no transverse markings, and are therefore known as non-striated or plain muscular fibres. Every muscular fibre has the property of contracting, that is, on the receipt of a certain stimulus a chemical change is brought about, resulting in a change in

the elastic tension of the cell. An increase of tension occurs in the points of attachment of the cell to neighbouring tissues, which ordinarily move under the strain, so that the length of the fibre decreases, while its diameter becomes proportionately bigger. In some Ms. this contraction is voluntary; that is, it is the result of an act of will. This modification of consciousness is accompanied by a certain mode of activity in some of the cells of the large brain, or cerebrum. By this means an impulse is communicated to the nerve-fibres supplying the Ms. and is conveyed to the M. by end-plates or expansions of the nerve-fibres situated on the surface of the muscular fibres. Other Ms. are not under the control of the will. Such are the Ms. causing the motion of the stomach and other parts of the alimentary canal. They are called involuntary Ms., and are made up of non-striated fibres, except the cardiac M., which resembles voluntary Ms. in being striated. It is, however, not always possible to classify Ms. as voluntary and involuntary, for some of them, such as those of the tongue, larynx, and eyeballs of the Vertebrata, and certain Ms. of Arthropoda, are intermediate in type. The capacity of a M. for responding to a stimulus is termed its excitability. In cardiac M. the extent of contraction does not depend upon the intensity of the stimulus, but in Ms. attached to the bones a relation is maintained between contraction and stimulus. If, however, a M. has been repeatedly contracted without much intermission, a stimulus does not evoke the usual extent of contraction. This condition is called muscular fatigue, and further evidence of it is afforded by the increasingly longer periods of relaxation. Eventually the M. will fail to respond at all to the stimulus. Muscular fatigue is due to the formation of lactic acid from the glycogen in the M. cells. This glycogen is produced by the action of insulin (q.v.) on the sugar dissolved in the blood, and, apparently by an internal rearrangement of the molecule, glycogen is converted into lactic acid. This change accompanies the contraction of the M., and heat is produced during the process. A young athlete, running as fast as he can, produces about four grammes of lactic acid per sec.

During relaxation some of the protein in the M. cell combines with and neutralises the lactic acid, and recovery from fatigue is effected by oxidation of the product. This process results in the re-formation of protein, the conversion of some of the lactic acid into glycogen, and the complete oxidation of the remainder with the elimination of carbon dioxide and the production of heat.

When exercise is moderate the amount of lactic acid in the blood reaches its maximum after a few minutes and is quickly removed by the increase of the oxygen supply by deep and rapid breathing. If exercise be very strenuous the lactic acid increases, until there are symptoms of distress, and eventually a type of *rigor mortis* may be caused. The fleshy part of a M. is usually attached at each

end to bands, or tendons, of white fibrous tissue, which is itself non-contractile, but in Vertebrata serves to join the M. to some bone. The attachment which is more fixed is called the origin; that which is more movable is called the insertion. Thus the biceps has two origins, in the coracoid process and the glenoid cavity; its insertion is in the tuberosity of the radius, or the outer bone of the forearm. Every M. is supplied with blood-vessels, and lymphatics to carry the substances for repair of tissue, for the combustion which liberates the energy resulting in contraction, and for the removal of

Muselier, *Émile Henri* (b. 1882), Fr. admiral, b. in Marseilles and educated at the Brest naval school. He was a corvette captain in 1918 and, after the First World War, became frigate captain (1922), rear-admiral (1933), and vice-admiral (1939). Among his commands before the Second World War were those of the defences of Cherbourg and of the second cruiser div. in the Mediterranean; in 1938 he was appointed admiral commanding the navy and defences of Marseilles. On the collapse of France in 1940 M. joined Gen. de Gaulle (July 1940), who made him commander-in-chief of the

MUSCLE

1. B. biceps muscle; O, origin, attachment to scapula by two tendons; L, insertion on radius.
2. Diagrammatic representation of nerve, F, and its end-plates on a striated muscle fibre; N, nucleus.
3. Connected cells of cardiac muscle (diagrammatic); N, nucleus.
4. Unstriated muscle fibre (diagrammatic); C, cytoplasm; N, nucleus.

waste products. See also CLONUS OR REFLEX. See Sir W. Mackenzie, *The Action of Muscles*, 1918; J. F. Fulton, *Muscular Contraction*, 1926; A. V. Hill, *Muscular Activity*, 1926; and A. D. Ritchie, *The Comparative Physiology of Muscular Tissue*, 1928.

Muscovy, name properly applying to the anct. principality of Moscow, but used in the sixteenth and seventeenth centuries to mean the whole of Russia.

Muscovy, or Musk, Duck (*Cairina moschata*), species of wild duck native to Central and S. America, where it nests in the trees of forest swamps. It is often reared in poultry yards of European countries as an ornamental bird for lakes and parks. It is also called Barbary duck.

Free Fr. naval forces (1940-42), and of the Free Fr. air forces (1940-41). M. led the Free Fr. naval forces in the occupation of Saint-Pierre and Miquelon Is. against the representatives of the Vichy Gov. there. He was made national commissioner of navy and merchant navy in the Fr. National Committee, but resigned in March 1942 and in the following year became assistant to Gen. Giraud (g.r.) in Algiers. After the war he was chief of the Fr. naval delegation of the military mission for Ger. affairs till 1945. Founded a new political party called the Union for the Defence of the Republic (1946). Hon. K.C.B.; Grand Officer of the Legion of Honour.

Muses (Lat. *Musæ*, Gk. *Μοῦσαι*) were, according to the earliest writers, the

inspiring goddesses of song, and, according to later notions, divinities presiding over the different kinds of poetry, and over the arts and sciences. They are usually represented as the daughters of Zeus and Mnemosyne, and *b.* in Pieria, at the foot of Mt. Olympus. Their original number appears to have been three; but afterwards they are always spoken of as nine in number. Their names and attributes were: (1) Clio, the muse of hist., represented in a sitting or standing attitude, with an open roll of paper, or chest of books. (2) Euterpe, the muse of lyric poetry, with a flute. (3) Thalia, the muse of comedy and of merry or idyllic poetry, appears with a comic mask, a shepherd's staff, or a wreath of ivy. (4) Melpomene, the muse of tragedy, with a tragic mask, the club of Hercules, or a sword; her head is surrounded with vine leaves, and she wears the cothurnus. (5) Terpsichore, the muse of choral dance and song, appears with the lyre and the plectrum. (6) Erato, the muse of erotic poetry and mimic imitation, sometimes also has the lyre. (7) Polymnia or Polyhymnia, the muse of the sublime hymn, usually appears without any attribute, in a pensive or meditating attitude. (8) Urania, the muse of astronomy, with a staff pointing to a globe. (9) Calliope or Calliopea, the muse of epic poetry, represented in works of art with a tablet and stylus, and sometimes with a roll of paper or a book. The worship of the M. was introduced from Thrace and Pieria into Bæotia; and their favourite haunt in Bæotia was Mt. Helicon, where were the sacred fountains of Aganippe and Hippocrene. Mt. Parnassus was likewise sacred to them, with the Castalian spring.

Museums (from Gk. *mouseion*, temple of the Muses), name now given to buildings where collections of scientific, literary, and natural curiosities and works of art are stored for the benefit of the public. The first of the kind was the famous univ. building at Alexandria (including the library). Here were lodged and entertained the men of learning, each of whom had a handsome revenue. Its foundation is attributed to Ptolemy Soter (c. 283 B.C.). A library or picture gallery may be included, but in Britain does not usually form the sole or even the most prominent feature of M. properly so called, though on the Continent the terms 'musée' and 'museum' are regularly used for such collections. These institutions remained practically unknown from the fourth to the seventeenth century, and the earliest were merely aimless collections of curiosities, amassed without method or system, usually by private individuals, such as the Tradescant Museum, which became more valuable as the Ashmolean Museum (c. 1679), at Oxford. The growth and development of the modern M. were a feature of the later nineteenth century, the chief aims (as enunciated in 1870) being to provide education and recreation for the people. Ideal M. should teach the connection between the different branches of learning, and destroy the arbitrary distinction drawn between M.

of 'science' and of 'art.' Lack of space has sometimes been responsible for such separations, notably in the case of the transfer of the natural hist. specimens to Cromwell Road, S. Kensington, from the Brit. Museum in Bloomsbury (founded c. 1753 from the Sloane collection). The Guimet Museum at Paris is a museum of religious; the Pitt-Rivers Museum at Oxford illustrates the evolution of man-made objects. The Fitzwilliam Museum at Cambridge possesses an excellent collection of engravings, MSS., and books left by its founder, Viscount Fitzwilliam; the 'Hunterian M.' of the Royal College of Surgeons is a museum of comparative anatomy. Noted M. of wider and more general aim are the Vatican in Rome (started by Pope Julius II.), the Uffizi and Pitti (chiefly painting and sculpture) at Florence, the Louvre of Paris (opened to the public c. 1789), M. at Leningrad, Dresden, Munich, Berlin, Vienna, Naples, Milan, Venice, and in America the Carnegie Institute at Pittsburgh, Pennsylvania (1896), and the National Museum at Washington (c. 1876), under the control of the Smithsonian Institution. M. may be under national, prov., or municipal control, or run by a semi-public body, such as a univ. or a trade guild. Many national M. originated in private collections, as, for example, the 'Hunterian M.' of the Royal College of Surgeons, London, and of Glasgow Univ., and above all the Brit. Museum itself. Holland formerly had many collections owned by her merchant princes. The various great exhibitions, and especially that of 1851, did much to promote interest in M. and led to the estab. of many in the nineteenth century. Some-what similar arrangements are made in the science exhibitions at S. Kensington where a wide range of mechanical appliances is prepared so that students may obtain instruction by setting in motion a number of working models. Medical and surgical M. are important to scientific training and are added to modern univs. granting surgical and medical diplomas. The wax model exhibition at Guy's Hospital is particularly famous. A comparatively modern movement is that of displaying exhibits of particular interest to the dist. This is done by the Gifford Museum in Kingsland Road, London, which lies in the centre of the furniture-making industry. One of the most interesting collections formed of late years consists of exhibits relating to the First World War which are now housed in the Imperial War Museum, Lambeth Road, S.E.1.

Despite the fact that bombing caused many of London's M. to remain closed for some time after the war, there was evidence, as early as 1946, of a greatly increased interest in the M. Thus the Natural Hist. Museum, with its galleries completely closed, was selling far more of its publs., including serious scientific works, than before the war. Attendances at the Science Museum were almost double those of the years before 1939 and, similarly, there were greatly increased attendances at the Victoria and Albert

Museum, although only a few of its galleries were open. The Imperial War Museum, the only big museum in central London S. of the Thames, had, even by mid 1946, only a very small part of its exhibition space in a fit state for use; the great bulk of its galleries, though not actually destroyed by bombing, was still not usable. The London Museum (Lancaster House) suffered no great damage from bombing, but was required by the gov. for offices and conferences, and for a time it seemed doubtful whether it would continue as a museum, although by the will of the late Lord Leverhulme the intention was to present his unexpired Crown lease to preserve a home for the London Museum and only secondarily to provide a setting for the above-mentioned uses. It is (1949) understood that the museum will be reopened in about eighteen months' time, not at Lancaster House but in a part of Kensington Palace. Also damaged was Sir John Soane's Museum in Lincoln's Inn Fields, which is not strictly a museum but, rather, a special trust. The Natural Hist. Museum or, in other words, the Brit. Museum (Natural Hist.), one of the great national scientific institutions, suffered severely from bomb damage, both to the building and to the exhibition cases, and it will be many years before the exhibition galleries are completely restored. In all, the damage suffered by museum buildings in London during the war amounted to £1,294,000. But very little damage was caused to their contents, apart from the loss of 200,000 books in the Brit. Museum library and some 30,000 vols. of prov. newspapers at its newspaper library at Hendon. It is planned to construct a new library building for the Brit. Museum on land adjacent to the museum, and a new ethnographical building at the N.E. corner of the museum site. The latter would take the place of the Ethnographical Museum at S. Kensington, suggested in the 1938 scheme of the Standing Commission on M. and Galleries, and would possibly allow of the removal of the contents of the India section of Victoria and Albert Museum to Bloomsbury. (Third Report of the Standing Commission on M. and Galleries, H.M.S.O., 1948.)

In recent years M. have been increasingly used for educational purposes in consequence of the adoption of methods of visual teaching. This method of instruction is largely adopted in the U.S.A., and instruction of this nature is afforded in the Brit. Museum where at stated hours lectures are given to groups of school children, students, and visitors. For full information on normal arrangements at the chief M. in the United Kingdom see *Whitaker's Almanack*.

Musgrave, Samuel (1732-c. 1780), Eng. classical scholar and physician. He wrote *Excitationes in Euripidem* (1762); *Two Dissertations*, on 'Gk. Mythology' and on 'Newton's Objections to the Chronology of the Olympiads' (1782); *Animal-versions in Sophoclem* (1800); and works on medical subjects. Helped edit Euripides (4 vols., 1778). His notes on Sophocles were bought by Oxford Univ. after his death, and were included in an ed. of the tragedies pub. at Oxford in 1800. See Schweighäuser's ed. of Appian; *Gentlemen's Magazine* 1770; and J. Nichols, *Literary Anecdotes*, 1781.

Musgrave, William (c. 1657-1721), Eng. physician and antiquary, studied at Oxford. He was secretary to the Royal Society (1685), and settled in Exeter (1691), practising as a physician. He wrote treatises on gout and medicine. His three antiquarian studies, *Julii Flaviae Epitaphium* (1711), *Geta Britannicus* (1716), and *Belgium Britannicum*, were reissued as *Antiquitates Britanno-Belgicae* (1719). For these researches he was presented by George I. (some say his son, the Prince of Wales) with a diamond ring on Aug. 6, 1720. See A. à Wood, *Athena Oxon.* iv. (Bliss ed.), and W. Munk, *Coll. of Phys.* i. (2nd ed.), 1878.

Mushroom (*Agaricus psalliota campestris*), very variable Brit. fungus, which has long been valued for its edible qualities, and has been cultivated from 'spawn' since the seventeenth century. The 'spawn' is obtained from rich old pastures where horses and cattle have been feeding, and is made up with moderately dry cakes of dung and earth. If properly prepared it lasts fit for use for five years, the fungus being in a white thread-like form (mycelium). Except during a few weeks in autumn the supply of good fresh Ms. falls far short of the demand; but their production throughout the year is not specially difficult, and while the crop is profitable in itself, the spent manure from M. beds is all important in the success of modern methods of intensive culture. The crop can be raised in the open air, in frames, sheds, or cellars, as well as natural caves, mines, or railway tunnels, wherever an even temp. of from 55° to 60° can be maintained from the fermenting manure. In the open the M. bed is made ridge-shape on the driest possible site; elsewhere it is made flat. The use of manure from horses fed largely on corn and littered with long straw is essential and the decline in the number of horses in Great Britain in recent years has presented M. growers with a serious problem; efforts have been made to find

a synthetic compost which will serve as a growing medium. There are no rough and ready distinctions of *Ms.* from other fungi; but the botanical features, though variable, make identification easily possible. When young it is globose, expanding until nearly flat, and from 3 to 6 in. across. It is white, and the thick flesh turns brown when cut or broken. The stem is stout, with a ring or frill near the top; and the crowded gills turn from rosy to dark brown. It occurs naturally in rich, open ground, not under trees. See also CHANTRELLE and FUNGI. See E. Step, *Toadstools and Mushrooms of the Countryside*, 1931; W. F. Bewley and J. Harnett, *Cultivation of Mushrooms*, 1934; W. J. May, *Mushroom Culture for Amateurs*, 1935; and L. L. Pray, *Common Mushrooms*, 1936.

Music, although in its modern form the most artificial of the arts, is primarily the most universal and spontaneous. It differs from the other arts in that 'time,' both in the rhythmic basis of *M.* and also in the definite duration of any musical phrase or performance, is an essential factor. In this it contrasts sharply with painting and architecture, which depend on spatial values, and it lacks the representational element of poetry, although poetry, *M.*, and the dance probably had a common origin in ritual. They still share the vital elements of rhythm. Structurally *M.* is allied to mathematical science, the two fundamental concords, the octave and the perfect fifth, being built up from the frequency-ratios 2 : 1 and 3 : 2 respectively. These facts were known in the sixth century B.C. to Pythagoras, who also defined the tonal position of the fourth.

M. in some form is probably as ancient and universal as speech; but in the general acceptance of the term, Gk. *M.* is the radix from which its development must be traced. Gk. *M.* was, doubtless, largely influenced by Chaldean and Egyptian, by Indian and Chinese, such as it was; and sev. early Christian chants were derived from Jewish synagogue tunes. But no deep study of such influences is possible, although it is surmised that ample material would have been available if the Alexandrian library had been preserved. Musical intonation was an important feature of all Gk. drama, and even the Homeric epics were declaimed to the accompaniment of a lyre. The term *M.* was held by the Gks. to signify any art over which the nine Muses presided, and poetry and melody were combined in one art form as a matter of course, although harmony in the modern sense was unknown—a characteristic which still persists in *M.* uninfluenced by the European tradition. The Gk. system was based on the tetrachord, a group of four notes derived from the four strings of the early lyre; the total span was a fourth, but three *genera* were recognised, whereby the two inner notes could be diatonic or chromatic or enharmonic (i.e. including quarter-tones). With the development of the lyre the span was increased to two octaves by the super-

imposition of four tetrachords; hence were derived the modes, eight-note scales whose character depended on the position of the *mese*, the upper note of the second tetrachord, which acted as a kind of tonic. Each mode was associated with a particular mood, and had a moral quality. Thus the Dorian mode was regarded as military and masterful, the Lydian as effeminate. At first all *M.* was handed down orally, as folk *M.* has continued to be, but with such importance attaching to *M.* as a literary adjunct, although its possibilities as an absolute art were unsuspected, it was not long before some method of definite systematisation and notation of sound was sought. The Gks. developed two such systems, one for vocal and one for instrumental *M.*, based on the letters of the alphabet, which could be differently placed so that half- and quarter-tones could be recorded. Under the Romans, the chromatic and enharmonic *genera* and the tetrachord basis of the system fell into disuse, and the whole tradition might have been lost but for the Christian Church. In the early days the congregation took a musical part in the service, and the *M.* naturally took over many Gk. and Jewish elements (cf. the verbal survival of *Kyrie Eleison* and *Aleluia*). Control gradually passed to the priesthood, who regularised it in the form of plainsong and estab. the eccles. modes. These are derived from the Gk. modes, with important differences; the Gk. names were applied to them by the theorist Boethius (d. c. A.D. 524). The Church frowned on instrumental *M.* and at first there was no rhythmic independence owing to the melody being tied to the scansion values of classical poetry. The commonest method of notation was the system of *neumæ*, but this served only to remind the singer of the approximate difference in pitch of successive notes in a melody he had already memorised, without expressing the exact intervals. It was not until the early tenth century that any definite progress in notation was made, although the literal code, in which Lat. characters had superseded the Gk., had been developed, and the modern seven-letter method began to be used in conjunction with the *neumæ*. About the time of Hucbald (d. 930), whose system of writing words in the spaces of a staff representing the strings of an instrument, useful in vocal *M.*, did not survive him, a red line was drawn horizontally across a page to represent F; and the immediate addition of a green or yellow line above and parallel to the red, to give the locus of C, made possible the precise expression of any interval up to an octave. The present type of staff was reached in the eleventh century; it consisted usually of four lines, although no number was definitely settled until the sixteenth century, when a four-line staff was restricted to plainsong, five-line being used for other vocal *M.* and six-line for organ and virginal. Signs F, C, and G were also written to their relative lines, thus originating the system of clefs. Bars, or staff-divs., were introduced about 1450 to

indicate accent; their use for rhythmic definition did not become general till the sixteenth and seventeenth centuries. Many of these improvements have been attributed to Guido d'Arezzo (d. c. 1050), but probably he did no more than systematise the general progress of the art. We owe to him the familiar symbols of solmisation (*ut, re, mi, etc.*), based on the opening syllables of each line of a hymn to St. John the Baptist.

By this time, aided by the progress in notation, M. had reached the stage of the 'descant,' or 'discantus' (see HARMONY), from which the whole art of counterpoint was evolved, although the Gk. practice of 'magadising' (i.e. singing in two parts, one an octave above the other) had been an attempt in the same direction. The *organum*, in which a series of fourths or fifths was added to a *canto fermo*, was the first step; its origins go back to the ninth century and may have been due to the inability of singers to remain in unison. Further intervals, oblique and contrary motion, and a feeling for cadences were added by degrees, and the hexachord system was adopted as a scientific guide to teaching. This pointed towards the major scale, but such implications were regarded as *musica fleta* and not followed to their conclusion. Composition at this time was an arbitrary process, governed by scientific rather than aesthetic rules; M. was classed with mathematics in the medieval univs. The twelfth and thirteenth centuries, sometimes called the Francoian period after the theorist Franco of Cologne, saw the development of the rhythmic modes, based on the old poetic metres, and further attempts to define consonance and dissonance. More than two independent parts were now allowed; the main voice was usually in the tenor, with the other parts embroidering above and below it. Among the new forms of vocal M. were the *conductus*, *motet*, *rondeau*, and *rota* (or *round*), which introduced the principle of canonic imitation. The most famous example of this type is *Sumer is i-cumen in* (MS. c. 1280, Brit. Museum; see article in Grove's *Dictionary of Music*), a flowing four-part canon over a brief two-part *rondeau*, also in canon, probably the result of treating a popular tune in the manner of contemporary church music. These early polyphonic problems gave rise to a considerable theoretical literature, chiefly written by monks.

Meanwhile secular M. had also changed: crude chants and folk-songs had given place to the heroic songs of the minstrels (*g.v.*) of the tenth and eleventh centuries. During the twelfth and thirteenth centuries the troubadours and trouvères in France, and the minnesinger and meistersinger in Germany became prominent; many of them were of high rank, e.g. Count William of Poitiers (d. 1127), and Richard I. of England (d. 1199). This movement was stimulated by contact with the E. through the crusades, the spread of the chivalry ideal, and the growth of the vernacular languages. It was concerned with poetry as well as music, but

had great musical influence owing to its rhythmic freshness and the strong folk element, which helped to loosen the old academic rules. The same period saw a great increase in instrumental M.; its notation was by means of tablatures based on the form of the instruments. The trouvère Adam de la Halle (d. c. 1287) wrote M. for a pastoral comedy and popularised the way to opera. The fourteenth century saw the introduction of a new method called *l'rs nova*, in which the rhythmic modes were superseded, duple time was used as well as triple, and other new devices, such as *fauvebourdon*, were added. The leading composer was Guillaume de Machaut (d. 1377).

The great polyphonic period began in the fifteenth century with the foundation of royal chapels, an enormous increase in technical resources, especially in imitative counterpoint, and the rise of national schools. In England Dunstable (d. 1453) achieved much greater smoothness of texture. The great Netherlands school, headed by Binchois (d. 1460), Dufay (d. 1474), and Ockeghem (d. 1495), reached its height in Josquin des Prés (d. 1521). Later Netherlands composers founded schools in other countries, e.g. Willaert (d. 1562) and Cyprien de Rore (d. 1565) in Venice and Arcadelt (d. c. 1575) in Rome, where the tradition of polyphonic church M. reached its apex in the work of Palestrina (d. 1594) and the Spaniard Victoria (d. 1611). The greatest of the Flemings, Lassus or Lasso (d. 1594), was a prolific composer in all styles, sacred and secular. This period was marked by the gradual decline of the modal system and a much greater interest in the emotional use of harmony as against polyphonic devices for their own sake. A stimulus was also given to Ger. church M. by the Lutheran Reformation, which encouraged congregational singing and popularised the chorale. Eng. church composers of the period were Tye (d. 1573), Tallis (d. 1585), Byrd (d. 1623), and Gibbons (c. 1625). Meanwhile secular music, aided by the Renaissance and the discovery of printing, flowered rapidly in the Fr. *chanson* and the It. madrigal, which was a cross between the popular *frottola* or street song and the Flem. motet. Marcenizio (d. 1599), Gesualdo (d. 1614), and Monteverdi (1567-1643), introduced new freedom and expressiveness into the madrigal, which perhaps found its perfect form in England in the works of Morley (d. 1603), Weelkes (d. 1623), Wilbye (d. 1638), Byrd and Gibbons. The first to write important original M. for the organ (introduced from the E. in the eighth century, but for long very primitive) was the Venetian Andrea Gabrieli (d. 1586), who developed the *ricercare* and *toccata*. He was followed by Merulo (d. 1604), Sweelinck (d. 1621), and Frescobaldi (d. 1644), in whom the *fugue* reached mature form. Much early instrumental M. was simply transcribed from the motet, but dances were written for the lute and the popularity of the new domestic keyboard instruments gave rise to a true instrumental style, especially in England

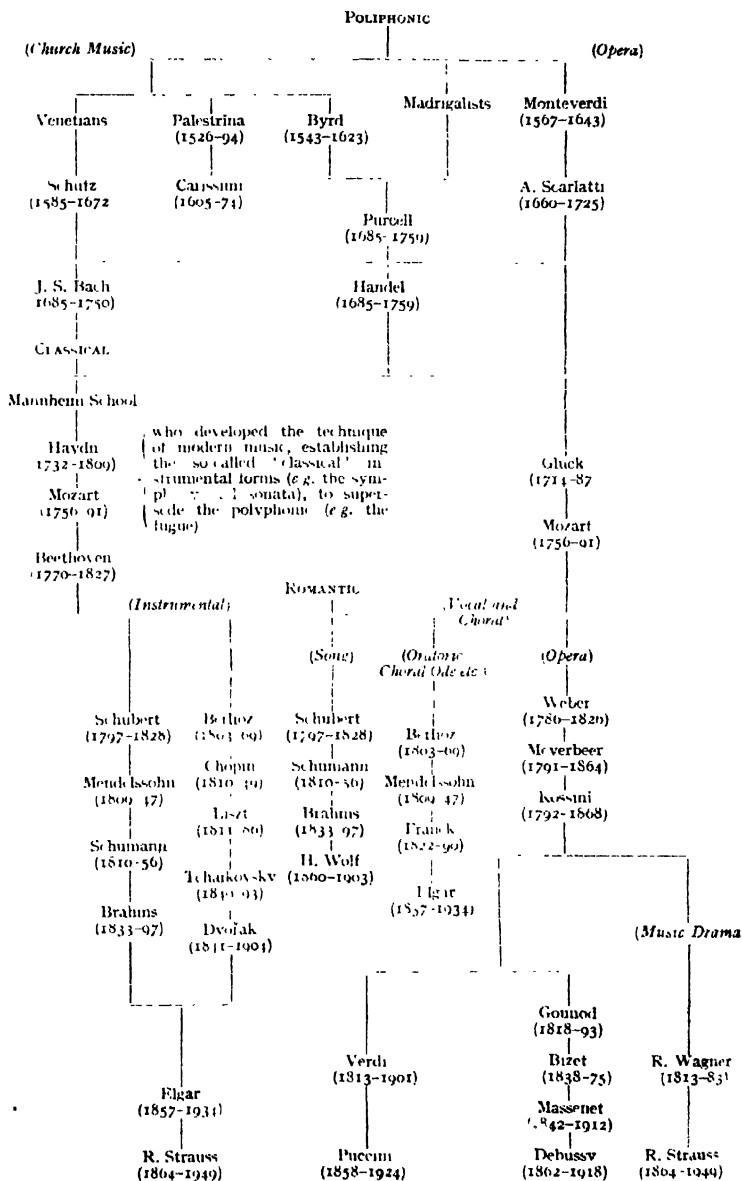

DIAGRAM SHOWING THE CHIEF LINES OF DEVELOPMENT OF MUSIC TO THE MIDDLE OF THE TWENTIETH CENTURY AND THE RELATIVE POSITIONS OF THE PRINCIPAL COMPOSERS

and Italy. It found expression in suites, variations, and primitive programme M. Fantasies for groups of viols are the ancestors of chamber M. An early master of orchestral M. was Giovanni Gabrieli (*d.* 1612), who wrote antiphonal works for contrasted groups of instruments.

The next new forms, both originating in Italy about 1600, were opera and oratorio. Opera was an attempt to revive the Gk. combination of M. and drama, and was also influenced by the madrigal; its first exponents were the Florentines Peri (*d.* 1633) and Caccini (*d.* 1618), but Monteverdi was the first master (*see* OPERA). His influence on the hist. of M. was enormous. He introduced string tremolando and pizzicato, and his harmonic advances led to the final substitution of key for the modal system. The first opera house was opened at Venice in 1637, and a thriving tradition began. Oratorio, in part evolved from the incidental M. of the early miracle and morality plays, began in Rome with Cavalieri (*d.* 1602). At first it was staged like opera, but Carissimi (*d.* 1674) endeavoured to separate it by strengthening the choral element. In Germany Schütz (*d.* 1627) produced a new type by combining Venetian influence with old Ger. Passion M., while a flourishing school of keyboard composers arose in Froberger (*d.* 1667), Buxtehude (*d.* 1707), Reinken (*d.* 1722), and Pachelbel (*d.* 1706) for the organ, and Kuhnau (*d.* 1722) for the harpsichord. All these traditions were consummated in the work of J. S. Bach. Italy still led the field in other instrumental forms, especially for strings, thanks to the perfection of the violin by the craftsmen of N. Italy. The trio, sonata, and concerto were developed by Corelli (*d.* 1713) and Vivaldi (*d.* 1741), and the harpsichord sonata by Domenico Scarlatti (*d.* 1757). Meanwhile It. opera had overrun Europe, but only in France, where Lully (*d.* 1687) combined it with the ballet, was a national style founded. In England Purcell (*d.* 1695) showed high dramatic genius but estab. no tradition. Opera was standardised by Alessandro Scarlatti (*d.* 1725), after whom it declined into empty formulas (*see* OPERA).

The first half of the eighteenth century is dominated by the figures of Handel (1685-1757) and J. S. Bach (1685-1750). Handel's style was cosmopolitan, comprising It. and Eng. as well as Ger. elements, and his genius essentially dramatic, as shown in his Jewish oratorios even more than his forty It. operas, although he used all the known forms. He combined unsurpassed lyric sweetness with massive choral effects on a greater scale than ever before. Bach's genius was religious and contemplative, introvert rather than extrovert; his Passions, church cantatas, and organ works are the summit of their kind. He was also the composer of much excellent violin and clavier M., and carried the new tonal polyphony to its utmost limits. Thanks largely to him a whole new world of keyboard M. was opened up by the general acceptance of 'equal temperament' (*see* TEMPERAMENT) which rendered possible

a greatly extended variety of modulations. But his full influence was delayed, since his greatest M. remained unknown for nearly a century. In France his most important contemporaries were François Couperin (*d.* 1733) in keyboard M. and Rameau (*d.* 1764) in grand opera and ballet. It was in France too that Gluck (1714-87) completed his memorable reform of opera, designed to end the tyranny of singers, emphasise dramatic expression, and so return to the principles of Monteverdi and the Gks. The middle years of the century saw the rise of an important movement led by Johann Stamitz (*d.* 1757) at Mannheim, where the modern orchestra and the symphony were evolved, and sonata form, based on key contrast and a reaction from polyphony, began to come into its own. It was derived partly from the binary form of the old dance movements and partly from the operatic aria of Scarlatti and Handel. C. P. E. Bach (*d.* 1788) created the modern piano sonata by applying sonata form to the colour possibilities of the new instrument. Symphony, sonata, and string quartet were all perfected by Haydn (1732-1809), the first of the great Viennese classical composers, and further extended by Mozart (1756-1791), whose use of chromaticism introduced an almost romantic expressiveness. He was the one composer to reach the highest rank in every musical form; his operas, remarkable for their subtle characterisation, both summed up the whole It. tradition and led by way of Ger. *Singspiel* to romantic opera. Judging by his experiments in harmony and 'colour,' and by the perfection to which he developed the new forms (including the concerto, which he made particularly his own), it has been suggested that, but for his premature death, he would have done much that Beethoven (1770-1827) was left to accomplish. But however much Beethoven's earliest M. may resemble Mozart's latest, his second and third period works, his sonatas, concertos, and chamber M., no less than his wonderful symphonies and overtures, opened up vast new territory in the realm of individual and subjective expression. His last works, long misunderstood, looked far into the future.

If Beethoven is the point of transition from 'classical' to 'romantic' (the terms are unsatisfactory, but have a generally accepted significance) in instrumental M., the same must be said of Schubert (1797-1828) in song, and of C. M. von Weber (1786-1826) in opera. The Romantic movement (*q.v.*) of the early nineteenth century was a general artistic reaction against 'academism' and 'formalistic narrowness'; it appealed to the remote, violent, and mysterious, became connected with political and social ideals, and ended as a cult of the excessive. Romantic M. soon developed a strong literary content, and sought to express alien ideas of all kinds, often at the expense of formal balance. Beethoven influenced the whole of nineteenth-century M., but in many different ways. The classical tradition of sonata and symphony was followed (with

deviations) by Mendelssohn (1809-47) and Brahms (1833-97). The leaders in piano M. were Chopin (1810-47) and Schumann (1810-56), whose attempts at the larger forms were less successful. The mantle of song passed from Schubert to Schumann, Brahms, and Wolf (1860-1903). The first great exponent of programme M. was Berlioz (1803-69), whose remarkably original powers of melody, drama, and orchestration were not at first recognised. Liszt (1811-86), besides exploiting the virtuoso powers of the piano and making important harmonic innovations, evolved from the symphonic form of Beethoven, the colour of Berlioz, and certain elements in Schubert's instrumental works a new form, the 'symphonic poem,' in which he practised an elaborate method of theme transformation. This form has been cultivated by many later composers, most successfully by Richard Strauss (1864-1949). The central musical figure of the period was Wagner (1813-83) who, beginning as a composer of grand opera in the Meyerbeer manner, combined Beethoven's method of symphonic development, Liszt's theme transformation, and certain of Gluck's ideals in a vast new stage form, the M. drama, which he described and justified in numerous prose writings. It is peculiar to Wagner and has defied would-be successors, although the operas of Strauss approach it at some points. It is closer to the symphonic poem than to true opera, which it did not supersede. Indeed opera flourished throughout the century, particularly in Italy and France, where the spectacular methods of Meyerbeer (1791-1864) were succeeded by the more lyrical style of Gounod (1818-93), Massenet (1842-1912), and others and the revitalised *opéra-comique* of Bizet (1838-75). In Italy the traditional line led through Rossini (1792-1868), Donizetti (1797-1848) and Bellini (1801-35) to Verdi (1813-1901), in whom it reached the height of musical and dramatic expressiveness. It then declined into inartistic realism, but Puccini (1858-1924) showed a strong lyrical and dramatic gift.

Related to the Romantic movement are the nationalist movements, which drew much of their strength from folksong. In Russia the movement began with Glinka (1803-57) and reached great distinction in the instrumental works of Balakirev (1837-1910) and Borodin (1833-1887) and the operas of Mussorgsky (1839-1881) and Rimsky-Korsakov (1844-1908). Tchaikovsky (1810-93), who used all forms except church M., was more influenced by the W. romantic tradition; his symphonies have a strong subjective element. In Scandinavia Grieg (1843-1907) showed a genius for the song and short piano piece, and Sibelius (b. 1865) for the symphony. In Bohemia Smetana (1824-84) founded a national opera, later enriched by Janáček (1854-1928), and Dvořák (1841-1904) enriched the classical forms. Later a lively Sp. school grew up under Albéniz (1860-1909), Granados (1867-1916), and Falla (1876-1946). The end of the century saw the decline of the

classical Austrian tradition in the verbose symphonies of Bruckner (1824-96) and Mahler (1860-1911) and the rise of important new movements in France and England. Franck (1822-90) late in life popularised cyclic form by applying Liszt's methods to the sonata, and the far-ranging harmonic experiments of Debussy (1862-1918) bore fruit in 'impressionism.' Ravel (1875-1937) developed on similar lines with a personal harmonic idiom, and the exuberance of Chabrier (1841-91) and the harmonic subtlety of Fauré (1845-1924) also left their mark. In England Elgar (1857-1934) added a personal and national flavour to the classical tradition in large-scale choral and instrumental works, and Dellore (1862-1934) adopted an intensely individual harmonic style. Holst (1874-1934) and Vaughan Williams (b. 1872) returned to folk M. and built up a style capable of mastering both traditional and modern forms on the largest scale.

The twentieth century has seen a development in M. of revolutionary rapidity to which there have been two main contributing factors; first the break-up of the key system, largely due to the influence of Wagner and Debussy, and the search for freer forms, new rhythmic patterns, 'atonality' (the abolition of 'key'), polytonality, and harmonic systems built on the whole-tone, dodecuple, and many other more intricate scales; secondly the rapid perfection of mechanised M., notably wireless, gramophone, and cinematograph reproduction. Two of the biggest influences in modern M. are Stravinsky (b. 1882), who has formed no definite 'style,' but has experimented in many new and daring rhythmic forms and 'tone-colours,' and Schönberg (b. 1874), whose somewhat arbitrary twelve-tone system has been adopted in certain quarters, notably by Berg (1885-1935); but it is quite possible that the main stream of M. will be found to have passed them by. Other important modern composers, apart from those mentioned above, are Hindemith (b. 1895) in Germany; Bartók (1881-1945) and Kodály (b. 1882) in Hungary; Honegger (b. 1892) and Poulenc (b. 1899) in France; Pizzetti (b. 1880) and Malipiero (b. 1882) in Italy; and in England and America, Bax (b. 1883), Ireland (b. 1879), Bloch (b. 1880), Bliss (b. 1891), Copland (b. 1900), Rubbra (b. 1901), Walton (b. 1902), Berkeley (b. 1903), Barber (b. 1910), and Britten (b. 1913). In the period after the First World War the reaction against the excesses of romanticism took an extreme form, resulting (as in the other arts) in various forms of self-consciousness and exhibitionism, which hardly helped to solve the problem of development. Recently there have been signs that it may be possible soon to distinguish the main course from the subsidiary disturbances. The other important present-day factor, the mechanisation of M., has brought knowledge and appreciation of M., especially classical M., to a vast hitherto uninterested public, and splendid performances of all important works can be

heard through the media of wireless and the gramophone. The standard of criticism, and thus of performance, is rising, and the demand for new M., for instance in the cinema, can hardly fail to encourage the composer. Jazz (q.v.) M. is a conspicuous contemporary phenomenon throughout the U.S.A. and Europe, as a dance-form and for mechanical transmission. Primarily it is an exploitation of syncopated rhythm, usually at the expense of other musical qualities, and it owes much to primitive Negro M. It is largely ephemeral, but may leave its mark on a few surviving works. A more significant phase of the popularisation of M. is the revival both in Europe and America of musical festivals and societies and the high standard of performance that distinguishes their concerts. See also articles on HARMONY; OPERA; ROMANTIC MOVEMENT; SCHOOLS OF MUSIC; SONG, etc., on M. under individual countries, and on the various composers.

Music, Abbreviations in, see ABBREVIATIONS.

Musical Box, instrument for producing music by mechanical means. It was invented in the middle of the eighteenth

MUSICAL BOX

century by the Swiss, who fitted minute plugs on a metal cylinder so arranged that they would strike separate bars of steel and set them vibrating, and so produce different tones. The M. B., however, has long been superseded by the piano-player and the gramophone.

Musical Clocks, see under HOROLOGY.

Musical Comedy, form of theatrical entertainment, developed from *opéra bouffe* and distinguished from opera by having spoken rather than sung dialogue. It has many of the characteristics of vaudeville (q.v.)—singing, humorous situations, topicality, and burlesque—but differs in having a loosely-connected plot, interspersed with songs. Musical plays

of this type first found their outstanding popularity with the London productions of George Edwardes (1852-1915) at Daly's Theatre and the Gaiety. *The Shop Girl* was produced in 1894 and ran for two years, followed by, among others, *The Grisha*, *San Toy*, *A Country Girl*, and *The Maid of the Mountains*, which ran for over 1300 performances. Ivan Caryll, Sidney Jones, Franz Lehár, Oscar Strauss, and Harold Fraser-Simson were among those who wrote the music for the successful productions of this epoch. M. C. has since continued to maintain its hold on public favour, being associated in particular with the names of C. B. Cochran (b. 1872) in London and of Florenz Ziegfeld (1867-1932) and Earl Carroll (b. 1893) in New York.

Musical Glasses were a set of glasses of equal size, forming a musical instrument; they contained varying quantities of water, the height of the water in any particular glass determining its note. The method of playing was by rubbing the moistened finger round the rim of the glasses. They are first mentioned in 1651, and were very popular in the eighteenth century, being played in London by Gluck in 1746, whilst Mozart and Beethoven wrote music for them. As improved by Franklin in 1760, M. G. were often called a 'harmonica'.

Music and Dancing Licences. Within the Metropolitan Police dist. (i.e. within 20 m. of the cities of London and Westminster, or in Middlesex) every house, room, garden, or other place used for public music or dancing must be licensed for that purpose by the co. council or co. bor. council within whose jurisdiction the place is situated. Elsewhere licences are required only in those tns. where section 51 of the Public Health Act, 1890, has been adopted, in which cases the licences are granted by the magistrate. The mere occasional use of a room for music and dancing, or a temporary use for dancing on the occasion of a festival, does not, but a skating rink where music is played does, require a licence. The decided cases show that to require a licence there must be something habitual about the use of the place for public music or dancing, though using the place once a month only would probably be regarded as 'habitual.' The licensing authority have an absolute discretion to grant or refuse a licence, subject to the obligation to exercise the discretion in a judicial manner.

Music Halls. The 'music hall,' or 'variety theatre,' is a development of the 'saloon theatres,' which existed in London in 1830-40. These were attached to taverns, and were very popular amongst the middle and lower classes who liked to mix their dramatic amusements with smoking and light refreshments. They gave dramatic performances as well as variety entertainments, but were restricted by the 'patent rights' which were ultimately abolished through the efforts of a number of distinguished literary men, among whom were Charles Dickens, Sir Edward Bulwer-Lytton, and Sir Thomas Noon Talfourd. After this the saloons

gradually improved in character, and the M. H. of to-day began to appear, the first being the Canterbury in Lambeth, which, under the direction of Charles Morton, cultivated the best class music; indeed 'An Operatic Selection' of Gounod's *Faust* was first performed in England here. Morton also opened the Oxford, and other halls soon followed, their popularity being assured by the cheap prices and physical comforts which they afforded. But the advance in the M. H. excited the jealousy of the theatre, and matters came to a crisis in 1865 when an ambitious ballet was produced at the Alhambra in Leicester Square. The Alhambra was prosecuted for infringing the Stage-play Act, and a long, unsatisfactory trial followed, with the result that the matter was taken up by Parliament, and the M. H. were granted the privilege of producing ballets, vaudevilles, pantomimes, and other light pieces. Some of the chief in the list of M. H. are the Coliseum, the London Hippodrome, the Pavilion, and the Palladium, and associated with them and older halls are the names of George Leybourne, Bessie Bellmore, Harry Champion, the Great Vance, Charles Coburn, Chirwin the White-eyed Kaffir, Gus Elen, and Marie Lloyd. The advent of the cinema, and especially the development of sound films, seriously affected the prosperity of M. H., and many were converted into cinema houses, the Empire and the Tivoli of London being notable examples. At the present time the term 'music hall' is giving place to the more applicable name of 'variety theatre,' the programme of entertainment often taking the form of 'revue.' See A. Hadden, *The Story of the Music Hall*, 1935; M. W. Disher, *Winkles and Champagne*, 1938; and H. Scott, *The Early Doors*, 1947.

Musk, Royal College of, see ROYAL.

MUSK

Musk (*Mimulus moschatatus*), small perennial plant of the order Scrophulariaceae, with hairy leaves and bright yellow flowers. Some fine horticult. varieties

have been introduced. These are best grown in pots trained on wire frames or in hanging baskets.

Musk, Artificial, substance known chemically as symmetrical trinitrotertiary-butyltoluene. It is used in perfumery as a cheap substitute for natural M., which it closely resembles in odour.

Musk Deer (*Moschus moschiferus*), native of the mountainous parts of Central Asia, which yields the musk of commerce. It is a small animal about the size of a roe deer, 20 in. in height, with large ears, long legs, and coarse, goat-like hair, which varies from a pale grey to a dark brown, spotted with tints of a lighter colour. It is of special interest to zoologists in that it possesses certain intermediate characters between the antelopes and the deer, and it is now placed in a special sub-family, Moschidae, of the order Cervidae. It is unique among deer in possessing a gall bladder, which is found in most of the antelopes. Antlers and horns are absent in both sexes, but, like the muntjac, the male has the upper canine teeth developed into projecting tusks 3 in. or more long. It is a solitary animal, feeding on leaves and flowers of forest shrubs. It is abnormally hardy and sure-footed on the most dangerous ground, being much assisted by the specialised development of the hoofs. Musk occurs as a resinous substance in a gland beneath the skin of the abdomen of the male, and the animals are mercilessly persecuted by hunters. The odour is probably the most penetrating and powerful in nature, and is said to cause haemorrhage in the hunters, when removing the glands, unless they cover their nose and mouth. The glands, after drying for exportation, are known as 'pods.' When they reach Europe they are commonly found to be heavily adulterated.

Muskegon, city of Michigan, U.S.A., and co. seat of same name, on the M. R., 38 m. N.W. of Grand Rapids. Has foundries, paper-mills, and machine-shops, and manufs. motor vehicles and machine-tools. Pop. 47,600.

Musket, see under FIREARMS.

Musketry, military term applied to that branch of work which deals with the theory and practice and regulations concerning small arms: the rifle, carbine, and revolver, and machine guns. The training in the use of weapons is graded from recruit drill, through various range and field practices, to special competitions. The marksman badge, crossed rifles, is awarded for highest efficiency, the 'best shot' having a star in addition. Field practice is very varied, being the development of range practice towards the requirements of M. in actual warfare; it includes company, battalion, and squadron practice, and deals with the tactical use of small arms. A modern development has been the introduction of miniature range-firing with the use of the Morris tube.

Musketry, School of, see SMALL ARMS SCHOOL.

Muskhogan Language, see under NORTH AMERICAN NATIVE LANGUAGES.

Muskhogeans, see CREEKS.

Muskogee, city and the co. seat of M. co., Oklahoma, U.S.A., 130 m. E.N.E. of Oklahoma city. It is the centre of an agric. and stock-raising region, and yields natural gas and oil. Its manufs. include road machinery, oil-well equipment, and lead products. Pop. 32,300.

Muskoka, dist., riv., and lake of Ontario, Canada, on the E. of Georgian Bay. The first named has numerous lakes intersected by streams, and is a popular resort for anglers. Bracebridge is the cap. The riv. rises in the Nipissing dist. of Ontario, and flows in a south-westerly direction, through the lake, into Georgian Bay. The lake is situated in the middle of the co. and communicates in the N. with Lake Rousseau.

Musk Ox, or **Musk Sheep** (*Oribos moschatus*), animal which, as the generic name implies, has features in common with the sheep and the ox. It is about the size of domestic cattle, and is covered with a dense coat of very long brown hair. The horns of the bulls meet in the middle line of the forehead. The legs are short, but the feet have a large spread, with a footprint much like a reindeer's, and the animals are capable of some speed. They are social in habit, and are now confined to Arctic America, though, at a remote period, they have had a very extensive range, which included Britain. At some seasons of the year they exhale a strong odour of musk, and this pervades the flesh, although it is well flavoured.

Musk Plants. The odour of musk occurs in a number of plants, besides the common musk. The musk mallow (*Malva moschata*) emits the odour when rubbed, especially in hot weather. The musk stork's bill (*Erodium moschatum*) smells strongly of it if handled; but the moschatel (*Adora moschatellina*) diffuses it from all parts of the plant except when bruised. The musk thistle (*Carduus nutans*) has a powerful musky scent. The musk orchis (*Hermithium monorchis*) smells like musk at night. A melon (*Cucurbita moschata*), the musk rose, and the musk tree (*Eurybia argophylla*), are among many other plants, etc., which give rise to the odour.

Musk Rat, name given to a number of rodents, and also to one insectivore, which diffuse a musky odour. It most commonly indicates the musquash (*Fiber zibethicus*). Allied to the voles and beavers, the musquash is found in Alaska and Canada. It is specialised for an aquatic life, the toes being webbed, and the long, almost naked tail being scaly and flattened laterally. The head and body together measure about 12 in. Though inclined to be omnivorous, it is chiefly vegetarian, and stores up food for the winter by plastering it with mud into curjous structures like haycocks. The musk is secreted by both sexes in a large gland in the groin.

Musk Sheep, see **Musk Ox**.

Muslin, fine cotton cloth, said to have been first made at Mosul (q.v.), a city of Mesopotamia. It resembles gauze in appearance, except that it is woven plain without any twisting of the warp threads on the weft. Some very fine specimens

have been produced in India, the Arni M. of the Madras prov. and the Dacca M., made at Dacca, in Bengal, being especially famous. The material is now made in Europe, and numerous varieties are produced. It is used for dresses, curtains, blinds, cushion-covers, etc.

Musorgski, Modest Petrovich, see Mrs. SONGSKY, MODEST PETROVICH.

Muspratt, James (1793-1886), Brit. manufacturing chemist, and the founder of the Brit. alkali industry, b. in Dublin. After service in the Peninsular war, and in the navy, he began the manuf. of chemical products for commercial purposes. Starting in Ireland with the production of potassium ferrocyanide, he moved to Liverpool, setting up a plant to produce sulphuric acid, and later sodium carbonate. Hydrochloric acid was recovered from the fumes by a process evolved by Wm. Gossage. It was the beginning of the Brit. heavy chemical industry. His son, James Sheridan M. (1821-71), was also a distinguished chemist.

Musquash, see **Musk Rat**.

Mussel, name for various forms of mollusc, but most commonly applied to the numerous widely distributed Mytilidae. The common M. (*Mytilus edulis*), which forms the familiar wedge-shaped shell, is

MUSSEL.

very abundant in Brit. estuaries. While young the Ms. are capable of moving about with the aid of the small brown foot, but later they attach themselves to rocks and to one another by spinning a bundle of tough threads (*byssus*). Though they are even more liable than oysters to pollution, they are important articles of diet in many dists., but they are utilised in greater numbers as bait in deep-sea fisheries. The fresh-water Ms. (Unionidae) are also numerous and widely distributed. The pearl M. occurs chiefly in Scottish rivs.

Musselburgh, tn. and parl. burgh of Midlothian, Scotland, on the frith of Forth, at the mouth of the Esk, 5 m. E. of Edinburgh, of which it has become practically a suburb. M. has extensive

market gardens, and manufs. nets, twine, bricks, tiles, pottery, etc. Here is Loretto School. There are also paper-mills, breweries, tanneries, and salt-works. The tn. is celebrated for its golf links. Together with Craigentinny, Craigmillar, and Portobello, M. forms the burgh constituency of Edinburgh E. and returns one member to Parliament. Pop. 16,900.

Mussel-picker, see OYSTER-CATCHER.

Musset, Louis Charles Alfred de (1810-1857), Fr. poet, novelist, and playwright, b. in Paris. In 1829 he met with great

ALFRED DE MUSSET

success, and at the same time with much hostile criticism, through his pub. of *Contes d'Espagne et d'Italie*. In 1830 his piece, *La Nuit vénitienne*, was produced at the Odéon by Harel, but was not well received. In 1832 he left the *Cénacle*, and in the following year pub. *Un Spectacle dans un fauteuil*, which was so far successful that he was asked to contribute to the *Revue des deux mondes*. For this he wrote (in 1833) his fine tragical comedies, *André del Sarto* and *Les Caprices de Marianne*. His next contribution to the *Revue* was his famous poem *Rolla*, written also in 1833, at the beginning of his liaison with George Sand, whom he had met in the summer of that year. Later in the year he left with her for Italy, and returned alone shortly afterwards broken in health and in spirit. The worst side of his moral character was brought out by his sufferings. George Sand gave her account of the catastrophe in a novel, *Elle et lui* (1859), to which de M.'s brother, Paul, replied in his *Lui et elle* (1860). The four *Nuits—de mai, de décembre* (1835), *d'août* (1836), and *d'octobre* (1837)—reflect the bitterness of soul and disillusionment which ensued on the breach with George Sand and the ending of the romantic dreams of ideal love which they had

founded on that relationship. His troubles did not prevent de M. from continuing to write. In 1835 he produced *Lucie*, *Le Chandelier*, *La Loi sur la presse*, and, more important, *Confession d'un enfant du siècle*, which is of great interest in revealing the poet's complex character. In 1838 he was appointed Librarian of the Ministry of the Interior, and two years later his health began to give way. Meanwhile he had written *Lettre à Lamartine* (1836), the comedy *Il ne faut jurer de rien* (1836), *Un Caprice* (1837), some of the *Nouvelles* (1837), and the fragment *Le Poète déchu* (1839). In 1840 he wrote *A trente ans*, and in the following year the spirited poem *Le Rhin allemand*. His latter years were comparatively unproductive, his works including *Il faut qu'une porte soit ouverte ou fermée* (1845); *Hélène* (1849); and *Carmosine* (1851). He was elected to the Academy in 1852, and d. of heart disease five years later. Alfred de M. was, above all, a lyricist, whose one dominant theme was love in its varied manifestations. All his work is markedly subjective. Beginning life as an enthusiast, he early experienced a sad disillusionment, owing chiefly to his unhappy liaison, and his later work is characterised by a melancholy which is preoccupied with the darker problems of life and ends by wooing a despair which sees in its bitter-sweet memories the only thing worth having experienced. Complete eds. of his works have been pub. by P. Lemerre (1876), E. Biré (1907-8), and M. Allem (1933-38), letters by L. Seché (1907), and a bibliography by M. Clonard (1883). See studies by C. F. Oliphant, 1890; Arvede Parino (Mme Vincens), 1893; L. Seché, 1907; E. Henriot, 1929; H. O. Sedgwick, 1932; and M. Allem, 1940; also Spoelberch de Loverjaul, *La véritable Histoire de Elle et Lui*, 1897; and P. Castinal, *Le Romantisme de Musset*, 1933.

Mussolini, Benito Amilcare Andrea (1883-1945), 'Duce' or dictator of Italy; b. at Varano di Costa, by Dovia, com. of Predappio, prov. of Forlì; elder son of Alessandro Gaspare M., blacksmith, atheist, and Socialist agitator, and later an inn-keeper, and Rosa Maltoni, a devout, simple-minded Catholic, who kept a one-room school at their home. Alessandro named his first-born after Benito Juárez, the Mexican revolutionary, Amilcare Cipriani, the Romagna anarchist, and Andrea Costa, a Socialist. M. attended an elementary school at Predappio, and, later, the Salesian school at Faenza. The Ms. were, according to Eng. standards, extremely poor and lived in a two-room tenement on an upper floor of an old house which is said at one time to have been a palace. M. worked for a time at his father's smithy. He then completed his education at the Royal Normal School of Forlimpopoli, a school for training elementary school-teachers, and was for a year a teacher at Gualtari, Reggio nel' Emilia. In 1902 conscious of himself as a misfit and anxious to avoid military service, he went to Switzerland; he worked as a mason, translated, starved, made revolutionary speeches, and was arrested

at Lausanne for vagrancy, but was befriended by Socialist organisations. Almost ignorant of the theoretical basis of Socialism, he yet developed into a formidable controversialist and was encouraged by Serrati, the well-known It. Socialist, and by Angelica Balabanoff, the colleague of Lenin. Meanwhile his father had been jailed for instigating the tampering with ballot boxes. In June 1903 he was expelled from the canton of Berne for revolutionary activities, and later in that year the news of his mother's illness caused his return to Forlì. After successfully evading the conscripts' draft by falsifying his passport for Geneva, he returned again to Italy and served in a Bersaglieri regiment in 1905-6. At the end of his military service he took a post as a teacher of Fr. at Oneglia, near Genoa, and at the same time conducted atheistic propaganda in the local Socialist newspaper. He then tried his hand at literature, writing, among other things, a flamboyant novel, *Claudia Particella* (trans. into Eng. as *The Cardinal's Mistress*, 1929). He was expelled in 1909 through offending the local clergy. In the following year he founded *La lotta di classe* ('The Class Struggle'), a weekly paper, at Forlì, using it as a medium for incitement to violence, attacks on the Church, denunciation of the monarchy, and gibes at nationalism in the manner of Hervé, all views which later, as a Fascist, he quickly jettisoned. He suffered imprisonment for his articles, but at the end of 1910 he became secretary to the Socialist Society at Trent, then an Austrian possession. He voiced his inherent irredentism in the Socialist paper *Il Popolo* and was banished by the Austrian authorities (Oct. 1911). He was next heard of as editor of the famous Socialist paper of Milan, *Avanti!* Up to the First World War he had been an extreme Socialist, using extremism as a lever by which to dislodge the moderate Socialist leaders and secure place and office for himself. At the outbreak of the war he advocated neutrality, and his sudden conversion to intervention on the Allies' side resulted in his expulsion from the Socialist party at a congress in Milan (Nov. 1914). The explanation of his swift conversion is generally sought in the activities of the Fr. Socialist deputy, Marcel Cachin, who probably told M. that his dream of owning a newspaper of his own might be realised through Fr. gold provided he advocated intervention.

His expulsion by the Socialist Congress at Milan was the turning-point in his career. All his old associates abandoned him in disgust; but M. was now the powerful owner and editor of a paper, for on Nov. 15 he had founded *Il Popolo d'Italia*. In April 1915 he was arrested in Rome for the violence of his interventionist campaign and fought a duel with the moderate Socialist leader, Claudio Treves. When Italy declared war (May 1915) M., who could have claimed exemption as an editor, volunteered as a common soldier in the 11th Bersaglieri regiment, who fought at the Carso. He

spent only five weeks in the trenches, sending back to the It. press sev. photographs of himself 'in the front line.' He served with the rank of corporal, his service ending on Feb. 23, 1917, when he was injured through one of his own mortars misfiring in exercise behind the lines. In Sept. he resumed editorship of his paper, its chief use now being to combat pacifism, and for this purpose he collaborated with the *Fasci di Resistenza*, or 'Unions of Resistance,' organised for that specific purpose. With the war ended, the exceptional disorder that reigned in Italy favoured the growth of the strong counter-revolution M. had been preparing. He had now decided to form his own political group and to that end held a meeting in March 1919, in rooms lent by a wealthy Milanese Jew overlooking the Piazza San Sepolcro—whence at first his group were known as *Sansepolcrista*. The group subsequently adopted the name *Fasci Italiani di Combattimento*, the term 'Fasci' being already in familiar use. Thus on March 23, 1919, the Fascismo institution was founded; its activities, which were directed by M., are recorded under Fascism. M. very soon dropped the original programme of the group, which seemed indeed to advocate the abolition of almost everything for which Fascism has subsequently stood. He found a much surer way to power through D'Annunzio's expedition to Fiume and opened a subscription list in his paper for the expedition. It was the blackshirts of D'Annunzio's *arditi* and their slogans, and also the gangster methods of their leader, that appealed so strongly to M. When, however, Fiume was bombarded M. did not, as was expected, move to D'Annunzio's assistance. He had in fact betrayed D'Annunzio at the instance of the new Prime Minister, Giolitti, who undertook for his part of their mutual bargain secretly to arm the Fascist bands. A state of guerilla warfare now raged throughout Italy. Fascist propaganda has always spread the legend that in the years 1919-22 Italy was in a state of revolutionary Bolshevism from which she was delivered by the leadership of M. But in fact Italy was in no real danger from Bolshevism, and when the workers locked themselves in the factories, M. gave his approval to their move. He was in fact prepared to support any one who would support him, and in May 1921 he actually made overtures for a truce with the Socialists and, as suddenly, veered round to the Monarchists. The wealthy industrialists and landowners saw in him a man who could be used as their tool in the same way that the Ger. industrialists sought to use Hitler. They became M.'s patrons, but were to find that, having adopted him, he became their master. He now pursued the familiar role of the political gangster, his first exploit in this kind being the so-called 'march on Rome.' In this *coup d'état* M. was the third choice of the duke of Aosta and other generals who had come to the conclusion that the weak gov. under Facta must be changed. Both D'Annunzio and Gen. Peppino Garibaldi refused to

lead the 'revolt.' M. accepted the offer and held a Fascist congress in Naples (Oct. 24-26) at which he declared that the Fascists would assume power by force. But he took care to leave the march on Rome to be organised and carried out by others, he himself travelling to Rome by sleeping-compartment. The marching columns met with no opposition whatever, and eventually fewer than a large div. actually approached the cap. (Oct. 28). Facta wished to declare a state of siege, but the king, his resolution undermined by the attitude of his kinsman, the duke of Aosta, first gave, and then withdrew, his approval. Had he agreed the regular troops under Badoglio (q.r.) could have dispersed the Fascist march in a few minutes. In the result Facta resigned and M. formed a coalition ministry with himself as Prime Minister, foreign secretary, and minister of the interior. But though so far he followed a conventional policy, humouring both king and church, he took care to convert his illegal armed bands into the legal Fascist militia, and thereafter incited them to a course of violence. The notorious murder of Giacomo Matteotti (q.r.), the Fascist gov.'s ablest critic, a few days after he had launched a brilliant attack in the Chamber on the Fascist chiefs, rocked the Fascist regime to its foundations; mutual recriminations followed and the Fascist chiefs, furious at M.'s dishonest repudiation of responsibility, now tried to compromise M. by publishing revelations in the press. The political stock of the Fascists now sunk very low. M. and his Fascists could even now have been overthrown had there been among the opposition a single man capable of resolution and leadership. But M. regained his prestige through a fortuitous visit to Rome by Austen Chamberlain on a mission of goodwill, apart from the fact that his party secretary Farinacci was quite prepared to continue gangster methods on a still more thorough scale. M. himself escaped three attempts at assassination about this time (1925), but gradually he succeeded in transforming Italy into a totalitarian state (q.r.) with himself as dictator. The chief instruments in this process were the secret police and propaganda. M.'s remedy for Italy's unstable economic condition was to follow the path of autarky (q.r.) or economic self-sufficiency, a policy which is generally doomed to frustration and succeeds only in a country which does not depend largely on other countries for its essential raw materials. M.'s autarkic policy inevitably led him to seek colonial expansion and eventually to embark on his aggressive policy against Ethiopia. He had not been long in power before finding that the Catholic party were among his chief opponents. He now deemed it politic to forget his crude atheism and to follow a policy of conciliation towards the Church. Thus he made a gift of the very fine Chigi collection of books and MSS. to the Vatican; hence too the inclusion of the mass in public ceremonies and the restoration of the crucifix to the schools. M. even sub-

mitted privately to having his marriage blessed. His union with Rachele (Guldi, who worked in his father's tavern, began irregularly in 1910; later, during the First World War, he went through a form of civil marriage with her. These sev. advances having met with some encouragement, M. now embarked on a solution of the fifty-year-old problem, the Itom. question, i.e. the problem of the relations between the State and the Vatican. The ensuing negotiation resulted in the Lateran Treaty and Concordat (Feb. 1929), by which the papacy gave up its claim to the former papal dominions, retaining unrestricted sovereignty over a small area of Rome thenceforth known as the Vatican City and receiving compensation in a large amount in cash and securities. M.'s dominant motive in concluding these

BENITO MUSSOLINI

E N A

accords with Pius XI. was to bring the Church within the orbit and, as far as possible, the control of the totalitarian state, to enlist the support of the strongest and oldest force in the country, and to win the applause of Catholics all over the world. For religion he cared nothing. Even when he visited the pope in 1932 he did not perform the customary obeisances. Soon afterwards he was making parallel overtures to the Muslims, posing as the champion of Islam with the same access of fervour as he had shown in kissing the gospels. To further his aggressive designs on Ethiopia, and indeed generally, he replaced Grandi by his son-in-law, Count Ciano, an utter nonentity. He had gradually relegated his other rivals to obscurity. Thus De Vecchi was sent to the Dodecanese as governor. Balbo (q.r.) was conveniently removed before he could bring to maturity his project of granting Libya independence, and Badoglio was deprived of all influence in Fascist circles. M., always contemptuous of legislative assemblies and cabinet gov., not only assumed office as Prime Minister, but took over the three service

ministries and the Ministry of the Interior, while putting the Foreign Office under the puppet, Ciano.

Thus Italy's policy became essentially that of M. himself; but, with the rise of Hitler in Germany, his path became beset with ever-increasing difficulties. Faced with the alternative of giving up his aggressive dreams or supporting Hitler, he paid the heavy price involved in the latter choice. This included the abandonment of It. influence in Austria, which had become almost a satrapy of Italy. There were angry meetings between the two dictators in 1934, and later, when Hitler seemed to be preparing to march on Austria, M. massed his troops on the Brenner Pass. Nothing decisive happened at that time, but in 1936 M.'s diplomatic position had weakened as a result of his Ethiopian policy, which had estranged both Great Britain and France. But making the best of both worlds M. joined Hitler in that year in supplying Franco with arms and men against the Sp. Republicans and so became a member of the Axis (g.r.) and a partner in the anti-Comintern Pact (g.r.). When therefore in 1938 Hitler actually marched into Austria, M. held aloof and, in the following year, the Berlin-Rome Axis became the so-called 'pact of steel.' In June 1940, with France approaching military collapse and the prospect of Great Britain's isolation, he declared war against both, hoping, 'like a jackal' (Mr. Churchill's description), to secure a cheap reward in the appropriation of Tunis, Cannes, and other portions of Fr. ter. It was the famous battle of Britain (g.r.), however, that offered the first check to his career as to that of his fellow dictator, and in the course of the next two years he found himself at war with both Russia and the U.S.A. as well as with Britain, while the jealousy and ambition of Hitler, who soon became master of Italy after the It. debacle in Libya and Greece, precluded any possibility of Fr. spoils for Italy.

With the loss of It. E. Africa M.'s prestige began to wane even more sharply than before his visit to Salzburg, which involved sending It. troops to uphold Hitler in his anti-Communist crusade. Mr. Churchill's speech on Nov. 29, 1942, inviting the world to realise that 'one man, and one man alone, has brought them (i.e. the Italians) to this pass,' was an implicit appeal to the It. people to overthrow M., and indeed the creation in Dec. 1942 of a new Fascist directorate, which was to look more particularly to the home front, was regarded as an indication of internal danger in Italy. The plight of Italy became aggravated in early 1943 with the threat of invasion. By the end of March M. sought to strengthen his control by reorganising the party directorate and by demanding a personal pledge of loyalty from all party leaders. But with the fall of Tunisia the situation grew steadily worse. In March Hitler demanded the aid of It. troops to relieve Ger. garrisons in France and the Balkans; but M. needed all his military strength at home now that he had lost one army in

Africa, besides the better part of ten divs. roughly handled on the Russian front. In his vain attempt to throw some gleam of light on a darkening horizon M. could only promise that Italy would yet return to Africa, a hollow boast that could hardly conceal the fact that the It. Gov. expected an invasion and had no hope of defeating it; and even the alternative of a peace based on the acceptance of unqualified defeat seemed out of reach while Kesselring's Ger. armies were arrayed in grim resolution on It. soil. In July the It. military authorities called for massive Ger. aid as the only hope of saving Italy. This new request drove Hitler to extreme recriminations against his fellow dictator, and the only course left to M. was to concentrate on defending the Po valley and to leave the rest of Italy to its fate. Soon after M.'s report to the Fascist Grand Council of the outcome of his meeting with Hitler, Grandi, with the dubious support of Ciano, Bottai (an ex-minister of education), and Gen. de Bono (the general who had been superseded in Ethiopia), led a revolt against him, and a demand for M.'s resignation, expressed in Grandi's motion that the king be invited to assume command, was carried by nineteen votes to seven. On July 25 M. was summoned to the royal palace, informed of his dismissal, and taken into custody as he left. His fall meant the end of the Fascist regime. The king took command of the army, Badoglio (g.r.) was entrusted with the formation of a new gov., and throughout Italy spontaneous demonstrations bore witness to the relief felt by the people at the loosing of the Fascist bonds, a release as yet more apparent than real. M. would certainly have been lynched had he appeared in the streets of Rome. He was conveyed by a strong force of carabinieri to a military barracks. He was sev. times transferred from one place of detention to another and eventually to a clinic on the Campo Imperatore, near Aquila, in the Abruzzi Mts. It was from here that he was carried off in a daring raid by a strong Ger. parachute force. M. in Nazi hands became, as was no doubt intended by Hitler, a potential rallying point for the endangered Fascists, who had everything to lose from a change of regime or an allied victory. M. set up a Fascist republic in the N. of Italy and early in the ensuing year (1941) Count Ciano was tried by a Fascist tribunal for his part in the overthrow of his father-in-law and shot. But gradually and inexorably, with the defeat of the Ger. armies in Italy, the partisans in the N. of Italy secured almost complete control of the situation, and M., now a sick man, tried to escape across the frontier into Switzerland. But he was betrayed to the partisans and arrested on April 28, 1945, and, together with some twelve members of his ex-Fascist Cabinet and his mistress, was executed by partisans, who carried the bodies of their victims to Milan for public display.

It has been well said that if M. sought a model for himself he could have found it

in the character of the tyrant as delineated by Plato or Savonarola and that nearly everything in his movement was borrowed from D'Annunzio. Though neither a deep nor original thinker, he acquired a hold over the It. people by the guns of his illegal bodyguard, the support of the army chiefs, big industrialists, and landowners, the most unscrupulous propaganda and flamboyant oratory. As a political showman his only rival was Hitler. His personal vanity was almost boundless, as might be gathered from the Caesarean mien and jutting jaw, and the equally studied concealment of his shortness of stature, baldness, and generally plebeian appearance. His issue, by his wife Rachele, numbered five. His eldest son Bruno was killed in the Second World War, and in M.'s memorial book, *I Talk with Bruno*, there are occasional gleams of paternal sentiment. His one brother, Arnaldo, for whom he seems to have entertained a genuine affection, pre-deceased him. His daughter Edda, the Countess Ciano, is said to have exercised a corrupting influence over his policy.

There is a copious bibliography on M. and Fascism and most books, being written either to extol or to condemn, must be read with reserve. See his *My Autobiography* (trans. by R. W. Child, 1928); C. Salvemini, *The Fascist Dictatorship*, 1928, and *Under the Axe of Fascism*, 1936; G. Megaro, *Mussolini in the Making* (to 1914), 1928; A. de Ambris, *Mussolini: la leggenda e l'uomo*, 1930; H. Finer, *Mussolini's Italy*, 1935; Margherita Sarfatti, *The Life of Benito Mussolini* (with a preface by him; trans. by F. Whyte, 1936); G. Selles, *Saevast Caesar, the Untold History of Mussolini and Fascism*, 1936; E. Lussu, *Enter Mussolini: Observations and Adventures of an Anti-Fascist* (trans. by M. Rawson, 1936); J. A. R. Marritt, *Makers of Modern Italy*, 1937; Angelica Balabanoff, *My Life as a Rebel* (comments on M.'s days in Switzerland), 1938; G. Pini, *Official Life of Benito Mussolini* (trans. by L. Villari, 1939); I. Thomas, *Who Mussolini is* (Oxford Pamphlets on World Affairs, No. 59), 1942; M. H. Macartney, *One Man Alone*, 1944, and *Memoirs of Mussolini*, 1942-43, 1946; P. Saperito, *Empty Balcony*, 1947, *Mussolini's 'La Mia Vita'*, 1947 (his early life to 1912), and (Eng. trans.) *The Fall of Mussolini*, 1948; and E. Amicucci, *I 600 giorni di Mussolini*; also M. Muggeridge (ed.), *Ciano's Diary*, 1947, and *Ciano's Diplomatic Papers*, 1948.

Mussooree, tn. and sanatorium of the United Provs., India, 130 m. N.N.W. of Rampur. Pop. 8000.

Mussorgsky, Modest Petrovich (1835-1881), Russian composer, b. at Karevo, Pskov, was at first a guards officer. In 1857 he began to study music under Balakirev (q.v.) and in 1858 resigned his commission, becoming a civil servant. A sympathy with common folk led him to write realistic songs, following the infections of their speech, and he endeavoured to do the same with his operatic characters. His life became

more and more poverty-stricken; he took to drink, and d. from a spinal disease. The influence of folk-music upon his work was strong, especially in his sixty songs. His chief operatic work was *Boris Godunov* (1874) from Pushkin, and his other best-known works are *Night on the Bare Mountain*, for orchestra, and the suite, *Pictures at an Exhibition*. See M. D. Calvocoressi (ed. by G. Abraham), *Mussorgsky* (Master Musicians), 1946.

Mustapha Kemal, see ATATÜRK.

Mustard. The two Ms. of importance are black, brown, or red M. (*Brassica* or *Sinapis nigra*) and white M. (*B.* or *S. alba*). The former is grown in Cambridgeshire and adjoining cos. for the production of seeds, which are ground, and

after removal of the dark-coloured testas are used as a condiment or are converted into M. oil. The white M. seedlings are commonly used in salads, and for the purpose should be sown three days after cross, with which it is usually eaten.

Mustard Gas (dichloroethyl sulphide, $(\text{C}_2\text{H}_4\text{CH}_2)_2\text{S}$, *Yperite*, *Yellow Cross*) was obtained by Ritchie, 1854, by the action of chlorine on ethyl sulphide. It was described by Guthrie, 1860, and prepared pure by Victor Meyer, 1886, by the action of ethylene chlorohydrin on sodium sulphide, followed by the action of hydrochloric acid. It was first used as a poison gas in the First World War by the Gers. at Ypres, July 12, 1917. It is a light, yellow, oily liquid boiling at 215°C . and solidifying at 14°C . It is a powerful vesicant (blister producer), and affects the eyes and respiratory tract after a period during which the effects are not obvious. It was manufactured in 1918 by the action of sulphur chloride, S_2Cl_2 , on ethylene at 30°C .

Mustique Island, see under ST. VINCENT.

Mut, Egyptian goddess, mother of the gods, and wife of Ammon or Ammon-Ra (q.v.). She was the great 'world-mother,' generally figured with a vulture head-dress, the vulture being the emblem of maternity. Sometimes she is given with

the head of a lioness, or additional ones of a culture or lioness.

Mutina, see **MOENA**.

Mutiny Act. The first Mutiny Act, that of 1689, made it possible to keep a standing army in time of peace, not only by sanctioning its existence for the first time in England, but by providing for the punishment of mutiny and desertion with death, and empowering the Crown to commission courts-martial to deal with those offences in time of peace. From 1689 Parliament passed the Mutiny Act annually until 1881, when it was finally superseded and merged in the Army Act of that year, an Act which is also annually renewed. The Jacobite Rebellion of 1715 made it necessary to increase the stringency of the Crown's disciplinary powers, and accordingly the Mutiny Act of 1715 authorised the Crown to formulate Articles of War to regulate generally the forces in the United Kingdom in time of peace. Prior to that year the Crown could only issue such articles in times of war or rebellion. Among other things, the later Mutiny Acts provided for the punishment by courts-martial of persons guilty of embezzling military or naval stores. See Sir C. G. Robertson, *Select Statutes, Cases and Documents illustrating English Constitutional History, 1660-1732* (7th ed.), 1936.

Mutiny, Indian, see **INDIA, History**.

Mutsuhito (1852-1912), known as Meiji Tenno, 122nd emperor of Japan, b. at Kyoto. He succeeded his father Komei in Jan. 1867. Before he was crowned radical insurgents from the S. seized his person on Jan. 3, 1868, and so overthrew the power of the Shogun. There followed the amazingly rapid modernisation of Japan, with a constitution modelled on the Brit. M. had but little personal hist.

Mutterstadt, com. and tn. of Germany, in the Rhine and Palatinate (formerly Bavaria), 6 m. S.W. of Mannheim. Pop. 5000.

Muttra, or **Muthura**, name of a dist. and tn. in the Agra div., United Provs., India. The dist. has an area of 1445 sq. m. and a pop. of 807,000. The tn. lies on the r. b. of the Jumna, and is the centre of Hindu devotion. Pop. 76,720.

Mutualism, see **SYMBIOSIS**.

Muyra Language, see under **SOUTH AMERICAN NATIVE LANGUAGES**.

Muyscar, see **CHIBCHA**.

Muzaffargarh, dist. of the Multan div., W. Punjab, Pakistan, covering an area of 5605 sq. m. Wheat, rice, pulse, and indigo are the chief crops, and large herds of camels graze upon the sandy waste. Pop. about 712,500. The chief tn. bears the same name, and lies on the r. b. of the Chenab, 20 m. S.W. of Multan. Pop. 8200.

Muzaffarpur, dist. in the Patna div. of Bihar, India. It was at one time included in W. Bengal, but the boundary of the latter was altered in 1912. M. is bounded on the N. by Nepal, on the E. by Darbhanga (also a dist. of Bihar), and on the W. by the dists. of Saran and Champaran. The dist. was originally formed in 1875 out of the great dist. of

Tirhut, which up to then was the largest and most populous dist. of lower Bengal, the then new dist. of M. being made up of M., Ilajipur, and Tajpur. Area 3035 sq. m. Pop. (1910) 2,751,790; (1941, estimated) 3,000,000. The tn. of M. is the headquarters of the dist. magistrate and collector. It has many broad streets, a courthouse, good schools, including a technical institution, and a jail. It is liable to inundation, and to prevent the riv. from reaching it an embankment has been thrown across the lake towards Daudpur; but in spite of this the riv. has cut deeply into the high bank near the court-house, and unless it changes its course it will probably in time break through the strip of land which now separates it from the lake. Pop. 51,000.

Muziano, Girolamo (1528-92), lt. painter, b. at Aquafredda, and studied under Romanus. It was not until 1550, when he went to Rome, that he began to be noticed. His most famous work is 'The Resurrection of Lazarus,' which was finally placed in the Quirinal Palace. The large fortune which he left was used to aid in founding the Academy of St. Luke at Rome, where he d.

M.V.D., secret police of Soviet Russia, successor of the Cheka, G.P.U., and N.K.V.D. (People's Commissariat for Internal Affairs). The operations of M.V.D. permeate every phase of Russian life. Its organisation includes armed troops, tanks, and aircraft, plain-clothes men, and part-time informers. It controls the labour camps and against its acts and decisions there is no appeal. It is under the control of Ministry of State Security.

Mycelium, see under **FUNGUS**.

Mycenæ, one of the oldest cities of ancient Greece, was situated in a very strong position on the hill overlooking the N. extremity of the Argive plain. In 468 B.C. M. was dismantled by the people of its ancient enemy Argos, and was never rebuilt. In the time of Pausanias the ruins consisted of a great part of the walls, with the gate called that of the Lions, from lions being sculptured above it, said to be the work of Cyclopes; the fountain called Persela; and the subterraneous buildings of Atreus and his sons. The discoveries which have been made here have greatly increased the knowledge of Gk. art, especially pottery. The museum at Athens contains many specimens.

Mycenæan Civilisation. This general term was first applied to the prehistoric civilisation discovered at Mycenæ, Trov, and Tiryns by Heinrich Schliemann in 1876. Since then so much has been discovered and laid bare by archaeologists that the word Mycenæan is now scarcely appropriate, for the main source of this civilisation apparently radiated from Minoan Crete, and therefore the present accepted name of 'Ægean civilisation' embraces more fully the breadth and depth of the great culture of which Mycenæan was an offshoot. Homer sang of great cities, of palaces peopled with civilised men and women, of battles and heroic deeds which

until the year 1870 had been merely myths and glorious legends. In that year Schliemann set out to find the site of Troy, and to prove that Homer had some foundation for his historic poems. No site in the Troad can really be placed accurately with Homer's Troy, but the ruinous mounds of Hisarlik, which have been thoroughly explored, first by Schliemann and continued after Schliemann's death by Dr. W. Dörpfeld, are accepted as the original site of famous Ilium. Schliemann dug with faith and enthusiasm, but without the scientific skill of the modern archaeologist. He reached his second stratum in 1873 and revealed a burnt city, with treasures of gold and silver and bronze that suddenly aroused the interest of all students of anct. hist. This find assisted in proving that the Homeric legend of Troy was not founded only on myth, but that a great and wonderful civilisation flourished at least 1500 years before the starting point of Gk. hist. as given by Grote and others. Schliemann next excavated Mycenæ. Here were found relics of a civilisation which sets as a link between that of Crete and the Gk.; the evidence suggests that a sudden introduction of Cretan civilisation took place. His belief that the tomb of Agamemnon lay within the gates of the citadel caused him to dig a pit some 100 ft. sq., about 40 ft. from the great 'Lion gate'; stone slabs were first unearthed, then a circular altar with steles carved in relief. Three feet below the altar lay the first of the five shaft graves, hewn from the rock. The roofs had collapsed, and buried with the bodies beneath the debris was a remarkable treasure. Gold masks, head-bands, breast-pieces, rings, pendants, daggers, and sword hilts, also objects of ivory, amber, silver, and bronze; sixty swords and daggers were found in one grave alone. Schliemann was convinced that these were the actual graves seen by Pausanias, containing Agamemnon and his household. Whether that is true or not we cannot prove; what was proved was the excellence of the metal work and other treasures, showing a highly advanced civilisation belonging to a wealthy prehistoric people. It is possible that this shaft-grave dynasty was estab. by some great family coming from Crete, bringing Minoan (Cretan) civilisation with them. The beehive tombs were explored next, the largest being the well-known treasury of Atreus; it was strongly built, with a passage leading to a high vaulted chamber shaped like a beehive. The door to the chamber was 17 ft. high, bordered with columns carrying a cornice masked with red porphyry, with spiral decorations, enriched with bronze and coloured marble ornaments; rich decorations were visible everywhere showing a high excellence in art. A tomb not far from the treasury of Atreus that Schliemann explored, and believed to be the grave of Clytemnestra, showed beautiful designs in green alabaster and coloured marbles. From Mycenæ he went to Orchomenos in Boeotia, and here other excavations showed the same rich

art and good workmanship, influenced by Egyptian art. Later at Tiryns his work laid bare the entire plan of a citadel palace, with towers, galleries, sleeping apartments, and living-rooms. A frieze of alabaster carved in rosettes and inlaid with vivid blue paste was found, also excellent fresco painting. After Schliemann's death Dörpfeld and others continued his work. Mycenæ was still considered to be the chief home of this great culture until Crete was explored.

Crete disclosed a period of civilisation belonging legitimately to the whole Ægean, scarcely less anct. than that of Egypt. The untiring work of Sir Arthur

Ashtolun Museum

FACSIMILE OF DAGGER INLAIN
WITH GOLD LILY PATTERN
FROM MYCENÆ

Evans has discovered for us the interesting conditions of art and architecture belonging to the Minoan periods. The principal excavations in Crete have been at Chioss, Tythos, and Hagia Triada (*see CHET.*). It was here that this Ægean civilisation apparently found its fountain head. For the general evidence of this culture there are ruins of palaces, villas, houses, and beehive graves; the decorations and architectural features are columns, friezes, mouldings, various mural paintings, and mosaic inlay, etc. Vessels have been found, from tiny pots to huge stone jars, and quantities of pottery. One of the general features of Mycenaean pottery is the stirrup-cup or false-necked vase, so-called from the fact that the neck to which the handles join is closed, or false, and another neck is fashioned further away from the handles for convenience in pouring out. These occur wherever this great culture has been brought to light,

and are the typical pottery of that period known as Late Minoan III. (Crete).

Many fragments of Cretan pottery have been discovered in Egypt, and it seems probable that a considerable trade may have been carried on between the countries. Mycenaean objects have been found in Sicily and Spain, and there were colonies on the Syrian and Turkish coasts. Large quantities of amber from the Baltic show the extent of trade. The two famous Vaphio cups, discovered in 1889 by Dr. Tsountas, were found in a beehive tomb; they were among many beautiful articles of gold, silver, bronze, crystal, etc. The cups were of gold, decorated in relief with scenes depicting the capture of bulls; they belong to the Late Minoan I. period, and represent a triumph of aet. art. Thrones, seats, and tables in stone and terra-cotta have been found, objects of art in ivory and precious metals, small sculptured works, but no large ones, jewellery of various kinds, weapons in metal, only a few later ones being of iron, engraved gems and gem impressions. Tombs of pit or dome-shaped style were also found, paved roadways with bridges and an excellent system of drainage, and, lastly, two main systems of script which as yet remain undeciphered. The principal deity was a mother-goddess, both in Crete and Mycenae, her symbol of the double-axe being frequently discovered in excavations. The dead were not burnt, but buried with great honour, apparently with the hope of a future life; there was possibly a hero-cult of the dead. The social organisation indicates a considerable body of law and a luxurious ruling class. Tradition asserts that Minos was a great lawgiver, and that he possessed a great navy which guarded his commerce with other countries. From the finds of Aegean pottery and various objects in other lands it would seem probable that they traded with Egypt and N. Africa, with Sicily and Italy, and even as far as Spain. The total duration of this great civilisation covers at the least 3000 years. Apparently with the use of iron the Aegean culture ended, about 1000 B.C.

The M. C. came to an end as abrupt as its beginning, with the Dorian invasion from the N., about 1000 B.C. After a dark age until the eighth century B.C., Athenian civilisation arose, rooted in the Cretan civilisation through the link of Mycenae. See H. Schliemann, *Mycenae*, 1878; G. Rodenwaldt, *Der Fries des Megarons von Mykene*, 1921; M. P. Nilsson, *The Minoan-Mycenaean Religion and its Survival in Greek Religion*, 1927, *The Mycenaean Origin of Greek Mythology*, 1932, and *Homer and Mycenae*, 1933; and A. B. Wace, *Antiquity*, 1943; also for Cretan civilisation in its later period, i.e. the so-called Mycenaean period, see Sir A. Evans, *Prehistoric Tombs of Knossos*, 1906; *The Palace of Minos*, 1921; and 'Knossos and Mycenae', address to the International Prehistoric Congress in London, Aug. 1932.

Mycetozoa, see MYXOGASTRES.

Mycoderma, in botany, the ferment fungi which form a thin film on the surface of

liquids, as wine, on which a film is created by *M. vini*, and vinegar, by *M. aceti*.

Mycological Institute, Imperial, see IMPERIAL MYCOLOGICAL INSTITUTE.

Mycology, science of fungi (see FUNGI) or the study of plant disease. The Imperial Mycological Institute at Kew co-ordinates information on plant diseases with the work on insect pests of the Imperial Institute of Entomology and that of the various Imperial agric. bureaux located at research stations. All these bodies came in 1934 under the control of the joint executive council, which since 1928 had regulated the other bureaux.

Myddelton, Sir Hugh, see MIDDLETON.

Myelitis, inflammation of the spinal cord; osteomyelitis is inflammation of bone-marrow. If the grey matter of the spinal cord is affected, the disease is called poliomyelitis (infantile paralysis); if the white matter, leucomyelitis. In acute M. the nervous tissue undergoes degeneration, but may be partially reintegrated; in chronic M. the nervous tissue becomes hardened and overgrown with fibrous connective tissue. The symptoms vary according to the seat of the lesion. Hyperaesthesia, or excessive sensibility, is at first apparent about the level of the lesion; but later sensibility is numbed, and the parts below the lesion pass into paralysis. The progress of the chronic form is slow; little can be done except to look after the comfort of the patient, and he may linger for years or be cut off by some intercurrent disease. The cause of M. may be injury or secondary inflammation from meningitis.

Myers, Frederic William Henry (1843–1901). Eng. essayist, poet, and author, b. at Keswick. He was appointed classical lecturer at Cambridge. M. was the leading spirit, with H. Sidgwick, R. Hodgson, R. Gurney, and F. Podmore, in founding the Society for Psychical Research in 1882. *Phantasms of the Living* (1886) was the result of some of his labours. His most considerable work in that sphere, however, was the posthumous *Human Personality and its Survival of Bodily Death* (2 vols., 1903), which, although incomplete and tentative, was the first attempt to connect the phenomena of hypnotism, mediumship, trances, hallucinations, etc., as belonging to one and the same field of inquiry. His other works include *Catholic Thoughts* (1873); *Essays Classical and Modern* (1883); *Science and a Future Life* (1893), etc.

Myitkyina, most northerly dist. of Upper Burma, Mandalay div., 10,840 sq. m. in area. Indawgyi Lake is in the S.W. The tn. is the limit of navigation on the Irrawaddy, and the terminus of the railway running N. from Mandalay. It was lost to the Jap. invaders early in 1942. In March 1944 it had become the immediate goal of the allied counter-offensive, their troops being by then firmly placed across the main routes by road and rail and riv. linking M. with its supply bases in the S. By the end of April Gen. Stilwell's forces were within 40 m. of M., though they met with tenacious Jap. resistance. On May 17, after a forced march

over 110 m. of mt. and jungle in twenty days, an Amer. force under Gen. Merrill suddenly descended on the airfield 2 m. S. of M., and wrested it from the surprised defenders. The Jap., however, still clung to M., and it was not until Aug. 3 that the tn. was finally taken, following a siege of two and a half months. Pop. 70,000. See further under BURMA, SECOND WORLD WAR, CAMPAIGNS IN.

Mylae, see MILAZZO.

Mylitta, the name of a goddess of Babylonian and Assyrian mythology.

Mylonite, rock formed by the grinding and shearing of the rocks of the earth's crust under the forces of intense earth movements. Ms. occur in the N.W. highlands of Scotland.

Mymensingh, Maimansingh, or Mymun-singh, dist. of E. Bengal, Pakistan, on the borders of Assam, and bounded on the W. by the Brahmaputra. The cap. is Nasirabad. Area 6287 sq. m. Pop. about 4,000,000.

Myna, or Grackle, genus of birds of the starling tribe, having dark-brown plumage, with white markings on tail and wings.

Mynyddislwyn, url. dist. of Monmouthshire, 8 m. from Newport and Pontypool. It is on a coal-field and has chemical and tinplate works. Pop. 14,000.

Myogen, see MYOSINOGEN.

Myopia, or Short-sight, defect in vision due to a faulty structure of the eye. Parallel rays of light are brought to a focus in front of the retina owing to an excessive length of the eye or the surface of the cornea and a too great convexity of the crystalline lens. Thus an indistinct image is thrown on the retina. This defect is corrected by the use of spectacles with concave lenses. The concavity of the lenses is adjusted so that parallel rays are focused on the retina as in ordinary vision. M. often has hereditary connections, and children of myopic parents should have regular examination of their eyes during the average age of inception (nine to eleven years).

Myosinogen, or Myogen, M. and paramyosinogen are the two soluble proteins present in muscle in the proportion of 4:1. They are of globulin nature and readily coagulate through heat. This coagulation change is reversible during life, but at death an irreversible coagulation occurs (*rigor mortis*), which is only removed by the solution of the protein through the action of proteolytic enzymes.

Myosis, condition of the eye in which the pupil is abnormally contracted and lacks its power of accommodation. It may be produced by use of certain drugs, e.g. opium.

Myosotis, see FORGET-ME-NOT.

Myrica, genus of evergreen shrubs and trees (family Myricaceae), bearing axillary peduncles of small white flowers, which are followed in some cases by edible fruits. *M. amplexicaulis* is a handsome shrub sometimes grown in the stove-house; *M. gale* is the bog myrtle, a Brit. plant.

Myriopoda, or Myriapoda, class of arthropods which comprises the Chilopoda or centipedes, and the Chilognatha (Diplo-

poda) or millipedes. The body is long and flattened or cylindrical, and the legs are numerous, though, of course, not so numerous as the popular names suggest. In their internal anatomy they resemble the Insecta, with which they have such other features in common as respiration by tracheal tubes and the possession of two antennae on the head, but the segmented body exhibits no distinction between the thorax and the abdomen, while wings are always absent. Their range is very extensive, and they live in dark places, as under stones, heaps of leaves, manure, and the bark of trees. Some possess powers of luminosity. The centipedes are always flattened and are characterized by a single pair of legs to each segment, the first pair being capable of inflicting poisonous wounds; they are all carnivorous. Millipedes live on vegetation, and apparently have two pairs of legs attached to each segment, but the segments are not perfectly separated; the bodies are round. Some foreign species attain a length of sev. inches. See also ARTHROPODA.

Myristica, tropical trees of the family Myristicaceae, yielding the nutmegs and mace of commerce, and oils and fats. *M. fragrans* yields the best nutmegs and mace, as well as an essential oil used in soap-making and perfumery. *M. officinalis*, of Java, Sumatra, and Celebes yields nutmeg or mace butter, used in pharmacy. *M. cinnab.* of S. America is used for candle-wax.

Myrmidones were, according to Gk. legend, an Aeolian race which inhabited Pithiotis in Thessaly. Their name is derived from an ancestor, the son of Eurymedusa by Zeus, in the form of an ant, or from the legend of the re-peopling of Egeia with ants, changed by Zeus into men. In Eng. the term M. is used for a ruthless subordinate, deriving from the loyalty of the M. to Achilles. See *Iliad*, ii. 68; Strabo, viii. 375, ix. 433.

Myron, Gk. sculptor of the fifth century B.C., b. at Eleuthera, on the borders of Boeotia and Attica. He worked almost exclusively in bronze, and was a late contemporary of Pheidias, as he made statues of the athletes Timanthes (456) and Lycinus (448). The 'Discobolus' at Rome is one of that city's most important statues because it is not, like so many others, a Rom. copy of a Gk. original, but if not the original work of M., it is at least a very early Gk. copy of it. There is a cast of a 'Discobolus' of his with the head on the wrong way in the Brit. Museum. See P. E. Aris, *Miron*, 1910.

Myronides, Athenian general of the fifth century B.C. In 459 he repulsed two Corinthian attacks on Megara, and by the victory of Oenophyta (456 B.C.) over the Spartans obtained the submission of Boeotia (save Thebes), Phocis, and Locris.

Myrrhine Vases, see MURRHINE.

Myrrhis, Myrrh, or Sweet Cicely, small genus of umbelliferous perennial plants. *M. odorata*, a tall, aromatic plant with large tri-pinnate leaves and umbels of white flowers, is Brit., and was formerly

much used as a pot herb and in salads. *Balsamodendron myrrha* is a gum-resin obtained from certain trees of Arabia and Ethiopia and is used in incense and for perfumery. M. was also used by the Egyptians in embalming. See MUMMY.

Myrtle, or *Myrtus*, genus of shrubs or trees with white fragrant axillary flowers and ornamental leaves, which are also fragrant. The common M. (*M. communis*) and its numerous varieties are hardy in mild sheltered positions. Its leaves are distilled to yield the perfume Eau d'ange.

Mysia, in anct. geography, was a dist. in the N.W. of Asia Minor, peopled by the Mysi, who were probably akin to the Nybians and Carians. The N. portion was called M. Minor, the S. M. Major. The chief tns. were Pergamum and Cyzicus.

Myslowitz, tn. in Polish Silesia about 45 m. W. of Cracow. There are zinc works, flax-spinning mills, and coal-mines near. Pop. 17,800.

Mysore: 1. Native state of India, surrounded by ter. of Madras, except in the N.W., where it is bordered by that of the prov. of Bombay. It is divided into two regions—the Malnad, or hill country, in the W., i.e. the country bordering on the W. Ghats, and the Maidan, or open country, occupying the greater part of the surface. M. is famous for its varied and picturesque scenery and for its temperate and healthy climate. The chief rvs. are the Kistna, Cauvery, and the Pennar, all unnavigable, and only useful for irrigation purposes. M. suffers less from famine (except 1876-77) than any other internal tract of India. The chief products include silk, coffee, sandalwood, gold, and ivory, but rice, oilseeds, sugar cane, cotton, coco-nut palms, and all sorts of grain (especially 'ragi') are cultivated. It was in the late eighteenth century that Hyder Ali wrested the power from the ancestors of the present dynasty, while his son, Tippu Sultan, largely extended the ter. of M. When Tippu was defeated (1799) the ter. were partitioned and the state of M., in its present shape, was reassigned to its former anct. Hindu dynasty. In 1855 the present ruler's grandfather was adopted as heir by the maharajah, and in 1881 he was put on the throne of M., and invested with powers under an investment of transfer. M. is a viable unit of the dominion of India, and responsible government has already been constituted in the State. There is a representative assembly of 320 members and a legislative council of sixty-eight members. The maharajah is assisted in the administration by a prime minister and other ministers, half of whom he himself nominates from the elected members of the assembly and council. Area 29,458 sq. m. Pop. 7,328,800 (chiefly Hindus). 2. Cap. of the above state, situated 10 m. S.W. of Seringapatam. M. is a city of wide streets and large, airy, white buildings, which lend themselves to flood-lighting. The city is overshadowed by a hill rising to 1000 ft., making it 3500 ft. above sea level. The maharajah has two palaces—the old state palace and the

summer palace. The latter stands on the summit of the hill. Half-way up this hill is a tremendous carving in rock of one of the sacred characters of the Hindu religion—Nandi the Bull. Higher still, just below the summer palace, is a massive temple. The state palace is the more magnificent of the two and has massive gold pillars everywhere and wonderful stained-glass windows. In the wedding room are solemnised all the royal weddings, and in the hall the lesser princes pay homage

E.N.A.

BRAHMIN OF MYSORE READING THE SACRED BOOKS

to the maharajah; here, formerly, the maharajah paid homage to the viceroy. The old palace, an example of Hindu architecture, was partly destroyed by fire in 1877. Its univ. was estab. in 1916. Gov. House was originally built by Wellesley (duke of Wellington). Pop. 150,500.

Mystagogue (Gk. *μυσταγωγος*, one who initiates into mysteries), the person who in the Gk. religious system supervised the preparation of those seeking initiation, and gave instruction as to the ceremonial to be carried through.

Mystery (Gk. *μυστήριον*, a secret): 1. In Christian theology a truth which cannot be known by the human reason unaided by revelation, and which even when revealed transcends human comprehension, e.g. the Trinity, the Incarnation. 2. A doctrine and its accompanying rites kept secret from all but the initiates, and having some consolatory effect upon those

who shared them. It is necessary to distinguish M. in these two senses from that derived from Lat. *ministerium*, a trade or craft, and more properly spelled 'mystery' (whence M. plays (*q.v.*), those acted by trade guilds). Among the Babylonians some scholars have detected such a rite in the mystic pantomimes which illustrated the myth of Tammuz and Ishtar. It is, however, doubtful whether we have here a true M., since the doctrines inculcated by these rites were not themselves secret, and the rites purported to do no more than to solace the dead. The earliest Ms. of which we have certain evidence, at least as early as 1875 B.C., are those connected with the legend of Osiris. In Greece certain public cults had secret rites attached to them such as the Arrephoric and Thesmophoric festivals at Athens. But the prin. Gk. Ms. were the Eleusinian and Adanian and the originally non-Hellenic Kaberoi of Samothrace. These were local, whereas the more emotional and licentious Dionysic and Orphic Ms. were practised by societies which sprang up in various parts of the Hellenic world. In the second century B.C. on the break-up of the Alexandrian Empire and the beginning of the Graeco-Rom. period there was a revival of M. religious which exerted mutual influence one upon another. To this period belongs the cult of Mithra which appears to have made a particular appeal to the Rom. legions who carried it with them wherever they went. The M. religions had this in common, that they offered to their initiates salvation (*σωτηρια*), a better way of life through communion with some saving deity. A M. was entered through an initial rite of purification usually baptism by water, or, as in the case of Mithraism, by blood; communion was estab. by the sharing of some sacred meal or cup; and the initiate then proceeded to the enlightenment (*αγνωση*) in which the doctrine was revealed by a solemn ritual which seems always to have included dancing. It is not possible to determine how far the early Christian missionaries assimilated their gospel to the esoteric doctrines and ritual of the M. religions. There is no evidence that such was the case in the synoptic gospels; but some have discovered such an influence in the epistles of St. Paul; and it is certainly true that the same circumstances which favoured the diffusion of the Ms. assisted also the spread of Christianity. See C. A. Lobeck, *Aglaophamus*, 1829; A. Maury, *Religions de la Grèce antique*, 1857-59; G. Aurieh, *Das antike Mysterienwesen*, 1891; F. Cumont, *Textes et monuments figurés relatifs aux mystères de Mithra*, 1896-99; R. Heltzstein, *Die hellenischen Mysterienreligionen*, 1910; H. A. A. Kennedy, *St. Paul and the Mystery Religions*, 1913; J. Leipoldt, *Die Religion in der Umwelt der Urchristentums*, 1926; and O. Bauhofer, *Das Geheimnis der Zeiten*, 1935.

Mysticism (Gk. *μυστικος*, secret or hidden), belief in spiritual apprehensions of truths beyond the understanding, can hardly be said to be either a philo-

sophy or a doctrine. It may be said to be a tendency in religious feeling, a temper, or an atmosphere. The starting point in M., and its goal, is that unity underlies diversity. So M. has been defined as an 'attitude of mind founded upon an intuitive or experienced conviction of unity, of oneness, of alikeness in all things.' M. leads to a belief that all things are manifestations of the divine life, and that the spirit is the only eternal thing, and, further, since unity underlies all, then man has some share of the nature of God, and through this Godlike part of him can apprehend God; for as through the intellect we apprehend material things, so through the soul can we apprehend the spiritual. So reason is not a part of M. According to M. we can only know thing spiritually by *being* it, and therefore the aim of a mystic is to attain union with the divine, and life becomes one long aspiration, and reality or truth ever and ever deepens and expands. M. appears in Buddhism, Hinduism, and may be said to have had its rise in Europe in Plato, although Plotinus, the founder of Neo-Platonism, was the first great European mystic. Then came the Christian mystics of the Middle Ages, headed by St. Augustine and the Syrian monk who ascribed his work to Dionysius the Areopagite, and the great Irish philosopher, Scotus Erigena, who trans. Dionysius into Lat. from the Gk. In the twelfth and thirteenth centuries may be mentioned Bernard of Clairvaux, Richard of St. Victor, near Paris, and Bonaventura, and in the fourteenth century Richard Rolle, Walter Hilton, Julian of Norwich, John of Chur, and Thomas à Kempis. The Christian M. evolved by these was based on the adoptive sonship of God attained by man through Christ the God-man. Christian M. is thus a deeper realisation of this supernatural unity of man with God through Christ which is finally consummated in the beatific vision. Later we find Paracelsus, Bruno, Campanella, Boehme, Schelling, and Swedenborg. In England we have the Cambridge Platonists, including Henry More and John Smith, and later Wm. Law, Blake, and Coventry Patmore. Among more recent writers it is only necessary to mention Burke, Coleridge, Wordsworth, Shelley, Keats, Rossetti, the Brownings, George Meredith, and Francis Thompson. To-day among the most prominent are W. B. Yeats and Evelyn Underhill. See also CARBALA: QUINTISM; ROSICRUCIANISM; THEOSOPHY, and the articles on the various religions and persons mentioned above. See W. R. Inge, *Christian Mysticism*, 1899, *Studies of English Mysticism*, 1906, and *Mysticism in Religion*, 1947; C. F. E. Spurgeon, *Mysticism in English Literature*, 1913; R. Nicholson, *Mysticism in Islam*, 1921; E. C. Butler, *Western Mysticism*, 1922; F. von Hügel, *The Mystical Element of Religion*, 1923; Evelyn Underhill, *Mysticism*, 1924, and *The Mystic Way*, 1930; E. Brunner, *Die Mystik und das Wort*, 1924; J. H. Leuba, *Psychology of Religious Mysticism*, 1925; A. Hopkinson, *Mysticism Old and New*, 1946.

Mystriosuchus, primitive Triassic crocodile, of the archaic order known as the *Parasuchia*.

Mytens, or **Meytens**, **Daniel** (1590-1656), Dutch portrait painter, b. at The Hague, came to England and became portrait painter to Charles I. When Van Dyck was made the king's prin. portrait painter M. wished to go, but was prevailed upon by the king to stay until about 1630, when he returned to Holland. He painted portraits of many notable persons, including Charles I. (in Buckingham Palace), the duke of Portland, the earl of Craven, etc.

quarter of the nineteenth century, but it was at this period that serious attention began to be paid to the comparison and elucidation of the world's store of mythic stories. Karl Otfried Müller (*Prolegomena zu einer wissenschaftlichen Mythologie*, 1825, a book which introduced the method of scientific investigation of myths) attempted to show that in reality M. was but a disease of language, and that the names of divinities were referable to words expressing natural phenomena.

A new school arose with Lang and Frazer, both of whom interpreted M. in

MYSTRIOSUCHUS

Fr. S. W. Williston, *Water Reptiles, Past and Present*, 1914.

Mytho, or **Mito**, port of Fr. Indo-China at the mouth of the Mekong R., 58 m. S.S.W. of Saigon. Pop. 23,000.

Mythology, that div. of tradition which deals with the acts and deeds of gods and other supernatural beings. It is not, as generally seems to be supposed, necessarily confined to an early state of society, for, in the shape of folklore, it still permeates our customs to a surprising degree. Early efforts to answer the question as to the genesis of the gods led to the formation of many different theories. Thus we find them regarded as the expression of natural phenomena, as the sun, moon, and wind personified. Among the most acute of the early investigators was Euhemerus of Thessaly, who advanced the doctrine that the gods were in reality early heroes exalted as divinities. Many tentative collections of myths other than those of Greece and Rome had been made before the last

terms of savage life and experience. An excellent review of the various theories which have been advanced to account for the origin of religion will be found in W. Schmidt's *Origin and Growth of Religion* (Eng. trans. 1931). The larger work on which this is based is *Ursprung der Gottesidee*.

Evolution of the Gods.—Until the appearance of Schmidt's epoch-making researches it was generally held that polytheism preceded monotheism in the evolution of religion. Schmidt, working historically and inductively, has shown that the most primitive races now existing (e.g. the pygmies of Africa and the bushmen of Australia) profess a rudimentary monotheism, and that multiplicity of gods and complexity of belief and ritual make their appearance as we ascend the scale of civilisation. Thus animism and fetishism, which were at one time thought to be at the root of all religious M., must now be

regarded rather as early stages in its growth. Animism is the name given to barbarian man's habit of attributing spirit life to the various phenomena of nature. Akin to it is fetishism (derived from the Portuguese word *feitico*, to make), the belief that wandering spirits may enter, or be coaxed into, objects of peculiar shape, the possession of which will benefit the savage. A further primitive belief which is found at the roots of all *Ms.* is that of totémism (*g.r.*). These three systems or root-beliefs have provided most *Ms.* with their pantheons. The spirits which inhabit natural objects, or which are supposed to lurk in natural phenomena, evolve from the animistic form into full-blown deities. Thus, too, a fetish which gains more than personal fame may evolve into a local god. And most totems succeed in achieving godhead after sev. generations of tribal adoration. In the latter class we can descry the animal-headed gods of Egypt and Assyria, while animism supplies us with examples of water- and sea-gods, thunder-gods, and all the pantheons.

Classification of Deities.—The deities of various *Ms.* fall into sev. well-defined classes. Thus in all systems we have war-gods, water-gods, wind-gods, thunder- and lightning-gods, gods of agriculture and the chase, gods of death, and many other mythic conceptions. Many of the deities of certain systems combine two or more of the attributes of godhead. Thus it is common to find war-gods who are also gods of agriculture, and wind-gods or thunder-gods who are gods of the chase. Deities of death quite often preside over agriculture, as it is imagined that the seed arises from their subterranean domain. When mankind partially abandoned the hunter state and entered upon a semi-agric. condition of life, a new type of mythical beings arose. With these man had an implied contract to the effect that he should provide the gods with sacrifice in return for their superintendence of the crops and fruits of the earth. For guidance in the hunt the personal forish was usually employed, but the health of the crops, and therefore the sustenance of the community, depended upon unseen beings who sent the rain, the wind, the thunder, and the lightning.

Cosmology.—An important dept. of *M.* is that which deals with the primitive conception of the world and its creation, and the origin of man. The likeness between cosmological myths collected from all parts of the world is extraordinary, and cannot be accounted for by any theory of circulated or borrowed conceptions. We find in most of these the creative agency brooding over a vast world of waters and raising the solid earth from the flood beneath, either by a process of strenuous thought or by physical toil. In other instances the universe is hatched from a cosmic egg. Man often passes through evolutionary types, sev. of which are discarded by the gods until they arrive at human perfection. Behind these we usually descry some dim creative figure, but oftentimes

the universe is the work of a combined pantheon (*see further under COSMOLOGY*).

The following is a brief *résumé* of the prin. characteristics of the world's most important *Ms.*

Greece and Rome.—The *Ms.* of these peoples may be considered together, as in many instances their deities are directly interchangeable. We discover in them a well-defined pantheon ruled over by the great god of the sky, Zeus or Jupiter, who has supplanted a still older generation of divine beings, and wields thunder and lightning. With his wife, Hera or Juno, he rules over a divine galaxy, many of the members of which are related to him. Hephaestus, the deity of smiths, and Vulcan, the Rom. god of devouring flames are the craftsmen or artificers—though there is some doubt whether Vulcan was also a presiding deity of smiths, his surname Mulcibes having reference rather to his power of quelling conflagrations. Pallas Athene or Minerva presides over wisdom, but at the same time has something of a martial character as a sort of divine amazon. Ares or Mars is the god of war. Aphrodite or Venus presides over love, and Hermes or Mercury acts as divine messenger between gods and men. Apollo is the god of song and art. Innumerable tales circle around these beings, tales which for beauty of conception and completeness of finish have never been equalled in the hist. of myth. But the Gk. mind speedily discerned the unsubstantial nature of the shadowy system it had itself evolved, and we find very early doubts expressed concerning the real existence of the gods. Probably no mythological system attained such a height of perfection or underwent such speedy collapse as that of Hellas. The *M.* of Rome, built by a sterner and more conservative folk, held its own for a little longer, buttressed as it was by the power of an upholding state, but it too crumbled speedily before the encroachments of monotheism.

Egyptian Mythology.—In Egyptian *M.* we find evidence that the faiths of the lower cultus, totémism, animism, and the like, although still permitted to exist, had superimposed upon them the philosophical beliefs of a priestly class which had arrived at a high state of theological capacity. Recognising the folly of communicating abstract beliefs to the ignorant the priestly caste retained so much of the early popular beliefs as seemed good to it, and employed them symbolically for the inculcation of higher religious thought. Thus Herodotus speaks of the apes and other animals kept in captivity by the Egyptian priests, but he is careful to explain that these were in no wise regarded as idols, but as typifying the multifarious attributes of deity. We find the gods of Egypt arranged in triads, or groups of three. Egypt was subdivided into nomes or provs., and each of these possessed its triad of gods. Thus Osiris, Isis, and Horus at one time presided over one of these localities, but later, because of their exceeding popularity, became the national gods. The myth of Osiris, his birth,

reign, and death, typifies the daily journey of the sun. His wife, Isis, and their son, Horus, lost all their original characteristics when they were interwoven with the Osiris myth. Nephthys, sister to Isis, probably represents the sunset. She was wife to Set, brother to Osiris, and god of darkness, who finally triumphed over his brother. Wisdom was personified in the god Thoth, or, as he was called by the Gks., Hermes Trismegistos. Anubis, or Anpu, presided over the lower regions, and was the patron of embalming. He was figured with the head of a jackal. Pasht, or Bubastis, the cat-headed, represented the heat of the sun. Besides these principal deities a large number of the kings of Egypt were deified. An enormous and ambiguous ritualistic system had crystallised round this M., much of which is represented in the *Book of the Coming Forth by Day*, and deals with funerary practices. It is, in fact, a guide to the soul after death through the various divs. of Amenti, the sad underworld of the dead.

Semitic Mythology.—In early Semitic M. polytheism had many of the features of totemism and animism embedded in it. There was also a widely distributed system of pillar worship, and each 'high place' and mt. appears to have possessed its special deity or *ba'al*. In the book of Genesis there is confirmation of the polytheistic condition of the early Israelites, for whereas a deity, Jahveh, is alluded to frequently, we find sev. notices of beings called the Elohim, the plural ending of whose name may denote multiplicity. Obviously a later monotheistic version has been combined with an older polytheistic one. The polytheism of the races surrounding Israel was merely a continuation of this old belief, and the monotheism of the Israelites arose in all probability from the great popularity of Jahveh, who had led them out of captivity into a happier sphere, who was a jealous god, and would brook no rivalry. The religions of Babylonia and Assyria were widely polytheistic, including as they did gods which represented every attribute and phase of deity. In Babylonian myth we find a great triad, An, En-lil, and Ea, who are at strife with darker deities, Apsu, Tiamat, and Marduk. The generic title *Bél* was bestowed on all gods alike. Dagon was probably a corn deity. One of the prin. Assyrian deities was Ash-taroth, or Astarte, the wife of Marduk and the goddess of love, and typical of fruitfulness. Ashur, from being the local god of the city of that name, became the head of the Assyrian pantheon, and was chiefly famous as the national god of war. There was a host of smaller gods with little more than a local significance.

Hindu Mythology.—The mythic system of the Aryan conquerors of India is polytheistic. The head of their pantheon is Brahma, whose leadership is oft-times, however, threatened by other powerful gods. The fullest account of the Hindu M. is to be found in the Vedic hymns. Brahma is passive, but when he acts he is given another name, Vishnu the Pre-

server, a more 'human' deity than the impersonal Brahma. Siva is Brahma in his guise as a punisher and destroyer. Varuna is god of the waters, and Indra wields the storm and the lightning. Vishnu has had many *avatars*, or incarnations, as has Durga, Siva's wife, the destroyer of demons. Innumerable inferior deities cluster around these conceptions.

Teutonic Mythology.—Perhaps the most important of the European mythic systems is that of the anc. Teutons. At the head of their pantheon was Odin, or Wotan, the All-father, who presided over the destinies of both gods and men. He possesses all the characteristics of a sun and sky god. His consort, Freya, typifies the Scandinavian matron and housewife. Thor was god of thunder and the Scandinavian Vulcan. Tyr was the sword-god and god of war. Loki was the mischievous god of evil. Balder, the graceful god of light and summer, whose myth typified the death of that season. The Scandinavian idea of the universe was that the *aesir*, or gods, dwelt at the top of the world-tree, Yggdrasil. Round this tree coiled the great world-snake. At its roots dwelt Hel, the dark goddess of death. In Midgard dwelt the race of men. But in the Norse conception even Asgard and its deities would not endure for ever. On the contrary, before the eyes of the gods there ever loomed a day of doom, when after the battle of Ragnarok they and the powers of evil would mutually destroy each other, darkness and chaos prevail, and a new heaven and earth be born.

Celtic Mythology.—The Celts in France and Britain possessed a well-defined mythological system, particulars of which can be gleaned from the remains of altars and images in France and England, and from the mythological tales of Wales and Ireland. The Celtic religion was strongly influenced by primitive elements, totemic, animistic, and agrie, and although later in the hist. of the Celtic race new circumstances prompted the evolution of new deities, those of growth and fertility were probably the most important. Most of the divinities, however, were tribal or local in character. In anc. Gaul we find Ogmios equated by the Romans with Mercury, and Boryo, Belenos, Grannos, and many more—all local gods—with Apollo. The martial character of the Gauls tended to the evolution of many war-like deities, Camulos, Albiorix, Caturix. Animal and nature gods also abounded, as Mullo, a mule-god, Vintius, a wind-god. 'Corn-mothers' were numerous and local, as, for instance, the famous Berecynthia, of Autun. In the mythical tales of Ireland we meet with a number of supernatural races, such as the Fomorians, Firbolgs, and Tuatha Dé Danaun, all of which probably represent the sev. pantheons of various emigrant races. The most prominent Fomorians were Balor, a personification of the evil eye; Bres, probably the god of night, or perhaps of growth; and Doman, a goddess of the depths of the earth. Of the Tuatha Dé Danaun, which means 'the folk of the goddess Danu,' the prin.

deities are Dagda, the most important of all Irish gods, who was probably an earth or agrie. deity; Oengus, son of Dagda, a god of growth; Nuada 'of the Silver Hand,' who may have been a harvest god; Manannan, god of the seas; and Lug, the sun-god. The prin. Brit. Celtic divinities, as treated in the Welsh *Mabinogi* and other myths, were Llyr, god of the sea, and his sons, Bran and Manawyddan, all associated with the ocean; Dôn, the Brit. equivalent of the Irish Danu; Gwydion, a sort of Celtic Proteus; Arianrhod, an earth-goddess; and Govannon, equivalent to Vulcan. In the Arthurian romances we find many mythological characters disguised, but any consideration of these cannot be embraced in the limits of this article.

Kerényi, *Einführung in das Wesen der Mythos*, 1941.

Mytilini, or **Kastro**, name of one of the three dists, and also of its cap. in the is. of Lesbos. The latter is divided into Molyro in the N., Calloni in the W., and Kastro in the E. M., or Kastro, the chief tn. of this dist. is built in the shape of an amphitheatre surrounding a small hill surmounted by an anct. fortress. It was at first situated on an is. close to the E. coast of Lesbos, but as the tn. grew the is.

were joined by a causeway, and M. expanded along the coast. During the Peloponnesian war the tn. revolted, and was besieged from 429 to 427; it was the scene of a battle between Callicrates and Conon in 105. Pompey raised M. to the status of a free community. Pop. 31,600.

Mytton, Flags, series of rocks of Lower Ordovician age, occurring in Shropshire. They consist of thick shales or flags made of ashy material, with a few fossils, including trilobites. They are remarkable for their copious supply of zinc, lead, and barytes, and some of the mines were worked by the Romans in Britain.

Myxodema, metabolic disease caused by disturbance of the function of the thyroid gland. This gland, which lies in front of the windpipe, is one of the so-called ductless glands. Its function is the secretion of the hormone *thyroxine*, which speeds up metabolism, growth, and mental activity. If the gland be removed by operation a state of sluggish metabolism sets in, with depression of mental function. The symptoms observed are similar to those occurring in the course of the disease described by Sir Wm. Gull in 1873, and known as Gull's disease or M. The body increases in bulk, and the subcutaneous tissue of the face and hands becomes infiltrated with a mucin-like substance, causing a swelling which does not pit on pressure. The mental processes become sluggish, the speech becomes halting, and there is marked loss of mental and physical energy. One of the characteristic symptoms is a total absence of sweating. The disease may run its course for many years with gradually increasing intellectual and physical incapacity. The connection of the disease with the loss of activity of the thyroid gland is demonstrated by the similarity of the symptoms to those of operative M., the existence of cases in which the thyroid gland is shown to be atrophied, and the fact that administration of thyroid extract causes a marked amelioration of the symptoms.

Myxogastres, **Myxomycetes**, or **Myxozoa**, group of widely distributed organisms numbering some 500 species. Some of them were known by the middle of the nineteenth century, and were understood to be fungi, but the spores on germination, instead of producing germ tubes, give rise to amoeboid bodies; these have the power of spontaneous movement, and combine in a solid mass or plasmodium or vegetative condition which remains buried in the matrix or host until it creeps to the surface and produces its spores in a position whence the wind will disperse them. Most Ms. are saprophytes, and some creep over and suffocate seedlings, but a few are parasitic on cultivated plants and trees, causing such destructive diseases as finger-and-toe, corky scab of potato, and crown gall. See also under *Fungi*.

N

N, fourteenth letter of the Eug. alphabet, follows M in most alphabetic scripts. Also its shape closely followed that of the letter M (*q.r.*). In the N. Semitic, the early Gk., Lat., and Etruscan alphabets, which were written from right to left, *n* was written *ŋ*. Gradually it assumed the shape N. N. The *n* minuscule developed slightly later than the *m* minuscule (*see* M). The sound N is determined by the position of the tongue against the palate. N, in Eng., standing by itself, is alveolar, and is pronounced with the tongue against the teeth sockets by expelling the breath through the nose. It is palatal or guttural according to the following sound. Thus in *branch* it is a palatal, while before *g* and *k* (e.g. *bank, thing*) it is a nasal. N and M have often been interchanged in the Eng. language. For instance, N tends to become M finally and then followed by *b, p, or f*, as in *time, Cambridge, hemp, and comfort*, from O.E. *tīc, tīc, Cantabrigge, hænen*, and Late Lat. *confortare*, respectively. On the other hand, a medial N may be derived from an M, as in *ant* (O.F. *āmele*, M.E. *āmel, āmel*). N is often found in conjunction with D, the latter dental being used to elench the sound of the former. Thus D is frequently introduced between N and L, or N and R, as in *spindle* (O.E. *spīndel*), *thunder* (O.E. *ṭunor*). Finally, D is sometimes dropped (e.g. *woodbine*, O.E. *wudu-bīnde*), and sometimes developed (e.g. *sound*, O.E. *sunu*). Initially, through popular etymology or careless pronunciation, N has been introduced in *nickname, neut.*, etc. (O.E. *fāc + nama, efete*), and dropped in *orange, adder, apron*, etc. (M.E. *norange, nadder, naperon*). In chem., N is the symbol for nitrogen, Ne for neon, Nd for neodymium, Ni for nickel, and Nb for niobium.

Naarden, tn. of Holland in the prov. of N. Holland, 20 m. S.E. of Amsterdam. The old tn., adjoining the IJsselmeer (Zuider Zee), is fortified by wide ditches in a geometrical pattern of the Vanban type, constructed in 1692. Pop. 6000.

Naas, tn. and urb. dist. of co. Kildare, Ire. It lies 20 m. S.S.W. of Dublin on the Great S. Railway. Pop. 3600.

Naba, Napa, or Naha, tn. and seaport on Great Luklu Is., Japan. Sugar, cotton, and silks are exported, and there is manuf. of hats similar to the Panama straw. Pop. 65,200.

Nabadwip, *see* NADIVA.

Nabatei, or Nabathæ, Arabian people, who occupied nearly the whole of Arabia Petraea, on both sides of the Atlantic Gulf of the Red Sea and the Idumean Mts., where they had their rock-hewn cap., Petra. We first hear of the N. in 312 B.C. in connection with the attack upon them by Athenæus, general of King Antigonos I., which ended in disaster. The N. at this time were uncivilised, but they

gradually advanced, and by the end of the second century B.C. became a power to be reckoned with. N. eventually fell under Rom. power, and we last hear of them in A.D. 106. Traces of Nabatean culture are found widely in Transjordan. Pottery has been excavated at Jerash, proving that their trade extended beyond the confines of their ter. in S. Transjordan, and Nabatean stations marked with thousands of fragments of pottery have been found the entire length of the Wadi-Arbah. The further we penetrate southward into the desert along the E. side of Transjordan the more does the widespread nature of the Nabatean occupation become apparent and it is evident that the N. occupied the desert more fully than did the Romans. This is proved by the remains of their fortresses and military outposts. The most commonly known Nabatean deity is dhu-Shara (Dushara, Dusares, i.e. Dionysus) and numerous dedications to him in Nabatean and Gk. have been found in temples in Transjordan. In these remains, numerous Nabatean gods, whose existence had theretofore been unknown, have been indicated. Most notable is the temple of Kherbet Tannar. *See* N. Glueck, *The Other Side of the Jordan*, 1940.

Nabbes, Thomas (1605-41), Eng. dramatist, native of Worcestershire. He began his career as a dramatist about 1630, and his chief plays are *Hannibal and Scipio* (1635); *Corant-Garden* (1638); and *The Spring's Glory* (1638) containing his best work. He also wrote a continuation of Knolles's *General Historie of the Turkes*. *See* works, ed. by A. H. Bullen, in *Old English Plays*, 1887.

Nabha, state of India, in the Patiala and E. Punjab Union. Area 947 sq. m. Pop. 340,044.

Nabis, ruler of Sparta (206-192 B.C.). He usurped the throne and allied himself first with Philip of Macedon and later with Rome. In 201 B.C. he took Messene, but was driven out by Philopemen in 200 B.C. Later he ravaged the surrounding ter. and occupied Argos, but was driven out by the Corinthians. He was assassinated by Alexamenus.

Nabium, *see* NEBO.

Nabius, or Nabulus, tn. of Palestine, 33 m. N. of Jerusalem. It manufs. a special brand of soap containing olive oil. It is peculiar among Palestinian tns. in having retained its more recent name, Neapolis, in preference to its original name Shechem. Shechem is associated with the earliest period of Jewish settlement, for here Abraham pitched his tent on entering Palestine, and set up the first altar to Jehovah on a spot still shown on Mt. Ebal. It was to Shechem, which lies in the narrow valley separating Mt. Ebal from Mt. Gerizim,

that Joshua led the Israelites after the miraculous passage of the Jordan. N. was captured by the crusaders under Tancred, and an important eccles. council was held here in the reign of Baldwin II. One of the best authenticated holy sites in Palestine is Jacob's Well, which lies just outside the E. end of the tn., below the vil. of Sychar. N. itself is long and narrow, and is traversed by two parallel *sugs*, containing sev. mosques, which were formerly crusaders' or Byzantine churches. This part of the tn. was severely damaged by earthquake in 1927 but has largely been rebuilt. The Great Mosque in the E. part of the tn. was originally a basilica built by Justinian and was rebuilt by the crusaders. Many Jews were murdered here in the Arab revolt of 1929. Pop. 23,200.

Nabob, corruption of the Hindustani *naib*, originally used only as a title for native Indian rulers, great officers of the Mogul's court, and governors of provs. The title was also used for the governors-general of the Brit. possessions. In the eighteenth century the title came to be used familiarly for any person who returned from a far country with great riches.

Nabopolassar, Chaldean soldier, viceroy of Babylon and father of Nebuchadnezzar. When the Assyrian Empire had become weakened by the loss of blood and treasure in the conflicts and conquests of Assurbanipal (see **BABYLONIA**), N., having quelled a revolt in Babylonia, seized the throne of Babylon (625 B.C.). For a considerable period he occupied himself in the consolidation of his Babylonian dominions; but when the Assyrian Empire was beginning to totter beneath the blows of the Medes, he entered into an alliance with these assailants of what had so long been the dominant power in S.W. Asia, and took as a wife for Nebuchadnezzar, Amytis (Amuhea in Eusebius), daughter of the Median king Astyages. Together the allies besieged and at length captured Nineveh; but meanwhile Pharaoh-Necho (see 2 Chron. xxxv. and xxxvi., and 2 Kings xxiii.), who is celebrated in Herodotus for having attempted to unite the Mediterranean with the Red Sea by a canal, anxious to secure some share of the crumbling empire, conquered Syria and occupied Carhemish, which guarded the ford on the Euphrates. N., who had associated his son, Nebuchadnezzar, with him on the throne, sent him to encounter Necho, who was completely defeated. N. was succeeded by his son in 604 B.C.

Nabu, see **NERO**.

Nabua, tn. in the prov. of Ambos Camarines, Luzon, Philippine Is., 20 m. S.E. of Nueva Caceres. Pop. 19,000.

Nachtigal, Gustav (1834-85), Ger. explorer, b. at Kichstedt, near Stendal. In 1869 he set out from Tripoli on a mission from the king of Prussia to Bornu, visiting Tibesti and Borku, hitherto unvisited by Europeans, and by way of Bagirmi, Wadai, and Kordofan, arrived unexpectedly at Khartoum in 1874. In *Sahara und Sudan* (1879-89) he pub. an account of his travels. In 1882 he was

appointed Ger. consul-general at Tunis. His mission to W. Africa in 1884 resulted in the annexation to Germany of Togoland and Cameroons.

Naerite, rare unisilicate mineral occurring in four-sided prisms in metamorphic rocks, both schistose and granite. It is friable in character, gleaming and pearly, consisting of greenish-white scaly plates, greasy to the touch. It comes under the species kaolinite, and is found in Wicklow in Ireland, and in N. America.

Naden, Constance Caroline Woodhill (1858-89), Eng. authoress and poetess, b. at Edgbaston, Birmingham. She was much esteemed by Gladstone for her poems. Her works include *Songs and Sonnets of Springtime* (1881), and *A Modern Apostle, The Elucidation of Life, and other Poems* (1887). Her complete poetical works were pub. in 1894. See W. R. Hughes, *Constance Naden: a Memoir*, 1890.

Nadezhdinsk, tn. of the Sverdlovsk Region of the R.S.F.S.R. Iron ore is mined, and also bauxite ore for aluminium, it is a centre of the fur trade. Pop. 64,700.

Nadia, see **NADIYA**.

Nadir (1688-1747), the Conqueror, shah of Persia, b. at Khorassan. He drove out the Afghans from Persia and restored Tahmasp II. to his throne (1725-27); N. himself imprisoned him and became regent for his infant son Abbas III. (1732). The latter d. in 1736, and N. was crowned. He extended his kingdom as far as Kandahar and Delhi (1738-39), but his tyrannical government caused much dissatisfaction, and he was assassinated. See life by Sir H. Durand, 1908.

Nadir (Arabic *nazir*), astronomical term denoting the point in the heavens which is directly beneath our feet as that directly overhead is called the zenith. A line drawn from our feet through the centre of the earth would cut the celestial sphere at the nadir. In figurative language, the lowest point or lowest stage of depression.

Nadiya, or **Nabadwip**, cap. of the Nadiya dist., E. Bengal, Pakistan, formerly situated on the Bhagirathi R., which has since altered its course. Near by is the battlefield of Plassey. Pop. 14,500.

Nævius, Gnaeus (c. 264-c. 194 B.C.), Rom. poet and dramatist. He came into prominence in 235, and composed an epic poem as well as writing tragedies and comedies. He attacked Scipio and the Metelli in his plays with entire recklessness, but was indicted by Q. Metellus and imprisoned; he recanted but later expiated a further offence by exile. He retired to Utica, where he d. c. 202 B.C. His poem on the first Punic war in the old Saturnian metre was the first Rom. national epic, but only a few fragments are extant. Although adapting Gk. tragedies and comedies N. had a distinct vein of native originality, and ranks high among the Lat. authors of his day.

Nævus, area of pigmentation, or mole; a tumour of the skin composed almost entirely of enlarged blood vessels. A mole is not dangerous, and does not tend to spread, therefore it usually requires no treatment. A vascular N. may diminish

in size of itself, in which case no treatment is necessary; or it may show a disposition to enlarge, thus constituting a possible danger through hemorrhage. The N. may be capillary, consisting of enlarged capillaries giving rise to a purplish mark known as 'port-wine stain'; it may be venous, consisting of enlarged veins, giving a bluish appearance; or arterial, when pulsation can be felt. The N. may be removed with the knife, or by tightly ligaturing the base, or the blood may be coagulated by electrolysis and other means.

Nafa, see NABA.

Nāga, name given to deified serpents in Hindu mythology; Sesha, the king of the snake world, is the sacred serpent of Vishnu. See also MYTHOLOGY.

Nagapattanam, see NEGAPATAM.

Nagar, see HUNZA and NAGAR.

Nagarkot, see KANGRA.

Nagas (*naga*, a snake), name of a non-Aryan group of peoples of E. Assam, alleged to be head-hunters, who live between the middle Brahmaputra and the Chindwin. At one time great virtues were ascribed to them. According to Indian mythology the N. are a race of demons descended from Kadin, the wife of the sage, Kasyapa. They have a jewel in their heads, giving them a sparkling appearance, and inhabit one of the seven beautiful worlds which lie between this world and the hills. Their world is ruled over by three chiefs, Sesha, Vasuki, and Takshaka; it is recorded that their daughters often wedded with man (compare the habits of mermaids as exemplified in W. folk-lore). The old sage, Ganga, one of the fathers of Indian astronomy, was said to owe all his wisdom to the god Sesha. See also MYTHOLOGY. See T. C. Hodson, *The Naga Tribes of Manipur*, 1911; and W. C. Smith, *The Nagas*, 1926.

Nagasaki, city of Japan on the is. of Kyushu, at the head of a long bay which forms its natural harbour. It is situated at the W. extremity of the peninsula of Fizen, which forms the N.W. portion of the is. of Kyushu. The harbour, one of the most beautiful in the world, is some 6 m. in width, and 3 or 4 m. in length. The hills surrounding the harbour are broken into long ridges and deep valleys, while the more fertile spots are terraced and under cultivation. Before its devastation in 1945, the W. shore was occupied by port facilities, shipbuilding and repair, and the E. shore by smaller shipyards, wharves, and dwellings. The main commercial and residential area of the city lay on the small plain near the head of the bay on its E. shore. From here the valley of the R. Urakami runs N. for several miles and a smaller valley branches N.E. for 2 m.; the smaller valley was crowded with dwellings, huddled around narrow roads, market streets, and temple squares; the Urakami valley contained large steel, engineering, and armament works, together with smaller factories and a mass of workshops and workers' dwellings. These industries, controlled by the firm of Mitsubishi, plainly dominated Nagasaki,

where everything which survived bore the stamp of a vast industrial slum. Early in 1945 some dispersal was begun to workshops set up for the purpose in tunnels and schools, and the latter, built of reinforced concrete, were among the few imposing buildings in Nagasaki. The city did, however, possess a fine complex of modern hospital and medical school buildings. Nagasaki was once a naval base but its importance declined with the development of the base at Sasebo. In 1910 its pop. was 253,000, having risen only slowly since 1930, but it had continued to rise during the Second World War, which gave new importance to its shipbuilding and to its production of torpedoes and other armaments. When the atomic bomb fell (Aug. 9, 1945) the pop. was 260,000, 14 sq. m. of the city were destroyed, and 24,000 people were killed; 30,000 were injured and many of these died later. The centre of damage wrought by the atomic bomb was in the industrial area between the two large Mitsubishi ordnance plants in the Urakami valley. Hence the harbour and the commercial area, 2 m. distant, escaped with minor damage, as also did the housing in the smaller valley screened by the intervening high ridge of hills (for which reasons the area of damage and with it the death toll were smaller than in Hiroshima) (*q.v.*). The few previous attacks on Nagasaki had been aimed at the shipyards, so that most of the damage from them was outside the area of atomic bomb damage; but, as in Hiroshima, the initial blast damage done by the atomic bomb was followed by extensive fires. Nagasaki in 1946 presented the appearance of a city struck by a brief but tremendous hurricane, and the scale of the disaster brought city life and industry virtually to a standstill.

A 50 ft. tower now marks the spot where the bomb fell and the devastated area, on which are playing fields, is surrounded by 10,000 new dwellings. In the dock area shipbuilding is again active and the residential areas bear little trace of the disaster. There is a plan to rebuild the city as a cultural centre.

Nägeli, Hans Georg (1773-1836), Swiss musical composer, b. at Westziken, near Zurich. In addition to composing music, he pub. and ed. the best classical works, including Beethoven's sonatas, and an excellent version of Bach's 'Forty-eight' from an original in the composer's handwriting. He estab. the *Schweizerbund* choral society, which soon formed branches, and reformed the teaching of music in schools on the lines of Pestalozzi's educational system. See lives by R. Hunziker, 1924, and A. E. Cherbuliez, 1938.

Nägeli, Karl Wilhelm von (1817-91), Swiss botanist, b. at Kilchberg near Zurich. After studying botany at Geneva under Candolle, he graduated at Zurich Univ., and was ultimately appointed prof. extraordinary of that institution. In 1852 he was appointed to the chair of botany in the univ. of Freiburg-in-Breisgau and, in 1857, was promoted to Munich, where he remained as prof. until

his death. He is famous for having proved, in 1862, by chemical analysis that protoplasm is nitrogenous and differs from other cell constituents. He is one of the fathers of biochemistry. One of his most notable discoveries was that of the antheridia and spermatozooids of ferns and of *Pilularia*. He wrote *Pflanzenphysiologische Untersuchungen* (with Cramer), *Die Neuern Algensysteme*, and *Mechanisch-physiologische Theorie der Abstammungslehre*, and with S. Schwendener, *Das Mikroskop* (1865-67).

Nagina, tn. of the United Provs., India, in the dist. of Bilānūr, with an important trade in sugar, cotton cloth, glassware, and ebony carvings. Pop. 26,000.

Nagorno-Karabakh, autonomous Region of the Azerbaijan S.S.R., in the S.W. of the republic. The cap. is Stepanakert.

Nagoya, cap. of Owari prov. on the is. of Honshu, Japan, lying at the head of the shallow Isenoumi Bay some 30 m. from Yokkaichi, 94 m. from Kyoto and 235 m. from Tokyo. It was the fourth city of Japan in size before the Second World War, its pop. (1940) being 1,323,000. It is the hub of railways running N.W. and W. to Gifu and beyond, N.E. and S.E. to Kifu and beyond, and along the coasts of Isenoumi Bay. Its old castle dated back to the early seventeenth century, and in modern times it was used as a military depot; but it suffered irreparable damage in the Amer. air raids. The religious buildings of N. included the Buddhist temple, Higashi Hongwanji. In N. were the famous Seto potteries, as well as large cotton mills. Especially notable were its silk and cotton fabrics dyed so as to show spots in relief with radiating colours. Cloisonné enamelling in Japan had its beginnings in N. But little of the tn. survived the Second World War: some 500 Amer. Superfortresses laid the city waste on May 13, 1945; and it was also hit on other dates.

Nagpur: 1. Dist. and a div. of the Central Provs., India. The N. part of the prov. is mountainous in character, being traversed by spurs of the great Vindhya Range. The climate is not healthy, and is especially insalubrious in the extensive tracts of low marshy land which abound. Area 23,521 sq. m. Pop. approaching 1,000,000. Between 1920 and 1947 N. was under a Brit. governor. 2. City of India, cap. of the Central Provs. and Berar, 450 m. E.N.E. of Bombay. Cotton cloths, coarse and fine chintzes, turbans, silks, brocades, blankets, woollens, tent-cloths, and articles in copper and brass, are manufactured. One of the eight federal univs. of India is at N. and was founded in 1923. There is also an engineering school. Pop. 301,957.

Nagybecskerek, see BECKEREK.

Nagy-Kikinda, or **Vel Kikinda**, tn. in Dunar prov., Yugoslavia, near the Rumanian border, with important trade in wheat and fruit. Pop. 25,000.

Nagy-Körös, tn. of Pest co., Hungary, 10 m. N.E. of Kecskemet. Melons, maize, and wheat are grown. Pop. 29,900.

Nagykunsag, see KUNANIA.

Nagyzeben, see SZUTC.

Naha, see NABA.

Nahel Asi, see ORONTES.

Nahuel Huapi, Lake, lake of Argentina, belonging to the same natural system as the Chilean Lakes (Todos Santos, Llanquihue, and others), from which it is not far separated. It has an area of 800 sq. km. and is more than 330 yards deep in some places. It stands 2500 ft. above sea level in full view of the peaks of the Cordillera. Mt. Tronador commands the scene and the blue waters of the lake, the mts., and the natural solitude contribute to its charm.

Nahum, seventh of the minor prophets, is described in the title of his work as an Elkoshite, and the tradition narrated by Jerome which identifies N.'s vil. with a certain vil. of Galilee is generally accepted. In Jerome's time this vil. bore the name of Elkesi. The prophecy deals with the fall of Nineveh, which is described with great vigour and majesty. The expression is clear, and the thoughts are striking. In ch. iii. 8-10, it is said of Nineveh that she will be as little able to avoid destruction as was Thebes (No-amon), and it is from this reference that the date of the prophecy must be fixed. From it one can say certainly that N. prophesied between 664 and 607 B.C. See A. B. Davidson, 'Nahum, Habakkuk, and Zephaniah,' in *Cambridge Bible*, 1896.

Naiads, see NYMPHS.

Naidu, Sarojini (Mrs.) (1879-1949), Indian poet, feminist and governor, b. at Hyderabad, daughter of a Bengali Brahmin educationist and principal of the Nizam's College, Hyderabad. She was educated at Madras Univ., King's College, London, and Girton College, Cambridge. Her first work, *The Golden Threshold* (1905), with a preface by Arthur Symonds, is western in imagery and sentiment. Her second vol., *The Bird of Time*, with an introduction by Edmund Gosse (1911) also revealed her lyric powers. This was followed by another book of collected poems, entitled *The Broken Wing* (1917). These too showed her mastery of metrical form, besides earning for her the title of 'the nightingale of India.' But thereafter she became too much engrossed in public affairs and, particularly, the feminist movement, to devote her life to literature. She was the first Indian woman to occupy the chair of the National Congress (1925), Mrs. Besant being the first woman to do so (1917). Later she toured America and Canada as a Congress propagandist and took part in Gandhi's non-co-operation cult. In 1931 she accompanied Gandhi as the sole representative of the Congress to the second session of the Round Table Conference. She was twice imprisoned for participating in the civil disobedience movement, and again in 1942, with other members of the Congress, for obstruction to the allied cause, being released on grounds of health in 1943. She took a prominent part in the long negotiations which resulted in the setting up of the independent dominions of India and Pakistan and was appointed governor of the United Provs. For her efforts in relief work in Hyderabad in the floods of

1908 she was awarded the Kaiser-i-Hind gold medal. She did much to break down the barrier of *pardah*, which had so long been strictly observed in that city, and after partition her influence was the major factor in preventing communal riots.

Nail. Until a comparatively recent period almost every kind of N. was produced by hand labour; each N., however minute, was separately forged from a thin rod of iron, a process which is still followed in the production of what are technically known as wrought Ns., which possess certain advantages, for particular kinds of work, over those formed either by casting, or by cutting or stamping out of rolled sheet metal. For some purposes Ns. formed by the much cheaper process of casting have been long used. Common cast Ns. are, however, so clumsy and so brittle that they can only be used for a few coarse purposes as in plasterers' work, and in the nailing up of fruit trees. By the introduction of great improvements in the manuf., however, a very useful kind of cast N. of an exceedingly pure material, has been successfully introduced for certain descriptions of woodwork. They are annealed to such perfection that the metal will bear far more bending than ordinary wrought iron without injury. This extraordinary degree of tenacity is, however, obtained at the expense of rigidity, such Ns. being often nearly as soft as copper, and therefore quite unsuitable for use in hard woods. In the making of cut Ns., the Ns. are cut from sheet-iron of suitable thickness, which is first reduced by cutting transversely into strips or ribbons of a breadth equal to the intended length of the Ns. See also SEWES; SCREW-NAILS or WOOD-SCREWS.

Nain, Le, Antoine (1588-1648). **Louis** (1593-1648), and **Mathieu** (1607-77), three brothers, Fr. painters, sons of a sergent, and all b. at Laon and d. in Paris. After being taught the elements of art, they went to Paris, where Antoine took pupils in 1629. They were all original members of the Fr. Academy, though little is known about their lives, while their works show no trace of the influences which prevailed when the academy was formed as, for example, the pre-occupation of Fr. taste for mythological allegories or the 'heroic deeds' of the monarch; and as their signature is rarely found and never accompanied by initials differentiation between the brothers is almost impossible. Although they were themselves Fr., their subjects suggest Holland and their methods Spain. These consist of familiar objects and incidents, such as tavern interiors, card-playing, domestic diversions. The genre pictures are said to have been painted by Louis and Antoine conjointly. Mathieu painted subjects for churches and also portraits—among the latter being Cinq-Mars, Mary de' Medici, Cardinal Mazarin, and Anne of Austria—but none has survived. Room XII. of the Louvre is dominated by the brothers, the chief pictures there being 'Boys Playing Cards,' 'The Forge,' 'The Peasants' Noonday Meal,' 'The Watering Place,' and 'The Holy Manger.' In the

Florence museum is 'The Adoration of the Shepherds'; in Valenciennes, 'Two Men Playing at Cards'; in Rouen, 'Rustic Interior'; in Stafford House (London) 'Life Player'; at St. Laurent (Paris) 'The Nativity of the Virgin'; and at Munich a striking picture of a painter at work on a woman's portrait. There are also some fine drawings by the brothers in the Brit. Museum. Champfleury wrote two works on the brothers (1850, 1861). See also A. Valabrègue, *Les Frères Le Nain* (1904).

Nain: 1. Anct. tn. of Galilee, 26 m. S.E. of Acre. Mention is made of this city in Luke vi. 11. 2. Station of the Moravians on the Labrador coast. Pop. 300.

Naini Tal, dist. and tn. in the United Provs. India. The dist., which is well wooded, has an area of 2627 sq. m.; the prin. crops are wheat and rice, some fruit, and a little tea in the hilly parts. Pop. 291,000. The tn. is 70 m. N. of Bareilly, and is the summer headquarters of the prov. gov. Altitude 6400 ft. Pop. 10,000.

Nainsook (Hindu, *nain*, eye; *sukh*, delight; but the etymology is doubtful), thin muslin-like material of fine texture, with a soft finish, and either plain or striped. It is a kind of jaconet and was formerly made in India.

Nairn: 1. Maritime co. of N.E. Scotland, bounded on the N. by the Moray Firth, and on its other sides by the cos. of Inverness and Moray. Salmon fishing is an important industry. Agriculture is carried on and there are large granite quarries. The R. N. runs through the co. in a beautiful valley, which presents particularly attractive and romantic scenery in the neighbourhood of Cawdor Castle, one of the residences of the earl of Cawdor. Area 162 sq. m. Pop. \$500. 2. Royal (1121) municipal burgh, and co. tn. of N. It lies on the Moray Firth, and has a harbour with pier and breakwater. Fishing is the main industry. Freestone is quarried, and there are rope and twine factories. The good bathing and fine golf course have made it a favourite summer resort. Pop. 6000.

Nairne, Carolina Oliphant, Baroness (1766-1845). Scottish song-writer, b. at Gask, Perthshire. She was called the 'Flower of Strathearn' on account of her striking beauty. She wrote songs under the pseudonym of 'Mrs. Bogan of Bogan' or 'B.B.' The most popular ones are *The Laird o' Cockpen*; *Land o' the Leal*; *Charlie is my Darling*; *Callin' Herrin'*, and numerous Jacobite songs. See G. Henderson, *Lady Nairne and her Songs*, 1905.

Nairobi, cap. of Kenya Colony and Protectorate, and the chief city of Brit. E. Africa. It stands at an altitude of 5453 ft. above sea level, 330 m. from the coast. It is a city of the plains, but behind it, to the W. of the line of the Ngong Hills, the character of the country beyond is clearly imaginable. N. grew out of the Kenya and Uganda Railway. When the first few stores followed the pioneer railway and a bazaar and a few rough roads appeared, it was hardly to be imagined that this was the nucleus of a new and thriving city and a new empire

cap. Yet not many years ago N. was a mere *weld dorp*, with corrugated iron buildings in the commercial area, unpaved sidewalks, and rough earthen roadways, while ragged gum-trees obscured the low shop-windows in the main street, giving the whole an untidy aspect. At that time the tn. was mostly an Indian bazaar and rickshaws were the chief means of transport. N. is in fact hardly half a century old. The train approaches the tn. from a somewhat unfavourable point. The buildings on the plains are scattered and unattractive: a quarantine hospital, the prison, the factory sites, the public works dept.'s premises, and rows of low houses provided for the African staff of the transport system. But this dreary introduction soon gives way to something far more impressive. The station is long and not unimposing, and the smoke-grimed engine-sheds and long workshop buildings suggest an industrialised setting after the unbroken peace of the plains. The new headquarters of the Kenya and Uganda railways and harbours is a fine pile set in a spacious and well laid-out site. To-day N. has wide macadamised streets, sev. modern and even luxurious hotels, theatres and picture houses, departmental stores, a cathedral, a racecourse, one or two up-to-date aerodromes, imposing supreme court buildings, and a fine city hall. The cultural life of the country is represented by a memorial library and a memorial museum. Its streets are thronged by a motley crowd of Europeans, Asiatics, and Africans of every kind and from almost every part of the continent. There is delightful country around N. and good motor roads. Visitors can arrange to go everywhere by car, train, or by air. The municipal council decided in Aug. 1919 to petition the king for a charter raising the status of the tn. to that of a city. In April (1950) N. will celebrate the fiftieth anniversary of local government there. The Royal College of Heraldry is to be invited to assist in blazoning a coat of arms, and inquiries are to be made about obtaining a mace. The petition to the king recalls that N. was originally a swampy watering place to which Masai herdsmen brought their cattle. To-day it has 120,000 inhab. (Europeans 6000), is the headquarters of both the Kenya Gov. and the E. African High Commission, and is the largest Brit. colonial tn. N. of Rhodesia. The first European resident was a sergeant of the Royal Engineers named Ellis, who in 1896 was seconded to the railway construction authorities.

Naivasha, tn. in Kenya in the prov. of N., and close to the lake of the same name. It is 39 m. distant from Mombasa. There are many farms taken up by Europeans in this neighbourhood. Some 35 m. E. of the tn. is Mt. Satima (13,000 ft.), the highest point of the Aberdare Range. White pop. is about 500.

Najd, see NEJD.

Nakhichevan, autonomous S.S.R. included in the Azerbaijan S.S.R. Also the name of its chief tn., on the r. b. of the Don, and near the mouth of that riv., 6 m. E. of Rostov. The tn. was founded

in 1779 by Armenian settlers. Tobacco, candles, tallow, cotton goods, and bricks are manufactured. The area is served by a branch line of the Baku-Tiflis railway. Pop. (tn.) 71,300.

Nakskov, port and cap. of Laaland, Denmark, 82 m. S.W. of Copenhagen. Brewing and sugar refining are carried on. Pop. 9000.

Nakuru, tn. of Kenya, Brit. E. Africa, cap. of Rift Valley prov. It is attractively situated on the shores of a salt lake of the same name, surrounded by mts. and sloping pastures, studded with extinct volcanoes. It is a centre of the Kenya Farmers' Association. An agric. show is held annually. There are European schools. The crater of Menengai (7470 ft.) close to Lake Nakuru is visited by tourists. The crater, which is 2000 ft. deep and 8 m. in diameter, affords fine views of the Rift valley. A branch of the Kenya and Uganda railways connects Nakuru with Kisumu (131 m.). Nakuru is the point of departure for Lako Baringo (78 m. distant), a lake 18 m. long and 10 m. broad. Pop. (white) 1500; (Asiatics) 1200.

Archaeology.—Lake Nakuru was the centre of the brilliant anthropological researches of Dr. L. S. B. Leakey (see MAX), who studied at the anthropological school of Cambridge Univ. and led the E. Africa archaeological expedition to the Rift valley in 1928. He and his companions unearthed in the lake deposits at Nakuru a very complete series of Pleistocene remains, including 'pygmy' implements of obsidian, decorated pottery, stone bowls, mortars, and beads, besides human remains—the latter being the most significant. Human remains were discovered on a site at the N. end of the Nakuru basin, below the railway station of the same name, and also at two other sites, some 15 m. distant at the S. or Elmenteita end of the Rift valley. The skull found by Mr. Leakey in the Nakuru deposits was remarkable for the great length in proportion to the width, and its other outstanding characteristics lay in the face, which was 136 mm. long and comparable to the Oldoway skull (see OLDOWAY MAX). Two skulls were also found by Dr. Leakey on the Elmenteita site, one resembling closely the Nakuru skull. The deposits found by Mr. Leakey in 'Gamble's Cave' in the S. end of the Nakuru basin form a wonderful series, and to find comparable examples we have to go to the Grotte des Enfants in the S. of France or Tzitzikama in the S. of Cape Prov. See Sir A. Keith, *New Discoveries relating to the Antiquity of Man*, 1931.

Naltchik, resort and cap. of the Khardinian autonomous S.S.R. of the R.S.F.S.R., in the central Caucasus. Pop. 26,900.

Namaland, see NAMAQUALAND.

Namangan: 1. Region of the Uzbek S.S.R., in the N.E. of the republic, bordering on the Kirghiz S.S.R. 2. Cap. of the above region, 50 m. N.E. of Kokand, in the Syr-Daria valley. There is trade in sheep, hides, cotton, and fruit; coalfields and naphtha beds are in the vicinity. Pop. 77,300.

Namaqua, Hottentot tribe inhabiting Namaqualand, S. Africa. Of all Hottentots they are by far the purest survivors, and are the only tribe to preserve not only the racial type, but their own language. Khoi-Khoen is the name by which they call themselves. A dictionary of the Namaqua language was pub. by Tindall in 1852.

Namaqualand: 1. Great, region of Brit. S.W. Africa, is a desert land sparsely peopled by Hottentots, lying N. of the Orange R. Angra Pequena, on the coast, affords safe anchorage. The chief activity of the region is the rearing of cattle. 2. Little, lies in the N.W. of the Cape Prov. and S. of the Orange R. There are copper mines at Ookiep, but the region is barren and is covered with rugged volcanic-looking mts. Chief tn., Springbokfontein. Although the larger mammals are extirpated, there are still troops of ostriches on the grassy flats of the Bushman country. The existence of copper in N. was known in the seventeenth century and rich ore was brought to Governor Van der Stel by natives in 1681. The supply has declined in recent years. The gravel beds near the mouth of the Orange R. up to Port Nolloth are diamond-bearing. Gold was discovered on the Richtersveld in 1931. Area 20,635 sq. m. Pop. 25,850.

Name Day: 1. On the Stock Exchange, prior to 1911, meant the second day of the periodical monthly settling day. On the second day a ticket, giving the name and address of the ultimate buyer, and the firm who was to pay for the stock, was passed through various intermediaries to the ultimate seller, so that the transfer of stock might be made directly. N. D. was sometimes called ticket day. Now settlements are made daily. 2. Day which is sacred to the saint whose name is borne by a person. The term is naturally used principally in Rom. Catholic countries.

Names, see NAMUR.

Names (O.E. *name*, Ger. *name*; cf. Lat. *nomen*, Gk. *ὄνομα*, title by which a person, place, thing, or class of persons, places, or things, is known. *Place N.*, when scientifically studied, furnish information about the early inhab. and the state of their lands, changing modes and conditions of settlement, and alterations of geographical environment. Eng. place N. have much of pure Eng. origin, but there are important Celtic, Scandinavian, Lat., and Fr. elements. They thus embody the hist. of England, its conversion to Christianity from heathen worship, its antiquities and early defence, its institutions and social conditions, meeting-places, industries, and productions. Some riv. and stream names (Avon, Dee, Stour, Thames) are of Celtic origin, as are those of hills and forests (Bront, Malvern, Saver-nake). The great settlement of Danes which took place in the E. cos. from the end of the ninth century onward has led to the tns. and vils. of that dist. being largely derived from the Scandinavian. A common place-name termination in the Lincolnshire dist. is *-by*, the Norse for a

vill. There is a vast number of Saxon place N. in England. Common and obvious suffixes are *-ham*, *-ton*, and *-ing*. Frequently the root of the name is that of the original possessors of the land, sometimes a tribe, sometimes a family, sometimes an individual, as in the case of Anlaby (from Anlaf), Rowiston (from Hroft). Rom. place-name influence in Britain was primarily military. The Lat. *castra*, a camp, appears in many forms, either alone or as a suffix (e.g. Chester, Doncaster, Dorchester). Other N. are derived from prominent local features, even from trees, as in the cases of Ashby, Lyndhurst, Aldershot, Olney, and Bromley. The investigation of the original significance of place N. may be extremely difficult, requiring an accurate knowledge of philology, for in the course of ages assimilation, corruption, and popular attempts at etymological correction have often altered the N. almost beyond recognition.

Personal N. are, in general, more easy to explain than are place N., though their hist. is more complex. Among uncivilised as well as among civilised peoples the custom obtains of giving each child a name at its birth, though among uncivilised races the name is sometimes given before this. The N. are chosen from nature, from religion, or from some event showing the circumstances of the birth. This method of naming children is well shown in the early books of the O.T. The N. of the gods of the tribe frequently form part of the N. In a later stage of development, the name loses its true meaning and the assignment of the private name of the individual depends on purely arbitrary considerations. By the time of the empire, Rom. N. were already many in number, but three of them were of special importance. The first name was purely personal and belonged to the individual. It was known as the *prænomen*. Common Rom. *prænomina* were Gaius, Marcus, Titus, Quintus. Following this came the *nomen* (*gentile*) which belonged to all members of the *gens* and those connected with it or adopted into it. Among patrician *gentes* the *nomen* almost invariably ended in *-ius*. The *cognomen*, or surname, was the family name, and was generally derived from some personal quality or peculiarity, as in the cases of Naso, Torquatus, Lepidus, Longulus, or from geographical considerations, as in Sabinus and Calatinus. Thus, in the case of Gaius Julius Caesar, Gaius is the *prænomen*, Julius the *nomen*, and Caesar the *cognomen*. Of these N., either the first or the last might be used alone, the first two, or the first and last, might be used in combination, but it is interesting to note that the present popular designation, Julius Caesar, is the only one that would never have been used by the Romans themselves. In addition to these three N., a fourth was sometimes given, generally in recognition of some great deed or conquest. Thus, it was by his exploits against Carthage that Scipio obtained his *agnomen*, or *cognomen secundum*, of Africanus. Similarly we have the additions

Asiaticus and Creticus. When a man was adopted into another family he took all the three N. of his adopted father and to these he added a second cognomen derived by the addition of *-anus* to his old nomen. Thus, when Gaius Octavius, grandson of Julia, the sister of Julius Cæsar, was adopted by his great-uncle, he became known as Gaius Julius Cæsar Octavianus. To these N. was added in 27 B.C. the name of Augustus.

At the present day the child's personal name is known as its Christian or baptismal name, having generally been given on the occasion of its baptism. During the early Middle Ages, a man had no name but this. In course of time the necessity for some further distinction arose, and a man was described according to his trade, his residence, his father's name, or some personal peculiarity. The historical novel has familiarised every one with these various types of surname, and it is not difficult to trace them in modern Eng. The prefix *at* is very common, showing a place of residence, as in the name Atwood, Atwell, Atfield. Many of the occupations which have provided us with surnames have now ceased to exist. Such are Dempster (judge), Scrivener (writer), Walker (fuller), etc. A very large number of N. are derived from the paternal Christian N., and in each country particular affixes are used. Thus, in England, we have the common termination in *-son* or simply *s*. In Ireland we have the prefix *O'* or simply *O*, in Scotland and Ireland the prefixes *Mac* and *Fitz* (Fr. *fils*), in Wales the form *Ap*, of which the *a* frequently disappears (e.g. Price from *ApRhys*). Surnames were very gradually introduced, and it is not until the twelfth century that they begin to become hereditary. Before and frequently after this time the surname as well as the Christian name was peculiar to the individual. Now, however, it is an established custom that the children should invariably be known by the name of the father. On the occasion of a woman marrying, it is usual for her to take her husband's surname. 'N. of dignity' (i.e. peerage ranks, 'lord' or 'sir') are not accepted by the registrar-general unless right is shown to them. Surnames in Scotland were late in becoming fixed, and owing to the clan system are much fewer than in England. The branches of the clans and houses were distinguished by a third name, which now usually survives in the designation, of the chiefs and chieftains of families, e.g. 'Mackintosh of Mackintosh,' 'Cameron of Locheil,' and these, where ordinarily used, are legally regarded as part of the surname. Women in Scotland do not lose their maiden name on marriage, but usually assume their husband's—including designation if any—and are described by both (e.g. 'Mrs. Margaret Gordon or MacDonald of Glenbracken') in legal deeds.

Change of Name.—In England N. may be changed by royal licence or by deed poll. The former is conducted by application through the College of Arms, and the deed poll is usually recorded there,

though advertisement alone is sometimes thought sufficient. In Scotland the Lord Lyon Knight of Arms has jurisdiction in this, and application for royal licence is made through him, but the cheaper course (replacing the deed poll in England) is the Lord Lyon's certificate 'officially recognising' the party under his new name (cost 15s. and expenses, payable to H.M. Treasury). See M. A. Lower, *Patronymica Britannica*, 1860; Christina Blackie, *Etymological Geography*, 1875; C. M. Yonge, *Christian Names* (new ed.), 1884; L. Wagner, *Names and their Meanings*, 1891; J. J. Egli, *Etymologisch-geographisches Lexikon*, 1892 93; B. E. Smith, *The Cyclopædia of Names*, 1894; *Green's Encyclopedia of the Law of Scotland*, s.v. 'Name and Change of Name' (the only reliable or detailed treatise on the Scots law upon this subject), 1896-1904; C. W. Burdley, *English and Welsh Surnames*, 1901; E. Weekley, *Romance of Names*, 1912; C. L'E. Ewen, *A History of Surnames of the British Isles*, 1931; E. Ekwall, *Concise Oxford Dictionary of English Place-names*, 1940, 1947; E. G. Withcombe, *Oxford Dictionary of English Christian Names*, 1915; H. G. Stokes, *English Place Names*, 1919; and the co. surveys of the Eng. Place-Name Society.

Namnetes, or Nannetes. see NANTES.

Namur (Flemish Namen). 1. Prov. of Belgium, bounded on the N. by Brabant, E. by Liège and Luxembourg, W. by Hainaut, and S. by France. The prin.

NAMUR

D. McLairh

rivs. are the Mouse, which entirely intersects the prov., the Sambre, and the Lesse. To the N. of the valleys of Sambre and Mouse this prov. forms part of the fertile Hesbaye plateau. To the S. it presents an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the

Ardennes, and are densely wooded, they attain an elevation up to about 1650 ft. Besides coal-mines Namur has important quarries of marble, slate, sandstone, and limestone. It has good steel, iron, and smelting works which are concentrated with the industries of glass and chemicals round the city of Namur and in the valley of the Sambre. Ardennes (*q.v.*) is the chief place of the ceramic manufs. in the prov.

The old co. of Namur came in 1188 under Hainaut, and in 1263 under Flanders. In 1421 it was incorporated in mighty Burgundy. In the sixteenth and seventeenth centuries it shared the historical fate of the S. Netherlands. In 1792 it came under France; was united again with Holland in 1815 and eventually became a Belgian prov. in 1830. Area 1411 sq. m. Pop. 356,000. 2. Cap. of the above prov., situated at the confluence of the Sambre with the Meuse, about 40 m. S.E. of Brussels. The city is strongly fortified and is the seat of a bishop. Its most noticeable architectural monuments are the cathedral, rebuilt during 1750-72, the belfry of the eleventh century and the restored citadel of the eighteenth century, at present laid out as a park and containing a forestry museum. Namur is noted for its cutlery, its leather works, and its iron and brass foundries. Porcelain, pottery, glass, cement, chalk, and jam are also manufactured. Namur is a very old tn. and has many times been bombarded and besieged. It was captured by the Gers. in Aug. 1911 and looted. In 1940 the new fortifications of Namur were passed by to the N. and S. Pop. 31,400. See J. Borquet and S. Bormans, *Cartulaire de la commune de Namur, 1871-1925*, and F. Rousseau, *Namur, ville mosilane*, 1945.

The prov. and tn. of Namur were in Ger. occupation between 1940 and 1914. The Amer. First Army, pouring across the Seine bridgeheads began a spectacular drive on a three-corps front towards Namur, Liège, and the Ger. frontier (Aug. 29-Sept. 4). On the right of this front the 7th Corps crossed the Aisne on Aug. 29 and captured Namur and the Meuse crossings near Dinant on Sept. 4-5 (see WESTERN FRONT IN SECOND WORLD WAR).

Namwang, see PHOMPHU.

Nanaimo, tn. and coal-mining centre in Vancouver Is., Brit. Columbia, Canada. 74 m. N.N.W. of Victoria. Chief exports are coal, lumber, salmon, and furs. Pop. 6,790.

Nana Sahib (1820 c. 1859). The last Marhatta peshwa, Bajee Rao (Raji Rao II.), who was deposed in 1818, and pensioned, adopted Dhondoo Punt (Dandhu Parth), also called N. S. In 1853 Bajee Rao died, and N. S. claimed Bajee Rao's estate and pension, but the latter was refused. On the outbreak of the Indian mutiny (1857) he joined the rebels, and is remembered for his treachery at Cawnpore (1859), where he caused men, women, and children to be massacred. Ultimately he was attacked and took refuge in the jungles at the foot of the

Himalayas, where he is supposed to have perished.

Nanchang, cap. of Kiangsi prov., China, situated on the R. Kan, 175 m. S.S.E. of Hankow. It is a railway junction, and has an extensive porcelain trade. Pop. 412,000.

Nancy, tn. of France, cap. of the dept. of Meurthe-et-Moselle, on the l. b. of the R. Meurthe, 175 m. S.E. of Paris. The anc. part of the tn. is noticeable for its narrow, irregular streets, while the modern part has broad open streets commanding a view of the surrounding hills. The handsome Place Stanislas divides the Ville Neuve from the Ville Vieille, and is surrounded by many important buildings, such as the hôtel-de-ville and bishop's palace. Other interesting features are the cathedral and the church of the Cordeliers. There is a univ., and N. is a garrison tn. In Aug. 1914 the Ger. Army reached the outskirts of the city, which was bombarded by aeroplanes and long-range guns, but the invaders were driven back in Sept. 1914. In the Second World War N. was involved in the fighting on the Rheims-Verdun-Metz axis following the allied crossings of the Meuse. The 20th (Amer.) Corps entered Verdun and crossed the Meuse (1 Sept.) reaching Etain on the road to Metz; at the same time the 12th Corps advanced to the vicinity of N. The Gers., however, then withdrew to the other bank of the Moselle and on Sept. 5 the allied corps reached N. and by the 11th had estab. themselves in strength on the E. bank of the riv. between Metz and N. See further under WESTERN FRONT IN SECOND WORLD WAR. N. is an important railway centre, and has numerous manufs. including chemicals, textiles, iron goods, and lace. Pop. 113,400.

Nanda Devi (the Blessed Goddess), peak of 25,660 ft., one of the most beautiful in the world, situated in a lofty basin in Garhwal almost impossible of access except through the very deep, difficult Rishi Gorge. Longstaff reached the rim of the basin in 1906; further attempts by him and Ruttledge and others failed to penetrate to the foot of the mt. E. Shipton and H. W. Tilman did so in 1931 but too late to make the ascent. The expedition of 1936 led by Graham Brown, with Tilman, Odell, Lloyd, Houston, Loomis, and others, was a triumph of unselfish co-operation, judgment, skill, and determination. Tilman and Odell were the two who reached the summit, the highest in what was then Brit. India as well as the highest in the world yet climbed.

Nandgaon, state of the Central Provs., India. Cap. Rainandgaon. Rice, cotton and wheat are produced. Area 872 sq. m. Pop. 202,900.

Nandi, dist. in Kenya, Brit. E. Africa. N. is also the name of a tribe of Uganda akin to the Masais.

Nanga Parbat, peak of 26,629 ft. rising 23,000 ft. above the Indus valley. In 1895 Mummery, after failing to climb the very difficult S. face, lost his life crossing to the N. side. In 1932 Willy Merkl's

party reached 23,000 ft. by a route up the *Rakiot* glacier below the ice precipices of the N. face. In 1934, after two nights at 25,000 ft., Merkl, Welzenbach, Wieland, and six porters perished in attempting to descend. In 1937 an avalanche from the N. face at night wiped out Wien's expedition; Bauer's expedition in 1938 found their corpses but reached no higher point.

Nankauri, see under NICOBAR ISLANDS.

Nankeen, cotton cloth of a peculiar yellow shade, which was originally manufactured in Nanking (China), but which has been imitated in other countries.

Nanking, or **Kiangning** anct. cap. of China, later the chief tn. of the prov. of Kiangsu and the residence of the governor-general of three provs. (Kiangsu, Kiangsi, and Nganhui), is situated about 3 m. from the S. bank of the Yangtszekiang and about 100 m. from its mouth. About 1000 A.D. it was named Kiangnan, but in 1368 it received its present name, which means Southern Capital. The anct. palaces have almost entirely disappeared, and the only remarkable monuments of royalty that now remain are some sepulchral statues of gigantic size near an anct. cemetery, known as the Tomb of the Kings. Here is the famous porcelain tower, 260 ft. high, completed in A.D. 1430, octagonal in shape, each side being 15 ft. wide. N. manufs. satin and crape and the cotton cloth called after the city nankeen. Paper and ink are also produced. It was here that peace was concluded between England and China in 1842. In normal times its imports were chiefly cotton goods and metals, and its exports silk goods, frozen meat, and skins. In 1909 the railway connecting it with Shanghai (192 m.) was completed, and Tukow on the opposite side of the riv. is the terminus of a line to Tientsin, opened in 1911. This railway caused a large increase in N.'s trade. The neighbourhood is marshy, which makes the climate dangerous to foreigners who are liable to malaria. It is the seat of the National S.E. Univ. In 1928 N. was chosen to be the cap. of China in place of Peking. In the Chinese-Jap. conflict it was bombed and attacked by Jap. infantry in 1937. It fell to the Jap. invaders on 18 Dec. 1937. The Jap. in 1940 set up a puppet gov. there but the Chinese embassies throughout the world formally disavowed it. See further under CHINA. *History*. Pop. 807,000.

Nansen, **Fridtjof** (1861-1930), Norwegian explorer, scientist, and philanthropist; b. at Store Frøen, near Oslo. His first voyage was made in the *Viking*, 1882; his second voyage was made to Greenland in 1888, when he and his companions, Otto Neumann Sverdrup, Capt. O. C. Dietrichson, and others, encountered many hardships in their attempt to cross the great ice-field. The most remarkable of N.'s adventures was his voyage in the *Fram* to the Arctic regions, where he deliberately allowed his vessel to drift with an ice-floe as far N. as he could go, and then abandoned his ship in order to push his way further N. The *Fram* sailed on June 24, 1893. Leaving the ship, N., accompanied by Johansen, pushed across

the ice, wintered in Franz Josef Land, and was picked up by the Jackson-Harmsworth expedition in 1896. Before the First World War, he investigated sea temps., etc., between Ireland and Iceland, and made further oceanographic research beyond Spitsbergen. In 1917 he represented neutral Norway on a mission to U.S.A. about food supplies. He was a prin. pillar of the League of Nations from its estab., being chief Norwegian representative. In 1921-23 he was chief inspirer and director of famine-relief work in Russia, working with Hoover. Officially thwarted in his attempt to induce the League to raise an international relief loan, he visited selected tns. in N. Europe and raised £250,000 from the public in six weeks. With this sum available, he ignored official channels, collected a small staff of skilled administrators, and, in conjunction with Hoover and his Amers., was soon feeding 10,000,000 people dying of hunger on the banks of the Volga. He was also high commissioner of the League of Nations for settlement of refugees. These refugees were composed for the most part of White Russians and later on of Gks. from Asia Minor. They were without a state or a recognised nationality, and N. provided them with a 'N. passport,' which was accepted by every gov. or certainly by those which were member states of the League. Lord Rector of St. Andrews Univ. in 1926, he refused the premiership of Norway. At the time of his death he was intending to go N. once more--this time by airship. Among Eng. trans. of his writings are *Farthest North* (1897); *In Northern Mists* (1911); *Through Siberia* (1914); and *Armenia and the Near East* (1928). See lives by E. S. Stanitt, 1930; J. Sorensen, 1932; E. E. Reynolds, 1932; and C. Turley, 1933.

Nanshan (the S. Mts.), name of a range of mts. in Central Asia, extending from the S.E. to the N.W. between Tibet and the Gobi desert. The average height of the range is over 13,000 ft., and the Humboldt spur extends for 60 m. at a height of 16,000 ft. From this spur the Ritter chain extends to the Tsaidan plateau. The N. range includes the S. Koko-nor and the Semarov ranges, and two ranges discovered and named by Przhevalsky. The whole system, like the Kuenlun, is older than the Tertiary period, and has large carboniferous beds. Marine formations have been found at a height of 18,000 ft. above sea-level.

Nanterre (anct. *Nemptodurum*, or *Nemetodurum*), tn. of France in the dept. of Seine, 8 m. N.W. of Paris by rail. It has manufs. of tallow and aluminium. The tn. contains the shrine of St. Geneviève (420-512), the patron saint of Paris; pilgrimage takes place hither in Sept. Pop. (com.) 27,000.

Nantes (anct. *Nannetes*, or *Nannetes*), seaport city of France, cap. of the dept. of Loire-Inférieure, is situated on the r. b. of the Loire, 30 m. from its mouth. The natural beauties of the site have been much improved by art, and now the riv. on which the tn. is placed, covered with

craft of every size and description, the is. that stud its channel, and the bridges that cross it and its tribs, here, combine to make the scene a highly picturesque one. The tn. possesses numerous striking and beautiful buildings; among which the cathedral of St. Pierre (severely damaged in the Second World War), containing the splendid monument of Francis II., the last duke of Brittany, and of Marguerite his wife, and the old castle, built in 938, are the chief. Within recent years much has been done by dredging for the improvement of the riv. bed, and large vessels can now reach the harbour, which is fairly spacious. The chief manufs. of N. are varieties of linen and cotton fabrics, calicoes, flannels; refined sugar and salt, soap, chemical products, cordage, sardines, preserved fruits, and meats, etc. It contains shipbuilding yards, tanneries, copper foundries, brandy distilleries, tobacco, biscuit, and sugar factories. Henry IV. signed the famous Edict of N. here in 1598. N. was in Ger. hands from 1940 to 1944, and during this time suffered heavy damage from bombing. Following the allied break-through in Normandy in July (1944) the Amer. Third Army advanced into Brittany against negligible resistance, and by Aug. 6 an infantry div. reached the Loire between N. and Angers. N. itself fell to the Amers. on Aug. 10, although part of the city S. of the riv. remained in Ger. hands for some weeks later. Pop. 200,200.

Nantes, Edict of, see EDICT OF NANTES.

Nanteuil, Robert (1623-78). Fr. engraver, b. at Rheims. Settling in Paris he was appointed in 1658 designer and engraver to the king, with a pension. He modelled his works with great exactness, according to nature, and gave them marked individuality. Among his finest portraits are those of Mazarin, Pomponne de Bellière, Turenne, Jean Loret, and Anne of Austria. See life by E. Douvy, 1924.

Nantgarw, vil., of Glamorganshire, Wales, in the valley of the Taff, 5 m. from Cardiff. It gives its name to a variety of china produced here by Samuel Walker and his father-in-law, Wm. Billingsley, in 1811. It was a hard paste porcelain and had a good glaze, but was vitreous and hard to fire. Billingsley, with the assistance of Wm. Weston Young, continued his work at N. until 1819 when he sold his factory to Young. The decoration at the pottery itself, mostly by Billingsley and Young, consisted of paintings of birds and flowers in bright colours. Generally there were bouquets in the centres, surrounded by elaborate borders enclosing small panels painted with single flowers.

Nantucket, tn. and co. seat of N. co., Massachusetts, U.S.A., on the is. of N. (51 sq. m.), 28 m. S. of Cape Cod Peninsula. It is chiefly important as a summer resort, but has also a large whaling fishery. N. has an interesting hist. from the time of its first settlement by Thomas Macy in 1659. The old name of N. was Sherburne, the present name being given in 1695.

Pop. 3400. See A. Starbuck, *History of Nantucket*, 1924.

Nantwich, mkt. tn. in Cheshire, England, on the Weaver, 5 m. S.W. of Crewe. There are some old timber houses of the sixteenth century. The tn. is visited for its brine baths. There are tanneries, flour-mills, iron foundries, and manufs. of boots and shoes and textiles. N. was a barony of the Norman earl, Hugh Lupus, who built a castle there for defence against the Welsh. No ruins of this castle remain. Twice in the first half of the twelfth century the Welsh invested the tn., and Henry III. later closed the brine-pits in order to remove the main cause of their incursions. At that time N. alone produced more salt than all the other salt-pits in Cheshire. In the early fifteenth and late sixteenth centuries N. was largely destroyed by fire, and thrice between 1587 and 1604 it was decimated by plague. Hence there are but few houses still to be seen standing of a date earlier than Thomas Cleese's house, called the pre-Armada house, with its rhymed tribute to Queen Elizabeth, who made a grant of timber from the royal forest of Delamere for the rebuilding of the tn. Pop. 7100.

Nantyglo, tn. of Monmouthshire, Wales, 7 m. W.S.W. of Abergavenny. It is part of the dist. of N. and Blaina and has coal-mines and ironworks. Pop. (with Blaina) 15,000.

Napa, see NABA.

Naphtha, term originally applied to the liquid hydrocarbons in the neighbourhood of the Caspian Sea (the *naphu* of the Assyrians and the *napha* of Dioscorides). The natural oils of other countries became included under the term, which has now been restricted to the mixture of low-boiling hydrocarbons obtained in the fractional distillation of petroleum, coal-tar, and shale oil. The paraffins are petroleum Ns., and olefines and paraffin are obtained from shale oil. Coal-tar N. collected up to 170° C. is a crude light oil which is redistilled fractionally for 'solvent N.' or 'burning N.' which consists of xylene, pseudocumene, etc. All these Ns. are volatile, highly inflammable liquids, with the odour of benzene, and are valued as burning oils and solvents for gums, resins, etc. Wood N. is crude wood-spirit, or methanol (q.v.).

Naphthalene (C₁₀H₈), aromatic hydrocarbon, occurs in coal tar. Crude crystals of N. are obtained by fractional distillation of coal-tar between 170° and 230° C. These are treated with sulphuric acid, and pure N. is finally obtained by distilling in steam. It crystallises in large lustrous plates, melts at 79° C., and boils at 218° C., and has a sp. gr. 1.15. It has a characteristic odour, is extremely volatile, is insoluble in water, but is readily soluble in hot alcohol and ether. As its vapour burns with a highly luminous flame, N. is sometimes used for carburating coal gas, but its chief use is for the manuf. of derivatives which are used as dyes and explosives. It is the starting point for preparing synthetic indigo. N. is also used as a mild antiseptic and insect killer.

On oxidation with dilute nitric acid, phthalic acid is formed, proving that N. contains the benzene group, and its constitution has been shown to be that formed by the condensation of two benzene rings. Two classes of derivatives are formed, called α or β according to the position of the entering groups. N. forms a characteristic crystalline derivative with picric acid.

NAPHTHALENE

Hydrocarbons and their monologues of the N. series are also found in sev. types of petroleum. The method of producing from petroleum is similar to that used for obtaining N. from coal tar. The action of heat greatly alters the chemical composition of petroleum hydrocarbons and at more or less red heat N. is produced. It is prepared commercially in crystals, flakes, balls, powders, etc. Natives of India and the Far E. carry it in the shape of sticks as a fever preventive.

Naphthionic Acid, member of the group of naphthylamine-sulphonic acids. It is used in the dye industry, while other members are employed in the synthesis of drugs to combat sleeping sickness and similar trypanosomic diseases (e.g. in the drug known as Bayer 205).

Naphthol ($C_{10}H_7O$). The two N. (α and β) are monohydroxy-derivatives of naphthalene corresponding to the monohydric phenols, which they resemble in properties, and are used as sources of dyestuffs; α N. (melting point, 95° C.; boiling point, 282° C.) is prepared from α -naphthylamine, and is a colourless crystalline substance with a faint smell, soluble in alcohol and ether, but sparingly soluble in hot water. The β variety (melting point, 122° C.; boiling point, 288° C.) is soluble in water, its solution giving a green coloration to ferric chloride, while the α compound gives a violet coloration.

Naphthylamine, or Amido-Naphthalene ($C_{10}H_7NH_2$), occurs in α and β modifications; α -naphthylamine is a colourless crystalline substance with a disgusting smell (melting point, 50° C.; boiling point, 300° C.), prepared by reducing α -nitro-naphthalene. The β compound prepared from β -naphthol is odourless (melting point, 112° C.; boiling point, 288° C.). Both varieties and their derivatives are extensively employed in the manuf. of dyes.

Napier, Sir Charles (1786-1860), Brit. admiral, cousin of Sir Charles James N., b. near Falkirk. He entered the navy in 1800, and took part in the operations in the W. Indies in 1806-9. In 1813 he went to America on the expedition up the Potomac, and was put in command of the *Gaitea* off Portugal, 1829. In 1833 he was asked to take command of the Portuguese fleet, with which he was victorious off Cape St. Vincent. In the Syrian war

of 1940 he stormed Sidon, and in 1854 was commander-in-chief in the Baltic against Russia. He twice sat in Parliament; for Marylebone (1842-46), and for Southwark (1855-60). See Maj.-Gen. E. Napier, *Life and Correspondence of Admiral Sir Charles Napier*, K.C.B., 1862.

Napier, Sir Charles James (1782-1853), Brit. general and statesman, b. in London. He fought in the Irish rebellion (1798), in Denmark (1807), and was wounded and taken prisoner at Corunna (1808). He returned to the Peninsula in 1811, took part in the expedition to Chesapeake (1813), and after peace was signed became governor of Cephalaonia (1818). In 1841 N. was dispatched to India, and two years later won a great victory at Meeanee, by which he subdued the rulers of Sind. His administration there was described by his brother, Sir W. P. F. Napier (1851), who wrote his life (1857). He himself wrote many books, chief of which *Colonisation* (1835), and *Defects, Civil and Military, of the Indian Government* (1853).

Napier, Sir Francis, ninth Baron Napier, first Baron Ettrick of Ettrick (1819-98), Brit. diplomatist, b. at Thirlestane in Selkirkshire. He began his career, in 1840, at Vienna and Constantinople, afterwards being sent to the U.S.A. and then to The Hague. From 1860 to 1864 he was ambas. at St. Petersburg, and from 1864 to 1866 at Berlin. In 1866 he became governor of Madras. After a temporary appointment as governor-general of India he returned to England.

Napier, John (1550-1617), Scottish mathematician, the inventor of logarithms, was b. at Merchiston Castle, near Edinburgh, and educated at the univ. of St. Andrews and on the Continent. In 1611 he pub. his invention by which sines, tangents, etc., may be briefly calculated in his treatise, *Mirifici Logarithmorum Canonis Descriptio*. Three years later he wrote *Rabdologie seu Numerationis per Virgulas libri duo*, describing an ingenious method of multiplying and dividing, known as 'N.'s bones,' or 'rods.' N.'s *Plaine Discovery of the whole Revelation of Saint John* (1593) enjoyed great popularity during his lifetime.

Napier's Bones. Previous to his invention of logarithms N. had devised a simple system of multiplication by means of rods known as 'N.'s bones.' The way in which they were used is illustrated by the accompanying figure that shows the 'bones' arranged for the multiplication of the number 85723. Each of these bones consists of the multiplication table from 1 to 9 for the particular number at its head. The digits are engraved below the diagonal in each square and the tens above it. The strip numbered from 1 to 9 is placed on the left in the position shown. As an example we may multiply 85723 by 5. Beginning at the extreme right of the row opposite 5, we write down the numbers in order, adding the number above a diagonal to the one below the diagonal in the column to the left of it. We thus obtain the answer 428615. In order to multiply 85723 by 7024 (say), the

above process is repeated for each number in the multiplier and the answer is obtained by appropriate addition thus:

342892
171446
514338
600061

653552152

See lives by the earl of Buchan, 1787, and by M. Napier, 1834; and an article by W. R. Macdonald in the *Dictionary of National Biography*.

NAPIER'S BONES

Napier of Magdala, Robert Cornelius Napier, first Baron (1810-90), Brit. soldier, b. at Colombo, Ceylon. He served with distinction through the two Sikh wars, was present at the relief of Lucknow, and afterwards defeated Tantia Topi on the plains of Jaora Alipur. In 1868 he was put in command of the Abyssinian expedition, and on account of his brilliant services at the storming of Magdala was created a peer. Subsequently he was appointed commander-in-chief of the forces of India (1870), governor of Gibraltar (1876-82), and constable of the Tower (1886). He was made field-marshal in 1883. See memoir by R. MacLagan, and H. D. Napier, *Field Marshal Lord Napier of Magdala*, 1927.

Napier, Sir William Francis Patrick (1785-1860), Brit. soldier and historian, a younger brother of Sir Charles James N., b. at Celbridge, near Dublin. He joined an Irish regiment in 1800, and subsequently fought in Denmark (1807) and in the Peninsula (1808). His *History of the War in the Peninsula* (6 vols., 1828-40) is a classic. His other works are *History of the Conquest of Seinde* (1845); *History of Sir Charles Napier's Administration of Seinde* (1851); and *The Life and Opinions of General Sir C. J. Napier* (1857). See life by Lord Aberdeen, 1862.

Napier, seaport and winter resort on the

E. coast of North Is., New Zealand, on Hawke's Bay, 200 m. N.E. of Wellington by rail. It has a good harbour, Port Ahuriri, protected by a breakwater. Large quantities of wool, meat, pelts, fruit, and canned foods are exported. N. is the third largest export port in New Zealand. Large industrial and residential areas are being developed and new industries are being estab. Pop. 20,200.

Napier's Bones, or **Rods**, see NAPIER, JOHN.

Naples (It. Napoli; anct. Neapolis): 1. Prov. in Campania, Italy. It occupies a coastal plain of the R. Volturno overlooking the Tyrrhenian Sea, and is backed by the Matese Mts. of the Apennines. Its climate is almost tropical, yet salubrious, but with the drawback of a dry summer; it is extremely fertile, and its people are hard-working and frugal. Olive, vine, chestnuts, corn, hemp, and cotton are grown; besides shipbuilding, there are manufs. of machinery, chemicals, motors, lace, cotton, paper, chocolate, musical instruments, etc. Area 351 sq. m. Pop. 1,360,000. 2. Tn. situated on the bay of Naples, is the third largest in Italy, its pop. (977,900) exceeding that of all other cities excepting Rome and Milan. It is, moreover, the largest port, its shipping exceeding that of Genoa by some 500,000 tons, and with Spezia and Venice shares the naval defence. The univ., founded in 1224 by Frederick II., is one of the oldest of Italy, and now the largest in the country, being attended by more than 12,000 students in 1938-39 (including students of schools for commercial education, of agriculture, the engineering colleges, the schools of architecture, and veterinary colleges, and schools for teachers, the higher naval college, and the schools for oriental languages at the univ.). In the Second World War the univ. library was deliberately burnt by the Gers. and all its contents were lost. It lies some 100 m. S.E. of Rome, with which it communicates by means of 125 m. of railway. Since 1881, after a bad outbreak of cholera, the tn. has been vastly improved, the old tn. being demolished, redrained, and rebuilt. The Museo Borbonico, built in 1586, contains the Farnese collections, large numbers of Rom. and early It. antiquities. The Museo Nazionale contains bronzes and other objects from Herculaneum and Pompeii and many important pictures. In the war these were stored for safety at Monte Cassino and elsewhere with the result that it was afterwards found that a number of treasures were missing, including the large bronze statues, 'Two Deer' from Herculaneum, and the 'Apollo' from Pompeii, besides painting by Breughel (or Brueghel), Claude Lorraine, Raphael ('Madonna of the Divine Love'), Titian ('Danae') and 'Portrait of Lavinia'). There are many libraries, including that of the Club Alpino. The marine biological station is one of the finest in Europe.

Among its buildings are the Castel Nuovo, 1283; the castle of St. Elmo, 1343;

the royal palace, 1600, enlarged and furnished as a summer residence in 1900; the Castel Capuano; the cathedral of St. Januarius, completed in 1316; sev. fine churches, and many theatres, notably the San Carlo, rebuilt after the fire in 1816. In the Second World War the Castel Nuovo was damaged by numerous bomb-hits, especially the S. Giorgio tower, but the triumphal arch and bronze doors were saved by being adequately sand-bagged. The royal palace sustained a score of direct hits and was badly damaged, but considerable repair work was soon effected and all the important books of its library had been moved away for safety. The Castel S. Elmo suffered slight bomb damage. The cathedral was

sculptured tombs by Rossellino and Benedetto da Majano were saved. The original church of the name of Monteoliveto was, in fact, destroyed by an earthquake in 1803, but at the request of the Confraternity of the Lombards, Ferdinand IV., Bourbon king of N., sanctioned the transfer of the cult to the nearby church of Monteoliveto and, in popular usage, the name too was transferred. Some traces of the original Gothic structure remained, but inside, as with most medieval Neapolitan churches, it underwent a complete transformation, notably at the hands of a local architect, Gennaro Sacco. The chief glory of the church, however, was not in its architecture but in its monuments and fittings of

THE PORT OF NAPLES AND VESUVIUS

E N 4

severely shaken, but by 1946 the walls and vaults had been consolidated and the roof repaired. Some twoscore of the other churches of N. were damaged, the most regrettable loss being that of S. Chiara, built during 1310-49 by Robert the Wise, and filled with the monuments of the kings of the Angevin dynasty, which he founded. Behind the high altar was the magnificent Gothic tomb of King Robert himself, designed by Paolo and Giovanni Bertini. The church was completely burnt out by incendiary bombs and the works of art destroyed were fourteenth-century Florentine bas-reliefs of the 'Life of S. Caterina'; tomb of Maria di Calabria by Tino di Camaino; two fourth-century sculptured columns from the 'Temple of Solomon,' and a sixteenth-century tomb of Antonio Gaudino; while partial destruction was wrought to the tombs of Robert d'Anjou (by the Bertinis), Charles, duke of Calabria (by Camaino), and Marie de Valois (by Camaino). The church is to be restored in its original Gothic form. A direct bomb-hit in a Ger. air raid on March 15, 1944, on the Chiesa di Monteoliveto (S. Anna dei Lombardi) destroyed the doors, porch, and campanile, but the

the Renaissance. The remarkable series of intarsia panels by Giovanni da Nola were not damaged, but the carved doors which were by the same artist were shattered. The Chiesa dei Girolomini, a baroque building with frescoes by Solimena and Giordano, was badly hit and the roof half demolished; Il Gesù Nuovo, a fine Renaissance church with rich baroque interior adorned with frescoes by Solimena, Ribera, and other seventeenth-century painters, was badly damaged, the altar being wrecked, but the facade escaped; a bomb pierced the roof of S. Domenico Maggiore and damaged the chapels, while paintings by Titian and Caravaggio disappeared and the tomb of Cardinal Filippo Spinelli was wrecked; S. Pietro Martire, founded in 1294, but completely remodelled in 1750, suffered the loss of its roof, the nave was entirely burned and other serious damage was sustained; S. Lorenzo Maggiore, a thirteenth- to fourteenth-century church, with later alterations, was in process of restoration before the Second World War, and its poor condition was further endangered by near misses, but it was not hit; direct hits destroyed the roof, choir, main altar, and

half the ceiling by Stanzone of the church of S. Paolo Maggiore; other churches more or less severely damaged were della Croce di Lucca, S. Agnello a Caponapoli, S. Agostino della Zecca, SS. Annunziata, SS. Apostoli, S. Maria del Carmine, S. Eligio, S. Giovanni a Carbonara, S. Gregorio Armeno, and S. Maria Regina Coeli; but in all cases considerable repairs were effected as early as 1946 (see Dr. Bruno Molajoli, *Per i Monumenti d'Arte danneggiati dalla Guerra nella Campania*, 1944).

The library of the Royal Society, rich in rare books, was completely burnt and destroyed by the Gers., and the building of the Brancacciana library, also, was damaged by bombing.

Originally a Gk. colony named Parthenope, a new tn., Neapolis, was built by a later colony. N. was captured by the Romans in 326 B.C. and became a resort of the upper classes on account of its Gk. culture and climate. Virgil composed the *Georgics* here, and was buried at Posilipo. It was taken, A.D. 536, by Belisarius, recaptured by Totila in 542, and again taken by Narses in 553. It remained under the E. empire till 572, became a duchy in the beginning of the eighth century, and cap. of the kingdom of N. in 1139, under Norman rule. It was a bone of contention between the houses of Anjou and Aragon, which gave rise to important movements in European hist. from the thirteenth to the sixteenth century. Its hist. was closely knit with that of Sicily (the two kingdoms being finally united in 1501), until both were absorbed into the united It. kingdom under Victor Emmanuel in 1861.

In the Second World War the R.A.F. made its first raid on N. on Nov. 1, 1940, and another raid followed on Jan. 1, 1941. In 1942-43 there were frequent and heavy raids. The fact that it was not only a seaport but a railway and industrial centre made N. particularly vital and drew upon it damaging blows. It was raided by heavy bombers on the night of June 20, 1943 and by Fortresses the following day, and yet another heavy blow struck it on the night of June 26. The damage to the port and the partial destruction of the royal arsenal seriously impaired its effectiveness, but did not save it from repeated blows after the allied invasion of Italy was launched, for these were part of a co-ordinated plan of destruction against the supply and communications system of the It. mainland. By the beginning of Sept. N. had been practically isolated by bombings of the key railway junctions surrounding it, and on Sept. 9, the day after the It. armistice, the Allies landed at Salerno, within striking distance of N. The announcement of the armistice was timed for the eve of the Salerno landing in the hope that it would enhance the element of surprise, but the Gers. had made their dispositions on the assumption that further It. aid or co-operation was not to be expected, so that the eventual defection of their ally had little immediate effect on the struggle for the beaches and for N., the greatest prize S. of Rome. By Sept. 20 the Allies

were in a position for a general advance which in a few days became a full-scale offensive. The Fifth Army, wheeling on Salerno, created a front along the Sorrento ridge which covered the approaches to N. and in the centre and along the E. coast the Eighth Army (G.C.) prolonged this sweeping movement which soon threatened to outflank Naples from the N.E. After the Eighth Army had captured the railway junction and air base of Poggiore, the Gers. abandoned hope of holding N. and concentrated on gaining enough time to make the port as useless as possible to the Allies. To the damage already done in the city by allied bombs the Gers. added a systematic destruction which wrecked docks and buildings and public services and tried to block the harbour with sunken ships. For six days the Ger. rearguard clung to positions along the Sorrento ridge against the increasing pressure of Gen. Mark Clark's Fifth Army. But on Sept. 22 the Allies broke through at Nocera and took Castellunare, thus opening the way for a drive along the coastal road toward N. and an advance on the right wing northward towards Benevento. On Sept. 30 the latter force took the road junction of Avellino and on the following day N. fell to the Allies. See C. E. Clements, *Naples, the City of Parthenope, and its Environs*, 1894; A. Norway, *Naples, Past and Present*, 1901; E. Lemonon, *Naples*, 1919; C. Headlam, *The Story of Naples*, 1927; B. Croce, *Storia del Regno di Napoli*, 1929; H. Belloc, *Naples*, 1932; and G. Lefebvre, *Naples*, 1933.

Naples, Bay of, fine deep semicircular sweep of some 50 m. from the Is. of Ischia round to that of Capri, with a low promontory to the N., a mountainous one to the S., while Vesuvius completes, within the bay, a view famous for its beauty.

Naples, Kingdom of, existed from 1138 to the middle of the nineteenth century. For a time it was ruled by the sovereigns of Sicily. In the sixteenth century it became a possession of the kings of Aragon and Spain, having previously been ruled in turns by the Hohenstaufens and the Angevins. In 1713 it passed to Austria under Charles VI. It was ruled by members of the Bourbon family between 1738 and 1806 and again between 1814 and 1860. After the liberation of Italy by Garibaldi it became part of the Sardinian kingdom (1860), which latter kingdom ceased to exist when Victor Emmanuel was crowned king of Italy in 1861.

Napoleon I. (Bonaparte) (1769-1821), emperor of the Fr., was b. on Aug. 15 at Ajaccio, in Corsica. The date of his birth has been the subject of considerable dispute, but from actual quotation from the diary of his father we are able to fix it definitely. (For details of his family, see the article BONAPARTE.) The early life and characteristics of the boy marked him out for a military career. His father, who had at first supported the Paolists, was now on good terms with the Fr. governors, and was able to obtain for N. a place at the king's expense in the school at Brienne. Here he was entered as a pupil in 1779.

His school days were far from being the happiest of his life, and his character here showed itself in its moroseness and its sullenness. It was the greatest grief of his schoolboy life that every one around him was of the conquering race, because deep down in N. was the feeling that the Corsicans would ultimately win their freedom, and he had the Corsican cause at heart. He did not show any very striking ability, but was proficient in mathematics besides showing steady application to his studies generally. In particular, he spent a good deal of his time in reading history.

In 1781 he proceeded as a cadet to the military school at Paris, and here he studied with greater zest, since he wished to enter the artillery, and was anxious for

NAPOLÉON AS FIRST CONSUL
Part of Labe's celebrated portrait.

the arrival of the time when he should be able to commence the rebuilding of the family fortunes. In 1785 he was gazetted to a regiment of artillery at Valence, and in Jan. of the following year he commenced his duties as a lieutenant. The death of his father had left him the head of the family, and during the years which followed the beginning of his military career he spent his furloughs in Corsica. He paid two visits to that Is., in 1790 and 1792. On his return to Paris in 1792, he had exceeded his furlough by some four months and taken an active part in the Paolist movement. But the breach between himself and Paoli quickly widened after this, and, trusting to the disturbed state of France, he returned there finally, in May 1793, taking his mother and sisters to Marseilles but going to Paris himself to find active employment. His judgment of the state of Paris was not wrong. Although by his absence he had forfeited his position, the revolutionary party could not afford to lose its trained officers, and so N. was reinstated and received arrears of pay. He was known, too, to be a good artillery officer and was given the rank of lieutenant-colonel in 1793 and sent to Toulon, which

was at that time holding out against the Convention and supported by an English fleet under Lord Hood. At this time the fortunes of the republic were at a very low ebb, a fact fully realised by N. In addition to wars with hostile external powers, France had also to fight against powers within. The royalists at Toulon had admitted the King, and the Spaniards, and N. was called in to help the besieging forces. Here he undoubtedly laid the foundations of the great military reputation he was destined to enjoy for all time. He introduced new methods of artillery attack, and ultimately he was mainly responsible for the withdrawal of the hostile fleets and the recapture of the town. A number of his future generals were present with N. during this campaign. He was made a general of a brigade at the end of 1793, and appointed to the command of the artillery of the army of Italy in the following year, but becoming an object of suspicion with the gov., he was recalled to Paris, arrested, and his name struck off the army roll. But great influence was brought to bear on his behalf and he was soon released.

For a short while he remained in straitened circumstances and obscurity and, at one moment, entertained the idea of offering his services to the Turks. But the Parisian insurrection of Oct. 1795 caused him to change his plans. His opportunity had come once more, from the very difficulties of the gov. themselves. The populace of Paris, angered by the work and methods of the Convention, determined to get rid of that body. The Convention, liable to be attacked at any moment by the National Guard, entrusted their defence to Gen. Barras, and he chose as one of his chief subordinates the lately disgraced general N. The famous Oct. 5, 1795, can really be taken as the first step in the rise of N. to the empire. His artillerymen commanded all approaches to the Tuileries, and their fire swept the streets. N.'s famous 'whiff of grapeshot' prepared the way for the restoration of the empire in 1804. The immediate result of the crushing of this rising was the imposition of a new constitution, the First Directory, which was still, however, essentially democratic, but which prepared the way for the ultimate changes which led to the foundation of the empire. The Convention rewarded him by making him general of div. In the next year he married Josephine, widow of the viscount de Beauharnais, who had lost his life during the Reign of Terror; and shortly afterwards he received the command of the army of Italy (Jan. 1796). He appears to have owed his promotion partly to his wife, although it is true that his plans for the It. campaign had been accepted by the Directory.

The opening of that campaign marks a new era in the hist. of the republic. Hitherto the wars had been fought by the Fr. for what they considered were the principles of the revolution; now all that was to cease, and the armies were given a material incentive in the prospect of spoil and plunder. Thus N. was able to

strengthen his position at the cap., to which he sent huge sums of money and priceless gifts which he had exacted, not as plunder, but as the natural spoils of the conqueror. His It. campaign is also in many respects his most brilliant, but, according to Tolstoy, N.'s success was due to the brilliant personnel of the It. forces and the unwillingness of his opponents to fight him. It was noted for the dashing energy and the untiring manner in which all attacks were carried out. Further, everything was carefully planned, nothing was left to mere chance. The two main features of the whole campaign were rapidity and accuracy. N. certainly fostered a spirit of revolution in the northern It. states. That spirit was to

THE EMPRESS JOSEPHINE

help him in his campaigns, and later in the war, when, threatened by an overwhelming Austrian army, he was able to depend upon an It. legion. Slowly but surely he drove back the Austrians and Piedmontese. From the neighbourhood of Savona he drove them back across the Adda, and finally, after the victory at Arcola, across the line of the Adige. The Austrians having thus been hopelessly defeated, the northern It. states formed the Cisalpine Republic. During the whole of this period N. was the servant of the Directory, but, as has already been pointed out, the spoils of Italy gave France and the Directory a new idea of warfare, a warfare that paid for itself and had enough left to supply magnificent presents to the republic, and in proportion to the plunder so did the favour of N. grow. He was able to a very great extent to act independently of the Directory, to make his own terms, to set up his own forms of government, to depose, and to treat with the princes of the lands conquered.

N., together with his ever-victorious army, now continued his war against the

Austrians, driving them back to Leoben, where negotiations for peace were opened. But the negotiations dragged on for some considerable time owing to the possibility of another revolution in France. The Moderate party was becoming powerful, the Royalists were beginning to take heart again. Hope ran high in Austria. But the Directory called upon N. once more, and he, piqued by an attack made on him by the council, and only too ready to do anything to further his power, came to their aid. The Tuileries were surrounded, the obnoxious representatives were arrested, the power of the Directory was saved. N. had strengthened his own position, and had gone one step further towards empire. The Austrians no longer held back, the treaty of Campo Formio was signed, Lombardy was added to the Cisalpine Republic, and Venetia was handed over to Austria. N. could now pursue the plans which he had always had of a campaign in the E. Almost immediately after the signing of the treaty, N. returned to Paris. So clearly had he shown his power that the Directory was concerned with one thing only, and that was to get him away again as soon as possible. He was placed in command of the army intended for the invasion of England, but he himself had resolved to go to Egypt. Why he was so intent on Egypt does not seem altogether clear, but affords a glimpse of his character, as a visionary of boundless aspiration. However, the Directory fell in with his plans and he embarked his army of England for Egypt. He just escaped Nelson in the Mediterranean, captured Malta, then in the possession of the Knights of St. John, and sailed to Aboukir Bay. Swiftly he landed his troops, the terror of Nelson still on him, and marched against the Mamelukes, whom he defeated. Then came the news of the battle of the Nile, and he determined to attempt an invasion of Syria, whether he actually contemplated invasion of India, in imitation of Alexander the Great, will never be exactly known, and to return to Europe via the Pers. of the sultan. His campaign in Syria was successful until he reached Acre, this, chiefly owing to Sir Sidney Smith, he failed to take, and thence he returned to Egypt. Here news of the republic greeted him, and leaving the army in command of Kléber, he sailed for France, landing there some six weeks later. The news from France was not, from the point of view of that country, encouraging. The war in Europe was gradually going against the Fr., the work of the It. campaign of N. had been well-nigh undone by the second coalition, and the Directory was tottering to its fall. It was, therefore, necessary to adopt drastic measures, and in the preparation of these he had the co-operation of Sieyès on his return to the cap. N.'s journey to Paris had been one of complete triumph. He was popular and he was fawned upon by all the chief men of the state. Yet for a moment he hesitated, and his actual *coup d'état* would probably have failed had it not been for his brother Lucien.

the president of the Council. He it was who kept the plot in view even when N. had been unnerved, and brought the soldiers to his aid. The constitution perished, even as it had sprung into existence, by the sword. The new constitution gave the power into the hands of three consuls, the first consul, N., being the head of the state, with practically all the power, the other two (Cambaceres and Lebrun) being mere figureheads.

N. was now the ruler of France; this was the third step in the direction of empire. The popular feeling was on his side. Liberty was to be restored, the days of the old republic were to be revived. The insurrections in the country were immediately put down, and overtures of peace held out to Austria and England; the first impression was to be of a N. aiming at peace for his country, not universal empire. Now he determined upon a campaign which should bring glory to his name, and thus add to the security of his tenure of power. The campaign against the Austrians ended with the battle of Marengo, which the Austrians, after virtually gaining victory, lost owing to the magnificent cavalry charges of Kellerman, Hohenlinden, a victory of Moreau, followed. Then came the treaties of Lunéville (1801) and Amiens (1802), and also the concordat with Rome. Between the election of N. as first consul and his election as first consul for life practically the whole of the old civil institutions of France were restored. N. had estab. his power in France by virtually dictating peace to the world; now he was to become the sole ruler of France. In Aug. 1802, as a reward for the peace, N. was created first consul for life.

From that moment, the object of peace having been accomplished, N. was again anxious for war—war almost at any price. His aggressions in Europe soon led to the resumption of hostilities with England, and he thereupon seized Hanover and prepared the way for the policy of aggression which he was about to adopt towards Germany. In 1804 he caused himself to be declared emperor of the Fr., a position for which he had long been preparing the way, and which, having got rid of all possible dangers, he now thought fit to assume. His gigantic preparations for the invasion of England were finally abandoned after the battle of Trafalgar (1805), but his policy of aggression had made possible another coalition, and having struck his camp at Boulogne, just before Trafalgar, he was soon to shake Europe by his land victories against Austria and Prussia. Violating the neutrality of Prussia, he overwhelmed the Austrians at Ulm and marched into Vienna (1805). The Austrians and Russians, impatient of delay, and not waiting for reinforcements from their Prussian allies, were struck down at Austerlitz (1805). These two blows killed Pitt, estab. the empire of N., overthrew the anct. Holy Rom. Empire, and estab. the confederacy of the Rhine under Napoleonic influence. Peace negotiations were broached but failed. Prussia, stung by

her contemptuous treatment by N., appealed to arms, but was crushed and heartened by the terrible blows of Jena and Auerstadt. Again at Eylau (Feb. 1807) and at Friedland, in the same year, he routed the combined Prussians and Russians, and the Tsar Alexander was compelled to sign the peace of Tilsit. Prussia, broken and dismembered, did not again rise until the end was in sight. The continental system by which N. sought to conquer Britain was in full force. He himself was the dictator of Europe, the conqueror of the Hapsburgs, the equal of the anct. line of emperors.

His star had indeed reached its highest point, but, thereafter the progress of his decline is to be traced in three facts: first the attempted annexation of Spain, secondly, the invasion of Russia; thirdly, the rising of the powers of Germany against him. In 1808 he compelled the Sp. king to abdicate and placed his brother Joseph on the Sp. throne. This led to war with Spain, a war in which the national spirit of the Spaniards was aided by the arms of England, and which for the rest of the period occupied a fair proportion of the Fr. troops. The defeat and capitulation of Dupont at Baylen and of Junot at Cintra mark the beginning of the wane of N.'s ascendancy. But he was yet to win many remarkable victories. The Austrians were defeated at Ratisbon and then at Wagram, and in 1809 peace was again signed, but the fact that the terms were prejudicial to Russia sowed the seeds of further trouble. In April 1810 N., having divorced Josephine who had given no heir to the empire, married the archduchess Maria of Austria, and a son was born in the following year, to whom the title of king of Rome was given. The economic difficulties caused by N.'s attempt to exclude Brit. goods from Europe still further exasperated Russia, and in 1812 N. decided to invade that country. His star was indeed setting; the N. of the Russian campaign was not the N. of the early days of the century. His army reached Vilna. He hesitated and then went on. He defeated the Russians at Smolensk; again he hesitated, yet again he went on, and reached Moscow, where he stayed until Oct., the tu. being in the meantime burned by the Russians. It was then that he resolved to retreat from Moscow, and although the retreat was actually carried out, five-sixths of the army he had taken with him perished. The next move was a virtual coalition of all nations against N., Russia and Prussia, then most of the Ger. states, and finally Austria, were in alliance. The allies, with troops numbering 500,000 men, now turned to face N., the morale of whose army was now low. The allies held their own, now inflicting a defeat, now sustaining one, until the great contest at Leipzig, which crushed N. and drove him back across the Rhine. The Rhine Confederacy was dissolved. N.'s star had sunk still lower towards the horizon. The negotiations for peace which were opened almost immediately after this failed, and the allies invaded France. In spite of a

contest full of genius, in spite of many victories, slowly but surely N. was driven back. The Austrians, Russians, and Prussians were all advancing and closing round Paris, while Wellington was gradually approaching the city from the S., having cleared the Fr. from Spain. In these circumstances N. surrendered and, after attempting useless negotiations, abdicated (1811). He retired to Elba, being given the sovereignty of that is., and the Bourbons, in the person of Louis XVIII., were restored to the throne of France.

But the long wars had left Europe in a very unsettled state, and the name N. was still one to conjure with, so that in Feb. 1815 N. again decided to try to revive his fortunes in France and Europe. He was enthusiastically received in France, and

and his coterie plotted to escape is clear, from the references to be found in the writings of his boon companion Las Cases. Amongst others, many Aimers. were ready to give financial assistance; an intercepted letter spoke of £16,000 being guaranteed. The vigilance of Sir Hudson Lowe, who arrived as governor of the is. in April 1816, thwarted all attempts, and for this reason, amongst others, N.'s bitterness against him was intense. Yet the stream of falsehood and vituperation directed by N. against the governor had a deeper motive: the plan was to arouse sympathy for himself by creating the idea that he was badly treated, in the hope that the opposition in England might bring down the gov. on the question, return to power, and then release him. How much chance of success this scheme ever had is doubt-

THE RESIDENCE OF NAPOLEON AT ST. HELENA

From an old print.

the Bourbons fled. Europe declared war against him, but only Prussia and England were ready to meet him. N. determined to strike, and to strike quickly, to separate the armies and defeat them in detail. He defeated Blücher at Ligny, but Blücher had a preconcerted plan with Wellington, and while Wellington fell back on Waterloo, Blücher pushed on to come up with him as soon as possible, and Grouchy, dispatched by N. to keep Blücher back, fought only with the rearguard of the Prussian army. Wellington held the field at Waterloo until the arrival of the Prussians, and the Fr. were swept away in headlong rout. N. fled to Paris, where for the second time he abdicated. He attempted to escape to the U.S.A., but finding this impossible, on July 15 he surrendered to Capt. Maitland of the *Bellerophon* at Rochefort. He was sent in Oct. 1815 to St. Helena, where he spent the rest of his life in exile, dying there on May 21, 1821, of cancer in the stomach.

The period of N.'s stay in St. Helena is one of great interest, for during it were laid the foundations of a Napoleonic legend, on which N. III. was to raise himself to the throne. It was, in fact, N.'s last campaign. The immediate object was a personal one, escape from the is. by one means or another. That N.

ful; however much misplaced sympathy might have been aroused, the misery and bloodshed N. had caused in his lifetime could not easily be forgotten. However, such was the scheme, and in pursuance of it the Fr. groups did their utmost to blacken Lowe's character as an inhuman jailer, admissions of this can be found in their writings. Thus it was that for many years after N.'s death, Lowe suffered much misrepresentation. Among those who fell into N.'s trap was Lord Rosebery whose book *Napoleon, the Last Phase* (1901) is a highly misleading travesty of the truth. The St. Helena campaign had another and wider object, to create a new idea of N.'s career and place in hist. Far from being the worst of autocrats, the story ran, N. had been the champion of liberty and democracy, crushed by the strength of the dictatorial monarchs of Europe; in him the revolution had found its leader and apothecists, and in his downfall the cause of freedom was lost. That this fiction was ever believed is remarkable. N. himself, never believed it: to Col. Keating he summed up his views on government: 'I know well that nowadays it requires a rod of iron to rule men, but it must be gilded, and we must make them believe when we strike them that they direct the blow themselves. It is

necessary we should always talk of liberty, equality, justice, and disinterestedness, and never grant any liberty whatever. In spite of the witness of his whole career, the Napoleonic legend took root and flourished. It created two nations in France; all those whom the reaction of the restoration antagonised, all who felt dissatisfied with the bourgeois monarchy of Louis Philippe, turned to the mirage of N. the liberator, and gave their support to this descendant, who was clear-sighted enough to see its tremendous value and to adopt the legend himself. Before him, it fired the young duke of Reichstadt, son of N. and Marie Louise, passing his adolescent years in the Austrian court. The exalted view of his father which he gained from N.'s memoirs fired his ambition to return to the throne of France. During his short life there were endless Bonapartist conspiracies centred around his person, and Metternich considered him, with justification, a standing menace to European peace. See F. Masson, *Napoleon incarné*, 1925; Lord Rosebery, *Napoleon, the Last Phase* (from deportation to death), 1901; H. A. L. Napoleon II. (1811-32), son of N. I. by his marriage with Maria Louise of Austria, b. at Schonbrunn, Vienna. After his father's downfall at Waterloo, he was proclaimed N. II., king of Italy. He was educated in Vienna and served in the Austrian Army. He was created duke of Reichstadt (or Bohemia) in 1817 and king of Rome by his father. But his health was poor, and physical weakness and illness led to his early death. See F. Masson, *Napoleon et son fils*, 1922, and Dormer Creston, *In Search of Two Characters*, 1945, 1947.

Napoleon III. (Charles Louis Napoleon Bonaparte) (1808-73) the third son of Louis Bonaparte, who was created by his brother king of Holland. His mother was Hortense Beauharnais, the step-daughter of the Emperor N. He was brought up principally at the castle of Arenenberg, his mother's residence in Switzerland, and was given a very sound education. He was something of a scientist and an engineer, and he also studied a good deal of hist. In 1831 he took part in one of the liberation campaigns in Italy, together with his elder brother Louis, who, however, d. of fever during the campaign. In 1832, by the death of the first N.'s only son, the duke of Reichstadt, he became the head of the family, both his elder brothers being dead. During the next few years he pub. a good deal of literature, dealing principally with his political ideas. During the reign of Louis Philippe, taking advantage of the disturbed state of France, he made two attempts to establish himself in that country. The first, in 1836, was easily repressed, and he was deported to America; the second, in 1840, when he landed at Boulogne, ended in his being condemned to lifelong imprisonment in the fortress of Ham. There he continued his writings, and added to his already large output of Bonapartist literature. After just over five years' imprisonment he managed to make his escape, and returned to London. Taking advantage of the revolution of 1848, he hurried back to France, where he had been elected as a deputy on the Constituent Assembly. Having taken his seat, he almost immediately resigned, but was again elected for five different constituencies. Encouraged by this, he determined to stand as a candidate for the presidency, and was elected by a majority of five to one over his opponent, Gen. Cavaignac. At first there seemed to be some possibility of concord in France, but the president, although he had taken the oath of allegiance to the republic, soon showed his hand. He rapidly assumed the control of the army, practically every post of importance was held by his own nominees, and finally, in Dec. 1851, he dissolved the Assembly by force and brought about his famous but violently bloody *coup d'état*. France for the time seemed to acquiesce. He was in the same month proposed as candidate for ten years as president and elected to the position by a majority of 7,000,000.

He now made no pretence at disguising his reactionary measures. Posing as the candidate and representative of the people, he rapidly developed into a despot, who gagged the press and did his best to repress liberty. In 1853 he married the Countess Eugénie de Montijo. He still continued to pose as the friend of democracy, but his interference in its affairs led to the annexation of Nice and Savoy to France, whilst his attempt to impose a monarch on the Mexicans led to one of the most pathetic tragedies that the world has witnessed. His foreign policy at times appears brilliant, and he was often in close alliance with Great Britain, e.g.

during the Crimean war. But he realised, probably in a greater degree towards the end of his reign, the necessity for turning the minds of Frenchmen towards foreign conquest. By 1865 it became apparent that his influence was on the wane. The book which he had written for the purpose of extolling his own methods of gov. did not meet with complete success, and he realised that a more liberal policy was necessary. This he tried to adopt, but too late. In 1870, becoming aware that his main support, the army, was beginning to fall away in its allegiance, he made a last attempt to rally it. He interfered in the question of the Sp. succession, for which a prince of the house of Hohenzollern was a candidate, and although the Prussians withdrew their prince, events led on to declaration of war. N. was unaware of the state of his army. When he declared war he was firmly convinced that the Fr. would easily gain Berlin, but 300,000 Frenchmen were opposed by 500,000 Prussians, and N. never crossed the Rhine. He was crushed at Saarbrücken, at Weissenburg, and at Metz, and finally came the crowning defeat at Sedan. On Sept. 2, the day after the battle, N. surrendered to the Prussian king, and was kept a prisoner until the end of the war. In the meantime his empress had retired to Chislehurst in Kent, where in 1871 she was joined by N., who d. here nearly two years later. He wrote *Reveries politiques* (1832), *Idées napoléoniennes* (1839), *De l'extinction du paupérisme* (1844), *Œuvres militaires* (1856) and *Histoire de Jules César* (1865-1866). See P. de la Gorce, *Histoire du second Empire*, 1894-1901; K. Marx, *The 18th Brumaire of Louis Bonaparte* (Eng. trans.), 1900; H. A. L. Fisher, *Bonapartism*, 1908; F. A. Simpson, *The Rise of Louis Napoleon*, 1909, and *Louis Napoleon and the Recovery of France*, 1923; and O. Aubry, *Le Second Empire* (with bibliography), 1938. Napoleon, Eugène Louis (1856-79), only son of N. III., see BONAPARTE.

Napoleon, Prince Lucien (1775-1840), see BONAPARTE.

Napoleon, obsolete Fr. gold coin of the value of twenty francs (nominally 15s. 10d. Eng. money), with a portrait of Napoleon stamped on it.

Napoleon, or more commonly 'Nap.', a card game. Probably the element of chance easily predominates over the skill required, for which reason the game may well be included under the category of gambling contests. The ordinary form of the game consists in dealing five cards to each of a number of players (as many as ten can play), the object being to make as many tricks as possible, each playing against each, or only combining for the sake of defeating the player who has obtained the lead, and therefore named the trumps to suit his own hand by making the highest call. Tricks are made by putting down the highest card in each

round, it being imperative to follow suit if possible; if not the player may, if he can, trump the led suit. There is nothing very complicated in the game. Betting is usually level-money all round, at some agreed sum per trick, very often a penny or halfpenny—hence the term 'penny nap.' Generally, if a player wins after 'going nap,' i.e. calling all five tricks, the other players pay him ten counters or pennies, or other unit adopted, i.e. double stakes. If he loses, however, he forfeits only five, probably as a consolation for a bold risk. There are variations of the game, one of the most popular being 'Misery.' Here there may or may not be trumps according to arrangements among the players, but as a rule there are no trumps. The *misère* hand is that held by the player who undertakes to lose all five tricks, the remaining players of course endeavouring to force tricks upon him.

Napoleona Imperialis, see BELVISIA.
Napoléon-Vendée, see LA ROCHE-SUR-YON.

Napoléonville, see PONTIVY.

Napoli, see NAPLES.

Napoli di Romania, see NATPLIA.

Napo Pastaza, prov. of Ecuador, combined with Santiago Zamora to form the Región Oriental, with an area of 219,095 sq. m. and a pop. of 295,200. The cap. of N. P. is Tena. Balsam wood is produced.

Nara, tn. of Hondo, Japan, 25½ m. from Osaka by rail. It has anct. temples and sev. shrines and relics of great age. Toys and fans are manufactured. Pop. 57,500.

Naracoorte, business centre of rich pastoral and delcying dist. Situated 239 m. S.E. of Adelaide, S. Australia. Railway junction on Adelaide-Mt. Gambier and N.-Kingston lines. N. caves, 7 m. from the tn., are a well-known tourist attraction, consisting of a group of deep limestone caverns with stalactite and stalagmite formations. N. has a large dist. hospital. Pop. 2191.

Narasinha, in Hindu mythology the fourth avatar of Vishnu, the reincarnation of the god in the form of man in order to put to death Hiranya-Kacipán, king of the Daityas, who was oppressing mankind.

Narayana, tn. in the state of Hyderabad, India, 70 m. S.W. of the city of Hyderabad.

Narbada, or **Nerbudda**, riv. of India, rising in the Central Provs., flowing in a generally W.S.W. direction till it falls into the gulf of Cambay, 28 m. W. of Broach. Length 750 m. Area of basin 39,260 sq. m. Navigation is impeded by rocks and shallows.

Narbonne, city in the dept. of Aude, France, 37 m. E. of Carcassonne. It is connected with the Mediterranean at La Nouvelle, 13 m. distant, by the canal du Midi. It had a notable cathedral, now the church of St. Just, begun in 1272, and connected by a ruined cloister with the archiepiscopal palace, now used as a museum of art and archaeology. It has a large trade in red wine and spirits, and a celebrated white leather honey. There are distilleries, tanneries, potteries, and manufs. of verdigris, bricks, and tiles.

Pop. 29,900. See R. Rev. *L'Art gothique du Midi de la France*, 1931.

Narbrough, or **Narborough**, Sir John (1640-88), Eng. admiral, b. in Norfolk. In 1670 he conducted an expedition through the straits of Magellan. In 1674 he commanded another expedition to the Mediterranean, and was successful in destroying sev. Algerian and Tripolitan pirate ships. His last expedition was that to the W. Indies in 1687, and while superintending the recovery of a treasure ship (off St. Domingo) he was attacked by fever and d.

Narceia, or **Narceine** ($C_{25}H_{27}O_9N$), somniferous poison prepared from opium bases. It is the most powerful narcotic of all the opium alkaloids. Practically insoluble in cold water, soluble in alcohol and hot water, insoluble in ether. Yields narcic acid on oxidation with potassium permanganate. It is decomposed by the stronger and concentrated acids. It is formed from narcotine (q.v.) by treating the methiodide with aqueous caustic soda.

Narcissus, youth in Gk. mythology famous for his beauty. He was beloved by many, including the nymph Echo (q.v.), but rejecting all their advances, was punished by the gods, who caused him to pine away for love of his own image, which he saw reflected in a pool. He was changed into the flower which bears his name, whence the term narcissism, by which psycho-analysts mean excessive love and admiration of one-self.

Narcissus, genus of hardy bulbous plants (family Amaryllidaceae), and including some of the most beautiful garden flowers. The six perianth segments are surmounted by the conspicuous corona; there are six stamens of three fused carpels, with an inferior ovary. The different varieties of the species are so numerous that they have been classified into three sections or groups: (1) Magni-coronati (trumpet daffodils); (2) Medio-coronati (star N.); (3) Parvi-coronati (poet's N.). The first group is typified by *N. Pseudonarcissus*, the common daffodil or Lent lily, the only Brit. representative of the genus. In this section, the corona is funnel-shaped or cylindrical, as long as, or longer than, the perianth segments. It includes *N. bulbocodium*, the hoop petticoat daffodil. The second section has the corona cup-shaped, about half as long as the perianth segments. In this are included *N. incomparabilis*, the chalice-cup daffodil; *N. triandrus*, angel's tears; and *N. juncifolius*, the rush-leaved daffodil. The third section has the corona small or saucer-shaped, and includes *N. poeticus*, the poet's, or pheasant's-eye, N.; *N. Tazetta*, the polyanthus N.; and *N. Jonquilla*, the jonquil. Speaking generally, the cultivation of Ns. is simple. The bulbs do best in a good loamy soil free from fresh animal manure, and the earlier they are planted the better. A general rule in planting is to set the bulbs about one and a half times their length deep in the soil. The flower should be removed after they have faded.

Many Ns. bear forcing well, and bloom can be had from Nov. N. bulbs should not be lifted till the leaves are quite yellow.

Narcissus Fly, or *Merodon equestris*, dipterous fly, giving rise to larvae which do very serious damage to N. bulbs. It appears between May and July, and lays its eggs between the leaves and on the ground. The fly is somewhat like a bee, about $\frac{1}{2}$ in. long and with variable stripes of red, yellow, or white, and with a black band across the thorax, but is distinguished by its two-winged character and the absence of the long black antenna found in all bees. The flies are best caught with a net when they settle for egg-laying, or can be trapped with saucers of treacle or honey. Newly bought bulbs should be carefully examined so that all infested bulbs can be lifted and destroyed. The occurrence of the pest must be notified to the Ministry of Agriculture.

Narcotic Poisons, see under POISONS.

Narcotics, drugs which produce stupor if the dose is increased beyond a certain limit. The most important N. is opium. The opium alkaloids, alcohol, belladonna, henbane, Indian hemp, and chloral all have a primary stimulating effect, but are poisonous in excess. Owing to their power of inducing sleep, some are called hypnotics or soporifics (e.g. sulphonal), while others which alleviate pain are called anodynes (e.g. antipyrin).

Narcotine ($C_{25}H_{25}O_7N$), alkaloid occurring in opium. It was discovered in 1817 by Robiquet, and thought to be the stimulating principle of opium, but it has less narcotic power than morphine. It is nearly insoluble in water, sparingly soluble in alcohol, and readily soluble in chloroform and ether. It has slightly alkaline properties, is a derivative of benzyl isosquinoline, and has a large number of decomposition products, of which vanillin is well known as the flavouring principle of vanilla. Its salts are not readily crystallisable, are more bitter than morphia, and its sulphate is used instead of quinine in India; its chief use is as a source of the medicinal substance cotarnine.

Narcylene, see under ACETYLENE.

Nard, and **Nardostachys**, see SPIKESARD.

Nardi, Jacopo (1176-1563), It. historian, b. at Florence. In 1527 he was sent as an ambassador to Venice. His work entitled *Storia della Città di Firenze dell'anno 1494-1531*, pub. in 1582 (and a second ed. in 1581), forms a sequel to that of Machiavelli.

Nardo, tn. of Italy, prov. of Lecce, 24 m. W. of Otranto. It has a fifteenth-century cathedral and textiles are manufactured. Pop. 21,500.

Narenta, see NERETVA.

Nares, Sir George Strong (1831-1915), Scottish admiral and explorer, b. in Aberdeen. In 1852 he was a member of Sir Edward Belcher's expedition in search of Sir John Franklin. In 1867 he was captain of H.M.S. *Challenger*, the first steamship to cross the Antarctic Circle. From dredging operations, it was inferred

that there was a continent in the far S. In 1875 Nares led an expedition to reach the N. pole, reaching Grant Land, $81^{\circ} 44'$ N. lat. Sir Albert Markham in the *Alert*, one of the boats of this expedition, reached $83^{\circ} 2'$ N. Nares did valuable hydrographical work on Mediterranean currents and on the equatorial current, and received the founder's medal of the Royal Geographical Society, 1877, and the gold medal of the Geographical Society, Paris, 1874. He pub. sev. works on his explorations.

Nares, James (1715-83). Eng. composer, b. at Stanwell, Middlesex. He studied music under Dr. Pepusch, eventually becoming organist of York Cathedral. In 1756 he became organist and composer to the king, and at about the same time received his degree as Mus.Doc. at Cambridge. In the following year he was appointed master of the choristers of the Chapel Royal. His compositions, mostly church music, include a number of anthems.

Narev (Narow), Battles of the, fought in 1915, the riv. forming the line of the Russian defence of Warsaw against Hindenburg's advance. The fighting extended over the period June-Aug., Warsaw falling in Aug. 1915. See further under WORLD WAR, FIRST.

Narino, dept. of Colombia, in the S.W. corner of the country, with the Pacific Ocean to the W. and Ecuador to the S. Stock raising is important, gold is mined, and cereals, cocoa, rice, potatoes, and sugar are grown. There are manufs. of footwear and Panama hats. There is a univ. at Pasto, the cap. Area, 11,515 sq. m. Pop. 537,400.

Narni, tn. and episcopal see, in the prov. of Perugia, Italy, 45 m. N. of Rome. It has a thirteenth-century cathedral, and was a bishop's see for 1500 years. There are mineral springs near, and many Rom. remains. The medieval bridge, adjacent to the Ponte Augusto, was blown up by the Gers. in the Second World War. Pop. 14,000.

Narocz, Battle of Lake. Lake Narocz is in Lithuania, situated about 60-70 m. N.E. of Vilna. In the autumn of 1915 the Gers. and Austrians forced back the Russians along the whole of the E. front, and in the region of the lake the line ran practically due N. and S. To relieve the pressure of the Gers. on the W. front, who were then making some progress at Verdun (q.v.), it was arranged to create a diversion on the E. front, and an advance in this region was designed. All available Russian resources were duly concentrated and the battle opened at dawn on March 18. Once the Gers. had recovered from their surprise they resisted every Russian advance. The battle dragged on for sev. days and eventually petered out about March 27, owing to the exhaustion of the Russians.

Narragansett Bay, inlet on the S.E. of Rhode Is., U.S.A. It is nearly 28 m. long and 3 to 12 m. wide. It encloses a number of is., the largest of which is Rhode Is. See RHODE ISLAND.

Narragansett Indians, nearly extinct

tribe of Algonquin stock, who formerly roamed about Rhode Is. and the W. shores of N. Bay. Their friendliness towards the original settlers of Rhode Is. later changed to hostility, and they were defeated by the Eng. governor, Winslow, in 1675.

Narragansett Pier, summer resort, 9 m. W. of Newport, Rhode Is., U.S.A.

Narrows, The, very short strait, 8 m. S. of New York, between Long Is. on the E. and Staten Is. on the W. It forms one of the prin. entrances to New York harbour.

Narses (A.D. c. 472-568), celebrated general and statesman of the Byzantine Empire. He was an Armenian by birth. In 538 he was sent to Italy to act in council with Belisarius against the Goths. He quarrelled with the general and was recalled in 539, but on the recall of Belisarius in 552, N. was appointed to command in Italy, and at a fierce engagement at Tagina defeated the Goths, and killed their king, Totila. In 553 he defeated Teja near Sorrento and took Rome. He was made exarch of Italy, fixed his court at Ravenna, and, until the death of Justinian in 565, administered the affairs of Italy with ability and vigour. At the accession of Justin he was accused of extortion and dismissed. After this he was accused of intriguing with Alboin, king of the Lombards, for a new invasion of Italy, but his participation was never proved, as he d. at Rome in 568 before the Lombard invasion. See E. Gibbon, *Decline and Fall* (ed. 1896-1900). See also GOTHS; JUSTINIANS.

Narsinghpur: 1. Cap. of a dist. of the same name, in Orissa Prov., India, 50 m. W.S.W. of Jabalpur. It is the seat of the cotton and grain trade of the Narbada valley. Pop. 12,000. 2. The dist., formerly a state, but now merged into Orissa Prov., occupies the upper part of the Narbada valley, where extensive grain crops are raised. Coal is mined in the dist. (at Mohpani), and there are manufs. of brass work, iron ware, cotton, and silk. The Great Indian Peninsula Railway traverses the dist., which has an area of 204 sq. m. and a pop. of 48,000.

Narthex, colonnade, outside the W. doors of basilican and certain other churches. In early times it formed part of the atrium, but on the disappearance of this feature it frequently remained. It was the place for the penitents who were not allowed to enter the church itself.

Narva, or **Ivangorod**, seaport in the Estonian S.S.R. on the R. Narova, 90 m. W.S.W. of Leningrad. It was founded in 1256. Its fortress, Ivangorod, was abandoned in 1864. There is a cathedral and an old tn. hall (1683). The falls of the riv. afford water-power for driving paper, cotton, woollen, and linen mills. Pop. 27,000.

Narvaez, Pánfilo de (c. 1480-1528). Sp. soldier, b. at Valladolid. He went to America, and fr. c. 1512 was under Velasquez in command of an auxiliary force in the conquest of Cuba. In 1520 he was sent to supersede and punish Cortés, but was defeated at Cempoalla and deserted

by his army. Having returned to Spain he was appointed governor of Florida in 1526, but was drowned in 1528.

Narvaez, Ramón María, Duke of Valencia (1800-68), Sp. general and statesman, b. at Loja, Granada. N. entered the army in 1815, supported the Constitutional party, 1822-23, served against the Carlists, 1831, completely defeated Gómez at Majaceite, Nov. 1836, opposed Espartero, and was obliged to flee to France about 1839, where he was afterwards joined by Queen Christina. He started a revolution in her favour and entered Madrid, 1843; the same year he declared the majority of Isabella II. and became lieutenant-general of Spain. He was created duke and Prime Minister, 1844-1846; ambas. at Paris, 1847; head of the ministry, 1847-51, 1856-57, and 1864-65. With O'Donnell he suppressed a great military revolt at Madrid, 1866; and was minister, with Bravo Murillo, 1866.

Narvik, or Victorihavn, seaport of Norway, on the Ofoten Fjord. It owes its rise to the construction of the Ofoten railway, completed 1903, and is the port for the shipping of iron ore. On April 13, 1940, a Brit. flotilla forced its way into N. fjord and sank four Ger. destroyers. Early in May a combined Anglo-Fr. force under Lt.-Gen Auchinleck (q.v.) made a strong attack on the Ger. garrison at N., which was captured on May 28; but on June 10 the Brit. forces left. Pop. 4500. See further under NAVAL OPERATIONS IN SECOND WORLD WAR: NORWAY AND DENMARK, GERMAN INVASION OF (1940).

Narwhal, or Sea Unicorn (*Monodon monoceros*), cetacean, allied to the dolphins and porpoises. The male has one, almost invariably the left, of the teeth or tusks in the upper jaw extraordinarily developed into a spirally furrowed horn of pure ivory from 6 to 10 ft. long. This is the longest tooth found in the Mammalia. The adult animal is from 10 to 16 ft. long. It has a grey back, mottled with black, the under parts being much lighter, but also spotted. It has a blunt short head, no dorsal fin and very small flippers, but is very active and a rapid swimmer. It is peculiar to the Arctic Ocean, though it occasionally strays as far S. as Brit. seas. The oil is valuable and the flesh edible.

Nascent State. Gases in the free state usually consists of molecules containing two or more atoms. These atoms are held together by a force of attraction which, it is natural to suppose, must be overcome before chemical action can be effected. So it would be supposed that gases, which have just been liberated from combination and before the atoms have had time to combine into molecules, would be more chemically active than after combination into molecules. This is found to be so, and chemists use the term 'nascent state' to define the condition of substances which so act at the instant of their liberation from combination. Ordinary nitrogen will not unite with hydrogen, but if a solution of a compound of nitrogen be poured into a flask in which hydrogen is being generated, then ammonia will be formed. The peculiar behaviour of

'nascent' gases varies according to the reactions in which they are formed, and thus is not solely due to their being in the atomic state.

Nascimento, Francisco Manoel do (1734-1819), Portuguese poet and miscellaneous writer, wrote under the Arcadian pseudonym 'Filinto Elysio,' though so far from ever having been a member of the so-called Arcadians N. founded a school of rivals, named Filintists. His graceful lyrics and prose enriched the language, resisted foreign intrusions, and preserved national traditions. His influence in thereby reviving letters in his country was considerable, yet not so great as that of the less original Manoel de Bocage. Among his works are romantic *contos* or scenes of Portuguese life. He is also remembered for his patriotic odes, notably *To Neptune speaking to the Portuguese* and *To the Liberty and Independence of the United States*.

Naseby, par. and vil. of Northamptonshire, England, 7 m. S.S.W. of Market Harborough. Near here was fought the famous battle which practically decided the issue of the Civil war on June 14, 1645. Prince Rupert commanded the right wing of the Royalist cavalry and, as usual, routed the forces opposed to him, who were led by Ireton. The king, in charge of the centre, was on the point of overpowering Fairfax, who was in command of the new model army of 14,000 foot and 7000 horse, when Cromwell, having put to flight the left wing of the Royalist army, hastened to the assistance of his chief. This movement decided the battle, especially as Rupert had lost his advantage by pursuing the fugitives too far. The Royalists were totally routed, the king's baggage taken, and his letters to the queen and to the Irish rebels, which showed that while negotiating with the Parliament he had no intention of coming to terms, were pub.

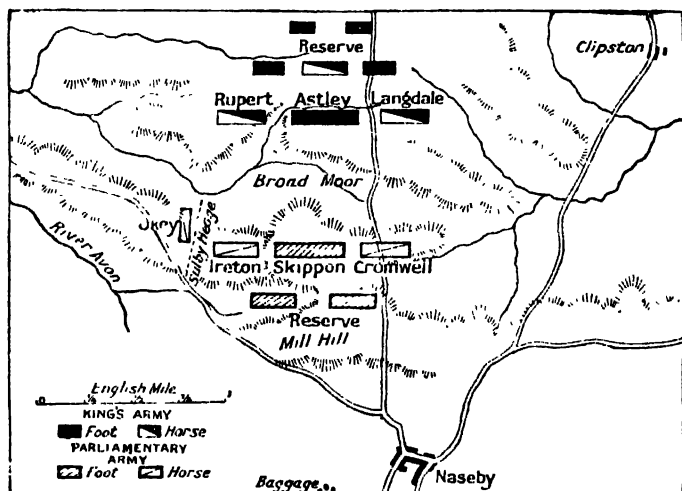

Nash, John (1752-1835), Brit. architect, b. at Cardigan in Wales. He is chiefly famous for his street improvements in London. He planned Regent Street between Carlton House and Regent's Park; repaired and enlarged Buckingham House, from which his entrance gateway, known as the Marble Arch, was removed to Cumberland Gate, Hyde Park; laid out Regent's Park, and designed the terraces along the edge of the park. The Brighton Pavilion is also a specimen of his work. See J. Summerson, *John Nash, Architect to King George IV.*, 1935.

Nash, John Northcote (b. 1893), Eng. artist, second son of W. H. Nash. He was educated at Wellington College, and joined the Artists' Rifles in 1916. He served in France 1916-18, and was commissioned to paint war pictures for Imperial War Museum. It is as an illustrator and wood-engraver that he is chiefly known. See his *Poisonous Plants*, engraved in wood (1927), and his illustrated eds. of Swift's *Directions to Servants* (1925); Ovid's *Elegrs* (1925); Spenser's *Shepherd's Calendar* (1930); and others. See also *John Nash* in Brit. Artists of To-day series, 1925.

Nash, Paul (1889-1946), Eng. painter, known especially for landscapes and water-colours; *b.* in London. He was educated at St. Paul's School and the Slade School. In 1917 he was one of the official artists on the W. front. His work was exhibited at the Leicester Galleries in 1918 and in 1924. A painter of the Post-Impressionist school, his style represents the flat definition in the Eng. Post-Impressionist movement. Though taught at the Slade School he had little in common with the orthodoxy of that institution. It was in 1911-12 that his water-colours began to attract attention at the New Eng. Art Club. His war pictures, poignant ex-

and was admired for his manners and taste, his sobriquet of 'Beau Nash' being an allusion to his foppery, his name having become proverbial in that connection. He was also mainly instrumental, with Ralph Allen and Dr. Oliver, in establishing the mineral water hospital at Bath. *See* *Life by Goldsmith*, 1762, and L. Melville, *Bath under Beau Nash*, 1908.

Nash, or Nashe, Thomas (1567-1601), Eng. satirist, critic, and playwright, *b.* at Lowestoft. His first pub. was an acrid review of recent literature prefixed to Greene's *Menaphon*, which he discussed at greater length in *The Anatomie of Absurditie* (1589). After this he was engaged in

THE BATTLE OF NASEBY, JUNE 11, 1645

pression in art of the emotions of broken soldiers, won instant popularity. One of the most striking is his 'Inverness Cope'. He was official war artist to Mr. Ministry, 1940; to Ministry of Information, 1941. *Publ.*: *Places, Prose Poems and Wood Engravings* (1922), and monographs in *Contemporary Brit. Artists* series 1923, 1927. His autobiography *Outline* was pub. in 1949. *See* Margot Eates, *Paul Nash Memorial Volume*.

Nash, Richard, or 'Beau Nash' (1674-1762), Brit. dandy, *b.* at Swansea and educated at Carmarthen, whence he was sent to Jesus College, Oxford, where he remained only a short time. Later he was given an ensign's commission, but soon left the army and then entered the Middle Temple, but never took up the law as a profession. A zest for pleasure and gaming drew him, in 1705, to Bath and thenceforth he made his living by gambling, and was noted for his extravagance. At Bath he estab. the first assembly room, became the recognised autocrat of the tn.,

the Marprelate controversy for a time, and in 1592 pub. *Perce Pennilesses, his Supplication to the Drell* as a reply to the savage denunciations of Richard Harvey. These were followed by *Strange News* (1592); *Christs Teares over Jerusalem* (1593), like Greene's pamphlets, a picture of loose life in London, with the same kind of dubious contrition and denunciation of immorality; *The Terrors of the Night* (1594), the theme of which is ghosts and superstitions, notable for the praise of Daniel's 'Delia'; and *The Unfortunate Traveller, or the Life of Jack Wilton* (1594), the best novel of adventure in England before Defoe's. Besides these he pub. *Hare with you to Saffron Walden* (1596), an onslaught on Gabriel Harvey; *The Isle of Dogs* (1597), a comedy in which he attacked the current abuses in the state, and for which he suffered imprisonment in the Fleet; *Lenten Stuffe* (1599), an amusing description of Yarmouth; and *Summer's Last Will and Testament*, a comedy (1600).

Nashua, co. seat of Hillsboro co., New

Hampshire, U.S.A., on the Merrimac R., 144 m. from Manchester. There are manufs. of sheetings, paper products, asbestos, refrigerators, etc. N. is situated in a farming dist. producing fruit, hay, potatoes, and stock. Pop. 33,000.

Nashville, cap. of Tennessee, and co. seat of Davidson co., U.S.A., on the Cumberland R., 185 m. S.S.W. of Louisville. It is a great railway and commercial centre, with extensive trade in cotton and tobacco, and manufs. of cotton, silk rayon, hardwood flooring, fertiliser, flour, oil, paper, woollen goods, leather, etc. Printing and publishing are important industries, and it has a large lumber market. It is also the seat of many educational institutions, including Vanderbilt Univ., N. Univ., Fisk Univ., and Walden Univ. for Negroes (founded as Central Tennessee College). Here in 1864 the Federals defeated the Confederates (see **NASHVILLE, BATTLE OF**). N. was founded in 1780, incorporated as a tn. in 1784, chartered as a city in 1806, and made the cap. of the state in 1843. Pop. 167,400.

Nashville, Battle of, in the Amer. Civil war a victory for the Federal forces under Gen. Thomas against the Confederates under Gen. Hood. In Nov. 1864 Thomas was garrisoned in the tn. of N., Tennessee, which had been surrendered to the Federals in Feb. 1862, and with his army of 50,000 men he faced the advance of Hood's superior force. A preliminary engagement took place at Franklin, where Gen. Schofield succeeded in retarding Hood's advance. On Dec. 15, 1864, Thomas advanced and succeeded in outflanking Hood on the left. This movement he followed up by a general attack which turned Hood's defeat into a rout. Hood's army was depleted of half its numbers and driven back across the R. Tennessee. The pursuit continued for thirteen days as far as Lexington, Alabama, although impeded by floods. The B. of N. was one of the most decisive in the course of the Civil war. See W. B. Wood and J. E. Edmonds, *Civil War in the United States*, 1937.

Näsijärvi, long narrow lake of S.E. Finland, N. of Tampere (Tammerfors). It has an area of 101 sq. m., and in parts reaches a depth of over 300 ft.

Nasik, tn. and dist. in Bombay Prov., India. The tn., situated on the Godavari R., is famous as a place of Hindu pilgrimage. In the vicinity are some anct. Buddhist caves. There are manufs. of cotton goods, brassware and copperware, and mineral waters. The dist. has an area of 5922 sq. m. Pop. (tn.) 42,756; (dist.) 1,113,900.

Nasirabad: 1. Or Nusseerabad, tn. of E. Bengal, Pakistan, in the Maimansingh dist., 74 m. N. of Dacca. The earthquake in 1897 destroyed the church and high school. Pop. 15,000. 2. Tn. of Bombay Prov., India, in the dist. of E. Khandesh, 120 m. S.W. of Indore, noted for the manuf. of glass bangles. Pop. 14,390. 3. Tn. and cantonment in Ajmer-Merwara, India. Pop. 25,000. 4. Tract of country now in Pakistan, acquired by the Brit.

from the khan of Kelat in 1903 on payment of an ann. sum of about £7300.

Nasir-ed-Deen (Nasir Uddin), Mohammed Ibn Hassan (c. 1200 c. 1276), Persian astronomer, b. at Toos in Khorassan and appointed superintendent of an observatory at Azerbaijan. He wrote the *Mechanic Tables*, somewhat resembling those of Ptolemy.

Nasmith, David (1799-1839), originator of tn. and city missions, b. at Glasgow. In 1813 he became secretary to the Glasgow Youths' Bible Association and devoted himself to religious work, and in 1821-28 was assistant-secretary to no fewer than twenty-three charitable societies. He founded the Glasgow City Mission in 1826, the Local Missionary Society for Ireland, the London City Mission, and the Brit. and Foreign Mission, besides about thirty-two in the U.S.A. and Canada.

Nasmith, Alexander (1758-1840), Scottish portrait and landscape painter, b. in Edinburgh. He was a pupil of Allan Ramsay. In 1778 he estab. himself in Edinburgh as a portrait painter, and had Robert Burns among his sitters. Ultimately he confined himself to landscape painting, although much of his time was occupied in teaching, and in 1822 he pub. sixteen views of places described in the Waverley novels. He was a member of the original Society of Scottish Artists, and an associate of the Royal Institution. See J. Nasmith, *Autobiography*, 1883.

Nasmith, James (1808-90), Brit. engineer, the son of Alexander N., and brother of Patrick. In 1834 he started business for himself at Manchester, subsequently establishing the Bridgewater foundry at Patricroft, where he invented the steam hammer. He was afterwards adopted by the Admiralty, N. having taken out a patent in 1842. He also invented a nut-shaping machine, a flexible shaft for driving small drills, and a hydraulic punching-machine; he was the first to observe, in 1860, a mottled appearance of the sun's surface called 'willow leaves' or 'rice grains'. He pub. *Remarks on Tools and Machinery* (1858) and *The Moon considered as a Planet, a World, and a Satellite*, in conjunction with James Carpenter (1874). See his *Autobiography* (ed. S. Smiles), 1883.

Nasmith, Peter, commonly known as Patrick (1787-1831), Brit. landscape painter, b. in Edinburgh. His landscapes won for him the name of 'the Eng. Hobbenia'. The reputation of his works has greatly increased since his death, indeed, one was sold at Christie's for 1300 guineas in 1892. Some of his paintings are 'Haslemere', 'Turner's Hill, East Grinstead', 'Cottage in Hyde Park', 'A Country Road', 'A Cascade', 'Sir Philip Sydney's Oak, Penhurst', and 'View of St. Albans'.

Naso, see **OVIN**.

Nasr-ed-Din (1829-96), shah of Persia. Through the influence of his mother, a princess of the Kajar family, he became governor of Azerbaijan and heir apparent in place of his elder brothers. His succession to the throne was strongly opposed,

particularly by the Babis (reformers), but he wreaked savage vengeance on them. He signed a treaty of friendship with Russia and so remained neutral during the Crimean war. In 1856 he seized Herat but was driven out by Sir James Outram, a treaty being signed in Paris (March 1857). For the rest of his long reign he treated Great Britain and Russia with equal friendship. He is famous as the first shah to visit Europe, which he did with a sumptuous retinue. One result of his contact with W. civilisation was a proclamation of religious toleration (for his other innovations see under PERSIA, History). His one fatal mistake was the grant of a tobacco monopoly to a private company. This he was soon compelled to abrogate owing to the objections of his subjects. This unpopular sale of the tobacco monopoly was probably a factor in his assassination, which occurred at Tehran on May 1 at the hands of a member of El Bab's faction. Abstemious in habits, he was devoted to music and poetry. He was succeeded by his son, Muzaffar-ed-Din (Muzaffaruddin).

Nassarawa: 1. prov. of N. Nigeria, situated on the N. bank of the R. Benue, with an area of 18,000 sq. m. Cotton is extensively grown, other products being rubber, palm kernel, and bent seed. Pop. over 170,000. 2. Tn., cap. of the prov., 90 m. N.E. of Lokoja. Pop. over 12,000.

Nassau: 1. Independent duchy up to 1866, in which year it was incorporated with Prussia and until 1916 part of the prov. of Hesse-N. (see HESSE). Its former area was 1830 sq. m. and at the time of its incorporation it had a pop. of 466,300, and an area of 1815 sq. m. The Taunus Mts. rise in the S. to an elevation of 2750 ft. The Rhine, Main, and the Lahn are the chief rivs. of the region, but there are also numerous small streams. The hills are well wooded, abounding in game, and the dist. is rich in minerals. There are numerous mineral springs, and the soil is very productive. In N. are the noted Erms and Wiesbaden spas. It was united to Orange-N. by Napoleon I. in 1806, who presented the dukedom to Frederick William. Pop. 2,200,000. 2. Formerly New Providence, is situated in the E. end of the Is. of New Providence. It is the cap. of the Bahamas, and has trade in pearls, fruit, of which tomatoes are important, salts, and sponges. Pop. 12,900.

Nassau or Pagi Islands, two Is. belonging to the Mentawi chain, off the W. coast of Sumatra. They are of volcanic origin, and have an irregular surface, which is densely wooded. The chief products are coconuts, sago, trepang, and timber.

Nasturtium, name wrongly but persistently given to the two garden species of *Tropaeolum majus* and *minus* (q.v.). The true N. is the common watercress (*N. officinale*) (q.v.).

Nastved, tn. of Zealand, Denmark, about 14 m. N.W. of Præsto. Kähler's works there are noted for their refined glazed earthenware. Pop. 9000.

Natal, original prov. of the Union of S.

Africa, lies in the S.E. portion of the continent, and is bounded on the E. by the Indian Ocean. The prov. has an estimated area of 35,284 sq. m. Zululand (10,425 sq. m.) was annexed to Natal in 1897, and the N. dists. of Vryheid, Utrecht, and part of Wakkerstroom, which formerly formed part of the Transvaal, were added to Natal ter. in 1903. The seaboard of Natal is about 376 m. in length, and has only one bay of importance, that of Durban. The country rises inland in a succession of terraces from the low and sandy coast, culminating in the heights of the Drakensberg, whose highest peak is Mont aux Sources (over 11,000 ft.). Majuba Mt. (7000 ft.) lies S.W. of the pass of Laing's Nek, which leads into Transvaal ter. The country is watered by the Tugela, Buffalo, Klip, Mool, and other rivs, which are useful for irrigation purposes, although useless for navigation. There are no fewer than thirty-five distinct rivs. running into the Indian Ocean. The climate is sub-tropical on the coast but somewhat colder inland. The cooler or winter half of the year is considered as beginning in April and ending in Sept., the average number of rainy days being thirteen. Malaria in a mild form is present on the coast lands of old Natal, becoming more severe in Zululand and as one proceeds northwards along the coast. The rainfall at Durban is about 39½ in. and at Pietermaritzburg about 30 in., the greater part of which falls during the summer months, May, June, and July being comparatively dry. The prevailing wind is S.E. in the summer months, as at the Cape of Good Hope. Occasionally the sirocco, or hot wind, from the N.W. is felt. Heat which might otherwise be oppressive is generally tempered by the sudden thunderstorms so frequent in Natal during the hot months. The leading crops for export are sugar, tea, maize, and wattle bark; other crops include lucerne, sweet potatoes, peas, pumpkins, and vegetables. Cotton and tobacco are also grown. The prov. is rich in mineral wealth, and asbestos, copper ore, fire-clay, gold, graphite, gypsum, iron ore, lead and silver ore, nitre, oil shale, limestone, and marble, manganese ore, mica, nickel ore, and tin ore are found. Coal is mined in the Klip R., Vryheid, and Utrecht dists.

The wild animals still found include the leopard, panther, jackal, hyena, wild cat, hippopotamus, crocodile, different species of antelope, but the larger animals are gradually disappearing. There are many varieties of snakes, including the python. The birds include the vulture, eagle, secretary-bird, parrot, flamingoes, many of them of brilliant plumage but mostly songless. The Giants' Castle Game Reserve (50,000 acs.) is situated in the Estcourt dist. in the Drakensberg Mts. It contains eland, blesbok, red hartbeest, and numerous species of small game, and birds. The Natal National Park, although not essentially a game reserve, exists for the preservation of the natural flora and fauna of the Berg. It is 10,000 ac. in extent, is 65 m. from Ladysmith, and

embraces some of the finest scenery in the Drakensberg Mts. The fisheries of Natal are notable. The prin. classes of edible fish found are red and silver bream, bass, rock cod, barracudas, and steenbrass. Whaling operations begin in May and end in Oct., the species of cetacea captured being sperm, humpback, finner, etc. Porpoise and dolphin abound all the year round on the coast. Rod and line salt-water angling on the coast is popular and well organised. All fishing in Natal

(Europeans 232,900; non-European, 1,949,800).

Administration.—By the South Africa Act, 1909, which constituted the Union of S. Africa, inaugurated in 1910 by the duke of Connaught, Natal sends eight members to the Union Senate and sixteen members to the House of Assembly. It has an elected prov. council of twenty-five members. These twenty-five elect four members to act with the administrator as the executive. The administrator is

South African Railways and Harbor

PIETERMARITZBURG: THE MAIN SHOPPING CENTRE

is administered under the Natal Fisheries Ordinance of 1910 by the Natal Fisheries Advisory Board. The total revenue for 1946-47 (including Union subsidy) was £5,376,814; and the expenditure £4,753,142.

The pop. of Durban, the prin. seaport and manufacturing centre of the prov., is 338,800, including 117,000 Europeans. Pietermaritzburg (the seat of gov.) has a pop. of 63,100 (including 27,000 Europeans. Ladysmith (q.v.), Dundee (pop. white, 1900; total 6700), and Newcastle (pop. white, 2300; total 9700) are other tns. Communication is easy; the total railway mileage, operated by the administration, is 1511 m. The construction of 174 m. of N. main lines, i.e. from Pietermaritzburg to Glencoe, was completed in 1926. A wireless installation for ship to shore working has been estab. at Durban. The total pop. in 1916 was 2,182,700

chosen by the governor-general of the Union in Council. He holds office for five years. The gov. of Zululand is in the hands of a prov. council and an administrator appointed by the governor-general. Its executive consists of four members. There is a native High Court in Natal with five judges to deal with peculiarly native cases.

Education.—With the exception of higher and vocational education, which is under the control of the Union gov., education comes under the prov. administration. A univ. college is at Pietermaritzburg, and over 319 primary schools for Europeans, and forty-two secondary and intermediate, all supported entirely or partly by gov. funds. For non-European children, there are 954 native schools; 137 Asiatic and thirty-four other coloured schools, state and state-aided. There are, besides, technical

colleges, a school for the training of teachers and a school of physical culture.

Religion.—The Christian pop. consists of members of the Church of England, with a bishopric at Pietermaritzburg, Rom. Catholics, with a bishopric at Natal, Wesleyans, Baptists, Presbyterians, and Independents.

History.—Vasco da Gama is reputed to have passed what is now Durban on Christmas Day, 1497, naming the country Terra Natalis, after the natal day of Christ: evidence, however, points to the fact that it was Pongoland which da Gama discovered. With the exception of the purchase of the bay of Natal by the Dutch in 1685, arising out of the adventures of Van der Stel's expedition, the hist. of European settlement in Natal commences at the close of the first quarter of the last century; and prior to 1823, only a few ships had touched on the coast for wood and water. In 1823 Lt. Farewell landed in the bay, and later, one Fynn was sent overland to obtain a grant of ter. from Chaka, the formidable paramount chief of the Zulus. Permission to settle was obtained from Chaka, but Chaka was assassinated in 1828 by Dingaan, his half-brother, and whose followers were hostile to the white settlers and their allies. Matters were not settled until 1831, when Fynn was recognised as the 'great chief of the Natal Kaffirs.' In 1835 Dingaan granted a concession of land to Capt. Gardiner, who formed a Brit. colony at Durban. In 1837 the Boers, trekking N. from Cape Colony, first entered Natal, and having crushed the Zulus at Blood R., Dec. 1838, attempted to estab. a republic, and in 1840 the flag of the Dutch republic of 'Natalia' was in fact actually hoisted on the shores of the bay and was followed by a proclamation taking possession of all land between the Tugela and Black Umfolozi Rrs. The Brit. Gov. refused to acknowledge the independence of the new state, and in 1842 a small force was sent to drive the Boers out, but was repulsed. One of the settlers, Richard King, however, rode through the Boer lines, a distance of 600 m. to Grahamstown and so secured relief. On Aug. 8, 1843, Natal was finally proclaimed a Brit. colony (annexed to Cape Colony) and the Boers moved westwards to the Transvaal. In 1856 Natal was declared an independent colony. In 1879 Cetewayo, king of the Zulus, was defeated and captured, and in 1897 Zululand was annexed to Natal. In 1881 the Transvaal Boers invaded the country and defeated the Brit. at Majuba Hill (q.v.). In the war of 1899-1902, Natal was the scene of some of the fiercest fighting, Elandslaagte, Glencoe, Ladysmith, and the second battle of Majuba Hill. After the war, Utrecht, Vryheid, and part of Wakkerstroom were added to Natal. In 1906 there was a formidable Zulu rising along the Tugela R., which was suppressed with great loss to the natives. In 1907 there was another outbreak which ended in the arrest of Dinizulu (d. 1913). On May 31, 1910, the colony of Natal was merged in the Union of S. Africa, becoming

an original prov. of the Union. See H. Brooks, *Natal*, 1876; J. Ingram, *Natalia*, 1897; R. Russell, *The Garden colony: the Story of Natal and its Neighbours*, 1910; A. T. Bryant, *Olden Times in Zululand and Natal*, 1929; C. Mackeurlan, *Cradle Days in Natal*, 1930; C. Fuller, *Louis Trichard's Trek across the Drakensberg*, 1837-8, 1932; M. Nathan, *The Voortrekkers*, 1937; and A. F. Hattersley, *Annals of Natal*, 1936-40.

Natal, tn. and seaport of Brazil, cap. of the state of Rio Grande do Norte. It stands on the r. b. of the Potengy R., 80 m. from Paraíba and 260 m. from Fortaleza. Exports sugar and cotton, as well as salt, carnauba wax, and hides. Its industries are cotton spinning and weaving and salt-refining. There are rail connections with Pernambuco, Maceio, and Paraíba. There is a large airport, used by transatlantic air services, 8 m. from the city. Pop. 63,000.

Natal, Port, see DURBAN.
Natchez, port of entry and co. seat of Adams co., Mississippi, U.S.A., 145 m. (direct) N.N.W. of New Orleans. Cotton is the chief industry, and there is shipping trade in cotton. There are also candy factories, canning factories, and a lumbering industry. The Jefferson Military College is at N. There are sev. fine churches. Its old name under the Fr. was Fort Rosalie and it remained a Fr. military and trading post till the Seven Years war, when it came into Eng. possession under the name of Fort Panmure. It was a bone of contention between the Amers. and Spaniards in the late eighteenth century, when the former were seeking outlets for their W. products, the Spaniards refusing to surrender it on the plea that England's title, under which the Amers. claimed it, was defective. It was in Sp. occupation from 1779 to 1798; in 1798 it became the cap. of the new ter. of Mississippi, but in 1820 the cap. was removed to Jackson. Pop. 13,500.

Natchez, tribe of N. Amer. Indians, whose original ter., extended along the gulf of Mexico, between Mobile and the Mississippi. They were nearly exterminated by the Fr. in 1730. The N. language is extinct.

Nathan: 1. Trusted adviser of King David who, in consequence of a vision, withdrew his approval of the king's purpose to build the Temple. He rebuked David for his peculiarly heinous sin, making him condemn himself, by means of the parable of the 'one ewe lamb' (2 Sam. xiii). 2. Name of a son, probably the third born to David by Bathsheba (2 Sam. v.). The right of succession to David passed to Salathiel, the descendant of N., who is supposed to be referred to in Zechariah xii. N. thus appears as an ancestor of Our Lord.

Nathan, George Jean (b. 1882), Amer. dramatic critic: b. at Fort Wayne, Indiana. He was educated at Cornell Univ., New York State, and the univ. of Bologna in Italy. He served at various times on the editorial staff of the *New York Herald* and as dramatic critic of various pubs. including *Harper's*

Weekly, Smart Set, and the *American Mercury*, the latter of which he founded with H. L. Mencken. In his critical work he is often mordant and always independent. Among his pub. works are *Bottoms Up* (1917); *The Popular Theatre* (1918); *Comedians All* (1919); *The New American Credo* (1927); *Art of the Night* (1928); *Testament of a Critic* (1931); *The Avon Flows* (1937); *The Morning after the First Night* (1938); *Encyclopaedia of the Theatre* (1940); *The Entertainment of a Nation* (1942); *Since Ibsen* (1943); and an ann. theatre book (since 1942).

Nathan, Robert (b. 1894), Amer. author of short novels, with a public that is small but select, b. New York City. He was educated at Harvard Univ. Most of his novels like *Autumn* (1921); *Youth Grows Old* (1922); *The Puppet Master* (1923); *The Fiddler in Barly* (1926) are distinguished by their note of gentle wistfulness and a mellow style. In *Jonah* (1925, pub. in England as *The Son of Amilai*), an adaptation of the Biblical story, he struck a new note of irony. This was reinforced in his *There is Another Heaven* (1929), the story of a converted Jew's experience in a very Protestant heaven. His other works include *One More Spring* (1933); *Road of Ages* (1935); *Winter in April* (1938); *Portrait of Jennie* (1940), and *They Went on Together* (1941).

Natick, tn. of Massachusetts, U.S.A., in Middlesex co., 16 m. W.S.W. of Boston. Manus. include boots and shoes, baseballs, and shirts. There are canned goods factories, boxes and corrugated paper are manufactured, and fruit farming is important. Pop. 13,800.

National Anthems. Patriotic hymns, to be sung at public ceremonies and on similar occasions are of comparatively recent date. The Brit. *God Save the King* assumed its present form about 1740-1745 and has been attributed to Henry Carey (1692-1743), though it is possible that it developed out of an old folk song. Carey evidently did not claim authorship, the first claim on his behalf being made by his son in 1795 who wished to get a pension from the gov. on that ground. He stated that his father wrote the words in 1745 or 1746, despite the fact that his father d. in 1743 (Scholes). The most important claimant to an early version of it is John Bull (1563-1628). It is not certain either who wrote the words or composed the tune of *God Save the King*, or who (supposing them to have been written) brought them together as the Brit. National Anthem. All that is known is that a version of words and tune was first pub. in a collection called *Thesaurus Musicus*, 1744, and that the popularity of the song as an expression of loyalty to the House of Hanover dates from the landing of the Young Pretender in 1745. (The versions in *Thesaurus Musicus* (1744 and 1745) differ slightly from each other and from the present form—Scholes.) The keyboard piece of 1619, which has caused the attribution to Dr. John Bull, is not very much more like the anthem than any of the other songs and pieces in a galliard rhythm, which have been supposed to

have contributed something to its outline. The air has been adopted by Switzerland to the words *Rufst du, mein Vaterland*; by Germany in *Heil dir im Siegeskranz*; by Denmark, in *Heil dir dem Liebenden*; while in the U.S.A. the air is sung to *My Country, 'tis of Thee*, by Samuel Smith.

Other N.A. are:

Abyssinia: *Etiopia hoy, des yibalish*; words by a group of Abyssinian scholars (1930); tune by M. K. Nalbandian (1925).

Albania: *Alla bandiera*; author of words unknown; tune by E. A. Mario (Giovanni Gaeta, 1937).

Argentina: *Oid mortales, el grito sagrado Libertad*; words by Vicente López y Planes (1813); tune by José Blas Parera, revised by Juan P. Esnaola.

Armenia: words by Sarmen; tune by Khatchaturian (1945).

Australia: *Advance Australia fair* (broadcast, but not actually adopted as a national anthem); words by P. Dodd McCormick (before 1916).

Austria (Imperial): *Gott erhalte Franz den (or unsern) Kaiser*; words by L. Haschka; tune by J. Haydn (1797). (Republican): *Österreichische Bundeshymne*, 'Sei gesegnet ohne Ende'; words also by L. Haschka; tune as above.

(Republican, 1920-29) *Deutsch-Österreich, du herrliches Land, wir lieben dich*; words by K. Henner; tune by Kienzl (1920).

(Nazi) *Lied der Jugend*, 'Ihr Jungen schliesst die Reihen gut'; words and tune by H. Leopoldi (c. 1933). From 1946, *Bruder, reich die Hand zum Bunde*; tune by Mozart.

Bavaria: *Bayern, mein Heimatland*; words by F. Beck; tune by F. Lachner (1848); also *Gott mit dir, du Land der Bayern*; words by M. Öchsner; tune by F. M. Kunz.

Belgian Congo, see Congo.

Belgium: *La Brabançonne*, 'Qui l'aurait dit de l'arbitraire'; words by Jenvoal (1830); tune by P. van Campenhout (L. A. H. Dechez, 1830). Flemish: *De Vlaamsche Leeuw*; words by H. van Peene; tune by K. Miry.

Bolivia: *Bolivianos, el halo propicio*; words by Ignacio de Sanjinés; tune by B. Vincenti.

Brazil: *Ouviram do Ypiranga as margens placidas*; words by J. O. Duque Estrada; tune by F. Manoel da Silva. (Earlier) *Seja um pulão luz*; words by M. Albuquerque; tune by L. Miguez.

Bulgaria: *Shoumi Maritza*; words by Mereček; tune by G. Sebek.

Burma: *Nain-gan-daw-Thuchin*, a revision of the *Doh-Ba-Ma* song composed by M. B. Saya Tin in 1930 and finally amended by the Constituent Assembly in 1947.

Canada: *The Maple Leaf for ever*, 'In days of yore, from Britain's shore'; words and tune by A. Muir (1867). (Fr.) *O Canada: Terre de nos rêves*; words by A. B. Routhier (1880); tune by C. Lavallée (adapted from the priests' march in Mozart's *Magic Flute*).

Ceylon: No decision regarding the future Sinhalese national anthem has been made (1949).

Chile: *Dulce patria*, 'Ha cesado la

lucha sangrienta'; words by Eusebio Lillo (1847); tune by Carnicer (1828).

China: *Tsung-kuoh kung ti juh dschou tian*; author of words and composer of tune unknown (1912). (Democratic) *The Song of Kuomintang*; words by Sun Yat-sen; tune by Ch'eng Mao-Yün (1928).

Colombia: *Oh! Gloria inmarcescible*, 'Cesó la horrible noche'; words by R. Núñez; tune by O. Sindici (c. 1905).

Congo (Belgian): *Vers l'avenir: Naar wijden tijd*, 'Le siècle inarche': 'De tijd spoedt heen'; words by G. Th. Anthéunis; tune by Gevaert (1908).

Costa Rica: *Noble patria, tu hermosa bandera*; words by J. M. Zeledón; tune by M. M. Gutiérrez (1821, in use from 1853).

Cuba: *Himno Bayamese*, 'Al combate corred bayameses'; words and tune by Pedro Figueredo (1868).

Czechoslovakia: Combination of *Kde domov můj*; words by J. K. Tyl; tune by Skroup (1831), and *Nad Tatrou sa blýska*; words by J. Maháská (1844); tune traditional (first officially used 1918).

Denmark: *Kong Kristian stod ved højen mast*; words by J. Ewald; tune by J. E. Hartmann (from opera *Fiskerne*, 1780); also *Der er et yndigt land*; words by A. Oehlenschläger; tune by H. E. Krøyer (twentieth century) and *Dengang jog drog afsted*; words by F. Faber; tune by J. O. E. Horneman (twentieth century).

Dominican Republic: *Quisqueyanos valientes, aleemos*; words by Emilio Prud'homme; tune by J. Reyes (1900).

Ecuador: *Salve! Oh patria, mil veces*, 'Indignados fusiljos del yugo'; words by J. L. Mera; tune by A. Neumann (1866).

Egypt: (march) *Hani an bē au da to samil ma kan*; author of words unknown; tune possibly by Verdi.

Eire, see Ireland, Republic of.

England, see above.

Estonia: *Mu isamaa, mu onn ja roon*; words by J. Jaanssen (1865); tune by P. Pius (1848).

Ethiopia, see Abyssinia.

Finland: *Maamme*, 'O maamme sinoni synnylmaa'; words by J. L. Runeberg (originally in Swedish, 1813); tune by P. Pius, as for Estonia. A second tune by P. Pius was also adopted.

France: *La Marseillaise*, 'Allons, enfants de la patrie'; words and tune by Rouget de Lisle (1792).

Germany (imperial) *Heil dir im Siegerkranz*; words by H. Harries (1790, adapted by B. G. Schumacher, 1793); tune as for Great Britain; also, after 1870, *Die Wacht am Rhein*, 'Es braust ein Ruf wie Donnerschall'; words by M. Schneckenburger (1840); tune by C. Wilhelm (1854). (Republican) *Deutschland, Deutschland über alles*; words by H. A. Hoffmann von Fallersleben (1841); tune by J. Haydn, as for Austria. (Nazi) *Horst Wessel Lied*, 'Die Fahne hoch, die Reihen dicht geschlossen'; words by Horst Wessel; the tune may have been adapted from a Rumanian comic song; in use 1933-45.

Greece: *Se gnorizo apo ten kopsi tu spafju ten tromere*; words by D. Solomos (1827); tune by N. Mántzaros; in use since 1873.

Guatemala: *Guatemala feliz!*; words by J. J. Palma; tune by R. Alvarez, in use from 1896.

Haiti: *La Dessaliné*, 'Pour le pays, pour les ancêtres'; words by J. Liérisson; tune by N. Giffard (1903).

Hawaii: *Hawaii pono!*; author of words and tune unknown, but possibly by Kula-kana, king of Hawaii (c. 1880).

Holkar's Dominions, see Indore.

Holland: *Wilhelmus van Nassouwe*; words by Philip van Marnix (c. 1570); composer of tune unknown (first pub. 1626); also *Wien Nederlandsch bloed door de aderen vloeit*; words by H. Tollens; tune by Jan Wilms (1820).

Honduras: *Compatriotas, de Honduras los fueros*; words by A. C. Coello; tune by C. Hartling.

Hungary: *Himnusz*, 'Esten áldd meg a Magyar!'; words by Kölcsey (1823); tune by Erkel (1845); usually followed by *Székely*, 'Házának rendületlenül légy híve oh magyar'; words by M. Vörösmarty (1836); tune by B. Egressy (1844).

Iceland: *O Gud vors land*; words by M. Jochumsen (1871); tune by S. Sveinbjörnsson.

India: *Jana Gana Mana* by Rabindranath Tagore. In addition, *Bande Matram* by Bankim Chandra Chatterjee is honoured as a national song.

Indore: *Prabho prarth ana parisa amuch*; author of words unknown; tune by J. J. J.

Iran, see Persia.

Iraq: *Royal Salute* (march); no words; tune by A. R. Murray.

Ireland, Republic of: *Soldier's Song*; words by Patrick Kearney; tune by Patrick Heaney (c. 1917).

Israel: *Hatikva* (The Hope); words by Naphtali Herz Imber, in 1878. The song was first called *Hatikvenu*. Only eight years later Imber called it *Hatikva* in his collection *Barkai* (Jerusalem 1886). There are two views as to the melody and composer. According to the one, the tune was taken from *Ma Vlasat* (My Country), a cycle of six symphonic poems by the Czech composer Smetana. According to the other, it had been composed by a Sephardic Jew, Henry Busato (or Russotto) on the basis of the liturgical music of *Hallel* (Psalm 117).

Italy: *La Marcia reale*; no words, tune by G. Gabelli (1831). (Sung in S. Italy): *Inno di Garibaldi*, 'All' armi, all' armi, si scopron le tombe'; words by L. Mercantini; tune by A. Olivieri (1858). (Fascist): *La Giovinezza*, 'Sù, compagni in forti schiere'; words by M. Manni; tune by G. Castaldo after G. Blanc (1921).

Japan: *Kimigayo*; the words are from the ninth century; tune by Hayashi Hironaki, revised by F. Eckert (1880).

Jewish, see Israel.

Yugoslavia, see Yugoslavia.

Latvia: *Diers, sveti Latviju*; words and tune by K. Braumanis.

Liberia: *Salve, Liberia, Salve!*; words by President Warner; tune by O. Luca (1860).

Lichtenstein: *Oben am deutschen Rhein lehnst sich Lichtenstein*; words by H. H. Jauch (1850); tune as for Great Britain.

Lithuania: *Lietuva tėrynė mūsų*; words and tune by V. Kudirkas (1918).
Luxembourg: *Ous Hemecht*, 'Wa d' Uolzécht duréich d'Wison zét'; words by M. Lentz (1850); tune by T. A. Zinnen.

Malta: *Tifhira lil Malta*, 'Int sabiha, Malta tana'; words by G. A. Vassalla; the tune is a Bersagliero song adapted (twentieth century). After 1942: 'Lil din Part Il-wa'; words by C. Psoula; tune by R. Samut.

Mexico: *Mexicanos, al grito guerra*; words by F. G. Bocanegra; tune by J. Nunó (1854).

Montenegro: words by John Sondeckitch; composer of tune unknown; also *Onam, onamo! za brda ona*; words by Prince Nicholas (1867); tune by Davorin Jenko.

New Zealand: *God defend New Zealand*; words by Thomas Bracken; tune by R. A. Horne, not consistently used until 1940.

Newfoundland: *When the sun rays crown thy pine-clad hills*; words by Sir Charles Cavendish Boyle; tune by Sir H. Parry. (This does not displace *God Save the King*.)

Nicaragua: *Hermosa Soberana*; words by Blas Villatas; tune by A. Cousin. (After 1917): words by S. I. Mayorga; composer of tune unknown.

Norway: *Ja, ri elsker dette landet*; words by Bjørnson; tune by Nordraak (1859).

Orange Free State: *Heft. Burgers, 't lied der vrijheid aan*; words and tune by Hamelberg.

Pakistan: At the end of 1949 no decision regarding a national anthem for the dominion had been made.

Palestine: *Hatikvah* (Hope), 'While even yet unchanged'; Heb. words by N. H. Imber; Eng. by N. Salaman; composer of tune unknown (1936).

Panama: *Alcanzamos por fin la victoria*; words by Gerónimo de la Osa; tune by S. Jorge (1903).

Paraguay: *Paraguayos, República ó muerte*; words by F. Acuña de Figueroa; tune by F. Dupey.

Persia: *Shāhanshān--a mā Zandah bādā*; words by S. Afshar; tune by N. Moghaddam (c. 1934).

Peru: *Somos libres, seámos lo siempre*; words by José de la Torre Ugarte; tune by J. B. Alcedo (1821).

Philippine Is.: 'Tierra adoraba' (*Marcha nacional filipina*); words by J. Palma; tune by J. Felipe (c. 1898).

Poland: *Jeszcze Polska nie zginęła*; words by J. Wybicki; tune possibly by Kleofas Oginski (1795).

Portugal (royal): *O patria, O rei, O povo*; words and tune by Pedro I. of Brazil, formerly Pedro IV. of Portugal (1822). (Republican): *Heiros do mar*; words by Lopez de Mendocça (1890); tune by A. Kell; used since 1910.

Prussia: *Borussia*; words by G. R. Duncker; tune by Spontini (1818); also *Ich bin ein Preuss*; words by B. Thiersch; tune by A. H. Neithardt (1826).

Rumania: *Trădăscă Regele în pace si onor*; words by V. Alexandri; tune by E. A. Hübsch (1861).

Russia (Imperial): *Bozhe Tsarya khrani*; words by W. A. Zhukovskiy (1833); tune by Lvov (1833). (Soviet to 1944): *L'Internationale*, 'Debout, les damnés de la terre'; words by Eugène Pottier (trans. into Russian, last in 1932); tune by Pierre Dégoyter. (Soviet, after 1944): *Gymn Sovetskogo Soiusa*; words by Sergey Mikhailov and I. Registan; tune by A. V. Alexandrov (c. 1942).

Salvador: *Saludemos la patria orgullosos*; words by J. J. Cañas, tune by J. Aberte. Scotland: *Scots wha ha'e wi' Wallace bled*; words by R. Burns (1793); tune traditional.

Serbia: *Srpska Himna*, 'Boze pravde, ti što spase'; words by J. Djordjević; tune by Davorin Jenko (1872).

Siam: *Taurasoen Barami*; source of words and tune unknown.

S. Africa (Union): *Die Stem van Suid-Afrika*; words by C. J. Langenhoven; tune by M. L. Villiers.

Spain (royal): *Marcha real*; no words; tune by an unknown Ger. composer (1770); also *Hymno de Riego*; author of words unknown; tune by Herta. (Republican): *Marcha granadera*, adapted, and Ger. Nazi and It. Fascist songs also used.

Sweden: *Du gamla, du fria, du fjällhöga Nord*; words by R. Dybeck; tune traditional (1814).

Switzerland: *Rufst du mein Vaterland*; words by J. H. Wyss (1811), with Fr. and It. trans.; tune as for Great Britain; also *Schweizerpsalm*, 'Trittst im Morgenrot daher'; words by L. Widmer; tune by Josef (Fathier Alberik) Zwyssig (1841).

Transvaal: *Kentj dat volk vol heldenmoed*; words and tune by Catherine Félicie van Rees.

Tunisia: *Marche beniculate*; no words; tune by an It. composer (1881-83), adapted by Sidi-Sadook.

Turkey: *Istiklal marsi* (March of Independence); no words; tune by Vittorio Radeaglia (1921).

U.S.A.: *The Star-Spangled Banner*, 'Oh, say, can you see, by the dawn's early light'; words by F. Scott Key (1814); tune by J. Stafford Smith; officially adopted 1931; earlier *Hail Columbia*; words by J. Hopkins; tune by Fyfe (c. 1800). U.S.S.R., see Russia.

Uruguay: *Orientales, la patria ó la tumba!*; words and tune by J. Coppetti. Venezuela: *Gloria al bravo pueblo*; words by V. Salías; tune by J. Landaeza (after 1810).

Wales: *Mac hen wlad fy nhadau* (*Land of my Fathers*); words by E. James, Eng. by John Owen; tune by J. James.

Westphalia: *Ihr mögt dem Rhein, den stolzen, preisen*; author of words unknown; tune by J. Peters.

Württemberg: *Preisend mit viel schönen Reden*; words by J. Kerner (1826); tune traditional.

Yugoslavia: A compound of the Serbian hymn *Bože pravde* (see Serbia), the Croatian hymn *Lijepa naša domovino*; words by A. Mihanović; tune by Lichtenegger, and the Slovene hymn *Napej zastava Slav*; words by S. Jenko; tune by D. Jenko.

Zanzibar: National march for military band by Sir Donald Francis Tovey.

National Art-Collections Fund (Incorporated by Royal Charter). The Wallace Collection, Manchester Square, London, W.1. Founded in 1903 to organise public opinion and secure works of art of all times to enrich the museums and galleries of the Brit. Commonwealth. The society has raised nearly £700,000 for the purchase of works of art. It has acquired by gift, bequest, or purchase many thousands of such works for presentation to public museums and galleries, including pictures, drawings, lithographs, etchings, and engravings of almost every period and school, MSS. and illustrated books, porcelain and pottery, both of the E. and of the W., armour, coins and medals, enamels, bronzes, silver and other metal work, jewellery, ivories, furniture, lace, embroidery and textiles, statues, and other objects of plastic art. Membership is open to all. Each member makes a minimum ann. contribution of one guinea and receives various privileges from museums and galleries, opportunities of visiting private collections not otherwise open to the public, and an illustrated ann. report. Management: committees and secretary.

National Assembly, first of the Fr. revolutionary assemblies, lasting from 1789 to 1791; since its chief work was the formation of a constitution, it is often called the Constituent Assembly.

National Assistance Act (1948). Fundamental purpose of this Act was to achieve the final replacement of the poor law by entirely new services founded on modern conceptions of social welfare. Under the Act a National Assistance Board administers a state scheme of financial aid for all persons in need who fall outside the national insurance scheme (see NATIONAL INSURANCE ACT (1946)), or whose requirements are not wholly met from that or any other source. The cost of this service falls on the Exchequer. Provision is made for a local gov. welfare service, of which an important feature is the provision of residential accommodation for old and infirm people and others who require care and attention. Residential hostels, when built, will be open to all, irrespective of means, and they will provide accommodation in return for payment. Sick persons who need hospital treatment are the responsibility of the national health service. See also NATIONAL HEALTH SERVICE ACT (1946). The local authority welfare service also extends to the blind and other handicapped persons.

The only qualification for national assistance is the need according to general standards prescribed in regulations requiring parl. approval. Any person aged sixteen years or over who is in need may apply for assistance, and where need is estab., the assistance will provide for any dependents as well as the applicant. Discretionary power is given to deal with special cases. There is no household means test. Resources as well as requirements of applicants and their wives are considered jointly. No account is taken

of the income of earning sons and daughters, but they will be deemed to be making a reasonable contribution towards rent and other household expenses. The directions about treatment of cap. in the Act are that the first £375 of War Savings shall be ignored. Capital not so disregarded will also be ignored if it is less than £75. If it amounts to £75 or over, but not more than £400, it will reduce the weekly assistance by 6d. for the first £75, and 6d. for each further complete £25. Assistance is not generally payable if capital exceeds £400. Applications will be dealt with by local officers of the board. There is a right of appeal. A condition of assistance may be registration for employment, and persons who neglect or refuse to maintain themselves or their dependents may be refused assistance unless they attend a course of training or instruction or enter a re-estab. centre. Re-estab. centres may also be used for vagrants. Local authorities are also obliged to provide and maintain temporary accommodation for them in reception centres. It is a responsibility of the National Assistance Board to make provision whereby persons without a settled way of living may be influenced to lead a more settled life. . . .

The second group of services are under the local authority, and include residential accommodation for the aged, the infirm, and others, with special welfare services for handicapped persons. These services are entrusted to co. and co. bor. councils in England and Wales and co. councils and large burghs in Scotland. The residential accommodation, board, lodging, and attendance, is intended for all who cannot wholly look after themselves. It includes amenities such as hot and cold water and laundry services. The local authority fixes a standard charge which those who can afford it will pay in full. Those who cannot afford it will pay according to their resources and commitments, subject always to a minimum of 21s. a week, and every one is assumed to need 5s. a week pocket money. Thus a person with a retirement pension of 26s. a week and no more will pay 21s. and keep 5s. Persons with less than 26s. a week will be referred to the National Assistance Board to have their income made up to this sum. Local authorities are also empowered to extend to the deaf, the dumb, and the crippled the same welfare services which are provided for the blind. The authorities may arrange for voluntary organisations to act as their agents in providing residential accommodation and specialised welfare services. The Act requires the registration of private institutions for the care of the old and disabled, and local authorities are empowered to inspect and withhold registration in unsatisfactory cases. Liability for maintenance which formerly rested on a wide range of relatives is reduced by the Act to a simple liability of a man to maintain his wife and children and a woman to maintain her husband and children.

It was estimated (in 1947) that the numbers of persons to be transferred to

the National Assistance Board would include 430,000 on outdoor relief and 72,000 receiving blind domiciliary assistance. In Sept. 1947 supplementary pensions were being paid to 500,000 old age and widow pensioners, and unemployment and other allowances to 30,000 persons. Some 50,000 sick people then in Poor Law institutions and 18,000 mental cases were to be transferred to the national health service. The non-sick, who were to remain with the local authority and benefit from residential accommodation, totalled 40,000. Some 30,000 children deprived of normal life were to come under the child care services of the Home Office. The additional cost of national assistance and non-contributory pensions which would fall on the Exchequer under the Act was estimated to be about £20,000,000 a year at the outset. The transfer of services will relieve local authorities of expenditure amounting to about £18,500,000 a year. Expenditure incurred by local authorities in exercising their new statutory duties will fall on local rates. *See also POOR LAWS.*

National Association of Boys' Clubs. co-operates with local education authorities to enable local voluntary youth organisations within their area to function effectively and to secure support for the association's local clubs and organisations in the service of youth. The Association has also initiated schemes by which training for youth leadership could be more concentrated, and planning more systematic than before 1939. The association has a permanent centre where courses in art, drama, music, and crafts can take place throughout the year. It also has a centre where senior club members can be trained on a national scale, following training in local courses, to understand more fully the club method and their responsibilities to translate that understanding into action in home and work. The purpose of the association's scheme of planned development is to ensure that, given the resources and money, a large and essential increase in the number of boys' clubs could be undertaken and that they would have adequate leadership, premises, and equipment. The association receives generous assistance from the King George's Jubilee Trust and great encouragement from the Ministry of Education. The headquarters of the association are at 17 Bedford Square, London, and the president is the duke of Gloucester. *See also YOUTH ORGANISATIONS OF GREAT BRITAIN.*

National Association of Girls' Clubs and Mixed Clubs. exists to see that clubs are available when and where they are needed, to help clubs to find the right leaders, and in close collaboration with the local education authorities, other voluntary associations, and the churches, to provide these leaders with expert help and advice. The youth clubs affiliated through some fifty-three local associations number 1900, with a membership of 120,000. Some of these clubs are in large industrial centres and are seven-night-a-week clubs with programmes ranging from 'make-do-

and-mend' to tennis and football; others are in remote hamlets where country boys and girls, once or twice a week, enjoy opportunities for the amusement and education which club life offers. *See also YOUTH ORGANISATIONS OF GREAT BRITAIN.*

National Association of Women's Institutes. *see WOMEN'S INSTITUTES.*

National Bank of Australasia, estab. in 1858, acquired the undertakings of the Colonial Bank of Australasia in 1918 and of the Bank of Queensland in 1922. Authorised capital, £10,000,000; issued, £6,800,000. Head office, Melbourne.

National Bank of Egypt, The, founded by Sir Ernest Cassel, and incorporated by khedivial decree, June 25, 1898, acquired the Egyptian business of Lloyds Bank in 1926. In 1939 an agreement was reached for a new charter for forty years until 1979 and constituting the bank as the central bank for Egypt. Authorised capital, £3,500,000; issued, £3,000,000. Head office in Cairo.

National Bank of India, estab. in Calcutta, Sept. 29, 1863. Registered in London on March 23, 1866. Capital authorised and issued £4,000,000. In 1919 the capital was increased from £2,000,000 to £4,000,000. Head office, London.

National Bank of Mexico, estab. in Mexico, Aug. 16, 1881, as Banco Nacional Mexicano; name changed in 1884. In 1934 new statutes were adopted in accordance with the new banking law. Authorised and issued capital, pes. 16,000,000. Head office, Mexico. The bank directly controls Pan-Amér. Trust Company (incorporated in state of New York).

National Bank of Scotland Limited, The, was estab. in Edinburgh in 1825 as the result of the amalgamation of three distinct banking ventures projected in the previous year. When business commenced the paid-up capital was £500,000 and early in the bank's hist. a comprehensive branch system was decided upon. In 1831 the bank obtained a charter of incorporation. Two years later it took over the Commercial Banking Company of Aberdeen, and in 1836 the Perth Union Bank was absorbed. A branch was opened in London in 1864, a step later followed by the other Scottish banking companies. An important event occurred in 1918 when Lloyds Bank Ltd. acquired a controlling interest by the purchase from the holders of almost the whole of the capital stock of the bank. A public issue of 'A' stock was made in 1938 and the present paid-up capital of the bank is £1,500,000 with reserve funds of £2,275,000. The total assets of the bank amount to £117,000,000. There are 195 branches and sub-branches with head office in Edinburgh.

National Book League, independent, non-profit-making, cultural society, was founded in 1944 as the successor of the National Book Council. The league's object is to promote the wider use and enjoyment of books, and most of its supporters are drawn from the general public, though many educationists, students, and members of the book trade also

belong to it. Among its corporate members are a large number of schools and most of Great Britain's public libraries, and there are overseas members in more than seventy countries. The league's activities cover every aspect of books, primarily from the reader's point of view, and also touch on the problems of authorship and book production. Frequent exhibitions; lectures on literature, including contemporary books and writers; a monthly jour., *Books*; a book information bureau which answers queries of every kind about books; children's book weeks, a pioneer movement originated by the league and supported by educational authorities all over the country; work for the wider use of technical books in industry—these are examples of the league's normal activities. The league was made officially responsible for the representation of books throughout the Festival of Britain, 1951. N.B.L. pubs. include book lists, reader's guides, and other aids both for the general reader and for the advanced student. In addition to its prov. branches the league has a London headquarters at 7 Albermarle Street, W.1, with exhibition galleries, members' rooms, and a specialised library of 'books about books.'

National Central Library, London, was founded in 1916 as the Central Library for Students. In 1930 it was reconstituted as the N. C. L. and in 1931 was incorporated under royal charter. Its original purpose, that of providing books for organised classes for adult education, has since been extended so that it is now the recognised national centre for the loan, between libraries of all kinds both within Great Britain and abroad, of books for study which cannot be obtained in any other way. It has also become a centre for the supply of information about books, and for the allocation of duplicate and 'unwanted' books to suitable libraries, including war-damaged collections, at home and abroad. The library lends, from its own stock, books on many subjects, with certain notable exceptions, such as books which are available at the local library, works of fiction, and the set text-books required for examinations. In addition, it is in a position to obtain on loan from other libraries a very large percentage of those books which it is unable to supply from its own shelves. It has, in this way, access to about 21,000,000 vols. as well as many thousand sets of periodicals. The library is maintained by a Treasury grant and by other voluntary grants and subscriptions. Persons desirous of obtaining books from the N. C. L. must apply to the librarian of their local, univ., or special library.

National City Bank of New York, The, has its head office at 55 Wall Street, New York. It was estab. in 1812. In July 1921 the Commercial Exchange Bank, on Jan. 1, 1922, the Second National Bank of New York, and on June 26, 1926, the People's Trust Company, of Brooklyn, were absorbed. The bank acquired in May 1929 the commercial banking business of the Farmers' Loan and Trust Company,

which changed its name to City Bank Farmers' Trust Company. The London city office is at 117 Old Broad Street, E.C.2. The bank has numerous branches throughout New York city, S. America, Europe, Cuba, India, China, and Japan. The business of the National Bank of Haiti was sold to the gov. of Haiti in 1935. Authorised and issued stock is \$77,500,000.

National Coal Board, see COAL MINES, NATIONALISATION OF.

National Convention, revolutionary assembly of France, consisting of 749 members chosen by universal suffrage, which on Sept. 22, 1792, supplanted the legislative assembly, proclaimed the republic, and condemned Louis XVI. to the guillotine. In spite of its difficulties and internal dissensions it succeeded in suppressing the Royalists in La Vendée and in the S., and notwithstanding the rest of Europe leagued against it, not only in the field, but in diplomacy. It laid the foundation of sev. modern Fr. institutions, and dissolved itself in favour of a directory of Five on Oct. 20, 1795.

National Council of Evangelical Free Churches, council of the Free Church Federation, founded in 1892. To it are sent representatives from the Presbyterian, Congregational, Methodist, and Baptist churches. The Federation has spread throughout America and the Dominions. The N. C. takes action when necessary on behalf of the federated churches. The monthly magazine, ed. for the N. C., is entitled *The Free Churchman*. The headquarters of the Council are at Memorial Hall, Farringdon Street, London, E.C.4.

National Debt, see PUBLIC DEBT.

National Dental Service.—Provision is made under the National Health Service Act, 1946 (*q.v.*), for treatment by dentists who join the service. Any dentist may at his option take part in the service, not. Of some 10,000 dentists in general practice in England and Wales the number in the N. D. S. in 1949 was 9300. Dentists joining the service are in contact with the local executive councils for their respective areas. Local dental committees have been set up by the profession and are responsible for the appointment of three members for each executive council as well as for maintaining contact between the dental profession and the executive councils. Lists of dentists taking part in the service are available in post offices and executive council offices. There is no need to register with a dentist. Patients are free to choose a dentist just as the dentist is free to accept them or not. The dental service provides free of charge all forms of treatment necessary for the restoration of dental fitness, and all repairs and replacements which are not due to carelessness. But a patient will pay the extra cost of certain treatment or appliances more expensive than is clinically necessary. In such cases the dentist will receive the normal fee from public funds and the patient will pay the extra cost in accordance with a prescribed scale. Such cases include metal dentures or the provision

of special dental treatment consisting of gold fillings, etc., when these are not rendered necessary by the patient's clinical condition; if they are clinically necessary, they will be provided without charge. Treatment falls into two main divisions—that which may be carried out without prior authority, and that which requires the prior authority of the Dental Estimates Board, consisting of a dental chairman, six dental members, and two lay members appointed by the Minister of Health. Treatment not needing prior authority includes all normal conservative treatment—i.e. prophylaxis, fillings and root treatment, extractions for the relief of pain or extractions not necessitating replacements by dentures (including any necessary anaesthetic), and ordinary denture repairs. X-ray examinations for diagnosis and certain other treatment may likewise be carried out at once, subject to a limitation of cost. Treatment needing prior authority includes the removal of teeth otherwise than above, the provision of dentures, extensive and prolonged treatment of the gums, gold fillings, inlays, crowns, special appliances, and oral surgery.

Where a dentist gives treatment in his own surgery, he is paid on a prescribed scale of fees based on items of treatment carried out by him. Apart from those cases in which a patient is contributing some part of the cost of more expensive treatment provided at his request, payment is made by the executive council with whom the dentist is in contract. The scale of fees is based on the recommendations of the Spens Committee (pub. May 1948). The main recommendations are these: (1) If there were sufficient dentists in relation to the demand for their services to secure a spread of incomes comparable to that in 1938, arrangements should be made to ensure that, between thirty-five and fifty-four years of age, three-quarters of those dentists should receive net incomes of over £850 a year, one-half should receive incomes of over £1100, and one-quarter incomes of over £1400. (2) Until there are sufficient dentists to secure such a spread of incomes, a single-handed dentist using all appropriate assistance and working efficiently for 1500 hours a year at the chair-side, together with the hours necessarily spent outside the surgery, should receive a net income of £1600. Extra remuneration may be earned by experienced dentists under partnership agreements with junior partners or by employing salaried assistants; by dentists able to work more than 1500 chair-side hours a year without loss of efficiency; by dentists with special skill and experience acting as part-time consultants or specialists; and by dentists practising in especially unattractive areas. Under new regulations (since Feb. 1, 1949) any dentist earning more than a gross income of £4800 a year will have his earnings above this amount cut by half. This is an interim measure, pending a detailed review of the scales of payment given above.

National Film Library, official film

archive of Great Britain for the permanent preservation of films and film records of all kinds. Films are chosen for preservation by a selection committee on two grounds; either their significance in the hist. of the film as a form of art and entertainment, or their value as historical records of events, manners, scientific discoveries, etc. The library is dependent on the voluntary co-operation of the film industry in presenting films, and does not enjoy the privilege of statutory deposit which the Brit. Museum, for example, has in respect of books. Research into the best technical methods of film preservation, and the cataloguing and indexing of its material, are two of the library's most important functions. It also has a lending section, through which many of the most important films in the library can be borrowed by schools, film societies, and other non-commercial educational bodies. The library is a dept. of the Brit. Film Institute (q.v.) and a certain portion of the institute's Treasury grant is allocated to its work.

National Galleries. The National Gallery of London contains the most important collection of pictures in the United Kingdom. The building was erected in the classic style from designs by Wilkins, 1832-38, opened in 1838, and enlarged in 1860, 1876 (when a new wing was added by Barry at a cost of £80,000), and 1886; it stands on the N. side of Trafalgar Square. The nucleus of the collection was thirty-eight pictures of John Julius Angerstein (d. 1823), a wealthy merchant of Russian extraction; his collection, one of the most famous in England, had been formed with the aid of his close friend, Sir Thomas Lawrence. This collection was purchased in 1824 by Parliament for £57,000, but, there being no place in which to exhibit the pictures, Angerstein's house was bought for the purpose. The Angerstein collection included the Hogarth series, 'Marriage à la Mode,' 1715; Wilkie's 'Village Festival,' 1811; three Claudes; and Titian's 'Venus and Adonis,' 1551. The largest painting in the collection was Sebastiano del Piombo's 'Raising of Lazarus,' 1517-19, and among other pictures acquired soon afterwards were Titian's 'Bacchus and Ariadne,' purchased in 1826, Annibale Carracci's 'Christ appearing to Peter,' 1826; Correggio's 'Vierge au Panier,' 1825; Reynolds's 'Holy Family'; Gainsborough's 'Market Cart'—these last two being presented by the Brit. Institution—Gainsborough's 'Watering Place'; and Copley's 'Death of Chatham.' The critic of the *Spectator* (April 11, 1838) singled out the following as 'unworthy of exhibition': Nicholas Poussin's 'Phineas and his followers turned to stone at sight of Gorgon,' Sir George Beaumont's landscape, 'Jacques and the Wounded Stag,' Hopponer's portrait of 'Gentleman Smith,' a portrait of Isaac Walton by Huysman, and a moonlight study by Pether. Constable's 'Cornford' was acquired in 1837 by a committee of friends and admirers of the painter organised to acquire one of his most characteristic works for presentation

to the gallery. A considerable sum is voted annually by Parliament for augmenting the number of pictures, and famous bequests include those of Beaumont (1826), Carr (1831), Olney (1837), Farnborough (1838), Vernon (1847), J. M. Turner (1856), Bell (1859), Peel (1871), Wynn Ellis (1876), Layard (1916), Salting (1916), Ludwig Mond (1924). The gallery is particularly rich in early It. masters and contains some of the best work of Raphael, Correggio, and Paolo Veronese. There are many important pictures of the early Siennese school, notably of Ugolino di Siena—"Procession to Calvary," "Two Apostles," and "SS. Bartholomew and Andrew"—and an exceptionally fine collection of pictures by the leading fifteenth-century painters, as Lippo Lippi, Signorelli—seven pictures, including "The Nativity," "The Triumph of Chastity," and "The Adoration of the Shepherds"—Uccello—"The Rout of San Romano"—and Pollaiuolo—"Martyrdom of S. Sebastian." In the Venetian school the gallery is almost unrivalled: e.g. there are Sebastiano del Piombo's masterpiece mentioned above and many of the outstanding works of Giovanni Bellini, besides Canaletto's "Interior of the Rotunda, Ranelagh," Cima's "Ecce Homo," Crivelli's "Madonna and Child adored, surrounded by Saints" (an altar-piece), a score of It. scenes by Gnardi (acquired after 1910), Lorenzo Lotti's "Lucretia" (bought by the National Art-Collections Fund in 1927), Mantegna's "The Agony in the Garden," Tiepolo's "Finding of Moses," Tintoretto's "Christ washing his Disciples' Feet," "The Origin of the Milky Way," and Vincenzo Morosini's (purchased through the National Art-Collections Fund *q.v.*) and presented in commemoration of the National Gallery centenary, 1921). Titian's "Venus and Adonis," "Bacchus and Ariadne," "Christ and the Magdalen," "Noli me tangere," "Madonna and Child with SS. John and Catherine," "Portrait of a Man" (formerly called Ariosto), "The Trinity" receiving Charles V., "The Gloria," and Paolo Veronese's "Adoration of the Magi," "The Family of Darius before Alexander" (bought from Count V. Pisani in 1857 for £13,650), "S. Helen: Vision of the Cross," "Scorn," and "Happy Union." Of the painters of the Umbrian school, Perugino is represented by the triptych, "The Madonna adoring the Child," part of the altar-piece commissioned c. 1496 for the Certosa, Pavia; Piero della Francesca by "The Baptism of Christ" and other panels; Raphael by seven pictures, among them being "S. Catherine of Alexandria," "Vision of a Knight," "Madonna, Child, and S. John," "The Crucifixion"—a very early work (c. 1502) strongly influenced by Perugino (bequeathed to the gallery in 1924)—and the world-famous "Ansidei Madonna," purchased from the duke of Marlborough in 1885 for £70,000. The Parma school is represented by Parmigiano's "Vision of S. Jerome," and by sev. pictures of Correggio, including "Ecce Homo," "Christ taking leave of his Mother," and the very famous "Mercury instructing Cupid before Venus" (purchased from the

Londonderry collection, 1834). The earlier school of Bologna is represented by the "Pietà" of Francia and the later by the "Ecce Homo" of Guido and specimens of the work of Annibale Carracci, notably "Erminia takes refuge with the Shepherds." Other outstanding It. paintings are "The Mystic Marriage of St. Catherine of Alexandria and St. Catherine of Siena to Christ," by Ambrogio Borgognone, Andrea Solario's "Portrait of a Venetian Senator," Moroni's "Portrait of a Tailor," Giovanni Dosso Dossi's "Adoration of the Schools," "The Vision of S. Eustace" by Pisano (formerly called Vittore), and Fra Bartolommeo's "Adoration of the Child." There are sev. pictures of the Florentine school, but only one by Leonardo da Vinci, and it was not definitely accepted as authentic at first; this is "The Virgin of the Rocks," of which there is an earlier version in the Louvre more Florentine in style. The picture was purchased from the earl of Suffolk in 1880. There are two pictures by Michelangelo—"The Entombment," painted, apparently, c. 1495, and first recognised as by Michelangelo by Cornelius and Overbeck. It was bought from R. Macpherson, London, in 1868. The other picture is the "Madonna and Child, S. John, and Angels," painted c. 1494 and perhaps the artist's earliest picture. It was purchased from Labouchere's executors in 1870. Among the most notable Ger. pictures are "St. Veronica" by William of Cologne, and Albrecht Dürer's "The Painter's Father" (purchased 1904) and "Portrait of a Senator." The "Duchess of Milan" by Holbein (the Younger) was purchased for the nation by the National Art Collections Fund in 1909 from the duke of Norfolk for £50,000. The same artist's "The Ambassadors" was bought in 1890 from the earl of Radnor with the aid of gifts from Lord Rothschild and Lord Iveagh.

The collection is rich in fine examples of early Flem. painting, such as specimens of the Van Eycks and their school. The "Entombment of Christ" by Van der Weyden the Elder, the "Reading Magdalene" by Van der Weyden the Younger, and the "Exhumation of St. Hubert" by Dierick Bouts, are all admirable examples of the work of these painters. "The Adoration of the Kings" by Pieter Brueghel was acquired through the National Art-Collections Fund and other funds in 1921. Equally well represented are the later Flem. painters: Rubens by some thirty or more pictures, including "The Rape of the Sabinæ," "Peace and War," "Conversion of S. Bavo," "The Brazen Serpent," "Triumph of Julius Cæsar," "Susanna Fournet (known as 'Le Chapeau de Paille')," "The Triumph of Silenus," and the famous "Judgment of Paris," which was painted 1635-36 and bought in 1844. Van Dyck is represented by many works, notably his "Charles I.," which cost £17,500, and "Lady and Child" (acquired in 1911). There is an equally full collection of great Dutch masters' paintings: Cuyp, with sev. pictures, mostly landscapes and riv. scenes; Frans Hals, portraits; Gerard van Honthorst, notably his

'Christ before Pilate': Mabuse, whose 'Adoration of the Kings' was bought in 1911 with the aid of sev. funds and a special grant from the gov.; Ostade, with 'The Alchemist,' 'Courtship,' and 'Man with a Jug'; Jan Steen, with 'The Music Master' and 'Skittish Players'; Vermeer of Delft, with 'Lady standing at the Virginals' and 'Lady seated at the Virginals'; and a number of paintings by Rembrandt and Ruysdael. There are a score of pictures of Rembrandt, notably 'Portrait of an Old Woman,' 'Adoration of the Shepherds,' 'Descent from the Cross,' 'The Woman taken in Adultery,' 'A Jew Merchant,' 'Portrait of Himself' (as an old man), 'Portrait of Margaretha Trip' (bought in 1899, a second picture of the same title being acquired in 1941), and 'Diana bathing.' Ruysdael is represented by many landscapes, with water-mills, while pictures acquired later include 'The Shore at Scheveningen' and many others acquired through the Salting bequest. There are also sev. notable paintings by Ter Borch or Terburg, including 'The Guitar Lesson,' 'The Peace of Munster,' and 'Portrait of a Gentleman.' Mention must also be made of Wouwerman (Phillips), whose ten pictures include 'Halt of Officers,' 'Interior of a Stable,' 'On the Sea Shore,' 'Gathering Faggots,' and 'Bohemians.' Of the Antwerp school, David Teniers the Younger is well represented by many pictures, which include 'An Old Woman peeling a Pear,' 'Teniers's Château at Perck,' 'Winter,' 'The Surprise,' 'The Village Fête' ('Fête aux Chaudières'), and 'The Cardplayers.' Of the school of Amsterdam Hobbema is conspicuous with 'View of Middleharnis,' 'A Village with Water-mills,' and a number of other scenes of castles, ruins, woods, and forests.

Among the pictures of the Fr. school are sev. fine landscapes by Claude (Claude de Lorraine), notably 'Landscape: Death of Procris' and 'Landscape with View of Rome' (ascribed); also prominent are Gerard David, with 'The Marriage of St. Catherine,' 'Canon with his Patron Saints,' and sev. others; Nicolas Poussin, with eight pictures, including 'Adoration of the Shepherds' (transferred from the Victoria and Albert Museum in exchange for other works, 1895), 'Bacchanalian Festival,' and 'Bacchanalian Dance'; Puvion de Chavannes, with 'Summer'; Manet, with 'Soldier examining the Lock of his Rifle' (acquired 1918); and Chardin, with 'La Fontaine' and 'The Lesson.' Of the Sp. school the gallery possesses an excellent portrait head of Philip IV. of Spain by Velazquez and another of that king hunting the wild boar. 'The House of Martha' (of the first or Sevillian period), 'The Adoration of the Shepherds' (ascribed to Velazquez and purchased in 1853, and, above all, 'Venus and Cupid,' are also by the Sp. master. The last-named picture, known as the 'Rokeby Venus,' was in the possession of Don Gaspar de Haro, Conde Duque de Olivarez, in 1682, later in that of Godoy, and eventually acquired by the National Art-Collections Fund in 1906 for £45,000. The

pictures of Murillo here, like so many out of Spain, are not outstanding examples of that artist's powers, but mention may be made of 'The Immaculate Conception' and 'St. John the Baptist,' both acquired in 1924 by bequests. El Greco is represented by 'Luigi Cornaro' and 'The Agony in the Garden.' The 'Kneeling Friar' of Zurbaran is a specimen of that painter's work which is not rivalled either in or out of Spain, and also in the gallery are his 'A Franciscan' and 'A Lady as S. Margaret.'

The gallery is, naturally, very well provided with pictures by all the famous Brit. artists, but only a few representative works can be mentioned here: Constable, 'The Cornfield, or Country Lane,' 'The Hay-wain,' 'Flatford Mill,' and many other pictures from the Henry Vaughan and Salting bequests of 1900 and 1910 respectively; John Crome, 'Monsieuld Heath'; Gainsborough, 'Mrs. Siddons,' 'The Painter's Daughters,' 'Ralph Schomberg,' 'Sir William Blackstone,' and nearly a score of others; Sir Thomas Lawrence, 'Queen Charlotte' (acquired 1927); Millais, 'William Ewart Gladstone'; Reynolds, 'The Graces decorating Hymen' (bequeathed 1837), 'The Holy Family,' 'Self Portrait' (from the Peel collection), 'George, Third Duke of Marlborough and his Family,' 'Catherine, Lady Bampfylde,' and many others; Romney, 'Lady Hamilton' - a popular picture - 'The Beaumont Family,' and 'Lady and Child'; and Whistler, with two nocturnes (the 'Fire Wheel' and 'Cremorne Light'). There is a large collection of Turner's works acquired through the Turner bequest. The popular favourites include 'Dido building Carthage,' 'Ulysses deriding Polyphemus,' 'The Sun rising through the Vapour,' 'The Fighting Temeraire,' 'Venice: the Bridge of Sighs,' and 'Yacht Racing in the Solent.'

Other and later (between 1929 and 1938) acquisitions include the following pictures: Jan Jansz Treck, 'Still Life'; Gerard Ter Borch, 'Portrait of a Lady,' supposed to be Hermann van der Cruysee (bequeathed by Sir Otto Beit, 1931); Jan Lisa, 'Judith and Holofernes' (presented 1931); a portrait of Dr. Johnson, described as 'from the studio of Sir Joshua Reynolds' (presented in 1930); and 'The Children of R. R. Graham Esq.' by Hogarth (presented through the National Art-Collections Fund, 1931). The National Art-Collections Fund, by securing the Rokeby Velazquez, the Norfolk Holbein, and since then the 'Madonna and Child with Angels' of Masaccio (1916) and Tintoretto's 'Morosini' (1924), has taken the foremost place amongst the private benefactors to the gallery. Other acquisitions through this fund include Titian, 'The Vendramin Family in adoration before a Reliquary of the True Cross' (1929); Richard Wilson, 'On Hounslow Heath' (1929); 'Death-bed Scene or Visit to the Sick' (sixteenth-century Antwerp school) (1931); and Rubens, 'The Watering Place' (1936). Purchases or gifts in the decade immediately preceding the Second World

War include Canaletto, 'Regatta on the Grand Canal, Venice' (bequeathed by Lord Revelstoke, 1929); Reynolds, 'Self Portrait' (bequeathed, 1930); Gerard van Honthorst, 'S. Sebastian' (1930); Rosa Salvator, 'Portrait of the Painter' (presented by the sixth Marquess Lansdowne, 1933); Hoppner portrait of 'Rt. Hon. Charles Long' (1934); Corot, 'Study of a Woman' (1934); Gainsborough, 'John, Tenth Viscount Kilmorey' (1934); Bernardo Cavallino, 'Purification of the Temple' (1935); J. S. Cotman, 'Seashore with Bouts' (1935); Constable, 'Hadleigh Castle' (1935); Caspar Netscher, 'Portrait of a Lady' (1935); Ingres, 'Madame Moltessier seated' (1936); Alfred Sisley, 'A Landscape in Spring' (1936); Raeburn, 'Pringle Fraser' (portrait of a young man) (1937); D. G. Rossetti, 'The Girlhood of Mary Virgin' (1937); Filippino Lippi, 'Moses causes Water to flow from the Rock' (1937); Richard Wilson, 'The Thames near Marble Hill, Twickenham' (1937); Piero di Cosimo, 'The Battle of the Centaurs and the Lapiths' (panel) (1937); Degas, 'Combing the Hair' (1937); Peter de Wint, 'Harvesters' (1937); Raffaellino de Garbo, 'Virgin and Child with Two Angels' and 'Virgin and Child with the Magdalen and S. Catherine of Alexandria' (1937); Van Dyck, 'The Virgin and Child adored by the Abbé Scaglia' (1938); David Cox, 'The Welsh Funeral, Bettws-y-Coed' (1938). (See supplementary catalogue of the National Gallery, pub. 1939).

Between 1937 and 1946 the gallery acquired about seventy pictures (not included in the supplementary catalogue pub. 1939 or in the director's report for 1937). Among them may be mentioned the following: Géricault, 'Horse frightened by lightning' (acquired 1938); Rembrandt, 'Flora' (1938); Zoffany, 'Mrs. Oswald' (1938); Reynolds, 'Admiral Kingsmill' (1939); Lorenzo Monaco, 'Legend of St. Benedict' (1940); Matsuo, 'Lady drawing' (1940); Dosso Dossi, 'Bacchante and Satyr' (1941); Niccolò dell'Abbate, 'Landscape, with the Legend of Eurydice' (1941); Hogarth, 'The Stay-maker' (1942); Pannini, 'Interior of St. Peter's' (1942); Titian, 'Catherine Cornaro' (1942); Dutch seventeenth century, 'Three Music-making Children' (1943); 'The Visitation' ascribed to Philippe de Champaigne (1944); Giovanni di Paolo, 'Four Scenes from Life of John Baptist' (purchased from executors of J. Pierpont Morgan, 1944); Venetian sixteenth century, 'Landscape with Mythological Scene' (1944); Nicolas Poussin, 'Annunciation' (1944); 'Virgin and Child with Angels' ascribed to Benozzo Gozzoli (1945); Greuze, 'Mme Gléon' (1945); Largillière, 'Monsieur Forest' (1945); Tiepolo, 'Deposition' (1945); Romney, 'Lady Hamilton, his second portrait of her' (1945); Dürer, 'Virgin and Child' (1945); J. F. Millet, 'Landscape with Storm' (1945); Portuguese school, 'Marriage of St. Catherine' (1945); ascribed to Sp. eighteenth century, 'Old Man holding Bottle' (1945); Nicolas Poussin, 'Worship of Golden Calf' (1945); Flem. seventeenth

century, 'Portrait of Man in Black' (1945); Reynolds, 'Landscape' (presented by the National Art-Collections Fund, 1945); and Mantegna, 'Imperator Mundi' (final part of Mond bequest, 1946) (see the *Burlington Magazine*, Dec. 1940).

In 1930 the National Gallery was extended by the opening of new rooms for the exhibition of the work of the early It. masters, the cost being borne by Sir Joseph Duveen. Before the Second World War there were about 2000 pictures at the National Gallery, Trafalgar Square.

John H. Stone

THE NATIONAL GALLERY
TRAFALGAR SQ., LONDON

Of these not more than about 850 were hung on exhibition; but the remainder were accessible at any time to any one who inquired of the head attendant. After the war only about 250 were exhibited (1945); but when the two larger galleries were reopened and other accommodation restored, about 400 were on view. The remainder of the collection could not be made accessible owing to the congested conditions of storage, though any individual picture can be produced if notice is given in writing. The National Gallery of Brit. Art, presented to the nation by Sir Henry Tate, and opened in 1897, is controlled by the trustees of the National Gallery. The Scottish National Gallery at Edinburgh, built during 1850-58 at a cost of £40,000, contains Gainsborough's 'Mrs. Graham' and fine examples of Van Dyck, Raeburn, Greuze, Watteau, and Kitty.

Domestic Galleries.—The National Gallery of Canada in Ottawa, founded by the Marquess of Lorne in 1880, is governed by a board of trustees estab. under the terms of the National Gallery of Canada Act, 1913. It consists of a sculpture court and nearly a score of picture and print galleries. The collection includes the work of It. schools—from fourteenth-century Siennese to Botticelli, Veronese, Titian, Canaletto, Tintoretto; painters of the Dutch, Flemish, and Sp. schools—Ruisdael (Ruydaert), Jan Levens, Rubens, Van Dyck, Goya, Murillo; and Hoppner, Gainsborough, and many others of the Eng. school. Veronese's 'The Rest on the Flight to Egypt', El Greco's 'St. Francis in Meditation'; Constable's

'Hampstead Heath,' and John Crome's 'Ruined Buildings' are recent accessions. There is also a section devoted to contemporary Brit. painting with the most complete collection of Canadian art in existence. The Art Gallery of Toronto (instituted in 1912), has a permanent collection containing works by Bordone, Boudin, Canaletto, Constable, Corot, Courbet, Delacroix, Gainsborough, Augustus John, Monet, Open, Pissarro, Sargent, Sisley, Hogarth, Rowlandson, Renoir, and Fantin-Latour. Canadian artists are also well represented. The National Art Gallery of New S. Wales, in Sydney, was opened in a temporary structure in 1885, but a new building in freestone has taken its place. The present collection is valued at £157,000 and includes examples of Brit. and foreign modern artists—among them Poynter, Millais, Leighton, Peter Graham, A. De Neville, Eildes, Shannon, Lavery, Clausen, and A. East. Recent additions include works by Corot, Boudin, Munnings, Open, and others. Two special courts are set apart for the works of Australian artists, which form the most representative collection in any Australian gallery—works by John Longstaff, George W. Lambert, Sir A. Streeton, W. Withers, Bernard Hall, Will Ashton, J. J. Hilder, and many others. The National Gallery of Victoria was incorporated in 1869 as the result of the appointment of a commission by the gov. to submit a scheme for the formation of a public museum, gallery, and school of art. The first permanent picture gallery, now known as the McArthur Gallery, was opened to the public in 1875. Galleries costing over £175,000 were subsequently added, including three in 1932 in a building erected mainly through the bequest of James McAllan of Richmond. In 1904 the sum of £189,000 was bequeathed by the late Alfred Felton for the acquisition of works of art or antiquities. Works by Turner, Watteau, Reynolds, Corot, Millet, De Wint, Open, Ruysdael, Lavery, Jan van Eyck, Burne-Jones, Bastien-Lepage, Puvis de Chavannes, Hoppner, Gainsborough, Allan Ramsay, Dupré, Courbet, Tintoretto, Titian, and numerous others have been purchased since 1905. Two courts of the National Art Gallery of S. Australia, in Adelaide, are devoted to Australian painters, and a fine collection has been built up. New Zealand's National Art Gallery, in Auckland, opened in 1888, contains two collections, one of which belongs to the city corporation, while the other is administered by a trust. The former consists mainly of pictures by both Brit. and foreign artists, with a section devoted to the work of New Zealanders. The latter, known as the Mackelvie collection from the name of its donor who bequeathed it in 1885, contains paintings representative of the modern school of Brit. and continental artists. The S. African National Gallery, founded in 1872, was taken over by the Cape Gov. in 1875 and the present gallery was built in 1928 and opened in 1930. It has paintings by Wilson Steer, Augustus

John, Sir W. Rothenstein, and a number of paintings by modern European artists. *European Galleries of Paintings.*—The great collections of paintings on the Continent are those in the Louvre, Paris; the Prado, Madrid; the Uffizi and Pitti palaces of Florence; the Pinacoteca of the Vatican and the Villa Borghese, Rome; the Accademia di Venice; the Borea and other collections in Milan; the Art-Hist. Museum of Vienna; the Old and New Pinakothek of Munich; the Dresden Gallery; the Kaiser Friedrich Museum, Berlin; the Rijksmuseum, Amsterdam, and the Mauritshuis of The Hague; the Antwerp Museum of Fine Arts; and the Palais des Beaux-Arts in Brussels. The foundations of the collections of the Louvre were laid by Louis XI. and supplemented by Charles VIII. and Francis I. Similarly, the Prado owes to its kings the greater part of its treasure and to none more than Charles V. The Louvre is the largest national gallery in the world. It contains so many picture rooms, widely divided by corridors and stairs, that no fair comparison can be made with the London National Gallery otherwise than by adding to the latter the Tate, Wallace collection, Victoria and Albert Museum, and the pictures of the Brit. Museum. The Louvre is numerically strongest in Fr. painting, as the National Gallery of London is in Brit. painting; and it has finer examples of every Fr. painter. Neither the Louvre nor the National Gallery (London) gives any adequate representation of the art of the other country. Similarly in the Prado, the Sp. school, from Coello to Goya; in Florence and Venice, the various It. schools; and in Belgium and Holland the Flemings and Dutch artists are all accorded by far the most space. Yet everywhere in Europe, excepting in the galleries of the Low Countries, and Italy (with the exception of two relatively small rooms in the Uffizi palace), there is no actual lack of foreign paintings. The Dutch paintings in the Louvre, as in the National Gallery of London, and also the few in the Uffizi gallery, are among the finest examples, and indeed the same may be said of those in Vienna, Munich, and Dresden. Generally speaking, there are not many fine examples of the Brit. school to be seen in the great public continental collections. The Eng. collection in the Louvre, however, if not large is at least representative: Reynolds, Romney, Raeburn, Lawrence, Hoppner, Boulton, Constable, Turner, and Wilson. Among the pictures of old masters in the Louvre are works of the It., Flemish, Sp., and Dutch schools. Among the notable It. pictures are the following: Leonardo, 'The Virgin of the Rocks,' 'John the Baptist in the Wilderness,' and the world-famous 'Mona (Mona) Lisa'; Raphael, 'Holy Family,' portrait of Balthasar Castiglione, one of the finest portraits in the Louvre, 'The Madonna,' known as 'La Belle Jardinière,' and 'Jeanne d'Aragon'; Sebastian del Piombo, 'Holy Family'; Titian, 'Vierge au lapon,' 'Entombré,' 'Antiope,' 'L'Homme au

Gaut'—one of the glories of the Louvre; Correggio, 'Mystical Marriage of St. Catherine'; Giorgione, 'Concert champêtre'; Tintoretto, 'Susanna in the Bath'; and Paul Veronese, 'Feast in the House of Simon.' Dutch and Flemish pictures include Rembrandt, 'Venus and Cupid,' 'Tobit,' and 'Pilgrims at Emmaus'—one of the great treasures of the Louvre; Van Eyck, 'Vierge au Donateur'; Frans Hals, 'Bohémiennne'; Jordaens, 'Christ expelling the Moneychangers'; Vermeer, 'La Dentellière'; Ter Borch, 'Concert'; and Rubens, landscapes. Also represented among old masters in the Louvre by fine examples are van Goyen, Holbein, Dürer, Paul Potter, Wouwerman, Jan Steen, Luini, Rogier van der Weyden, Memling, and Dirk Bouts. Old masters of the Sp. school are represented by Murillo's 'Immaculate Conception of the Virgin' and 'La Cuisine des Anges,' but most of the greatest paintings by Murillo, as those of Velazquez, are in the Prado. The Fr. pictures in the Louvre range from eccles. paintings of the fifteenth century and the great classical painters of the eighteenth century— notably Ponsin and Claude—to the Chaulard, Schlichting, Thomy-Thierret, Moreau-Nélaton, and Camond collections. Among the glories of the Louvre are Nicolas Poussin's 'Inspiration of a Poet,' 'The Shepherds of Arcady,' and 'The Funeral of Phocion.' Masterpieces by Claude include 'Marriage of Isaac and Rebecca' and 'Embarkation of the Queen of Sheba.' In their chronological order the next artists represented are Grenze; Boucher, 'Diana leaving the Bath'; Fragonard, 'Vou à l'amour,' 'Étude,' and 'La Chemise enlevée'; Delacroix, 'The Fight at the Barriers in 1830'; Ingres; Corot; 'Fillette à sa toilette,' 'La Femme à la perle,' and 'Danse des nymphes'; Millet; Rigaud; Lancret; Watteau; Manet (portrait of his wife on a sofa); Daumier; and Toulouse-Lautrec. In the Chaulard collection are Corot's 'Le Moulin,' Millet's 'La Tricoteuse' and 'La Bergère,' Meissonier's 'Retreat from Moscow,' and Henner's 'Magdalen Reading in a Cave.' Boucher's brilliant if audacious 'Odalisque' is in the Schlichting collection, as also a portrait of the Pompadour. In the Thomy-Thierret collection Corots are in abundance, notably 'Entrée de village,' 'Le Vallon,' and 'Le Chemin de Sèvres'; also Daubigny's 'La Marais'; Millet's 'Les Bouteleurs' and 'Précantion maternelle'; Rousseau's 'La Plaine des Pyrénées,' 'L'Étang,' 'Bords de la Loire,' and especially 'Le Printemps.' In the Moreau-Nélaton collection are other Corots; Manet's famous 'Picnic'; and, in the Camondo collection works of the Impressionist landscape school of Monet and Sisley; but the most striking works in this collection are those of Degas, notably his 'Absinthe Drinkers,' and Cézanne's 'Maison du Pendu.' The Luxembourg gallery, in Paris, is devoted entirely to Fr. paintings, its foreign collections having been removed to the Jeu de l'Amour at the corner of the Place de la Concorde and the rue de Rivoli. In the Luxembourg

are the following especially noteworthy paintings: Monet's 'Yacht Race,' Bonardin's 'Port of Bordeaux,' Sisley's 'Cour de ferme,' portraits by Carolus-Duran and Fantin-Latour, Chabas's 'Au Crépuscule'; and pictures by Vallotton, Puvion de Chavannes, Ribot, Cottet, and Gervex. In one room are a famous landscape by Bastien-Lepage, fine examples of the work of Degas, and pictures by such moderns as Matisse and Gauguin. Many of the painters represented at the Luxembourg are also represented in the Petit Palais, which is where the city of Paris houses its statuary and paintings. The more modern Fr. school is represented by Alphonse, Charlot, Chartrain, Maurice Denis, Laprade, Lepère, and others. The pictures in the Jeu de l'Amour are not particularly representative; the Sp. section, however, has pictures by Zuloaga; and in the Eng. are pictures by Sir Wm. Nicholson, James Pryde, Watts, Sargent, Winslow Homer, and Orpen.

If the Prado owes much to Charles V. and Philip II., it was Philip IV. who gave the gallery its distinctive character, for it was he who at an early age attached Velazquez, then a young artist of Seville, to his person and, in fact, for the rest of their joint lives allowed affairs of state and even family to be postponed to the interests of art. There are some sixty of the paintings of Velazquez in the Prado and they include nearly all of his masterpieces, and no other gallery has any of Velazquez's paintings that can compare with his 'Los Meninas' (Impressionist), 'The Tapestry Weavers,' 'The Surrender of Breda,' 'Los Borrachos' (i.e. The Topers), and 'Esop,' and other portraits. The next great Sp. painter represented here is Murillo, but there are also many fine works by him in other N. G. outside Spain. Among his best in the Prado are a picture of the Holy Family known as 'The Little Bird' and 'Los Niños de la Caneha'—representing the children Jesus and St. John playing together with a lamb. There are here hundreds of Goya's paintings—numerous life-like portraits, his popular 'Maja' and its fellow portrait of a Sp. girl on a couch, and also scenes of the Fr. invasion of 1808. To the above three great Sp. national artists must be added El Greco (Domenico Theotocopolis), Zurbaran, and Ribera; and together these six artists' works make the Prado a gallery apart. There are, however, here some of the finest works of Titian, Rubens, and Van Dyck—notably Titian's 'La Fecondidad' (a number of cherubs), and his portrait of Charles V. Also among the foreign paintings are a splendid 'Conception' by Tintoretto, Raphael's portrait of Cardinal Riario, Van Dyck's 'Countess of Oxford,' and a number of early Flem. works.

The Uffizi and Pitti palaces of Florence contain two of the greatest collections of pictures in the world. Lorenzo the Magnificent was the virtual founder of the Uffizi, though it was left to Francis I., Ferdinand II., and Cosimo III. to make the collections what they are to-day. The Uffizi gallery takes its name from the Palazzo degli Uffizi, or Palace of the

Offices, where the municipal gov. was carried on. The special pictorial treasures of the Uffizi, after the examples of paintings at the earliest, from Cimabue, through Giotto, to Fra Angelico, are the 'Holy Family' of Michelangelo; the 'Adoration of the Magi' by Leonardo da Vinci (unfinished); the 'Baptism of Christ' by Verrocchio; many paintings by Botticelli; Piero della Francesca's portraits of the duke and duchess of Urbino; and many famous paintings by Raphael, Titian, Giovanni Bellini, and Hugo van der Goes (a foreigner). Botticelli's paintings include the 'Primavera,' 'The Calumny of Apelles' (painted as a tribute to Savonarola), 'Judith and Holofernes,' 'Pallas and Mercury,' 'The Birth of Venus,' and the 'Madonna of the Magnificat' depicting the boy Lorenzo and his brother Giuliano. Other popular favourites are Fra Lippo Lippi's 'Madonna and two Children'; Raphael's 'Madonna of the Goldfinch'; and scenes in the life of Christ by Honthorst (a foreign painter). Also must be mentioned Luca Signorelli's 'Madonna and Child,' Bronzino's portraits of the later Medici, Correggio's 'The Respose in Egypt,' Titian's 'Madonna of the Roses,' Bellini's 'Sacra Conversazione,' and a wealth of other paintings by Titian, Bellini, and Giorgione which afford unrivalled opportunities to study the work of these artists in the Venetian room at the Uffizi where they are concentrated. Among foreign works here are paintings by Rogier van der Weyden, Memling, Rubens, Van Dyck, and Jordaens; while the Ger. school is represented by Cranach and Durer. Like the Uffizi collections that of the palace of Luca Pitti was formed by members of the Medici family. The Uffizi collections represent all It. art but with special emphasis on Tuscan. The Pitti paintings, on the other hand, belong much to one period, the mature period of It. art, when Raphael was dominant. Here are Raphael's 'Madonna del Granduca' (the Grand Duke Ferdinand III.) and the 'Madonna della sedia' (both known everywhere through coloured reproductions), and also the same master's 'La Donna Velata' or 'The Fornarina' (baker's daughter and the artist's betrothed), his portrait of Pope Leo X. and his 'Vision of Ezekiel'—all in one gallery of the Pitti. Also famous is Giorgione's 'Concert'—sometimes attributed to Titian. Tintoretto is represented by some fine portraits and Titian's works here include one known as 'The Young Englishman' (said to be the earl of Arundel). Among other artists at their best in the Pitti are Andrea del Sarto, Fra Bartolommeo, whose masterpiece 'The Deposition' is here, and Filippino Lippi. Among foreign artists represented in the Pitti are Van Dyck, Rubens, and Sustermans. The chief of the smaller galleries of Florence are the Accademia and the Museo di San Marco. One of the most popular pictures in the Accademia is Fra Bartolommeo's 'Vision of St. Bernard'; others are Michelangelo's 'David' and the 'Prisoners.' In the Museo di San Marco are notable works by Fra Angelico. The

Vatican frescoes of Raphael are important as exhibiting powers far from exhausted in the painting of Madonnas; while Rome has also Michelangelo's Sistine ceiling and the 'Last Judgment'—an astounding feat of decoration. Among the paintings in the Vatican as distinct from frescoes are Raphael's 'Coronation of the Virgin' and works by Fra Angelico and Sano di Pietro. Two pictures in the Villa Borghese enrich further Rome's art treasures: Correggio's 'Danae' and Titian's 'Sacred and Profane Love.' Here too are Domenichino's 'Chase of Diana'—a popular favourite—and a scene by Paolo Veronese. The school of Lombardy is conspicuous in the Brera collection of Milan, the chief treasures of which gallery are Venetian, such as the 'Finding of the Body of St. Mark' by Tintoretto and a 'Pieta' by Giovanni Bellini. Also must be mentioned Raphael's 'Espousals of the Virgin,' portraits by Cima and Lotto, and Luini's 'Madonna in a Bower of Roses.' Milan's other great gallery, the Ambrosiana, is made glorious by its examples of drawings by Leonardo and by the original cartoon for Raphael's 'School of Athens' fresco in the Vatican.

The central gallery of Venice is the Accademia on the Campo di Carità. In it may be studied the whole sequence of Venetian art from the fourteenth century onwards, from Lorenzo Veneziano to the Bellinis to Carpaccio and Cima and so to the great period of Titian, Giorgione, Tintoretto, Palma Vecchio, Lotto, Paris Bordone, and down to Tiepolo. One of the outstanding possessions of the Accademia is the splendid series of paintings by Carpaccio on the legend of St. Ursula. Next to these may be seen the series of Giovanni Bellini's Madonnas, one of them, 'Madonna with the Magdalen and St. Catherine' being equal to his work in the National Gallery of London. The finest of Titian's paintings here is his 'Presentation of the Virgin.' Two other great treasures are the dramatic 'Miracle of St. Mark' of Tintoretto and the splendid composition, 'The Feast in the House of Levi,' by Paul Veronese. With Tiepolo the greater days were past, but much excellent work is to be seen in the water-pieces of Canaletto and Guardi.

The nucleus of the Venetian gallery in the Art-Hist. Museum in Maria Theresa Platz was formed by Ferdinand I., brother of Charles V. of Spain, who succeeded the latter as emperor of the Holy Rom. Empire. The artists of all nations are well represented here. In the early Dutch masters the gallery is rich, particularly the work of Joost van Cleve, Mabuse, Jacob Cornelisz, Jan van Eyck, Memling, and Hugo van der Goes. Here also are paintings by Ter Borch, Jan van der Capelle, Brouwer, Van Goyen, Ruisschel, Jan Steen, Van den Hoekker, Pieter de Hooch, and Rembrandt—the latter is represented by no fewer than eight pictures, including that of his son Titus. There is a famous series of pictures by Brueghel, the best of his work in any gallery, not excluding even Belgian galleries. Other great Flem. painters represented are Rubens with his

immense 'Festival of Venus,' 'St. Ambrose and the Emperor Theodosius,' and 'Ignatius casting out Devils'; Van Dyck; and Jordaens with 'The Drinking King,' a variant of a similar theme in the Louvre. The wonderfully elaborate 'Trinity' of Dürer is one of the outstanding works in Vienna and also here are his 'Young Venetian Woman' and a 'Madonna and Child.' Other Ger. masters follow, including Holbein with portraits of Jane Seymour and John Chambers. Eng. artists are especially represented by Hogarth, Reynolds, and Gainsborough (with a landscape). The Viennese gallery is strong in Venetian and other It. schools. Here are Titian's most dramatic picture, 'Ecce Homo,' some of his finest portraits, and his 'Child with the Tambourine.' Other earlier Its. represented here are Tintoretto with his portrait of the admiral, Sebastiano Veniero; Palma Vecchio; Paris Bordone, and Giorgione, with his unforgettable 'Three Magi.' Among the works of later It. artists are the pagan and voluptuous 'Io' and 'Ganymede' of Correggio; Parmigianino's (Parmigiano) 'Cupid shaping his Bow'; Raphael's 'Madonna al Verde'; Fra Bartolommeo's 'Presentation in the Temple.' Also in Vienna is the *Liechtenstein* collection, which is notable for its pictures by Rubens and Van Dyck alone. Here are the latter's beautiful portrait of a woman 'Marie Luise von Tassila' and Rubens's portrait of his two sons.

The Old Pinakothek of Munich was built for a picture gallery early in the nineteenth century by Ludwig I. and its pictures are chiefly of royal descent, but the true patron of this gallery was Maximilian II. Emanuel (1679-1726) who bought numerous pictures, especially by the Flem. artists, when he was stadtholder of the Low Countries, and he also built a new castle in which to house his pictures. Later the Elector Palatine, Charles Theodore, transferred to Munich the Mannheim collection formed by the Elector Charles Philip; while his successor Maximilian IV. added 2000 pictures of the Zweibrücken collection. In 1795 the Fr. under Moreau entered Munich and pillaged the galleries, though some of the stolen works were returned after 1815. Previously (1805) the famous Düsseldorf academy collection, founded by Maximilian III. Joseph, was transferred to Munich. Ludwig I. not only built the present gallery but added a fine collection of altar-pieces. Like the Louvre and the Viennese gallery, the Munich gallery is divided into large rooms and cabinets, a continental custom which tends to obscure the true wealth of a collection, besides dispersing the pictures in such fashion as to make it harder to study each school in turn. The Munich gallery is, naturally, strong in the works of the early Gers., and also in the later Ger. masters, such as Altdorfer, Hans Baldung Grün, and Schongauer. Among the great Flem. artists examples of whose best work may be seen here are Rogier van der Weyden, Dirk Bouts, Memling, Gerard David, and, above all, Rubens, who is represented here

by the most varied paintings—from the immense 'Last Judgment' to the 'Drunken Silenus' and 'Landscape with Rainbow,' besides portraits of himself and his first wife. Here too is Jordaens's 'The Satyr in the Peasant's Home' illustrating Æsop's fable, and Van Dyck's popular 'Rest in the Flight to Egypt.' Among outstanding pictures of the Dutch school are Rembrandt's 'Abraham and Isaac' and 'Descent from the Cross'; Hals's 'Fish Girl,' and a seascape by Cuyp. The Munich gallery, however, is relatively poor in examples of the It. schools though there are paintings of the Holy Family by Raphael, Andrea del Sarto, and also Perugino's 'The Virgin appearing to St. Bernard.' Titian is, however, well represented by a beautiful 'Madonna and Child' and a portrait of Charles V. of Spain. Other outstanding pictures are Goya's portrait of Luisa, queen of Spain, Poussin's 'Apollo and Daphne' and 'Bewailing Christ,' and the rare series of tavern pictures of Adriaen Brouwer.

The foundations of the Dresden Gallery collection were laid by Augustus I. in the sixteenth century and by Francis III., duke of Modena, who purchased Raphael's 'St. Luke Madonna' from the Benedictines of San Sisto. This is commonly regarded as the supreme treasure of the collection, but other and equally outstanding pictures are Titian's 'Christ and the Tribute Money,' 'Madonna and Child with Saints,' and 'The Man with a Palm'; Correggio's 'Holy Night'—remarkable for its lovely irradiating light effect; Lotto's 'Madonna with Christ and St. John'; the Swiss painter Liotard's 'Chocolate Girl'; Rembrandt's 'Saskia with a Pink' (i.e. Saskia van Uylenborch (Uijlenburgh), a Frisian girl whom Rembrandt married in 1634 and who *d.* in 1642), and 'Moses'; Holbein's portrait of the Sieur de Morette; Vermeer's 'Young Courtesan'; and Giorgione's 'Sleeping Venus'—supposed to have been left unfinished and completed by Titian. There are also many works by Lucas Cranach and a self-portrait and other works by Dürer. The Dutch collection is also famous—works by Hals, De Brey, Brouwer, Adriaen van de Velde, the two Ruysdaels, Van Goyen, and many others not quite so well known.

The Kaiser Friedrich Museum, in Berlin, was named after the Emperor Frederick III. —the nucleus of its paintings being the Gutslin collection bought in France in the early nineteenth century and some hundreds of works collected by Edward Solty, an Eng. trader resident in Berlin in the same period. The finest masterpieces in the collection are the radiant 'Daniel's Vision' by Rembrandt; Van Dyck's portrait of the Marchesa Geronima Spinola; Vermeer's 'Pearl Necklace'; Holbein's portrait of George Gisze; Giovanni Bellini's 'Christ Risen'; Zurbaran's 'Group of Theologians'; Signorilli's 'Pan'; Dürer's 'Young Woman'; and Frans Hals's 'Little Bobbe' and Mother and Child. While this collection is unquestionably universal in range, it is, naturally, very strong in the Ger. school from the early masters to the mature era

of Dürer and his contemporaries. Among Ger. artists represented here besides those mentioned, are Altdorfer, Breu, and Adrian Richter. Rubens is particularly well represented, notably by his 'Perseus and Andromeda,' and 'St. Cecilia.' Other Low Country masters with notable works here are Ter Borch, with 'Concert'; Pieter de Hooch, and Koninck, with a 'Landscape.'

The Antwerp Museum of Fine Arts was built in 1890 to house the Rubens and Van Dyck collections consisting of paintings from suppressed religious foundations and churches, from the Steen Museum, and from the tn. hall, together with numerous engravings and photographs. Like the Palais des Beaux-Arts in Brussels, the Antwerp Museum is rich in pictures by Van Eyck and Rogier van der Weyden, in their early period, as well as in paintings of the great florid period of Rubens's art. Notable among the paintings here are Van Eyck's 'St. Barbara' painted as far back as 1437, and his almost equally old 'Madonna of the Fountain,' and Van der Weyden's 'Seven Sacraments.' But pride of place is naturally given here to Rubens and Van Dyck, both men of Antwerp—as indeed was also Jacob Jordaens, who is also well represented here, notably by his 'Family Concert' and boldly imaginative 'Last Supper.' Among the Antwerp Museum's outstanding examples of Rubens's prolific art are the triptych of St. Thomas with contemporary portraits of the donors in the wings and the 'Descent from the Cross'—regarded as the masterpiece of the gallery—the huge 'Adoration of the Kings,' and 'Christ Crucified between Two Thieves.' In a different mood is his 'Venus Frigida.' There are of course many portraits by Van Dyck, who was largely a portrait painter. Here are his portraits of the Eng. Charles II, as a child and of Hélène Fourment. Other notable pictures here are Memling's famous 'Heavenly Choir,' the 'Salome' of Quintin Matsys, Cornelis de Vos's portrait of the old Guildsman, Jan Steen's 'Dutch Wedding Feast,' and pictures by Brueghel, Brouwer, Coques, Abel Grimmer, Hals, Hobbema, de Hooch, Koedijk, Rembrandt, Schalcken, Ter Borch, Van de Capelle, Van Goyen, De Vries, and Vermeer.

Among outstanding Flem. masters' pictures, apart from the works of Rubens, in the Palais des Beaux-Arts, Brussels, are Memling's 'Martyrdom of St. Sebastian'; a 'Virgin and Child' by Gerard David; an 'Annunciation' attributed to 'the maître de Flémalle' (Robert Campin); and a beautiful 'Holy Family' by Hugo van der Gucht. Rubens, however, outshines all others here, the prime favourite being his great 'Adoration.' Other great pictures of his are the 'Assumption of the Virgin' and 'Venus at the Forge.' Also here are a number of his sketches for paintings. The Brussels Van Dycks include representations of St. Francis of Assisi and St. Anthony of Padua. Among the finest paintings by Jordaens are his 'Pan and Syrinx' and 'The Drunken King.' Here too are works by Nicholas

Maes, a rare painter outside Holland, and the 'Weaver's Repose' by Ostade; 'The Gift' (a landscape) by Wynants; and pictures by the old Brueghels (and others assigned to the various Brueghels), Snyders, Cornelis de Vos, Gaspard de Crayer, Ter Borch, and also some pictures by the Eng. school—Reynolds, Raeburn, Constable, and Lawrence.

The great gallery of the state museum in Amsterdam is devoted to indigenous works. The nucleus of the collection consisted of pictures belonging to the House of Orange. Other and later accessions were the collections of Adriaen van der Hoop and Baron van der Poll acquired in 1880 and collections from the various guild houses. All the Dutch masters are represented here in abundance, although a few of their great works may have been exported. It is generally held that Rembrandt's somewhat misnamed 'Night Watch' is the *pièce de résistance*. It was painted in 1612 and is the master's largest picture. Other favourites of Rembrandt here are 'Syndics'—a group of Dutch merchants in conference—and the 'Jewish Bride.' There are sev. of the choicest paintings of Vermeer, among them being 'Maid-servant Pouring Milk,' his very popular 'The Letter'—an elaborate painting of a woman with a mandolin and 'Little Street.' Mention must be made of 'The Never-ending Prayer' by Maes and the same artist's 'The Spinner'; and also of the Fr. paintings in the modern section of the gallery. There is also a large collection of Van Gogh paintings and drawings, but suspicion has recently been cast by experts on their genuineness.

The Mauritshuis at The Hague dates from the 1630's when it was the residence of Count John Maurice of Nassau, but the building only became a gallery in 1821 when it was used to house the remainder of various collections of the princes of Orange which had survived the vicissitudes of war. Here again, as at Amsterdam, the outstanding work is by Rembrandt, namely his sombre and dignified 'The School of Anatomy'; and hardly less famous are his 'Susannah Bathing,' 'Simon in the Temple'—a miracle of composition and light—and 'David Playing the Harp before Saul.' Yet equally popular are Jan Vermeer's 'View of Delft' and 'Head of a Young Girl,' and Paul Potter's 'Bull'—great in scope and treatment. Other well-known pictures here are the genre study, 'Young Housekeeper,' by Gerard Dou, a pupil of Rembrandt, and a view of Haarlem by Jacob Ruysdael, 'The Oyster Feast' by Jan Steen, and also a number of pictures by Ostade, Ter Borch, Wouwerman, and others. Among the few works of foreigners are portraits of his two wives, Isabella Brant and Hélène Fourment by Rubens and works by Holbein, Van Dyck, and Velazquez. Here may be mentioned the Haarlem Museum Gallery which is largely a Frans Hals memorial. There are in it, however, some very fine landscapes by Vermeer, portrait groups by Ter Borch, and paintings by Van der Helst and Brouwer.

United States Galleries.—There are several galleries of paintings in the various great art museums of the U.S.A.; but the National Collection of Fine Arts, occupying the central hall of the natural history museum of the Smithsonian Institution (Tenth Street, Constitution Avenue, Washington, Dist. of Columbia) and the National Gallery of Art, formed through the gifts of the late Andrew Mellon (which is at Constitution Avenue, Madison Drive, 4-7th Street, Washington, and comes under the administration of the Smithsonian Institution), together constitute what may be regarded as the N. G. of the U.S.A. Little was done in art in the Smithsonian Institution until Harriet Lane Johnston bequeathed her collection to the Corcoran Gallery of Art to hold until the forming of a national gallery of art. The decision of the supreme court of the dist. of Columbia in 1906 established the fact that the Smithsonian Institution was already the National Gallery of Art. The collection was then delivered. It consisted of paintings by Beechey, Constable, Hoppner, Lawrence, Romney, Reynolds, Luhl, and others. About the same time Charles L. Freer of Detroit gave his extensive art collection, including among paintings work by Chinese and Jap. artists and a large collection of Near E. paintings, and also representative examples of the work of Amer. painters, Whistler being extensively represented. The next gifts of importance were the collection of twenty-four old masters given by Ralph Cross Johnson, including works by Coques, Flinck, Francia, Gainsborough, Guardi, Hogarth, Lawrence, Lotto, Maes, Mainardi, Van Orley, Raeburn, Rembrandt, Romney, Rubens, Titian, Turner, and Wilson; and in 1907 Wm. T. Evans inaugurated his gift of paintings by contemporary Amer. artists, which by 1916 numbered 151 paintings by 107 artists. In 1929 John Gellatly gave his collection, which included 142 paintings by 44 Amer. artists and 22 by European artists, including Gonzales, Guardi, Puvion de Chavannes, Rubens, Tiepolo, and Van Dyck. In 1935 came the announcement of the plans of Andrew W. Mellon to present to the gov. his great collection of paintings and also to furnish funds with which to erect at Washington a building, to be called the National Gallery of Art, or a similar name. The completion of these plans was expected to place the U.S.A. upon an equality with other nations in regard to great art possessions. The building under the Mellon fund was completed in 1940 and is known as the National Gallery of Art, the former National Gallery of Art of the Smithsonian Institution being now known as the National Collection of Fine Arts. The latter collection, besides the works mentioned above, contains a number of works by contemporary Fr. artists. The permanent collection in the N. G. formed under the Mellon fund includes the Mellon collection of 126 paintings, chiefly of the It., Flam., Dutch, Eng., and Amer. schools, and 24 pieces of sculpture of the It. Renaissance, as well as the Kress col-

lection of 375 paintings, 18 pieces of sculpture, and 400 Amer. prints.

Famous painters of all countries are well represented in the Boston Museum of Fine Arts, among the most notable being Fra Angelico, Rogier van der Weyden, Florenzo di Lorenzo ('Madonna and Child and St. Jerome'), Piero della Francesca ('Madonna and Child'), Andrea Mantegna, Velazquez ('Don Baltazar and his Dwarf') and 'Infanta Maria Theresa'), El Greco ('Fray Felix Hortensio'), J. M. W. Turner ('The Falls of the Rhine at Schaffhausen' and 'The Slave Ship'), Manet ('Kneeling Monk'), Gauguin, and Van Gogh ('The Postman Roulin'). The paintings in the Fogg Art Museum (Harvard Univ.), which was founded by a bequest of Mrs. Elizabeth Fogg, 1891, include many by It. masters—Fra Angelico, Ghirlandajo, Botticelli, Simone Martini, Giovanni di Paolo, Girolamo di Benvenuto, and Cosimo Tura, and of the Sp. school, paintings by Luis Borrassa, Ribera and Murillo, and of the Fr., paintings by Cézanne, Monet, Renoir, Degas, Forain, Manet and Toulouse-Lautrec; and also paintings by Copley, Gainsborough, and Van Dyck. The Art Institution of Chicago has a collection of over 1000 paintings—including Fr., Dutch, Flemish, It., and Amer., together with prints and drawings by Rembrandt, Whistler, Meryon, Toulouse-Lautrec, Zorn, Bredin, and others. The Cincinnati Art Museum has paintings by Mantegna ('Tarquin and the Cumean Sibyl'), Lucas Cranach the elder ('St. Helena'), Bernardino Luini, Lorenzo di Credi, Bronzino, Frans Hals ('A Dutch Family'), Rembrandt, Van Dyck ('John, Count of Nassau'), Gerard Ter Borch ('A Music Party'), El Greco, Murillo, Gainsborough ('Viscount Downe'), and a large group of Turner and Whistler prints. In the Wm. Rockhill Nelson Gallery of Art, Kansas City (opened in 1933) are paintings by Titian, Veronese, Hals, Rubens, Goya, Rembrandt, Caravaggio, Tiepolo, El Greco, Hobbema, Poussin, Claude, Robert, Millet, Van Gogh, Ingres, Tintoretto, and Joos van Cleve. In the Carnegie Institute, Pittsburgh, founded in 1896, considerable interest is shown in contemporary Amer. paintings, and an international exhibition of paintings is held here annually. The permanent exhibits of the City Art Museum, St. Louis (reorganised 1909) include European and Amer. paintings—among them El Greco's 'St. Paul'.

Dick, *Hours in the National Gallery*, 1925; C. Bell, *Enjoying Pictures*, 1934; and Sir K. Clarke, *One Hundred Details from Pictures in the National Gallery* (presenting a hundred almost unknown works to the public) 1938.

National Geographic Society, formed in 1888, in the U.S.A., by Gardiner Greene Hubbard, who held the presidency until his death in 1897. His successor was Alexander Bell, inventor of the telephone. Existing for the 'increase and diffusion of

geographic knowledge,' the N. G. S., in collaboration with the gov., and other public bodies, has sponsored many expeditions. Amongst them, were the Peary expedition to the N. Pole, the Byrd expeditions to the N. and S. Poles, and the Beebe expedition of 1934, 'man's deepest plunge' into the Atlantic, as well as expeditions into Peru, China, and New Mexico. The society's maps were extensively used by Brit. and Amer. military and naval authorities during the Second World War. In 1899 the N. G. Magazine was produced under the editorship of Gilbert Grosvenor, who still holds the post as well as the presidency of the society. It has a monthly circulation of over 1,800,000, one-tenth of it in the Brit. Commonwealth. Lord Bryce, Lord Halifax, and Sir Wilfred Grenfell have been amongst the Brit. contributors.

National Government (Great Britain), name given to the gov. which replaced the second Labour Gov. in Aug. 1931, and which was made up of ministers drawn from all three political parties, with Ramsay MacDonald as Premier. The resignation of the Labour Gov. followed their inability to concur in measures to meet the threatened financial crisis, a saving of some £120,000,000 being required to balance the budget of 1930-1931. The N. G. was formed to carry out a policy of retrenchment of expenditure so as not only to provide for the needs of the budget, but also to restore foreign confidence in the financial stability of Great Britain. The Cabinet comprised ten members—four Conservatives (Stanley Baldwin, Neville Chamberlain, Sir Samuel Hoare, and Sir Philip Cunliffe-Lister), four Labour (Ramsay MacDonald, Lord Sankey, Philip Snowden, and J. H. Thomas), and two Liberals (Earl Reading and Sir Herbert Samuel). Arthur Henderson, who had been foreign secretary in the Labour Gov., became leader of the Opposition. The newly formed Cabinet was to continue in office until means were provided to balance the budget and the crisis passed, when a general election would take place. With the aid of Conservative and Liberal votes, the N. G. passed the second budget. Economies were effected by increased taxation; the standard rate of income tax rising to five shillings. Surtax was increased by 10 per cent and extra taxes imposed on beer, tobacco, petrol, and entertainments. Further economies were effected by the reduction of civil service pay and the pay of the forces, police, and teachers, etc., by cutting down unemployment pay (the 'dole') by 10 per cent. A temporary impetus was also given to the export trade by the abandonment of the gold standard. Confidence at home and abroad having thus been restored by the saving of the pound, the N. G. appealed to the nation, asking for a 'doctor's mandate' to do whatever was necessary to secure financial and economic stability. The N. G. obtained the record majority of nearly 500—the Labour opposition being almost wiped out. The actual figures were: N. G.: Conservatives, 471; National

Liberals (followers of Sir John Simon and Sir Herbert Samuel), 68; National Labour, 13; National Independent, 3; total 554; *Opposition:* Labour (Socialist) 52; Liberals (followers of Lloyd George) 7; Independent, 2; total 61. (The Communists secured no seats.) The gov. was, in effect, a Conservative Gov. In Nov. 1935, a second so-called 'N.' G. was returned. Out of its 454 seats the Conservative party retained 385, thus obtaining a clear majority over all other parties combined. The 'National Liberals,' whose policy thenceforward became indistinguishable from that of the Conservatives, obtained 32 seats, and 'National Labour,' a party with no future, only 8 seats. The Liberals came back only 17 strong instead of 26, and the Independent Liberals 4 instead of 6. The Labour party increased its representation by 95 seats to 154, while the Independent Labour party secured 4 and the Communists 1 seat. The total Opposition thus amounted to 184. The N. G.'s success at the polls was remarkable in view of the fact that it had no constructive policy; but apparently the country was content to endorse a programme which, mainly concerned with foreign affairs, contemplated the League of Nations as the corner-stone of Brit. foreign policy and the adoption of a firm line in the Italo-Ethiopian dispute—which latter was not adhered to. Early in 1939 there was a general expectation in political circles, that, barring the outbreak of war, there would be another election, the issue being foreign policy, with rising popular disaffection over 'appeasement.' The outbreak of war, however, imposed a truce on party conflict and the N. G. remained in office; but, in 1940, the gov. was reconstituted under Winston Churchill as a Coalition Gov. including a number of leading Labour and Liberal members. Every shade of political opinion was thus represented in the National Ministry, but criticism of the conduct of the war was freely voiced in Parliament by recognised gov. supporters as well as by former political opponents, and gov. by Parliament as a whole might almost be said to have taken the place of gov. by party. *See also* MACDONALD, RAMSAY; POLITICAL PARTIES; SNOWDEN, PHILIP.

National Grid, Brit. system of map-reference instituted after a recommendation by the Davidson Departmental Committee of 1933-38. From the central meridian are laid out squares with sides at right angles and parallel to it respectively, and which are multiples of the international metre. Thus there can be found for every point a map-reference peculiar to itself consisting of the rectangular co-ordinates of the point measured eastwards and northwards. The Full Kilometre reference consists of two figures showing the square with 100 km. sides followed by two pairs showing the square with 1 km. side, e.g. 41/2668. The initial point from which measurements are made has been arbitrarily fixed at a point to the S.W. of the Scilly Isles. The scale of the

map does not affect the reference, though since with the larger scales more digits can be included, greater accuracy is thereby achieved. A sheet line system related to the grid links the various scales by allowing the smaller to be used as indexes to the larger. The N. G. system has proved of very great value in many fields of activity: in local gov., for keeping records and statistics, for describing sites, for police work, and so on. The War Office is in the process of replacing their military grid by the N. G.

National Guard, name given to an armed force of citizens organised for local defence. The term is applied particularly to the *Fr. garde bourgeoise*, which was enrolled at the time of the revolution. The National Assembly proclaimed in 1790 the principle of compulsory and universal service, to which all qualified citizens belonged, and membership of which was in most cases a necessary corollary of the full rights of citizenship. The N. G. was not abolished until 1872. Local forces in Spain, Italy, etc., and organised militia in all parts of the U.S.A., are also called N. Gs. See UNITED STATES. *Army*.

National Health Service Act (1946) gives legislative form to the State scheme for promoting a comprehensive health service in England and Wales (there is a similar Act for Scotland), which was evolved from the proposals made by the wartime Coalition Gov. as pub. in a White Paper in Feb. 1944. The main services include: (i) *Health Centres and Family Doctor Service*.—Personal health service and treatment by doctors and dentists, whom the patient chooses, are available at health centres, at home, or at the doctor's own surgery. Doctors may choose whether or not to join the service and joining it does not debar them from receiving fees from patients who do not wish to take advantage of the state scheme, which is available to every one, free and without qualification or limitation.

(ii.) *Hospital and Consultant Service*.—All forms of general and specialist hospital care and treatment, both in-patient, and out-patient, are included. Specialist opinions and treatment of all kinds are available at hospitals, institutions, clinics, and also at health centres and in the patient's home. The minister of health is responsible for this service, which is administered by regional boards. The existing premises and equipment of voluntary and public hospitals are transferred to the minister, and he is empowered also to acquire by purchase, if necessary, other hospitals and their equipment, which may be required for the service. The endowments of voluntary teaching hospitals are given special treatment under new boards of governors. Both types of board are free to receive gifts or legacies (see further under HOSPITALS). (iii.) *Supplementary Services*.—These include midwifery, maternity and child welfare, home nursing, a priority dental service for children and expectant and nursing mothers, and domestic help when needed on health grounds. These

services are administered by the co. and co. bor. councils, which are known as the local health authorities.

The Act makes provision for the service of family doctors, dentists, and chemists to be organised by local executive councils and based upon the health centre. The members of these councils are to be nominated in equal numbers by the major local authorities and the minister and by the local practitioners. All doctors and dentists contract with the councils, and each doctor has his own list of patients whom he has agreed to attend and may use the health centres in place of surgeries (as also may dentists). The patient's freedom in the choice of doctor is not cancelled by the Act, nor is there a provision for a general direction of doctors. Payment of doctors is by capitation fees. The sale of practices which are wholly or partly within the National Health Service is prohibited, and compensation is payable to present practitioners for loss of selling values. Normally compensation is payable on retirement or death.

There is no legal obligation to register as National Health Service patients to obtain any of the benefits of the service. All the benefits are available to the private patient, save only the free services of his doctor and the drugs and appliances ordered on the official prescription form. The hospitals, the Medresco hearing aid, the spectacles, dentures, and other things are his if he needs them.

Hospital Staffs.—The staff of all hospitals in the national service will be in the employment of regional boards (or boards of governors of teaching hospitals). Specialists taking part in the service will be attached to the staff of hospitals. Part-time participation in the service does not debar the specialists from continuing any private practice outside the service. The boards will determine the terms of engagement of any staff employed in the hospital service. The minister of health, however, is empowered to make regulations governing the qualifications, conditions of service, and remuneration of any or all classes of hospital staff—as of the staff engaged in any other part of the health service.

Pay-bed Accommodation.—Where there are single bedrooms or small wards in hospitals the minister of health is empowered to make them available to patients who wish to secure greater privacy by paying the extra cost; but this is subject to the requirements of patients who need such accommodation on medical grounds, and these will be able to have it without payment. The minister is also empowered to provide separate pay-bedrooms or blocks for which people can pay the whole cost privately and in which part-time specialists within the service can treat private patients. Private patients using the accommodation will pay their own specialist's fees, but the Act enables the minister to prescribe maximum fees which specialists may charge in these circumstances.

Compensation for Loss of Selling-values of Practices.—Doctors who join the public

service at the outset are entitled to compensation in respect of loss incurred through being unable thereafter to sell their practices. Any doctor who dies or retires between the date of the passing of the Act and the appointed day, and whose practice has not been sold in the meantime, is qualified for compensation. The total amount of compensation to be made available to the profession under the Act is a sum of £66,000,000 for England and Wales and Scotland. Provision is made for the total sum to be reduced if the number of practitioners taking part in the service falls substantially short of the expected total. The detailed method of apportioning the total sum among doctors is governed by regulations. The Act contemplates that the settling of the apportionment among the individual doctors shall be left in the main to the profession itself. Under an amending Bill of 1949, where one partner not in the service is obliged to buy the share of a partner in the service—which may be of little value to the former—that obligation becomes an option, and the partner in the service is not entitled to be paid compensation out of the fund. But where a partner in the service is obliged to buy the share of a partner outside the service, he will be entitled to compensation from a fund additional to the original compensation fund. There is a further provision that, where one partner in the service sells the goodwill of his practice to another partner in the service, the compensation payable under the Acts is substituted for the contract price provided for in the partnership agreement, and becomes payable on the transfer taking place.

Drugs, Medicines, and Appliances.—Those who use the general practitioner service are entitled to the supply, free of charge, of necessary drugs, medicines, and appliances (save for a nominal charge of 1s.). Every properly qualified pharmacist has the right to join the new service. Drugs, etc., required for hospital purposes will be supplied as part of the hospital service.

Dental Service.—Outside the priority arrangements noticed above, the Act provides for a general dental service, in which any dentist may participate, with remuneration by appropriate salaries for the amount of time which they give to the service. Outside the centres it is open to any one to arrange with any dentist in his own surgery, who agrees to undertake his or her dental care. The dentist may subsequently submit a claim for payment from public funds. But for certain forms of treatment the dentist will submit an estimate to the Dental Estimates Board, a new professional body estab. by the Act (see further under NATIONAL DENTAL SERVICE).

Eye Services.—The care of the eyes, with sight-testing and the supply of spectacles, is carried out in special ophthalmic depts. and clinics forming part of the hospital and specialist service, and also by commercial opticians.

Efficient Service.—The Act provides for setting up a special tribunal to investi-

gate cases where it is claimed, either by executive councils or otherwise, that the continued inclusion of any doctor, chemist, dentist, or optician in the lists drawn up by the executive councils would be prejudicial to the efficiency of the service. The tribunal will have a legal chairman appointed by the Lord Chancellor and will include a member of the same profession as the person whose case is being investigated and one other, the latter two being appointed by the minister of health.

Local Mental Health Services.—The main mental treatment and mental deficiency services are part of the new hospital and specialist arrangements. Local health authorities, however, are given responsibility for all the ordinary local community care in the mental health service.

Vaccination and Immunisation.—Compulsory vaccination is abolished by the Act, but it is the duty of the local health authority to provide free vaccination and diphtheria immunisation.

Ambulance Service.—Apart from vehicles which may need to be provided as part of the hospital service, the provision of main ambulances and hospital transport required for the health service is the duty of the local health authorities, either directly or by arrangement with voluntary organisations. The local health authority's ambulances may, and must, if necessary, operate outside their own area.

Care and After-care of the Sick.—Local health authorities are empowered to make approved arrangements for the prevention of illness and the care and after-care of the sick. This may include the provision of special foods and special accommodation for invalids and convalescents, and the making of grants to voluntary organisations doing work of this kind (but it does not include cash allowances to individuals or families, which is the function of National Insurance). A charge may be made in appropriate cases.

The Act in Operation.—The Act came into force on July 5, 1948. After operation for over a year the costs of the scheme had far exceeded the original estimates; the bulk of the necessary funds were derived from income tax, only a small fraction (less than 1s.) of the weekly insurance contributions being available for health purposes. The services provided had in many ways proved satisfactory and had on the whole been well received by the general public, though many individuals objected to the compulsory nature of the payments. The voluntary hospitals, many of which were prior to the Act in severe financial straits, became independent of charity, but lost some of their autonomy; the provision of hospital beds was still inadequate, especially sanatorium accommodation for tuberculous patients. As regards the remuneration of those providing the services, dentists in private practice earned so much that amounts in excess of £1800 per annum were halved, and their average gross income then far exceeded that of general medical practitioners, who were allowed a maximum of 4000

patients and received a capitation fee in the region of 18s. per patient per annum; it is hoped later to increase this capitation fee to £1 15s for the first 1000 patients on the doctor's list. Medical practitioners in isolated country dists. have a special mileage allowance. Specialist doctors in hospitals were remunerated for services which were previously honorary, though the grading of such doctors was somewhat arbitrary. Private patients were not allowed to receive medicines through the services provided in the Act. Hearing aids for the deaf are to be provided in the future. Many foreign visitors utilised the services, which were available to them without contributions. Statistics produced by the minister of health (Oct. 1949) indicated that the number of persons within the National Health Service was then 41,200,000, or about 95 per cent of the entire pop.; while the number of doctors was between 18,000 and 19,000 out of some 21,000 (statistics do not show how many of these doctors in the service also carry private patients). Prescriptions dispensed in the first year of the service were stated to have numbered 187,000,000 at an average cost of 2s. 9d. each. The ann. expenditure on the health service was, according to the minister, about £300,000,000, or twice the amount originally estimated, due principally to the raising of remuneration above the level at first expected. Regarding optical services, it was officially stated that up to Oct. (1949) 5,250,000 spectacles had been supplied, 3,000,000 were then still on order, and current production was at the rate of 7,000,000 a year. Of deaf aids, some 29,000 were issued during the first year, production being at the rate then of 2000 aids a week. Dental patients

accepted for treatment under the scheme numbered 8,500,000; dentists in service, 9400; hospitals taken over, 2688; hospital beds, 501,738; hospital and midwifery staff, 149,783. See C. Hill and J. Woodcock, *The National Health Service*, 1949, and the extra number of the *Practitioner*, 1949.

National Ideology, see IDEOLOGY.

National Insurance Act (1946), gives legislative form to the all-embracing scheme of social insurance which first took shape in the Beveridge Report of 1942 and was developed in the White Paper pub. in Sept. 1944 (see SOCIAL INSURANCE). The Act provides payment by way of unemployment, sickness, and maternity benefit; retirement pension; widow's benefit; guardian's allowance; and death grant. It repeals all existing enactments relating to unemployment insurance, national health insurance, widows' and orphans' and old age contributory pensions and non-contributory pensions; and it provides for payments towards the cost of the national health service (see NATIONAL HEALTH SERVICE ACT (1946)). The main benefits and grants payable under the Act are:

Sickness and Unemployment: 26s., with 16s. for a dependent and 7s. 6d. for the first child.

Retirement pensions: 26s.

Widows and Orphans: widow's allowance, 36s.; widowed mother's allowance, 33s. 6d.; widow's pension, 26s.; guardian's allowance, 12s.

Maternity allowance: 36s.; attendance allowance, 20s.

Maternity grant: £4.

Death grant for adults: £20.

The main contribution rates are set out in the following tables:

EMPLOYED PERSONS

Description of Employed Person	Weekly Rate of Contribution	
	Initial rate	Permanent rate
	s. d.	s. d.
Men between the ages of 18 and 70 (not including men over the age of 65 who have retired from regular employment):		
Earning remuneration at a weekly rate exceeding 30s.	4 7	4 9
Earning remuneration at a weekly rate of 30s. or less	2 8	2 9
Women between the ages of 18 and 65 (not including women over the age of 60 who have retired from regular employment):		
Earning remuneration at a weekly rate exceeding 30s.	3 7	3 9
Earning remuneration at a weekly rate of 30s. or less	2 2	2 3
Boys under the age of 18	2 8	2 9
Girls under the age of 18	2 2	2 3

For the purpose of this (Part I.) and Part II. (next table) of the First Schedule of the Act a person is deemed to be earning remuneration at a weekly rate of 30s. or less if, but only if, his remuneration does not include the provision of board and lodging by the employer and the rate of the remuneration does not exceed 30s. a week, and to be earning remuneration at a weekly rate exceeding 30s. in any other case.

EMPLOYERS

<i>Description of Employed Person</i>	<i>Weekly Rate of Contribution</i>	
	<i>Initial rate</i>	<i>Permanent rate</i>
	<i>s. d.</i>	<i>s. d.</i>
Men over the age of 18:		
Earning remuneration at a weekly rate exceeding 30s. or not being liable to pay a contribution as an employed person	3 10	4 0
Earning remuneration at a weekly rate of 30s. or less and being liable to pay a contribution as an employed person	5 9	6 0
Women over the age of 18:		
Earning remuneration at a weekly rate exceeding 30s. or not being liable to pay a contribution as an employed person	3 0	3 2
Earning remuneration at a weekly rate of 30s. or less and being liable to pay a contribution as an employed person	4 5	4 8
Boys under the age of 18	2 3	2 4
Girls under the age of 18	1 9	1 10

SELF-EMPLOYED PERSONS

<i>Description of Self-employed Person</i>	<i>Weekly Rate of Contribution</i>	
	<i>Initial rate</i>	<i>Permanent rate</i>
	<i>s. d.</i>	<i>s. d.</i>
Men between the ages of 18 and 70 (not including men over the age of 65 who have retired from regular employment)	6 2	6 6
Women between the ages of 18 and 65 (not including women over the age of 60 who have retired from regular employment)	5 1	5 5
Boys under the age of 18	3 7	3 9
Girls under the age of 18	2 1	3 3

NON-EMPLOYED PERSONS

<i>Description of Non-employed Person</i>	<i>Weekly Rate of Contribution</i>	
	<i>Initial rate</i>	<i>Permanent rate</i>
	<i>s. d.</i>	<i>s. d.</i>
Men between the ages of 18 and 65	4 8	5 0
Women between the ages of 18 and 60	3 8	4 0
Boys under the age of 18	2 9	2 11
Girls under the age of 18	2 3	2 5

Note: In the above tables of contributions the initial rate means the rate payable as from the appointed day for the introduction of the new pension rates under this Act; the permanent rate means the rate payable after the expiration of five years from the date of the introduction of the new pension rates.

The above rates exclude contributions under the industrial insurance scheme (see WORKMEN'S COMPENSATION) but include contributions to the national health service. Men aged seventy and over and women aged sixty-five and over pay no contributions. Men aged sixty-five to seventy and women aged sixty to sixty-five pay only if they are working and have not retired from regular employment. These provisions, however, do not affect the employer's liability to pay contributions.

EXCHEQUER SUPPLEMENT

Description of person by or in respect of whom contribution is paid	Amount of Supplement			
	For contribution as employed person	For employer's contribution	For contribution as self-employed person	For contribution as non-employed person
	s. d.	s. d.	s. d.	s. d.
Men over the age of 18	1 1	1 0	1 1	9
Women over the age of 18	10	9	11	7
Boys under the age of 18	7	7	7	5
Girls under the age of 18	6	5	6	4

The contributions are to be increased, at the end of 5 years from the date when existing pensions are raised, by 4d. Generally, contributions are paid by means of stamps on a single insurance card. For an employed person the stamp covers industrial injuries insurance as well as insurance under this Act and the responsibility for paying contributions rests primarily on the employer, but he may deduct the worker's share from the worker's wage. Exemptions from payment of contributions may apply to those unemployed or incapable of work, those drawing pensions or other benefits, or those under full-time education or unpaid apprenticeship, and such persons will be credited with contributions. People earning under £104 a year may claim exemption. The benefit rates and contributions are to be reviewed by the minister of national insurance every five years so that the purpose of providing social security may be safeguarded. The central administrative body under the Act is the Ministry of National Insurance, which has regional and local offices throughout the country. The Act provides for the transfer of the administration of sickness and maternity benefit from the 'approved societies'—generally friendly societies, which were an integral part of the earlier national insurance schemes—and for compensation of their staffs where necessary.

Contribution Conditions.—For unemployment or for sickness benefit: (a) twenty-six contributions paid between entry into insurance and the day for which benefit is claimed; and (b) not less than fifty contributions paid or credited in respect of the last complete contribution year before the beginning of the benefit year. For maternity grant and attendance allowance: (a) not less than twenty-six contributions paid between entry into insurance and day of confinement and not less than twenty-six paid or credited in respect of the last complete contribution year before confinement. For maternity allowance: not less than forty-five contributions paid by or credited to the claimant in respect of the fifty-two weeks immediately preceding the period for which the allowance is payable. Widows' benefit or retirement pension: not less than 156 contributions paid in the period between entry into insurance and the date of

reaching pensionable age or dying under that age, and a yearly average of contributions paid or credited of not less than fifty. For death grant: not less than twenty-six contributions between entry into insurance and the deceased's death and not less than forty-five paid or credited in respect of the last complete contribution year or a yearly average of at least forty-five contributions.

Sickness and Unemployment Benefit.—Employed persons can qualify for both; self-employed persons for sickness benefit. **Rates.** The weekly rate of sickness and unemployment benefit for a man or single woman over eighteen is 26s. The ordinary rate for a married woman over eighteen is 20s. for unemployment and 16s. for sickness. But a married woman over eighteen receives the same rate as a single woman, if she is supporting an invalid husband, or if she is not living with her husband and cannot obtain any financial help from him. There are lower rates for persons under eighteen. Where the applicant has a wife living with him, or mainly maintained by him, or has an adult dependent, he will receive an extra 16s. a week. Where he has a child in his family, he will receive an extra 7s. 6d. A woman applicant who has dependents receives similar allowances. The child's allowance of 7s. 6d. will be paid only for the first child in any family, who will not count for family allowances.

Duration of Benefit.—During the same spell of absence from work an insured person can draw: (a) sickness benefit without limitation of period if he has paid at least 156 contributions at any time; (b) 180 days of unemployment benefit, together with additional days of benefit, assessed on his record of contributions and benefit. Two spells of absence from work count as one if not separated by more than thirteen weeks. When an insured person has exhausted his right to benefit of either kind he can requalify for that benefit when he has paid thirteen more contributions. **Disqualifications.** Refusing an offer of suitable employment; in the case of sickness benefit, failing to comply with rules of behaviour.

Maternity Benefits.—For a confinement a woman will receive a maternity grant of £4 on her husband's insurance or on

her own. For a woman who ordinarily follows a gainful occupation there is in addition a maternity allowance of 36s. a week for thirteen weeks, beginning six weeks before her confinement is expected, provided she abstains from work. For other women there is, instead, an attendance allowance of £1 a week for four weeks in addition to the maternity grant.

Widows' Benefits.—A widow will qualify on her husband's insurance for an allowance of 36s. a week for thirteen weeks. If she has been left with a child of school age she will receive an extra 7s. 6d. a week during those thirteen weeks, and will thereafter receive a widowed mother's allowance of 33s. 6d. a week (for herself and the child), so long as she has a child of school age. If she is over forty when this allowance ceases, and ten years have then elapsed since the date of her marriage, she will qualify for a widow's pension of 26s. a week. A widow who is left without any children of school age will receive a widow's pension of 26s. after the period of her widow's allowance, if she had reached the age of 50 when her husband died, provided that ten years had elapsed since the date of her marriage. If, by reason of mental or physical infirmity, a widow is incapable of self-support at the time when her widow's allowance ceases, she will receive a widow's pension of 26s. so long as she is incapable of self-support. A widow whose husband had qualified for retirement pension before his death will receive the ordinary widow's benefits as above specified, if she is then under sixty. If she is over sixty, any retirement pension which she is already receiving will be raised to the single person's rate. Both widow's pension and widowed mother's allowance will be reduced, if the widow earns more than 20s. in any week by 1s. for every 1s. she earns over 20s.

Guardian's Allowances.—Where the parents (including step-parents) of a child are dead, and one at least of them was insured under the scheme estab. by this Act, any one who has the child in his family will qualify for a guardian's allowance of 12s. a week. There is statutory power to extend the allowance to cover certain cases excluded from the previous scheme.

Retirement Pensions.—An insured person who (a) has reached pension age (sixty-five for a man and sixty for a woman); (b) has retired from regular employment, and (c) has paid the prescribed number of contributions will receive a retirement pension for life at the rate of 26s. a week. Men aged seventy and over and women aged sixty-five and over do not have to satisfy condition (b). Where a man aged sixty-five to seventy or a woman aged sixty to sixty-five does any work after having qualified for pension, and earns over 20s. in any week, the pension will be reduced by 1s. for every 1s. the pensioner earns above 20s. Where the insured person postpones his retirement beyond pension age, his pension, when he qualifies for it, will be increased by 1s. for every

twenty-five contributions he pays in the five years after pension age. **Wives.**—If a pensioner has a wife under the age of sixty, either living with him or mainly maintained by him, he will get an extra 16s. a week for her, provided she is not gainfully occupied. When a man qualifies for pension, his wife, if she has reached sixty, will be entitled to a separate pension on his insurance. The basic rate for the pension will be 16s. a week, but it will be increased by 1s. a week for every twenty-five contributions the husband pays after he has reached sixty-five and she has reached sixty. A wife insured in her own right can draw retirement pension on her own insurance, even though her husband has not retired. **Widows.**—A widow will qualify on her late husband's insurance for a retirement pension of 26s. a week if, immediately before reaching sixty, she was drawing one or other of the various widow's benefits under this Act. **Non-contributory Pensions.**—Any one who had reached fifty-five years of age when the new pensions under this Act began to be paid, will qualify, subject to his means, for a non-contributory pension on reaching seventy, if he or she is not qualified for a retirement pension.

Death Grant.—This grant is payable for the expenses connected with the death of an insured person or with the death of his wife, or child, or widow. Where the insured person is a woman a grant is payable on the death of her husband or child. The grant is £20 for an adult; £15 for a child aged six to seventeen; £10 for a child aged three to five; £6 for a child under three.

The cost of the benefits under the new scheme estab. by this Act is estimated at £452,000,000 in 1949, rising to £462,000,000 in 1950 and to £496,000,000 in 1955. The Exchequer's share will be £118,000,000 in 1949, £122,000,000 in 1950, and £143,000,000 in 1955. In the gov. actuary's report on the financial provisions of the Bill when it was introduced in 1946 the estimated expenditure over the next thirty years was as follows:

Estimated Expenditure, in £ millions.
1948-78

Benefits	1948	1958	1968	1978
Retirement pensions	238	301	421	501
Widows' benefits and guardians' allowances	22	35	42	40
Unemployment benefit	94	94	94	89
Sickness benefit	70	83	86	81
Maternity benefits	9	8	8	8
Death grant	*1	6	9	12
Cost of administration	18	18	18	18

* A notional figure depending on the date of the commencement of the benefit.

In another table the actuary gives the estimated yields of contributions for benefits under the Bill and towards the national health service:

and public control, as e.g. in a Town and Country Planning Bill which was introduced in Jan. 1947 (q.v.) and a Bill which proposed not N. of the land but rather

Yields of Contributions in £ millions

<i>Contributions by Insured Persons and their Employers</i>				<i>Contributions by Exchequer</i>
<i>Calendar Year</i>	<i>For benefits</i>	<i>Towards Health Service</i>	<i>Total</i>	<i>For benefits</i>
1948	313	36	349	82
1958	331	37	371	83
1968	335	37	372	83
1978	312	35	347	78

National Insurance (Industrial Injuries) Act, 1946. See WORKMEN'S COMPENSATION.

Nationalisation, acquisition by the State of land or any public utility, usually by purchase; or, in Socialist politics, the acquisition by the State of all the means of supply and distribution. N. has, of course, been carried to extreme lengths in Soviet Russia; but in other countries it has been restricted until recently to public utilities, such as telegraphs and telephones. In Canada, Australia, and some other countries some or all of the railways have been nationalised. The N. of the land has, at times, been proposed in Great Britain, but no substantial progress has been made by societies existing for that purpose. The Brit. Labour party has long advocated N. of the mines and railways and both these had a measure of gov. control during both World Wars. In its election appeal in 1945 the Brit. Labour party declared its intention to ensure a more equitable distribution of the nation's wealth among the community and, to achieve this aim, the Lab. Gov. which came into power in Aug. 1945 proposed public ownership of the coal mines, the iron and steel industry, inland transport, and the Bank of England. A Bill providing for public ownership of the Bank of England became law in 1946. A Bill to nationalise the coal mines was also passed with the same lack of controversy, largely because the country was already committed to the change by the findings of the Sankey Commission of 1919 and by those of the Reid Committee of 1915. A Bill to nationalise railways and other inland transport was approved in principle but its original proposals were considerably amended. Similarly, while the gov. was committed to pass a Bill establishing a measure of public ownership in the iron and steel industry, it experienced some difficulty in drafting a Bill which would survive not only the criticism of the Opposition but also the div. of opinion on amount and method of compensation among its own members. In some fields of enterprise new legislation attempted to compromise between private ownership

of profits from its development and improvement, taking away from the landowner the right to decide when and for what purpose his land might be developed. Again, a Control of Investments Bill purported to give the State control over issues of bonds to finance new undertakings and empower the gov. to guarantee priority to projects in which the community interest would be served. See further under GREAT BRITAIN, *History*.

Nationalism, spirit of nationality, the predominant feature of the modern state-system and, in the language of political thought to-day, the antithesis of internationalism. In an age when political ideas and doctrines have become the staple of current conversation, N. has occupied the forefront of discussions of foreign affairs as one of the *idea-forces* (*idea-forces* as Fr. publicists style them) which are active in the contemporary world and constitute so large a part of the compelling power of latter-day power politics. N. is not to be confused with racialism, for many races may be incorporated in one nation-state, though racialism was the strongest element in the particular type of N. preached by Hitler and, to some extent, it is implicit in the ideas of Herder on the nation as an enlarged family. N. was the inevitable sequel to the growth of the nation-state out of feudalism and the medieval conception of sovereignty as developed by Machiavelli, Hobbes, Locke, and Rousseau. N. is a commonplace to-day, because it is but natural that a politically compact people, speaking the same language and sharing the same historical traditions and social customs or adherent to the same creed should be united politically as a sovereign independent nation. While as a political institution N. has never been susceptible of clear definition, it is evident that it is only with the growth of the modern spirit of nationality that the complex problem of the national state arises. Different writers give varying emphasis to the contributory factors noticed above, yet it is probable that none of them, whether religion,

language, ter., tradition, or economic interests can claim monopoly or even predominance. Unity of language is a strong factor in national unity but by no means decisive; for Soviet Russia, where there are hundreds of different languages, has given dramatic proof of the strength of her national cohesion; while, conversely, a common language did not operate to prevent the separation of the Amer. colonies from England. Unity of religion may have formed the national character of the Spaniards or the Scots, but the great religious split between Protestants and Catholics has markedly failed to prevent national unification in Germany. Unity of economic interest has more often than not been ignored in favour of more irrational considerations—the hist. of the peace treaties of 1919 shows an almost uninterrupted record of N. cutting across economic ties. Perhaps the most prevalent influence is community of hist., tradition, and culture, difficult to define in general terms, but altogether exercising an immensely powerful influence: for in Renan's classic definition: 'A nation is a soul, a spiritual principle. . . . The existence of a nation is a daily plebiscite, just as that of the individual is a continual affirmation of life' (Renan, *Qu'est-ce qu'une nation?*, 1882). Certainly patriotism may be the dominant note with individual political thinkers, as illustrated by Mazzini's stirring address to his fellow countrymen (*To the Young Men of Italy* (1859)) to take up arms against their foreign masters. What is, however, incontrovertible is that in the early nineteenth century N. was a revolutionary force, deriving its impetus from a sense of tyranny among many peoples who were far from enjoying political freedom. This revolutionary force was most strikingly exemplified in France, under the inspiration of the teaching of Rousseau, which 'invested the gospel of fraternity among men of the same nation with all the finality of a scientific dogma' (Carlton Hayes). This teaching spread to other nations of Europe and within a century the spirit of nationality produced an independent Greece, Belgium, Serbia, Norway, Italy, and Germany. It is, however only gradually, though with increasing momentum, that N. has become an articulate force throughout the world; thus the consciousness of nationality was only awakened among the Chinese by the labours of Sun Yat-sen, though in his *Three Principles of the People* (1924) he speaks of his country's 'lost nationalism, the revival of which is the divine mission of its four hundred million people.' Under this revolutionary influence the peoples of each of the European countries above mentioned became conscious of nationality for the first time in their hist., with all its implications, the chief of which was that patriotic men of the same nation should be brothers-in-arms ready to defend their liberties and traditions, their customs or way of life against the tyrant and their hearths and homes against the external aggressor. Whatever its defects in the eyes of political

thinkers, N. has yielded impressive results in political democracy, inspiring great deeds, stimulating art and literature, and promoting popular education. But undoubtedly the concept of N. was employed too often to emphasise to citizens what was peculiar in tradition and achievements to their own nation, rather than to what mankind shared by way of common heritage. It emphasised the exclusiveness of each state and it encouraged selfishness in a new and national form in the same way that individualism and *laissez-faire* had promoted the prosperity of the bourgeoisie of all the great trading nations of the world at the expense of the proletariat. It brought nations which had not yet achieved complete unity and independence, like the Poles, the Irish, and the Czechs, into conflict with more fortunate nations; while in the fortunate nations it induced a selfish intolerance which led to the oppression of dissident minorities and to the forcible imposition of their own civilisation arbitrarily upon those whom they regarded as 'inferior' races. Thus N. or the national theory 'marks the end of the revolutionary doctrine and its logical exhaustion and, in proclaiming the supremacy of the rights of nationality, the system of democratic equality goes beyond its own extreme boundary and falls into contradiction with itself' (Lord Acton, *Essay on Nationality*, 1862). Yet N. had an important mission in the world by marking the final conflict and end of two forces which are the worst enemies of civil freedom—the absolute monarchy and the revolution. Ideally N. should have led, not retrogressively to eighteenth-century indifferent cosmopolitanism, but towards twentieth-century internationalism, to a confederation of all the free nations of the world for mutual co-operation and support. It was the tragedy of N. that on the eve of the First World War it had not led to this goal, and this fact has focused the attention of numerous publicists on its influence as the major predisposing cause of that war. N. was no less a decisive factor in bringing about the Second World War. Ger. N. became so aggressive that it sought to interfere in the affairs of other states wherever there were minorities of Gers. large or small in those states. Everywhere in the twentieth century the spirit of nationality operated to reinforce the anarchy both of international politics and of international economics. 'Modern imperialism, curiously enough, became an arc on the circle of exclusive nationalism. It was a vicious circle and the only way to break it seemed to involve the method most terribly anarchic—war' (Hayes). Conversely N. in the U.S.A., whose public opinion has a profound effect on policy the world over, was so narrowly involved in what may be called the Amer. way of life as to stress isolationism and to turn away from internationalism even at the cost of security. A most important development of N. in Germany, Japan, and the other newer States was the economic activity of the State in which theories of a planned economy acquired

force from protective tariffs as an integral factor of political strategy. In modern Germany this has been especially exemplified by the malign activities of the I. G. Farben Trust in exploiting, or in aiming at the exploitation of, the whole continent of Europe; but a development so directly in conflict with the individualism of liberal political theory, far from being a highly modern one, has its inspiration in the economic doctrines of Johann Gottlieb Fichte, Adam Müller, and Friedrich List. The emergence of Japan as a national state affords striking parallels to that of Germany in spite of the very different racial, historical, and social background, the nobility, feudal leaders, and merchants creating a modern state which rested on very similar foundations to those of the Germany of Hitler. If in the older national states (Britain, U.S.A.) political authority and economic interests did not co-operate in a common plan, the exigencies of war have resulted in assimilating their relative position closely to that of the totalitarian states. Some political theorists think that a crisis threatens the modern nation-state from two utterly opposed quarters — the international monopolies and cartels which necessarily induce a deadly conflict between national loyalty and international economic interests; and the ideology of Communism, which accentuates social conflict as against national community, ranking members of the same economic and social class together in opposition to other classes within the same nation. None of all kinds is, to Marxism, a device of capitalist domination over the workers. See C. J. Hayes, *A Brief History of the Great War*, 1920; B. Russell, *Freedom and Organisation 1814-1914*, 1931; J. Huxley and A. Haddon, *We Europeans*, 1935; H. Lascelles, *The State in Theory and Practice*, 1935; P. Henry, *Le Problème des nationalités*, 1937; R. Crossman, *Government and the Governed*, 1939; *Nationalism*, by study group of Royal Institute of International Affairs, 1939; A. Zimmern (ed.), *Modern Political Doctrines*, 1939; E. H. Carr, *The Future of Nations, and The Twenty Years' Crisis*, 1939; E. Norman, *Japan's Emergence as a Modern State*, 1940; W. Friedmann, *The Crisis of the National State*, 1943; and H. M. Chadwick, *The Nationalities of Europe and the Growth of National Ideologies*, 1945.

Nationalist Party (Irish), Irish political movement for Home Rule (*q.v.*) which became an important force in the Brit. House of Commons in the late seventies of last century under Parnell (*q.v.*). When the Liberals and Conservatives were of almost equal strength the Nationalist vote was of vital importance. John Redmond (*q.v.*) succeeded Parnell as the party's leader in 1890. It became defunct in 1918 on the rise of Sinn Féin (*q.v.*).

Nationality Act, British (1948). This Act, which was enacted on July 30, 1948, replaces the British Nationality and Status of Aliens Act of 1914 as the basis of the law of Brit. citizenship. Every person who, under this Act, is a citizen of the United Kingdom and Colonies, or who is

or becomes a citizen of Canada, Australia, New Zealand, the Union of S. Africa, India, Pakistan, S. Rhodesia, and Ceylon, shall by virtue of that citizenship have the status of a Brit. subject. Every such person having such status has the choice of being known as a Brit. subject or as a common citizen of the commonwealth, both expressions having the same meaning (this proviso was made because some might not wish to be called Brit. subjects, *e.g.* Fr. Canadians or Indians or Sinhalese). The Act provides a new method of giving effect to the principle that the people of each self-governing country within the Brit. Commonwealth have both a particular status as citizens of their own country and a common status as members of the commonwealth. Under a common clause accepted by all the commonwealth countries (except Eire (*q.v.*)) all persons recognised as Brit. subjects in any part of the commonwealth are recognised as such throughout the whole of it. To preserve the principle of complete unity of status, there is a single citizenship, governed by identical conditions and applicable without distinction to the peoples of the United Kingdom and Brit. colonies. The permanent provisions governing the acquisition of citizenship of the United Kingdom and colonies are based on the principles previously governing the acquisition of Brit. nationality under the Act of 1914. The first generation *b.* in another commonwealth country of a father *b.* in the United Kingdom or colonies, is a citizen of the United Kingdom and colonies, but not the second generation. Citizens of the United Kingdom and colonies who acquire citizenship of other commonwealth countries (*i.e.* possessing 'dual citizenship') may, if they wish, denounce their citizenship of the United Kingdom and colonies. Citizens of Eire cease to be Brit. subjects, though Eire citizens in the United Kingdom at the time the Act was passed continue to have all the rights and obligations of Brit. subjects and all Eire citizens are treated under Brit. law in the same way as Brit. subjects and not as aliens. The Act removes women's disabilities as regards nationality, and for nationality purposes married women are placed in the position of single women. From the date when the Act became law, women citizens of the United Kingdom and colonies do not, as theretofore, lose their citizenship on marriage to aliens, and may only divest themselves of it by a formal act of renunciation. Women married to aliens when the Act was passed, had their nationality restored, becoming citizens of the United Kingdom and colonies or of some other commonwealth country. Alien women marrying citizens of the United Kingdom and colonies no longer automatically acquire citizenship on marriage, but if they desire may apply for registration, to be granted in the home secretary's discretion. Women citizens of other commonwealth countries on becoming citizens of the United Kingdom and colonies do not automatically acquire their husband's citizenship, but may claim it as of right,

whether or not they are resident in the United Kingdom or colonies.

In April 1949 Eire became, by her own action, a republic and left the commonwealth. But, in fulfilment of the Brit. Prime Minister's promise that S. Irishmen would not be treated as foreigners in the United Kingdom in spite of their country's unilateral action in declaring her independence of Crown and commonwealth, the United Kingdom Parliament in May introduced the Ireland Bill, one purpose of which was to confirm citizens of the new republic in all the rights which they held in the United Kingdom while Eire was still a member of the commonwealth. The effect of the Bill is that inhab. of Eire can claim to remain Brit. subjects or, if they prefer, be citizens of the republic of Eire and still reside in the United Kingdom on the same conditions as in the past. A new clause was inserted in the Bill as the result of an amendment by the Lords to which the gov. agreed. It made clear that, whatever might be the position under Eire law, a person *b.* in S. Ireland of a S. Irish father, who was domiciled in N. Ireland on Dec. 6, 1922, and who had not acquired Eire citizenship by residing permanently in S. Ireland on or after April 10, 1935, or by registering as an Eire citizen, did not cease to be a Brit. subject on Jan. 1, 1949, and became on that date, a United Kingdom citizen unless he was a citizen or potential citizen of some other commonwealth country. But the special status thus accorded to Irish citizens by this Bill involves questions in international law and international relationships which are not within the competence of the Brit. Parliament to settle, and indeed they remain to be answered.

National Liberal Club of London, is the headquarters in Great Britain for social purposes of the Liberal party. The club, which was opened in 1887, is pleasantly situated on the Thames Embankment near Charing Cross station, and houses the Gladstone Library of 25,000 books, mainly political and sociological.

National Parks. The phrase national park is variously used in different countries. The definition adopted by the N. P. Committee (England and Wales) is that of Mr. John Dower's *Report on National Parks* (Cmd. 6628), viz. 'an extensive area of beautiful and relatively wild country in which, for the nation's benefit and by appropriate national decision and action, (a) the characteristic landscape beauty is strictly preserved; (b) access and facilities for public open-air enjoyment are amply provided, (c) wild life and buildings and places of architectural and historic interest are suitably protected, while (d) established farming use is effectively maintained.' The Committee mentioned above was appointed in July 1945 by the minister of tn. and country planning to consider the areas proposed in the Dower report and their special requirements, the measures necessary to secure the objects of N. P., and the conservation of wild life. The committee produced its detailed

scheme in June 1947 (Cmd. 7121) recommending the estab. of twelve N. P. by ann. instalments of four over a period of three years, as follows: (first instalment) The Lake Dist. (892 sq. m.), N. Wales (870 sq. m.), The Peak Dist. (572 sq. m.), Dartmoor (392 sq. m.); (second instalment), The Yorkshire Dales (635 sq. m.), The Pembrokeshire Coast (229 sq. m.), Exmoor (318 sq. m.), The S. Downs (275 sq. m.); (third instalment) The Roman Wall (193 sq. m.), The N. Yorkshire Moors (614 sq. m.), Brecon Beacons and Black Mts. (511 sq. m.) and The Broads (181 sq. m.). The Cornish Coast, one of the ten areas chosen first in the Dower Report, was omitted because of administrative difficulties in treating it as a national park, but it is among the 'conservation areas' scheduled for a somewhat different and looser form of administration. These conservation areas include such diverse stretches of scenery as the N. and S. Pennines, the Wye Valley, the New Forest, Charnwood Forest, and other famous localities varying in size from 633 to 11 sq. m. Control of the parks is proposed in two parts, central and local. At the centre there is to be the N. P. Commission, appointed by the minister of town and country planning and financed by the Exchequer. The task of this Commission is to evolve a common policy throughout the parks, to integrate it with the national and local economies, and to keep close touch with the Ministry of Agriculture, the Forestry Commission, and the Biological Service, which is one of the proposals put forward by the Wild Life Conservation Special Committee (Cmd. 7122). This latter report recommends a nation-wide biological service under a permanent nature conservation board to preserve and study the wild life of England and Wales. The main recommendation is that the gov. should take general responsibility for conserving and controlling the country's flora and fauna and should also protect the geological and phys-geographical features on which the plants and animals live and depend. These measures would entail the expenditure of public money on taking over the management of the reserves and in employing scientists; but (according to the report) the benefits would be great and would extend over agriculture, forestry, game preserving, park and estate management, fresh-water fisheries, as well as water supply, drainage, quarrying, and many aspects of civil engineering. Recognition of the inalienable rights of the National Trust over its properties is to be found in the provision protecting them from compulsory purchase. The onus of upkeep of public footpaths is put on the highway authority, with power to reclaim from private persons discovered to be under customary obligation, though it is suggested by many that the public interest would be better served by removing such private obligations altogether. Not all the proposals of the N. P. Committee have been adopted in the Bill, but quite enough to mark a great advance in the preservation of the country-

side and the provision of access to its most attractive areas.

After the Bill had passed through Standing Committee and been recommended to the Commons, the terms of service of N. P. commissioners were improved, and they may now be members of Parliament. But their powers and status are derived entirely from the minister of town and country planning. They may make recommendations and notify their opinions; they may even call upon the minister to inquire in private why their recommendations have not been acted upon, and in some cases ask him

Australian News and Information Bureau

The Prince's Highway, Bull's Pass, near Sydney.

to use his powers in default. This, however, seems to be the limit of their powers, which, for the rest, are restricted to advising the minister and the existing planning authorities. Some contend that what is needed is a strong and independent commission and that the local administration of N. P. should be entrusted to bodies outside the control of the local planning authorities, because the interest to be upheld is a national one, and is bound to conflict at many points with local self-interest.

National Parks in Africa.—The Brit. Gov. presented to an international conference in London (1933) a draft convention relative to the 'preservation of fauna and flora in their natural state' and the delegates, considering that the natural fauna and flora of certain parts of the world, and in particular in Africa, were in danger, accepted the convention in all

essentials as regards the continent of Africa. It was hoped by advocates of conservation that, after the war, the United Nations, under the lead of Britain, would adopt a world-wide convention on the lines of the 1933 convention, for that convention contained a number of excellent provisions for wild life conservation. Unquestionably the keynote of the convention was the proposal to establish the national park, inalienably set aside under public control as a sanctuary. A miniature national park of about 40 sq. m. has been estab. near Nalrobi. Beyond this no N. P. have been made in any Brit. African dependency. Kenya has passed a National Parks Act, and in 1948 by a formal resolution in the Kenya Legislature it was decided to establish the Tsavo National Park of 7000 sq. m. (*see under KENYA*). In Tanganyika an area in the Serengeti has been declared a national park, but the park is under no control. There are, of course, many 'game reserves' in the various colonies, in which hunting is controlled, but the administration of such reserves, as of the other provisions of the convention, is governed by the adequacy of departmental staffs, and it is believed that in no colony except N. Rhodesia is the staff adequate to the duties they should be called upon to perform. It is, however, also to be emphasised that frequently official policy aims at destruction rather than conservation, particularly in fly-belt areas where farmers near the reserves demand the slaughter of game animals on the supposition that it is only by the extermination of such animals that the tse-tse fly can also be exterminated (*see C. F. M. Swynnerton, The Tsetse Flies of East Africa, their Ecology and Control*).

For a list of the N. P. and reserves of Canada, *see under GAME RESERVE*. A description of the great Yellowstone and Yosemite N. P. of the U.S.A. will be found under those names. The chief Australian national park is at Port Hacking, New S. Wales (area 57 sq. m.), and lies 15 m. S.S.W. of Sydney, bordering on the Pacific for 7½ m.

National Park, Scottish, see under SCOTLAND.

National Physical Laboratory, The, was opened in 1902, managed by an executive committee and general board, but under the ultimate control of the Royal Society, with the object of assisting industries, research, etc. It is situated at Teddington, Middlesex. There are nine main depts.: (1) Physics; (2) Light; (3) Electricity; (4) Radio; (5) Metrology; (6) Engineering; (7) Aerodynamics; (8) Metallurgy and Metallurgical Chem.; (9) The Wm. Froude Laboratory. Observations on terrestrial magnetism, the electricity of the atmosphere, etc., are carried on, and a large number of barometers, thermometers, etc., are tested, on payment of a small fee. The physics dept. deals with questions of maintaining electrical standards, photometry, optics, thermometry, etc. The engineering dept. investigates the behaviour of bodies under sustained and intermittent pressure, impact, etc.

and tests road materials. The metallurgical dept. carries on research connected with the constitution of metals, alloys, etc. The Wm. Froude laboratory carries on experiments on model vessels. The aerodynamics dept. deals with the numerous problems of mechanical flight. A collection of abstracts of all papers pub. by the laboratory, and the results of researches, are issued annually.

National Playing Fields Association, exists to provide adequate playing fields for all sections of the community, and playgrounds for children. The greater provision of opportunities would mean a considerable improvement in general health, would materially reduce the number of juvenile delinquents, and would appreciably decrease the toll of deaths on the road among children while at play. The association endeavours to ensure the acquisition, layout, and construction of playing fields, protects existing fields from appropriation for other purposes, helps to secure gov. grants, uses its influence to persuade local authorities to make use of their permissive powers for the provision of recreation grounds, and gives expert technical and legal advice on layout and specifications and other matters connected with conveyance, dedication, trusteeship, etc. The London and Greater London Association is an organisation within the national body, and is concerned with the immense problem of catering for the considerable needs of the metropolis. The duke of Edinburgh is president of the N. P. F. A., which was founded in 1925.

National Portrait Galleries. The gallery in London was founded in 1856, estab. at S. Kensington in 1869, and finally moved to the present building to the N.E. of the National Gallery in 1896. Its chief feature is the collection of portraits of Brit. historical characters, the upper rooms containing portraits, arranged chronologically, of the sovereigns from Richard II., Chaucer, Shakespeare, Cromwell, and the two Pretenders, while the lower rooms contain portraits of celebrated statesmen, divines, and others. There are specimens of Van Dyck, Reynolds, Gainsborough, Romney, Raeburn, Lawrence, and G. F. Watts. There is an admirable catalogue by the first director, Sir George Scharf, K.C.B. (1820-95). For the Scottish National Portrait Gallery, see under **EDINBURGH**.

National Provincial Bank, Ltd. This is one of the 'big five' joint-stock banks in the Eng. banking world and was estab. in 1833, the first branch being opened at Gloucester in 1831. On Jan. 10, 1866, the bank started to do banking business in London, and sacrificed, by this step, its right to issue its own notes. In 1874 the institution was registered as an unlimited company under the Companies Acts, but on April 8, 1880, it was decided to register the bank as a limited liability company. In 1918 amalgamations were made with the Union of London and Smiths Bank and the Bradford Dist. Bank. In the following year the Sheffield Banking Company was also absorbed and sev. other banks have been taken over since the First

World War. As at Dec. 31, 1941 the authorised capital was £60,000,000 of which £9,479,416 was paid up. The head office of the bank is situate at 15 Bishops-gate, London, E.C.2.

National Range, see **SAWATCH**.

National Reform Union, association founded in 1861 by members of the committee of the Anti-Corn-Law League (*q.v.*) to promote political reform. It was re-organised in 1875; lecturers are sent out by the union, and political literature widely distributed. The objects include the promotion of the formation of Liberal organisations, the propagation of political knowledge, and the discussion of topical questions.

National Register, census of Great Britain, taken on Aug. 15, 1915 and Sept. 10, 1939 to facilitate the best use of manpower, for rationing purposes.

National Research Development Corporation, was set up by the Development of Inventions Act which was passed July 30, 1918. The object of the Act is to secure for Brit. industry the maximum benefits for inventions and discoveries by Brit. scientists. The corporation's functions are (a) to secure, where the public interest requires it, the development or exploitation of inventions resulting from research by gov. and other publicly financed organisations, and any other inventions which it considers are not being sufficiently developed or exploited; and (b) to accept, acquire, and hold rights in inventions (including new processes and techniques) and to grant or dispose of such rights for consideration or otherwise. The corporation, which in its work must comply with the general directions of the Board of Trade, has no special powers of acquiring patents, *i.e.* it cannot compel private firms owning and suppressing patents to sell them, and inventors are in the same legal relations to it as to patent agents. The Board of Trade may advance to the corporation (within five years of its estab.) up to £5,000,000 for working capital, without interest for the first five years. The corporation may borrow temporarily up to £250,000 for general or specific purposes, whilst if it is asked by a gov. dept., in the public interest, to carry out a project which results in a loss, the latter may be recouped from public funds.

National Rifle Association, founded in 1860, and incorporated by royal charter in 1890, to encourage rifle shooting in the king's dominions. From 1860 to 1889 meetings were held at Wimbledon, after which they were held at Bisley. The first shot at the first meeting at Wimbledon was fired by Queen Victoria from a Whitworth muzzle-loading rifle. The competitions at Bisley at target marksmen from all parts of the world. For particulars as to prizes, range, etc., see **BISLEY**. The offices of the association are on Bisley Camp Ground, Brookwood, Surrey.

National Savings Certificates, first issued in Feb. 1916, to raise money for the First World War, since when there have been sev. later issues and one conversion issue. The first issue was at the cost price of 15s. 6d. each certificate, with a maturity

value of 28s. after ten years and interest at 1d. a month after the tenth year; the price of the other issues was 16s., excepting the sixth and seventh which were 15s., and the period ten years for the second, third, conversion, and sixth and seventh issues, eleven years for the fourth issue, and twelve years for the fifth issue. Maturity values were, for the first and second issues, 26s., 24s. for the third issue or 28s. and 33s. if held longer than the original period (and with higher interest if held for such longer periods), conversion issue, 24s., fourth and fifth issues, 23s., sixth issue, 20s., seventh issue, 20s. 6d., and eighth issue, 13s. The total number of certificates sold up to March 31, 1949, was 4,324,389,733 (excluding those of the conversion issue), representing a cash investment of £3,159,914,005. The amount, including accrued interest, remaining to the credit of investors on March 31, 1949, was approximately £2,136,200,000. In 1947-1948 £223,750,000 was subscribed and £135,150,000 (excluding interest) was repaid.

National Socialism, Ger. nationalistic movement led by Adolf Hitler. A Ger. National Socialist movement originated in 1912 in the National Socialist Labour party formed at Karlsbad (then in Bohemia) by a group of *Frei-loten* Gers., but no direct link of this party with that of Hitler has been proved. Hitler's party was founded at Munich by Drexler in 1919 as the Ger. Labour party and renamed the National Socialist Ger. Labour party by Hitler. In 1920 the party adopted a programme the chief aims of which included the union of all Gers., abrogation of the Versailles treaty, persons of Aryan blood only to be members of the nation, foreign nationals to be excluded from Germany, nationalisation of trusts, substitution of Ger. for Rom. law, nationalist education, and improvement of the nation's physique. Only the nationalist, as distinct from the Socialist, slogans were fulfilled, and from the year 1933, when Hitler came to power, no attempt at systematic Socialism in the traditional sense was made, though economic initiative and control passed entirely to the State, not out of regard for Socialist theory but in furtherance of the policy of rearmament. The Nazi (*q.v.*) party, the sole lawful political association in Germany, was based on the leadership principle and the party members had no rights in relation to the conduct of policy, which was the exclusive function of the 'Führer.' Subsidiary organisations of the party of a compulsory character were the Ger. Labour Front, comprising all employees, and the Hitler Jugend (Youth), and the party also organised its own military forces, the S.A. (*Sturm-Abteilung* or storm troops) and S.S. (*Schutz-Staffel*, protective squadron). After the S.A. purge of June 30, 1934, the S.S. or *élite* assumed greater importance in the party system. A party congress was generally held at Nuremberg every year. The original basis of the party lay in the middle class, which the Nazis promised to save from the ruin threatened by big business and the economic crisis, but while the

small trader's business increased, he suffered from heavy taxation and price control, while, later, 'superfluous' small shops and businesses were closed down altogether and the idea of saving the most needy section of the middle class was soon abandoned. See further under HITLER.

National Sporting Club, club for gentlemen interested in sporting and theatrical matters. It was started in 1891, and was long noted as the scene of the princely contests, both amateur and professional, in the boxing world. After the Second World War the club ceased to exist.

National Stud, Brit. state-sponsored racehorse breeding farm, founded by Lord Waverley in 1916. Its first centre was at Kildare, Eire, but in Oct. 1943, it was moved to Gillingham in Dorset. The N. S. is one of the princely centres of the blood-stock industry, and the finest possible racehorses are bred for both the home and foreign market. Stamina and speed are carefully studied, and only horses with a long record of racing successes are kept for breeding. A stallion at the N. S., being national property, can be used by any owner with a mare good enough to be mated with him, and the stud fee is appreciably lower than on a good private stud farm. The king leases horses from the N. S. and pays the gov. one-third of any stake money he wins. Although nominally a non-profit making concern, the N. S. shows an accumulated profit of £195,000 since its foundation.

National Theatre (Britain). N. Ts. have existed for many years in other European countries than Britain. In France, for example, there has been such an institution for about 270 years. The movement for a N. T. in Britain is a comparatively recent development, and the first plans for a N. T. to be built by public subscription were laid by Harley Granville-Barker (*q.v.*) and Wm. Archer (*q.v.*) in 1903. Seven years later this scheme was combined with another already in existence, to provide a national memorial to Shakespeare. The appeal then launched by the Shakespeare Memorial N. T. Committee attracted many distinguished supporters and some contributions. The largest contribution was that of Sir Carl Meyer, who gave £70,000 towards the cost of building a theatre which it was hoped to open in 1916 in the tercentenary of Shakespeare's death, but this was prevented by the outbreak of war in 1914. It was not until 1937 that a site of one acre near the Victoria and Albert Museum was purchased, where it was proposed to erect the N. T., for which the committee had been collecting subscriptions. After the Second World War it was decided that the theatre should be erected in a more central locality. The L.C.C., who contemplated setting up a cultural centre in the area between the Co. Hall and Waterloo Bridge, offered to exchange a site on the S. bank of the Thames for the site in S. Kensington held by the Shakespeare National Memorial Committee and also to provide approaches and roadways to the centre. The Joint Council of the N. T.

and the Old Vic then had at its disposal about £70,000, but it was estimated that to build a worthy memorial theatre would cost about £1,000,000. This sum being outside the range of the Joint Council, it was decided that the gov. should ask Parliament to underwrite the project and to give guarantees and assurances that money up to £1,000,000 would be forthcoming as soon as it was possible to erect the memorial. The gov. accordingly introduced a two-clause Bill to that effect (1919). The first clause provided that the Treasury might make a contribution not exceeding £1,000,000 towards erecting and equipping the theatre and the second made provision for the appointment of trustees. The architects' plans provided for a building containing two theatres: one seating 1200 people, and the other about 500. There would also be accommodation for workshops, stores, conference rooms, library, canteens, and a public restaurant. It was also intended by the gov. to stimulate the art of the theatre and to organise N. T. tours throughout the country and overseas. In the gov.'s view the N. T. should be as much a national theatrical centre as a N. T. for the cap. of the commonwealth. In this connection it is to be noted that there is an Act of 1948 under which municipalities can begin to build municipal theatres and civic centres, so that they can receive the repertory companies and other players who would undoubtedly begin to tour from this national centre. The proposed N. T. is not to be looked upon solely as a memorial to Shakespeare, especially in view of the memorial theatre at Stratford-on-Avon; but rather as one of the first of a chain of living theatres throughout the country.

National Trust. The N. T. acquires lands and houses of natural beauty and interest to ensure their preservation. Founded in 1895 by Octavia Hill, Sir Robert Hunter, and Canon Rawnsley, its status was confirmed by the National Trust Act, 1907, and later Acts of 1919, 1937, and 1939 confirmed and increased its powers. Lands or buildings bequeathed to the N. T. and declared inalienable, are exempt from death duties; properties are generally either self-supporting or accompanied by endowments of money or land. A tenancy may be substituted for a freehold, under the 'Country House Scheme' where the owner wishes continued residence for himself and his descendants. The trust is controlled by a president and a council of fifty, partly elected, and partly appointed by various representative bodies: any person may acquire membership. There are eight committees to deal with particular spheres of work, three regional, and six dist. representatives, and more than a hundred local committees. Under the Town and Country Planning Act of 1947 the N. T. is in the same position as an ordinary landowner, as regards its alienable land; for its inalienable land it does not share in the Land Fund and does not pay a development charge. The trust is financed by bequests left for the benefit

of particular properties, or the acquisition of new properties, and by public appeals.

Many types of land and property are preserved by the N. T. Its finest historic house is Knole, in Kent, a combination of country home, Renaissance mansion, eccles., palace, and feudal manor house, given in 1486 by Lord Sackville. There is also Little Moreton, Cheshire, a fine specimen of sixteenth-century half-timbered work; Montacute in Somerset, Blickling Hall in Norfolk, with an estate of 4500 ac., and others. Castles include Bodiam (c. 1386), Tattershall (c. 1440), and Lindisfarne (1550). There are nearly twenty pre-Rom. and Rom. antiquities, including Chedworth Rom. villa and Hadrian's Wall; Lacock Abbey is a fine example of medieval architecture. Whole vills. have been placed under the trust's care; the Holnicote estate alone includes Selworthy, Allerford, Bossington, and Luccombe. Tenants are found for more than 500 farms, 45 ac. of agric. land, and 20,000 ac. of grazing land owned by the trust. Many miles of coast in England, Wales, and Ulster are owned or protected. There are mts. such as Scafell Pike, moorlands like the 12,240 ac. of the Holnicote estate, and valleys like the 1250-ac. Dolmelynllyn estate on the Ffestiniog road. Ornithological reserves include the Farne Is. (Northumberland) purchased in 1924 by public subscription, the Gulf of Man, Wicken and Burwell Fens. In 1918 the N. T. began to undertake the care of formal and informal gardens, and a joint committee with the Royal Horticultural Society was set up for this purpose: the first acquired was Hildcote in Gloucestershire, and others include Killerton, Packwood, and Stourhead. Bridges are also preserved, such as Stainforth Bridge in Yorkshire, Easing in Surrey, and sev. packhorse bridges in Somerset. The greatest single area possessed by the trust is Monk Coniston estate in Lakeland, of 4300 ac., bequeathed by Mrs. Wm. Heelis (Gentrix Potter).

The headquarters of the N. T. are at 12, Queen Anne's Gate, London S.W.1; there is a separate N. T. for Scotland, and similar bodies have been instituted in other countries including Eire, Belgium, U.S.A., Australia, and New Zealand.

National Union of Teachers (N.U.T.), official organisation of the members of the teaching profession engaged in elementary or state-governed secondary schools, and may be termed the teachers' trade union. It was formed in 1870: (1) To associate and unite the teachers of the kingdom of England and Wales. (2) To provide means for the co-operation of teachers and the expression of their collective opinion upon matters affecting the interests of education and the teaching profession. (3) To improve the conditions of education in this country, and to obtain the estab. of a national system of education, and to secure for all public elementary schools adequate financial assistance and accommodation. (4) To afford to the Board of Education and other public or private organisations in connection with education the advice of the association. (5) To

secure the effective representation of educational interests in Parliament. (6) To watch the working of the various Acts of Parliament in connection with education, and to secure the removal of abuses. (7) To raise the status of the teaching profession, and to open the highest posts in the educational service of the country, including the Inspectorate of schools, to the best equipped members of the union. There are also a provident society, a teachers' benevolent and orphan fund, and orphan homes in connection with the union. In addition to the above aims, the union affords advice and assistance to members in legal matters. The union examinations board conducts examinations and issues diplomas in various commercial and educational subjects. The present membership is about 150,000, being approximately 75 per cent of the total number of teachers. The executive of the N.U.T. is vested in a council consisting of the president, the Vice-president, the ex-president, the treasurer, and thirty-three other elected members. In 1938 there were negotiations for affiliation or amalgamation with some or all of the numerous smaller teaching professional associations which include teachers in private and public schools. The secretary of the N.U.T. is Sir Frederick Manner, and the offices are at Cheltenham. See *The Yearly Handbook and Account of the Conference Proceedings*.

Nativity, name given to the Christmas season, celebrating the birth of Jesus Christ, which is fixed by the Church as Dec. 25. Also, the N. of the Blessed Virgin Mary is a festival in the Rom. Catholic Church, and celebrated on Sept. 8. This festival was formally appointed to be observed by the Synod of Salzburg in A.D. 800, but had in reality been celebrated since about 690. For the various usages in connection with the N. of Christ, see CHRISTMAS. In astrology, N. has the same meaning as horoscope.

Natrolite, zeolite, one of the common secondary products after minerals of the nepheline group. Is found in the basalts of Ireland and Scotland, Auvergne, etc. It has the composition $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 + 2\text{H}_2\text{O}$. Is white or yellowish-red in colour and usually transparent (sp. gr. 2.2, hardness 5.5). Fuses in the candle flame, and gelatinises with acids, silica being liberated.

Natron, naturally-occurring sodium sesquicarbonate, $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$, formed by the gradual drying up of soda lakes. Deposits occur in many regions, notably near Lake Magadi in Kenya, in Mexico, Venezuela, Hungary, and the U.S.A. The **N. Lakes** are a group of lakes, some sixteen in number, situated in the Wady Atrun or N. Valley, Libyan Desert, Egypt, 60 m. W.N.W. of Cairo. The locality is also noted for four monasteries, from whose libraries many valuable MSS. have been added to European collections.

Natterjack, or **Rush Toad** (*Bufo calamita*), indigenous to W. Europe. Smaller than the common toad, with shortened hind limbs, short almost webbed toes,

yellowish-brown, with bright yellow line running down the back. It moves by walking or short runs instead of hopping. The male has a vocal throat-sac which, when distended, is larger than the head. The eggs are laid in the water and the tadpoles are extremely small.

Natural (in music), the term applied to any un-inflected note. The normal key, which begins on C, is constructed on Ns. The sign ♮ is used to cancel a preceding sharp or flat.

Natural Gas. In some parts of the world, gases of different composition are found associated with rocks of varying geological age. They are usually confined under pressure, and boring serves to free them from their site. The gases often consist of a mixture of hydrocarbons of the methane series in which the first member, methane, predominates. But there may be present ethane, propane, butanes, pentanes, hexanes, etc., as well as nitrogen, carbon dioxide, and sometimes helium and other rare gases. Occasionally hydrogen sulphide is present in fair amounts. These N. Gs. are frequently associated with oils. About 95 per cent of the world production of N. Gs. comes from U.S.A., whilst Canada is responsible for the larger proportion of the remaining 5 per cent. The gases are commonly carried for hundreds of miles along pipes and are employed for heating purposes, domestic and industrial. The calorific value is high (unless a high percentage of nitrogen is present), being in the region of 1000 B.Th.U. per cubic foot. In addition to this, N. G. has been put to useful advantage in the making of many valuable organic products such as methyl chloride, alcohol, etc., in the driving of gas engines (q.v.). In Utah, Colorado, and at Medicine Hat in Alberta there occurs a N. G. which is comparatively rich in helium, and by a process of fractionation all the other gases present are liquefied, whilst the helium is pumped off and purified as far as possible. This is the source of the helium employed in science and industry. The origin of this gas is probably radioactive transformations which have taken place in the past.

To some extent N. G. is found in coal mines, when it gives rise to the dreaded firedamp. The mixture of the gas with air is apt to be a very explosive one, and as it has neither any particular colour nor smell it can only be detected by special means (see DAVY LAMP). Again the N. G. sometimes takes the form of carbon dioxide mainly. This, in virtue of its high density compared with that of air, is inclined to collect in pockets.

Natural History, term which originally meant the systematic study of all natural objects, animal, vegetable, and mineral, and thus included all sciences, such as biology, geology, chem., etc. With increasing knowledge and the growth of specialisation, such a term by its very vagueness became unsuitable in many cases. It is, what is now used, practically synonymous with zoology, although by some naturalists it is confined to the study of the living organisms, thus not including

comparative anatomy. The name is gradually falling into desuetude, but survives in such titles as the Museum of N. H., or, to give it its true title, the Brit. Museum (N. H.).

Naturalisation, see under ALIEN.

Naturalism, term of philosophy which has borne different meanings according to its use. When now used it generally denotes the antithesis of Idealism, and is akin to, though differing slightly from, materialism and pantheism. In theology it is the denial of the supernatural system of sanctifying grace.

Natural Order of Plants, system of classification of the members of the vegetable kingdom according to the structural and essential characters of each individual, grouping those together which agree in the greatest number of characters. A species comprises individuals which agree in all their constant characters; species similar in important respects are grouped into a genus which with related genera forms a natural order or family. Classes are still more comprehensive groups, and these are divided into the two sub-kingdoms Phanerogamia, or flowering plants, and Cryptogamia, or so-called flowerless plants.

Natural Philosophy, term denoting science as a whole, or that branch of it usually called physics at the present day. The philosophy of the ancients included the study of natural phenomena and hypotheses regarding their relations. As knowledge progressed, there was a tendency to subdivide science into various spheres. In the course of differentiation, the term natural philosophy was retained for that branch of science which does not deal with the ultimate structure of substances, but only with such phenomena as light, heat, sound, etc., which are independent of chemical conceptions. It is no longer possible to maintain such a separation. See also PHYSICS; HEAT, LIGHT; SOUND; MAGNETISM; ELECTRICITY. See Sir E. Whittaker, *From Euclid to Eddington*, 1949.

Natural Theology deals with such knowledge of God as may be attained by the human reason without recourse to the aid of divine revelations. The div. of Christian apologetics into two parts, revealed religion and N. T., is now generally given up, the whole subject being treated on a wider basis and the evidence being arranged according as it lies in the realm of physics, of psychology and metaphysics, of morality, or of the spiritual. The Eng. classical defence of N. T. is Wm. Paley's *Evidences of Christianity* (1794). The aim of the argument from natural religion is to prove that God exists and to evolve such notion of God as is attainable by pure human reasoning. This it strives to do from six main arguments: (1) That of general consent. The universal belief of mankind has more than a subjective value; it bears witness to a law impressed in our nature. (2) The cosmological argument, which, taking the world as the effect, argues *a posteriori* to a first cause. (3) The teleological argument, or argument from design, stated by Paley in his first

chapter, where he makes the well-known comparison of the world to a watch. (4) The ontological argument, which we owe to St. Anselm, which bases belief on the statement that 'that must exist than which no greater can be conceived.' It is developed at length in his *Proslogion*. (5) The argument from man's moral sense; and (6) the argument from design in hist. Aquinas elaborated (2) and (3) showing God to be first mover, first efficient cause, the only being ontologically necessary and perfect, and the ultimate designer of a designed universe. From each and all of these attributes he deduced the idea of God as simple, spiritual, autonomous, being, infinite and perfect, transcending the created universe. This is still the classic N. T. of the Rom. Catholic theologians. The argument of St. Anselm is generally discarded.

'Nature.' name of a Brit. weekly periodical, estab. in Nov. 1869. It aims at placing its readers in touch with the results of scientific claims and discoveries, and urges the claims of science to a more general recognition. Articles on scientific subjects, full accounts of new discoveries, reviews of notable books and papers, and accounts of noteworthy meetings, are included. The paper is pub. by Macmillan.

Nature Printing, name of a process of obtaining plates or engravings by means of impressions taken from the actual objects, and by printing from these impressions. This process can only be used in connection with objects which have flat surfaces, such as lace, and dried plants. The result is obtained by placing the object between two plates, one of copper and another of lead, and by pressing the plates by means of a pair of rollers. The impression thus produced on the leaden plate may be used if only a few copies are needed, but if a large number is required a facsimile of it may be obtained on copper by the electrotpe process.

Nature Study, modern revolt against the bookish tendencies of older methods of education. It is encouraged in schools with the object of teaching children to observe for themselves and not to accept common hearsay, with its frequently superstitious associations, as fact. In relation to the modern attempts to repopulate the countryside, N. S. is of the very first importance, especially in the country schools. The practical application of N. S. in schools by gardening, and by the keeping of small live-stock, such as poultry and bees, has in recent years made rapid progress.

Nature Worship, worship which is given to any of the powers or objects of nature and which assumes various forms. In most cases the powers of nature are personified, and the spirit which is regarded as belonging to them is the object of adoration. Among the objects which are worshipped may be mentioned stones of various sizes and forms, trees which were either supposed to be the deity or the dwelling-place of his spirit, animals which are worshipped in some cases because they are supposed to contain the spirit of a

departed friend or relation, and in others because they are of use. The sun and moon were worshipped by some early tribes, as were also the stars, and they still remain deities among some races. The worship of rivs., water, and of mts. has been practised in various countries at different times and in different ways, sometimes the thing itself being the object of worship and sometimes a spirit embodied in it. See also ANIMISM; MOON; SUN WORSHIP; ZOROASTRIANISM. See Sir J. G. Frazer, *The Golden Bough* (3rd ed.), 1907-15, and *The Worship of Nature*, vol. i., 1926.

Naucratis, name of a Gk. trading settlement in Egypt, which was situated between Cairo and Alexandria, near the modern Nebreh. The settlement was probably founded by Milesian colonists about the seventh century B.C., and was noted for its flowers and pottery. The site was discovered in 1881, and the ruins include those of temples, buildings, etc.

Naudé, Gabriel (1600-53), Fr. scholar and librarian, b. in Paris. He studied medicine at Paris and Padua, and was physician to Louis XIII. In 1628 he took charge of Cardinal Bagnio's library, and in 1641 was librarian to Cardinal Arberin and later to Queen Christina of Sweden. His book *Aider pour dresser une bibliothèque* (2nd ed., 1644) was the first to consider the methodical arrangement of a library. In 1653 he was requested by Mazarin to come and help him to re-form his library, which N. had helped to collect, and was on his way when he died at Abbeville.

Nauen, tn. of Brandenburg, Germany, 20 m. N.E. of Brandenburg. Pop. 9000.

Naugatuck, bor. of Connecticut, U.S.A., in New Haven co., 27 m. N.E. of Bridgeport. One of the world's largest rubber regeneration plants is here, and other manu. include chemicals, glass, plastics, and aeroplane instruments. Pop. 15,300.

Nauheim, or **Bad Nauheim**, tn. of Hesse, formerly in the grand-duchy of Hesse-Darmstadt, Germany, 24 m. N.N.E. of Frankfurt-on-Main. It is a noted health resort and possesses thermal saline springs with a temp. of from 81° to 95° F. Pop. 12,900.

Naumachia (Gk. *ναυμαχία*, from *ναύς*, a ship, and *μαχία*, a battle), the name which the Romans gave to the mimic sea-fights which were waged as a spectacle, and also to the scenes of the combats. The latter took place sometimes in the Circus Maximus, water being introduced sufficient to float ships. The first N. on record represented an engagement between the Tyrian and Egyptian fleets, and was given by Julius Caesar in 46 B.C. in the Campus Martius. The custom of exhibiting naumachiae was not confined to Rome, as we find arrangements for flooding the amphitheatres at Capua and Nîmes. The combatants fought as in the gladiatorial games, no quarter being given; gladiators or condemned criminals were employed.

Naumburg, tn. of Saxony, Germany, on the Saale, 24 m. S.W. of Halle, with a considerable wine trade, and manu. of

beer, vinegar, chemicals, cotton, and woollen goods, etc. The most important building is the cathedral of St. Peter and Paul (1207-42). Pop. 26,006.

Naunton, Sir Robert (1563-1635), Eng. author and statesman, noted for his book *Fragmenta Legalia, or Observations on the Late Q. Elizabeth, her times and favorites* (1641), which was revised by Sir W. Scott in 1808, who added N.'s memoirs to the ed. J. Caullfield also ed. this book in 1814. In 1601 N. was elected public orator at Cambridge Univ. He attracted the notice of James I., who appointed him master of requests (1603). After holding other political offices, he was appointed secretary of state (1618). See life by J. Caullfield, 1811 (?).

Nauplion, small fort. tn. and seaport, cap. of Argolis, Greece, at the N. extremity of the gulf of Argos of Nauplia, and 7 m. S.E. of the tn. of Argos. In the thirteenth century it was occupied by the Venetians, and was taken by the Turks in 1540. From 1824 to 1835 it was the cap. of Greece. The roadstead is one of the best in Greece, having deep water, good shelter, and the protection of two fortresses. Pop. 7000.

Nauplius, king of Euboea and father of Palamedes. To avenge the death of his son, whom the Gks. had put to death during the siege of Troy, he watched for the return of the Gks., and as they approached the coast of Euboea he lighted torches on the dangerous promontory of Caphareus. The sailors, thus mis-guided, suffered shipwreck.

Nauplius, unsegmented larvae of the lower crustacea with a single frontal eye. See CRUSTACEA.

Nauru Island, is. in the Pacific Ocean, situated in 166° E. long. and 26° S. lat., administered under mandate by Great Britain, Australia, and New Zealand. Area 8 sq. m. Pop. 2700, of whom 200 are Europeans. In Nov. 1947 the United Nations general assembly brought N. I. within the United Nations trusteeship system, with the govs. of Australia, New Zealand, and the United Kingdom as joint administering authority. Valuable phosphate deposits were discovered in 1900 and developed by the Pacific Phosphate company. In 1919 these interests were bought up by the mandatory govs. The revenue in 1938 was £30,000. The is. was bombed by Jap. planes on Dec. 10 and 12, 1941, and occupied in Aug. 1942, until the Jap. surrendered in Sept. 1945.

Nausari, see NOSARI.

Nausea, sense of sickness at the stomach, a desire to vomit. The word is derived from *ναύς*, a ship, and is therefore especially associated with sea-sickness. The condition, however, brought about by many varied affections of the nerves and digestive organs, and is a symptom of many diseases.

Nausicaa, beautiful daughter of Alcinoüs, king of the Phæacians, and his queen Arete; was noted for her simplicity, modesty, and gentleness. One day when she was playing ball on the shore with her maidens, the shipwrecked Ulysses suddenly appeared, striking terror into all

but N., who took him to the court of her father. See Homer's *Odyssey*, vi.; and J. A. Symonds, *The Greek Poets*, vol. 1, 133-137, 1873-76.

Nautch Girl (Hindu *nach*, dance), Indian professional dancing girl. Many are attached to temples where they perform sacred dances in jewelled dresses; others are hired to entertain guests at private secular dances i.e. nautches in the strict sense. Moslem N. Gs. perform only in secular dances, as on the festival evening of Rāmādān. The dance consists of posturing and slow steps, each part of the body being used to express emotion.

'**Nautical Almanac**,' gives the spherical co-ordinates of the sun, moon, planets, chief stars, and also the rectangular co-ordinates of the sun, for every day of the year (those of the stars change so little that ten-day intervals suffice), times of occultations of sunrise and sunset, moonrise and moonset, of eclipses, and scores of other matters essential to the astronomer. It is pub. annually at least a year in advance and collaboration between the N. A. office and other similar institutions in different countries is essential, owing to the magnitude of the work involved in making the necessary calculations. It was first produced in 1766 for 1767, and continued the responsibility of the Astronomer Royal (although the work was supervised by a superintendent known as the 'comparer') until 1832 when it was pub. by order of the Board of Admiralty.

Nautical Surveying, see under SURVEYING and LEVELLING.

Nautilus, name given to two distinct Cephalopods, but the pearly N. is generally indicated, the paper N. being referred to the quite distinct genus *Argonauta*. The genus N. inhabits the Indo-Pacific Ocean,

a number of small retractile feelers instead of arms with suckers and hooks, and in having an external chambered shell. The shell is pearly within, and has a regularly convoluted form, the last whorl being equal to all the others. The chambers or cells are perforated towards the centre and connected by a slender tube or syphon which probably makes the progress of the shell muscle. The number of partitions in the cell indicates the periods of growth, a new outer chamber being added as the capacity of the previous one is outgrown. The total number of compartments is often about thirty. Externally the shell is covered with a calcareous layer and is brown in colour and marked by dark bands 'like a tortoiseshell cat.' The shell yields a fine mother-of-pearl, which is used for inlaying. The N. frequents the sea bottoms, where, with its foot, it can make fairly rapid progress. It lives chiefly on molluscs and small crustaceans, and is sometimes taken lobster pots and hoop nets. Like other members of its class, it occasionally swims backwards on the surface by propelling spouts from the syphon, the head and tentacles being projected out of the shell; but the rise is probably involuntary and caused by storms. The animal appears to be much exposed to the attacks of various enemies, having no operculum, and being but feebly attached to the shell, and it is the only Cephalopod which lacks the power of discharging an ink-like fluid to darken the water to escape from its enemies. On the Nicobar coast of India its flesh is salted and dried.

Navajoes, or **Navahoes**, are N. Amer. aborigines, forming the most important tribe of the S. div. of the Athabaskan stock of the N. Amer. Indians. The remnants of the tribe are located in the Navajo reservation, New Mexico and Arizona, and number about 20,000. See Dr. W. Matthews, *Navaho Legends*, 1887, and C. Kluckhohn and D. Leighton, *The Navaho*, 1917.

Naval Air Arm, title given in 1946 to the air component of the R. N., previously known as the Fleet Air Arm (q.v.). The N.A.A., or naval aviation, comprises from one-quarter to one-third of the total strength of the R.N.

Naval and Military Scientific Societies. Probably the best known of these is the Royal United Service Institution, with its imposing home in Whitehall. There are among others the Institute of Royal Engineers at Chatham; the Royal Artillery Institution at Woolwich, and the Institution of Naval Architects; the Army Historical Research Society; the Society of Nautical Research; and the Navy Records Society. Most of these bodies issue quarterly magazines: *The Mariner's Mirror*, *The Journal of the Society of Nautical Research*, and *The Army Historical Research Magazine* (estab. soon after the First World War) are all well-known productions which deal with naval and military subjects of current or historical interest. The Navy Records Society has no periodical, but issues rare and hitherto unpublished records of

NAUTILUS POMPILIUS

A, swimming; B, shell in section; C, crawling.

and differs from all other living Cephalopods in having four gills instead of two, whence it is placed in a separate order (Tetrabranchia) of its class. Of over thirty genera of that order it is the only surviving genus. It differs, too, in having

the navy in vol. form, dealing with special events or important persons.

Naval Cadet, see NAVAL EDUCATION

Naval Colleges, Royal, see NAVAL EDUCATION.

Naval Discipline Acts define the offences and procedure of naval law. The first comprehensive code was drawn up by command of Richard Cœur de Lion in 1194 after his return from the third crusade. This code was known as the Naval Laws of Oleron from the is. in which the code was drawn up and sealed. It became the virtual basis of the sea laws of 1530 drawn up by order of King Henry VIII., of which naval discipline forms a large part. The Act which is now in force is the Act of 1884, which amended the Act of 1866. This Act defines the constitution of the court-martial which tries naval offences, and regulates its personnel according to the rank of the person charged. The Act also defines the limit of locality for naval law. See COURT-MARTIAL.

Naval Education, for officers, is given at: (1) The Royal Naval College, Dartmouth, through which officers are normally admitted to the R.N. Under the new scheme estab. In 1948 there are three entries of cadets each year, at the age of sixteen. Special entry cadets, at a later age are also admitted and remain at Dartmouth for four months instead of two years. Subsequently all cadets spend eight months in a training cruiser before joining the fleet as midshipmen. Competitive examinations, held near the candidate's own school, make an initial selection, and admissions are finally decided by a full day's test of character, aptitude, and intelligence. Fees have been abolished, and there is free board and lodging, parents paying for uniform and personal expenses according to their means. (2) The Royal Naval Engineering College, Keyham, for officers specialising in engineering. A course lasts four years and midshipmen join the college on completion of their cadet training. New classes join in Jan. and Sept. each year and training qualifies officers for service afloat in the engineering branch. (3) At sea by instructor and technical officers. (4) The Technical Schools of Gunnery, Torpedo, Navigation, etc., at Portsmouth, and, to a smaller extent, at other dockyard ports, where all executive sub-lieutenants must qualify for lieutenant. Technical schools also provide courses for specialists and other officers. (5) The Royal Naval College, Greenwich, estab. in 1873 for the education of naval officers. Also includes the Naval Staff College, the Naval War College, the School of Naval Architects, and Women's Royal Naval Service Officers' Training Corps. Instruction is given to naval and marine officers in all branches at all stages of their career from sub-lieutenant to captain R.N., in theoretical and scientific study bearing on their profession. The Royal Naval College is commanded by a vice-admiral (president) assisted by an administrative and professorial staff. The president also has direct control of

the Naval War College where, with a captain R.N. as deputy, senior officers study the higher strategy of war. The Naval Staff College is commanded by a captain R.N. (director). Officers from the army and R.A.F. also attend the Naval Staff and War Colleges. (6) Other estabs. such as the Tactical, Joint Anti-Submarine, Signal Schools, Royal Naval Air Stations, etc. All R.N. educational estabs. are open to officers of the dominion navies and those of India and Pakistan. Officers of foreign navies may also attend for special courses. For men and boys—at boys' training estabs. such as H.M.S.

Ganges (Shotley), H.M.S. *St. Vincent* (Gosport), at R.N. barracks, in the training squadron, and at technical schools. At sea, general education is carried out by instructor officers and schoolmasters. R.N. vocational training to give men an opportunity to improve their prospects of employment on return to civil life is carried out mainly by lectures at the naval depots and at municipal training colleges, etc.

Naval Expenditure. The real beginning of the expenditure of a fair proportion of the public funds on the upkeep of the navy dates back to the time of Cromwell.

Previous to that time the navy, such as it was, had been supported chiefly by special grants and by ship money, a tax which is supposed to date back to the time of Alfred the Great. By 1683 N. E. had reached the sum of nearly £1,000,000 per annum, but during the eighteenth century, when we were struggling for colonial supremacy, the personnel of the navy and the cost of the upkeep went up by leaps and bounds. Under the administration of the elder Pitt, the expenditure per annum reached £5,500,000, and during the Amer. War of Independence the personnel of the navy reached practically 100,000 men, and the expenditure was wellnigh £9,000,000 per annum. By the end of the Napoleonic war (1815) the expenditure had reached the colossal figure of £23,500,000. During the peace years which followed it remained evenly at about £7,500,000; this naturally increased during the Crimean war, when the figure again crept up to about £20,000,000. In the financial year ending March 1914 the total amount voted for the navy was £15,075,000. The ratio-agreement and limit of size of capital ships prescribed by the Washington Treaty of 1922 (*q.v.*) prevented the race in armaments for many years and kept expenditure within tolerable bounds, and at the end of the first decade and a half after the First World War the total figure did not much exceed £50,000,000, increases being mainly for replacements and modernisation, always within the treaty limits. Further limitations on design agreed on by the London Conference of 1930 imposed some check on expenditure, while, under the London Treaty of 1936, qualitative development of all the major navies was regulated, and the old Washington limit on capital ships retained. Thus in 1935-1936 expenditure was only £60,050,000, a low figure in view of the fact that Germany was now free to build up to a higher ratio to Brit. construction and that scientific development in armaments involved ever-increasing expense. But the chief factor in enhancing Brit. N. E. was the refusal of both Japan and Germany any longer to be bound by any treaty limitations whatever after the expiration of the Washington and London Treaties in 1936. Hence in the financial year 1937-38 the figure for N. E. rose to £95,196,000, the increase being mainly in respect of three new battleships and some eighty other new ships, all, however, being constructed within the qualitative limits of the treaty of London of 1936. In 1938-39 the total was £113,810,000 and, in view of the menacing international situation, Great Britain contemplated adopting the 'escalator' clause (allowing building over the 35,000-ton limit) of the London Treaty, owing particularly to Jap. construction. In the year 1939-40 the figure rose to £149,399,000, fifty ships being added in the previous year and sixty more in the year 1939, all this construction being directed against Germany. In 1940-41 the total amount of N. E. rose sharply to £384,162,000, construction being limited only by the building capacity of the shipbuilding yards.

This figure continued to rise and in 1943-1944 reached £690,563,761. On conclusion of the Second World War it naturally fell, and in 1948-49 dropped to £153,000,000. In the following year, however, it began to rise again to £189,250,000, due mainly to improvements in naval and civilian emoluments, exhaustion of war stocks, and higher prices. With prices still rising; with the necessity to replace obsolescent equipment and to meet the advance of science by supplying the fleet with the latest devices (all more complicated and expensive) it is unlikely that N. E. will drop in the foreseeable future.

Naval Literature. The literature which has grown up round so important a subject as the navy has by this time reached immense proportions. We can deal first of all with official literatures, and we find that this side of the subject alone contains such a vast amount of works that it is possible here only to mention the chief headings under which they can be found. 'General regulations' is the title of the first sub-heading, and the literature to be found here deals simply with those regulations which govern the men who belong to the R.N. Special handbooks are issued which deal with special subjects, such, for example, as manuals of gunnery, handbooks for special guns, e.g. *Handbook of the Nordenfeldt 6 Pr. Quick-firing Guns, Marks 1. and 11.*; *Handbook of Gymnastic Exercises for the Use of His Majesty's Fleet: Signals for the Royal Navy and Ships under Convoys* (1746, one of the more recent books issued on the latter subject being *The Seaman's Signal Manual for the Use of His Majesty's Navy* (1928)). Special manuals are also issued dealing with training ships, uniform, watch, station, quarter, and fire bells, reviews and manoeuvres, Royal Marines, R.N. Reserve, and there is, of course, also the periodical pub., the *Navy List*. Practically two columns of the catalogue of the Brit. Museum Library are taken up with lists of addresses and petitions from the R.N., and in glancing through these we find, 'A letter from the commanders and officers of the fleet of this commonwealth unto General Monck in Scotland' (1659), and 'To his Highness the Lord Protector, the humble petition of the seamen belonging to the ships of the commonwealth of England.' Among the miscellaneous literature catalogued in the vol. already mentioned we find *A Brief Inquiry into the present condition of the Royal Navy* (1801), which only goes to prove that a topic which is ever recurring at the present day is by no means new, and also a copy of the oath taken by the seamen of the revolted ships (1648). Most of the pamphlets to be found here deal with some grievance or some supposed fault of the R.N. To turn, however, to the more modern side of the literature of the Brit. R.N., we find that within even the last few years literature has increased at a great rate. Modern general literature with some bearing on the navy includes amongst many other pubs. the following: Count Reventlow, *Die Englische Seemacht*

1906; E. S. Bellasis, *The Fighting Ships and their Work*, 1925; C. H. Brown, *Manual of Seamanship*, 1927; and A. E. Seaton, *Manual of Marine Engineering*, 1928; and for sailing ships, R. and H. C. Anderson, *The Sailing Ship*, 1926. Works dealing with naval hist. include Ford, *Earliest English Navigation and the First Schools of Warfare* 1906; Kill, *Seemacht in der Ostsee im 17. 18. Jahrhundert* (Kiel, 1907-1908); 'The Elizabethan Naval War with Spain' (in the *Cambridge Modern History*, vol. iii., 1904); 'The Navy of the Commonwealth and the First Dutch War' (*Cambridge Modern History*, vol. iv., 1906); *Naval Operations between Great Britain and America, 1812-15* (Theodore Roosevelt); *Peppys's Memoirs of the Royal Navy, 1679-88* (ed. by J. R. Tanner, 1906); Adm. Sir H. Richmond, *The Navy in the War of 1739-1748*, 1926; 'The Struggle for the Mediterranean' (*Cambridge Modern History*, vol. viii.), and 'The Armed Neutrality and the Command of the Sea' (*Cambridge Modern History*, vol. ix.), both by H. W. Wilson. Literature dealing with naval science also has been pub.: Sir C. A. G. Bridge, *The Art of Naval Warfare*, 1907; R. Daveley, *A Study of Naval Strategy*, 1909; A. T. Mahan, *Naval Administration and Warfare*, 1908; and Sir H. Richmond, *Naval Warfare, 1930*, and *The Economy of Naval Security*, 1931; and on special topics we find a literature on such subjects as: A. Stenzel, *Submarine Navigation and Warfare*, *Naval Art*, *Deutsches seemannisches Handbuch* (Berlin), 1904; A. Pearce-Higgins, *Defensively Armed Merchant Ships*, 1917, and *The Right of Visit and Search*, 1927; C. J. Colombos, *A Treatise in the Law of Prize*, 1926; H. A. Smith, *The Modern Development of the Law of Naval War*, 1929. Other books which may be mentioned in this class are A. T. Mahan, *Influence of Sea Power upon History*, 1890, *Influence of Sea Power upon the French Revolution and Empire*, 1892, and *Sea Power in its Relation to the War of 1812*, 1905; J. A. Froude, *English Seamen of the 16th Century*, 1895; and Sir H. Richmond, *Sea Power in the Modern World*, 1934, and *The Navy*, 1938.

Compared with army literature the First World War did not produce a large amount of N. L., but mention must be made of J. S. Corbett and H. Newbolt, *Naval Operations (1914-19)*, 1920-23; C. E. Fayle, *Seaborne Trade*, 1920-24; A. Hurd, *The Merchant Navy*, 1921-24; T. G. Frothington, *The Naval History of the World War*, 1924; and the official dispatches of the battle of Jutland. On this battle a narrative poem, correct in its naval details, has been constructed by Shane Leslie (1931). Among N. L. of the Second World War are included Capt. R. Grenfell, *The Bismarck Episode*, 1948; Capt. Taprell-Dorling ('Tafrail'), *Western Mediterranean*, 1942-45, 1947; W. E. Benyon-Tinker, *Dust upon the Sea*, 1947; Capt. J. Cowie, *Mines, Minelayers, and Mine-laying*, 1949; Comdr. G. Stitt, *H.M.S. Wildcat*, 1943, and *Under Cunningham's Command*, 1944; and Comdr. R. Wemyss, *Walker's Groups in the Western Approaches*, 1948.

An important side of N. L. is that which deals with the biographies of famous seamen. Amongst the more important of this class may be mentioned: J. Charnock, *Biographia navalis*, 1794-98; R. Southey, *Nelson*, 1813; J. Corbett, *Memoirs of Paul Jones*, 1830; *Drake*, 1890, and *Drake and the Tudor Navy*, 1898; E. Brenton, *St. Vincent*, 1838; J. Ross, *Saumurcz*, 1838; E. Edwards, *Raleigh*, 1868; F. Jones, *Frobisher*, 1878; C. Fitzgerald, *Naval Biographical Dictionary*, 1861, and *Tryon*, 1897; D. Haunay, *Blake*, 1886, and *Rodney*, 1890; A. T. Mahan, *Nelson*, 1899; and H. Keppel, *A Sailor's Life under Four Sovereigns*, 1899. As far as naval fiction is concerned we may mention merely T. Smollett, *Roderick Random*, 1748; Fenimore Cooper in the *Pilot*, 1823, and the *Two Admirals*, 1812; Capt. Marryat in *Frank Midway*, 1829, *Peter Simple*, 1834, and *Mr. Midshipman Easy*, 1836; E. Howard in *Rattlin the Reefer*, 1836; 'Q' in the *Blue Parlious*, 1903; C. S. Forester, *The Ship*, 1943, and the stories of Paymaster Commander L. A. da C. Ricoi (Bartimeus). Amongst personal reminiscences are notable: *Peppys's Diary*, 1660-78; M. Taulman, *Diary of a Chaplain*, 1719; W. Dampier, *Voyages*, 1779, and *Cook's Voyages*, 1893; Lord Byron, *Journal of a Voyage Round the World*, 1821; S. Osborn, *Stray Leaves from an Arctic Journal*, 1852; C. Darwin, *Voyage of the 'Beagle'*, 1852, and *Journal of H.M.S. 'Beagle' in 1831-36*, 1890; and Hubert Pasha, *Sketches from My Life*, 1886.

Naval Manœuvres, see STRATEGY AND TACTICS, and under NAVY AND NAVIES.

Naval Operations in Second World War. Blockade of Germany.—The naval side of the war was opened by the Ger. sinking by torpedo the 13,000-ton Atlantic liner, *Athenia*, on Sept. 1, 1939. This was the first Ger. submarine attack on the high seas and the ship, which was carrying 1400 passengers, was sunk without warning about 250 m. W. of Donegal. Most of the passengers were picked up by Brit. destroyers, but 128 persons lost their lives. The Ger. Gov. promptly announced that the Brit. Admiralty had sunk the boat in order to rilly Germany, a grotesque travesty which was not even characterised by the customary, if superficial, cunning of the Ger. propaganda machine. As soon as war broke out the Brit. Gov. indefinitely suspended all their obligations under the London Naval Treaty, 1936, and the agreements of 1937 with the U.S.S.R., thereby giving Britain a free hand in building ships of any tonnage and armament whatsoever. The blockade of Germany was begun at once, though the war was well advanced before some of the more glaring loopholes in the blockade were circumvented. While Italy remained neutral great quantities of oil and other essential commodities found their way through that country into Germany, while, again, until Ger. exports were stopped, as a reprisal for the laying of magnetic mines, the blockade was defective in that it allowed Germany to exploit the various terrified 'neutrals.' Ger. merchant ships were soon being

steadily driven from the seas in spite of the use of every artifice and every expedient of concealment to avoid capture. At the outbreak the total tonnage of Ger. ships at sea or in neutral or allied ports (excepting the Baltic) was about 1,105,000 tons. Practically all that shipping had been cleared off the seas by the second week of the war. Some were captured, some scuttled, and much of it interned. It was at once evident that Germany was prosecuting an unrestricted submarine campaign as violent as that on which her navy embarked in 1917, and that her submarine commanders had been given orders to sink all ships at sight and without warning. As time went on it became obvious that Germany's only hope of counteracting Britain's command of the seas was to sink, by fair means or foul, as great a total tonnage as possible. Early in the war only a certain measure of success attended the R.N.'s operations against enemy submarines and it was fortunate that the menace did not at first approach the magnitude it assumed in the First World War. In Nov. 1939, after much mysterious talk about using 'a terrible secret weapon,' Germany tried the device of sowing the seas with magnetic mines dropped from aeroplanes or laid by submarine. But very soon one of these mines fell on swampy land on the E. coast so that its secrets were disclosed, with the result that ships were fitted with a defensive device called the 'degauzing' xirde (the gauss is a unit of magnetic flux) which had the effect of demagnetising or depolarising the ship. (The xirde ran round the hull with an electric current passing through it, the effect being to demagnetise the field through which the ship passed.) No less than 120,000 tons of Brit. merchant shipping were lost in the first fortnight of the war, while only 30,000 were lost in the second fortnight. In the ensuing period the total varied considerably, rising perhaps to as much as 70,000 tons Brit. and neutral. It was impossible, very early in the war, to apply the convoy system while so many of the ships were afloat on the high seas, but when it was applied its results were no less decisive than in the First World War. But however well devised and applied, these and other counteractive measures could hardly prevent occasional very serious losses at the hands of a powerful, determined, and resourceful foe.

Loss of 'Courageous' and 'Royal Oak'.—On Sept. 17, 1939, the aircraft carrier *Courageous* (22,500 tons) was torpedoed and sunk, and of the total complement of 1202 officers and men, 515 lives were lost, including the commander. The *Courageous* was originally completed as a cruiser in 1917, but was converted into an aircraft carrier between 1924 and 1928 and refitted in 1936. She was attended by four destroyers, but at the time two of these had to go and hunt a U-boat which was attacking a merchant ship, and when the aircraft carrier turned into the wind at dusk to enable her aircraft to land on her deck, she happened by an extraordinary chance to meet another U-boat.

Grand-Adm. Raeder at about this time stated that if Brit. merchantmen were armed this would provoke counter-measures; but Mr. Churchill, then First Lord of the Admiralty, retorted that very soon the whole mercantile marine of the empire would be armed and, as time was to prove, their crews repeatedly defended themselves with success, often bringing down attacking seaplanes or bombers. Despite the menace from the air, vastly more developed than in the previous war, the navy's command of the seas enabled some 158,000 Brit. soldiers to be transported to France within five weeks from the outbreak of war—as compared with 148,000 men in six weeks in the First World War. More devious routes were taken than in 1914 and again the ships had to carry a much greater load of guns, tanks, and mechanised material. Early in Oct. there was considerable intensification of the U-boat campaign against Scandinavian shipping and it was evident that the Ger. Gov. were not to be deterred by any considerations of neutrality where it was to their advantage to ignore them; and, at this time, the Ger. Gov. also announced that as Ger. submarines had been attacked by Brit. merchant ships every vessel of the Brit. mercantile navy would be regarded as a warship. This was a change of policy and was soon followed by the sinking of freighters off the coast of Brazil by an armed raider—probably the *Graf Spee* whose operations off the S. Amer. coast had been reported by the naval authorities at Durban. Ger. bombing from the air was not very effective. Thus on Oct. 5 there were repeated actions in the North Sea between enemy planes and Brit. cruisers and destroyers, but no Brit. ship was hit, and indeed, by good manoeuvring, B.L. ships could generally avoid a direct hit. The most serious loss sustained by the navy in the early days of the war was that of the *Royal Oak* on Oct. 14, in Scapa Flow, a few hours after two U-boats had been destroyed by depth charges S. of Ireland. The *Royal Oak*, a battleship of the *Royal Sovereign* class (29,150 tons), laid down in 1914, had recently undergone extensive repairs and had only been recommissioned in June 1939. Of her normal complement of 57 officers and 1153 men, 24 officers and 809 men were killed, the much lower proportion of ratings being due partly to the fact that many could not swim, and also because large numbers thought, when the first of many torpedoes was discharged, that the attack was from the air and took up their air-raid stations under armour. It having been revealed that the anchorage was not proof against the attack of a U-boat on the surface or half submerged at high water, steps were at once taken to obviate a recurrence. In the whole course of the First World War the anchorage at Scapa Flow was immune from U-boat attacks on account of the obstacles imposed by currents and the net barrages, and entry by a U-boat was therefore a 'remarkable exploit of professional skill and daring' (Mr. Churchill).

German War on Neutrals.—The list of

sunken cargo vessels was always a long one and the circumstances in which ships were torpedoed were not seldom the theme of bitter comment by neutral ministers who still seemed to labour under the impression that the Ger. Gov. would observe the accepted code of international usage. Thus there was an outcry in the U.S.A. on the Ger. seizure, on Oct. 15, 1939, of the Amer. *City of Flint* (5000 tons), carrying conditional contraband, in the Atlantic by the pocket battleship *Deutschland*, whose captain put a prize crew on board which took her to Murmansk. Later the vessel was released by the Soviet Gov. flying the swastika and was sighted by Brit. naval forces in Norwegian territorial waters. Fearful of Brit. action the Norwegians then interned the Ger. crew and restored the ship to her own crew. As regards the Brit. mercantile losses through the U-boat campaign, while no more than 14 per cent of Brit. tonnage which was afloat at the beginning of the war had been lost at the end of a couple of months, the corresponding figure for the Ger. submarine service was 30 per cent. Moreover, by rebuilding, the net gain to the Brit. tonnage was considerable. Furthermore over 10,000,000 tons of cargo were brought into Britain in the first eight weeks of war and less than 250,000 lost; but over 40,300 tons consigned to Germany had been captured. With the object of expediting the passage of neutral cargoes it was decided to re-introduce the system of 'navicerts' as in the First World War (see further under ECONOMIC WARFARE, MINISTRY OF). Much concern was shown by neutrals at the time by the decision of the allied govts. to seize Ger. exports as a reprisal for the barbarous use of magnetic and unmoored mines, but the only comment that might seem obvious is that this form of reprisals should have been taken at the beginning of the war, it being evident that the status of a 'neutral' meant nothing to Germany, practically every state in Europe being marked out for ultimate exploitation or invasion by the common enemy. Another severe loss occurred on Nov. 23, 1939, when the armed merchant cruiser *Razulpindi* (16,687 tons) was sunk off Ireland. She was part of the N. patrol by which the contraband control of Ger. trade was enforced. In the face of overwhelming odds she engaged the Ger. battleship *Deutschland*, which was accompanied by another warship, maintaining the fight with her 6-in. guns until the whole ship was ablaze and sank with her flag flying, 39 officers and 226 men being lost. At this time two Ger. pocket battleships and probably one other cruiser were at large in the N. and S. Atlantic or near Madagascar. But already the Brit. Gov. had nearly 1,000,000 tons of warships of all classes under construction and the number of hunting craft in home waters was trebled between Aug. 31 and Nov. 30 and was still being augmented.

Battle of the Plate River.—'Altmark' Affair.—The most dramatic event at sea was now in process of enactment, when the Ger. pocket battleship *Admiral Graf*

Spee, which had been operating in the Atlantic Ocean as a commerce raider since the outbreak, was intercepted and attacked on Dec. 13 by the Brit. cruisers *Exeter* (8300 tons), *Achilles* (New Zealand ship, 7000 tons), and *Ajax* (7000 tons) off the coast of Uruguay, and, after a running fight lasting 14 hrs., was driven into the port of Monte Video, severely battered, with 36 of her crew dead and 60 wounded. The battleship, which was completed in 1936, was armed with six 11-in. guns and eight 5.9-in. guns, while her armament was superior to the combined power of all three Brit. cruisers, whose heaviest guns were only 5 in. The Brit. ships showed superior speed and manoeuvring and by using smoke screens boldly brought the enemy ship within range of their guns. The *Exeter* dropped out of the battle after suffering a number of hits, and proceeded to the Falklands for repair, while *Ajax* and *Achilles* kept up the pursuit. With unconcealed satisfaction the world learned shortly afterwards that the *Graf Spee*, after endeavouring by one excuse or another to remain in Monte Video, was forced out of the harbour. Her captain, Langsdorff, was faced with the choice of submitting to internment or coming out to resume the fight with the Brit. cruisers which were watching outside the harbour for her. She came out, but not to fight; for she was scuttled in the fairway by her captain, who then took his own life. Yet all that awaited the battleship were *Ajax* and *Achilles* and the 8-in. cruiser *Cumberland*, which last-named had arrived to take the place of the damaged *Exeter*. The Ger. ship had on board sixty-two survivors of nine Brit. merchant ships which had been previously sunk by her. These prisoners were released after the ship had put in at Monte Video, having been cooped up in the ship during the battle. The *Exeter*, which had led the attack, suffered a loss of 64 killed and 21 wounded and at the end only one 8-in. gun remained in action and that could only be fired by hand. The whole action was worthy to rank with the finest exploits of the R.N. and Henry Harwood, the commander of the squadron, was knighted and promoted to rear-admiral. The wreck of the *Graf Spee* was eventually sold to a Uruguayan dealer for £10,000. Over 300 other Brit. seamen, made prisoner from vessels sunk by the battleship before her destruction, were all this time aboard the Ger. vessel *Altmark*, which had been armed as an auxiliary ship. This ship had succeeded in escaping across the Atlantic and reaching the protection of Norwegian territorial waters which her captain proposed to use in order to convey the Brit. prisoners in triumph to Germany. But Brit. aircraft located the *Altmark* on Feb. 15, 1940, and she was intercepted by the Brit. destroyer *Intrepid* after having entered Jösing Fjord in the hope of evading the Brit. warships. Orders were given by the Brit. Admiralty to enter neutral waters, search for the *Altmark*, and rescue any prisoners on board. Two Norwegian gunboats were at the mouth of the fjord. The captain in command of

H.M.S. *Cossack* offered to place a joint Brit.-Norwegian guard on the *Allmark* and to escort her to Bergen for an investigation according to international law. The offer was declined by the Norwegians, who stated falsely that the *Allmark* was unarmed and that nothing was known of any prisoners on board. On these assurances the Brit. destroyers withdrew; but, after dark, on receipt of further Admiralty orders, the *Cossack* re-entered the fjord. The gunboats still refused to co-operate. The *Allmark* then tried to ram the *Cossack*, but ran aground and was boarded from the destroyer. After a short fight in which sev. Gers. were

some twenty-eight had been sunk, the number being balanced by the acquisition of new boats. The hundreds of other small craft, which supplemented the destroyers, were boats converted from civilian use and were all armed with 'Asdics' (anti-submarine device), the depth charge, and the gun. The U-boat was being steadily driven from using the gun upon the surface to more ruthless but less effective warfare by torpedo and it had been largely driven from that by mine-laying. The Gers. broke every rule accepted by the world for regulating mine warfare. Besides this they committed outrages upon fishing

THE END OF THE 'ADMIRAL GRAF SPEE'

killed or wounded, the *Allmark* was overpowered and the Brit. prisoners, numbering 299, discovered and released, part of the Ger. boat's crew surrendering while others fled across the ice to the shore. This must be one of the most dramatic rescues in the hist. of sea warfare. The unfortunate prisoners had been confined below and battered down ever since the battle of Dec. 13 and had been subjected to brutal treatment by the *Allmark's* notorious captain.

German Illegalities.—By the end of 1939 the Gers. had lost nine out of the fifty-seven U-boats with which they started the war, and probably less than ten fresh submarines came into action in that period. Thus the enemy probably ended the year with about fifty-eight U-boats, of which twenty were required for training, and the number operating at any one time possibly did not exceed ten. Allied losses were substantial, and great preparations were made to cope with the full scale of attack which was to come later. Britain began the war with a very modest number of destroyers, and by the middle of 1940

fleets, small unarmed merchant vessels, and upon lightships, and in order to counteract these methods thousands of guns were issued to the Brit. merchant and fishing fleets. Neutrals accepted the Ger. illegalities and atrocities as part of the ordinary day-to-day conditions of war, and so terrified were they of Ger. attacks, which spelt the doom of hundreds of their sailors, that they generally ignored Brit. advice to take counter-measures and would agree to Germany being allowed to gain one set of advantages by breaking all the rules and to insist, when it suited her purpose, upon the strictest interpretation of the international code she had torn to pieces. It was therefore hardly surprising that the Brit. Gov. preferred to interpret all conventions by the light of humanity rather than of legal pedantry. Early in 1940 a number of Ger. merchant vessels tried to escape from neutral ports, but were either seized by Brit. ships or followed the customary Ger. policy of scuttling themselves, relying on Brit. gallantry to save their crews.

German Losses in Norwegian Waters.—In April 1940 the Gers. sustained heavy losses during the invasion of Norway, whose territorial waters their warships and merchantmen, or troopships disguised as merchantmen, were using with impunity. Hence the Brit. Gov. laid mines in these waters, but when the actual invasion of Norway followed, the Brit. fleet had already been decoyed northward to Narvik while the Ger. troopships and troop-carrying planes crossed the Skagerrak and landed the invading forces. Earlier in these operations off Norway the Brit. destroyer *Glow-worm* was lost in N. waters through leaving the main body of destroyers to pick up a man lost overboard. The flagship *Rodney* was hit (April 9) by a heavy bomb, but her strong armour resisted the impact; while the cruiser *Aurora* successfully sustained an attack by five successive waves of bombers. Off Narvik (April 9) the *Renown* sighted, amid snowstorms, the *Scharnhorst* in the dim distance and opened fire. She hit the Ger. ship's forward structure at 18,000 yds. range, but the *Hipper* threw a smoke screen across the tracks of the *Scharnhorst* and she escaped. Five Brit. destroyers under Capt. Warburton-Lee (awarded the V.C. posthumously) on the same day gained a victory at Narvik over a number of Ger. destroyers, sinking three. It was a fight worthy of any in the annals of the Brit. Navy. The Ger. Navy, as a result of the operations between April 7 and 11, lost four cruisers or one-half their pre-war strength in this class of ship, a number of destroyers, sev. U-boats, and numerous store-ships and transports. Again, at Narvik, two days after Warburton-Lee's action, the *Warspite*, accompanied by a strong force of destroyers, and led by Vice-Adm. Whitworth, advanced up Narvik Fjord and sank four Ger. destroyers in Narvik Bay. Three others, which fled up a narrow inlet behind Narvik fn., were pursued and also destroyed. It was evident that in order to achieve the conquest of Norway the Gers. were prepared to gamble with their navy. It is equally evident that had the Brit. Gov. realised that the invasion of Norway was intended, the R.N. might have sunk most of the rest of the Ger. Navy in the S. waters of Scandinavia. The Ger. invasion having proved entirely successful, the Allies laid a new mine-field in the Categat and Baltic, so as to complete the blocking of all Germany's coast-line both in the North Sea and the Baltic as well as that of Dan. and Norwegian waters. On April 11 the pocket battleship *Admiral Scheer* was torpedoed by a Brit. submarine but evidently not sunk. In the succeeding days Brit. submarines sank numerous Ger. supply ships and transports, notably off Narvik. In all the three weeks from April 7 to April 20 there was intense naval activity in these waters, as is indicated by the losses on both sides. The Gers. had 2 capital ships damaged, 3 and possibly 1 cruisers sunk, as well as the 7 destroyers lost in the Narvik actions, 30 transports and store-ships sunk, scuttled,

or set on fire, with the loss of thousands of lives, and another 10 transports or store-ships were struck by torpedo and probably sunk. The R.N. lost 4 destroyers, 3 submarines, 1 sloop, and 5 trawlers; 5 other warships were damaged by air attack and 1 store ship was sunk by a U-boat. From these figures it will be seen that the strength and efficiency of the R.N. were but little affected, but the damage to the Ger. Navy was so substantial as to alter the balance of naval power and to permit an important redistribution of the main allied fleets—a most valuable result in view of the fact that Italy was soon to declare war against the Allies. But it is not to be gainsaid that the Brit. Navy continued to suffer heavy losses in Norwegian waters in early May when conveying allied troop transports from Norway, these losses including sev. more destroyers, though, against this, must be set many Brit. submarine successes (see further under NORWAY AND DENMARK, GERMAN INVASION OF (1940)).

In this period occurred the invasion of Holland when the bulk of the Dutch Navy, serving in European waters, succeeded in making their way to Brit. ports—like the Polish ships—to co-operate with the R.N. for the remainder of the war. These included five cruisers and a considerable destroyer and submarine force. During the invasion a flotilla of Brit. motor-torpedo boats went to keep watch on the Zuider Zee while the oil-tanks were fired and to cover the evacuation of refugees, including Queen Wilhelmina and the Dut. royal family. The next exploit, in order of time, of the R.N. was the co-operation of the fleet with the R.A.F. in the evacuation of the B.E.F. from Dunkirk. (This is fully described under WESTERN FRONT). During the naval operations in connection with the withdrawal of the allied forces from Narvik, the aircraft carrier *Glorious*, sister ship of the *Courageous*, was lost, together with two 1350-ton destroyers, both the *Scharnhorst* and *Gneisenau* taking part in the action involving their loss. Thirty-eight survivors subsequently reached the Faroes and a few more were taken prisoner by the Gers. By now naval operations had been in progress against the Its. in the Mediterranean and very soon a number of their submarines were sunk by submarines or bombers; but the R.N. found it very difficult to lure the It. fleet from its bases.

British Attack on French Fleet.—By the terms of the Franco-Ger. armistice Fr. naval forces were to be demobilised, and had the Brit. Gov. taken no action the whole of the Fr. Navy would have passed into Ger. and It. hands for use against Britain. The Ger. Gov. solemnly declared that they had no intention of using these ships for their own purposes but the Brit. Gov. had not the slightest reason for believing in any "solemn assurances" given by Hitler. Already a number of Fr. ships had come into Portsmouth and Plymouth. Under Mr. Churchill's lead the Cabinet soon decided on drastic action.

The fleets in the two ports above mentioned were at once taken under Brit. control. They comprised 2 battleships, 2 light cruisers, some submarines, 8 destroyers, and 200 small mine-sweeping and anti-submarine craft. They were boarded by superior Brit. forces, no resistance being offered, and indeed a considerable number of Fr. sailors elected to continue the war against Germany. But at Alexandria, where lay another Fr. fleet, the situation was more difficult, and it was only after some days that agreement was reached to demilitarise the ships. Had the Fr. commander disagreed his ships would have been sunk. Things were still more critical at Oran in N. Africa where lay a large Fr. fleet, including the finest of their battleships. At Oran and Mers el Kebir were the *Dunkerque* and *Strasbourg*—two of the most modern battleships of the world—two other battleships, including the *Bretagne*, seven light cruisers and a number of destroyers, submarines, and other vessels. Adm. Somerville demanded that this fleet should either continue the fight against Germany and Italy, or sail with reduced crews to a Brit. port or to the W. Indies, or, if these alternatives proved unacceptable, that the Fr. commander should within six hours sink his ships, failing which the Brit. admiral would use the necessary force to prevent the ships from falling into enemy hands. The parleys continued all day, but Adm. Gensoul, cowed by orders from Wiesbaden, rejected all alternatives. Before darkness fell Adm. Somerville opened fire on the Fr. fleet, which was protected by heavy shore batteries. The action lasted for only ten minutes and was followed by strong attacks from Brit. naval aircraft, carried in the *Ark Royal*—whose reappearance in the news after its repeated 'destruction' in the enemy war communiqués was one of the stock jokes in the war. The *Strasbourg* made off for Toulon, but was put out of action for a long time by Brit. torpedo attack. The *Dunkerque* was driven ashore, severely damaged and attacked again later so as to ensure her virtual loss to the enemy. The *Bretagne* was sunk, together with two destroyers. Heavy fire was directed on the Brit. ships but without damage. The It. fleet kept prudently out of the way. The net result of this tragic action was that of the eight capital ships which France possessed at the time of the armistice between Pétain and Hitler, practically all were prevented from being used by Germany against Britain. There was, of course, a furious outburst in Germany, for the action at Oran went far to redress what might have been a serious adverse balance against Britain's naval power. The impotent Marshal Pétain, acting under orders from Hitler, ordered all Fr. warships which might still be on the high seas to intercept Brit. merchant shipping and repel all further attacks with fire or to scuttle themselves. A few days later (July 8) Brit. ships at Dakar, Fr. Senegal, took action against the *Richelieu*, the newly completed Fr. battleship. Terms

having been refused, a Brit. naval officer dropped depth charges astern so as to damage the propeller and steering gear, and later aircraft attacked the ship with torpedoes.

'Arandora Star'—'Bartolomeo Colleoni.'—In the same month (July) the Blue Star liner *Arandora Star* (15,500 tons), carrying 1500 Ger. and It. internees to Canada with a Brit. crew and guards numbering 500, was torpedoed and sunk by a U-boat in the Atlantic, about 1000 survivors being landed in Scotland. The frantic struggle between Gers. and Its. for places in the rescuing boats offered to the world a significant illustration of enemy morale. On July 19 H.M.A.S. *Sydney* (6850 tons), accompanied by a smaller destroyer force, won further laurels for Dominion naval forces by sinking the It. cruiser *Bartolomeo Colleoni* (5069 tons) in the Mediterranean. The It. ship, with another cruiser, sped for her base, and being one of the fastest ships in the world's navies ought to have escaped. But accurate fire from the *Sydney* reduced her speed and enabled the destroyers to complete her destruction. In this month, too, a U-boat torpedoed and sank the *Meknes*, a Fr. merchant ship off Portland, which was carrying 1280 Fr. naval officers and ratings for repatriation from England. This was a peculiarly cynical outrage, for the nationality of the ship was plainly displayed. There were only 400 survivors.

British Mercantile Marine Losses.—The 'Jervis Bay.'—While the enemy's attention was almost exclusively devoted to the invasion of the N. neutrals, the losses of Brit. and allied merchant shipping sank to very low figures; but from then onwards the curve of destruction rose sharply. For the anti-U-boat craft employed on convoy escorts were progressively depleted. Hence it was all the more valuable to the allied cause to receive from the U.S.A. in Sept. some fifty old destroyers in return for the lease of defence bases in Brit. Atlantic ter. (W. Indies and Newfoundland). But the toll of losses continued to rise until, in Oct., it reached just over 400,000 tons, of which 300,000 tons were Brit. The losses then declined and averaged some 68,000 tons a week for the whole year. Their further substantial diminution, however, remained one of the chief problems facing the Brit. forces, especially as it was clear that the Ger. Gov. were bending their energies throughout the winter months to the construction of a great many more U-boats in order to offset the advantage, which Britain was obviously going to obtain from President Roosevelt's Lend-Lease and Lend Bill, by sinking cargoes of planes, guns, and tanks coming over the Atlantic. One of the Ger. pocket battleships at large in the Atlantic made an attack on Nov. 5 on some thirty-eight ships in convoy, but all save five of them escaped, the immunity of the remainder being due to the gallant action of the armed merchantman *Jervis Bay* (Capt. E. S. Fogarty Fegan) which was accompanying the convoy and which, despite its greatly inferior armament, gave battle to the

enemy against overwhelming odds, and being of course sunk (sixty-five of her crew were rescued later by a merchant ship). Capt. Fegan, severely wounded, went down with his ship. Homage to his bravery and that of his crew was paid in the House of Commons by Mr. Churchill and by Mr. A. V. Alexander, First Lord of the Admiralty, and on Nov. 22 Capt. Fegan was posthumously awarded the V.C.

In the *Mediterranean*, where, as we have seen, the collapse of France had left the Brit. Mediterranean fleet substantially inferior to the It. fleet, the balance was soon to be redressed in dramatic fashion. Brit. convoys and squadrons had continued to sail the sea at will, and every contact between the two navies ended with the precipitate retirement of the faster It. force. Engagements on various dates between June and Oct. had, however, already rather seriously reduced the It. Navy, when on Nov. 11, between Italy and Albania, a Brit. cruiser force came up with an It. convoy of four ships escorted by two destroyers. One was sunk, two set on fire, and one of the escort damaged before she could retire under the smoke screen she had put up for her own protection. The same night Fleet Air Arm aircraft, despite heavy anti-aircraft defences and balloon barrages, delivered a daring attack on the main It. fleet lying in Taranto. The new It. battleship *Littorio* and two of the *Carauc* class battleships were damaged so that they had to be beached to prevent their sinking, one of the latter so seriously that she was later abandoned. Two cruisers in the minor harbours were also damaged. The bulk of the fleet left the port, which till then had been its chief base, a few days later. At one stroke the It. battle fleet had been reduced from superiority over Sir Andrew Cunningham's fleet to inferiority, even on paper. This was evident not long afterwards when the remnant of the It. fleet, consisting of the *Littorio* and *Uscio*, the other big new battleship, and a large number of cruisers and destroyers, on Nov. 27 encountered a Brit. force under Sir James Somerville, whose flagship was the *Renown*, C. of Sardinia. For once again the action took the form of a chase in which the Brit. ships naturally became strung out, the *Renown* leaving her heavier consorts far behind. But the It. ships were not to be caught and retired under smoke screens to the fortified port of Cagliari. That Adm. Cunningham's freedom of action was now greatly enhanced was shown decisively during the battle of the W. Desert, when his ships heavily bombarded It. positions at Bardia and Tobruk and elsewhere on the coast of Cyrenaica and thereby made an essential contribution to the hurricane Brit. victory (see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN, *Battle of the Western Desert*). By this time, however, the hard-pressed It. were receiving military aid from Germany in the form of bomber aircraft, which were based on Sicily. A major sea and air action was fought in the Central Mediterranean on Jan. 10, 1941, when

escorting ships of a convoy, passing through the Sicilian Channel and laden with much material assistance for Greece, were attacked by Ger. bombers. Two It. destroyers had been encountered earlier in the morning; one fled to safety, the other, heavily outgunned, fought courageously until she went down with all hands. This action was fought within range of the It. guns on Pantelleria Is. Shortly after noon the new aircraft carrier *Illustrious* (23,000 tons) was heavily attacked by fifteen Junkers dive-bombers of the Luftwaffe, assisted by It. aircraft. Five separate attacks were made on the *Illustrious*, the Ger. pilots, with great recklessness, penetrating heavy barrages of thousands of shells and dropping a number of heavy-calibre bombs, one of which, a 1000-lb. bomb, hit the aircraft carrier below the bridge. The ship, though shaken from stem to stern, maintained a withering fire, and eventually, though suffering damage and casualties, arrived safely in port, where she was repaired. The 9100-ton cruiser *Southampton* was also hit, and later, owing to the outbreak of fire aboard, was abandoned and sunk by Brit. forces, most of the crew being saved. The Ger. and It. dive-bombers were heavily engaged by Brit. naval aircraft and twelve enemy planes were destroyed. The convoy emerged safely from the action and reached its destination. In the early morning of Feb. 9 ships of Force 'H' under Vice-Adm. Sir James Somerville, consisting of the battle cruiser *Renown* and the battleship *Malaya*, the aircraft carrier *Ark Royal*, and the cruiser *Sheffield*, accompanied by light forces, bombarded military targets in Genoa, firing over 300 tons of shells into the port (see further under GENOA).

Lofoten Islands Raid.—The reality of sea-power and the value of the element of surprise in its operation were well exemplified on March 4 when ten enemy merchant vessels and an armed trawler were sunk, over 200 Gers. taken prisoner, together with a number of Norwegian traitors, in a naval raid on the Lofoten Is. The main object of the raid, which was successfully accomplished, was to destroy the plant used for the production of fish oil for explosives, the whole of the output of which was absorbed by the Ger. masters of the is.

Material aid came from the U.S. Gov. in the spring of 1941 with the arrival in Brit. waters of fifty-five U.S. Navy submarine chasers and eighteen mosquito torpedo-boats to join the Brit. Navy in hunting down the Ger. U-boats. These were the first of ninety-nine U.S. warships scheduled for transfer to the Brit. Navy under the Lend-Lease Act which passed Congress in March. Other ships included in the transfer were seventeen over-age destroyers and nine over-age submarines. It was stated at the time that far more than these ninety-nine vessels would be sent if Britain required them.

Battle of Cape Matapan.—On March 28 was fought an important naval battle in

the Mediterranean when, some 100 m. to the S.W. of Cape Matapan, Adm. Cunningham destroyed three heavy It. cruisers and two large destroyers, while another destroyer and a new battleship of the *Littorio* class sustained serious damage. The sole Brit. loss was that of one aircraft and its crew of two (see MATAPAN, BATTLE OF CAPE).

Battle of the Atlantic Operations between April 1941 and June 20, 1942.—For sev. nights in the spring Brit. bombers made repeated attacks on the two Ger. battle cruisers *Scharnhorst* and *Gneisenau*, which were sheltering in Brest harbour. While these two extremely powerful armoured vessels were at large they might always succeed in catching some Brit. merchantmen, and experience showed that the last thing they sought was an encounter with Brit. battleships. Brit. planes repeatedly bombed the two ships while they were in Brest harbour, it being of the highest importance to do everything practicable to reduce the great losses that were being sustained in what was called the battle of the Atlantic. Until the U.S.A. came into the war (Dec. 1941) the burden imposed on the R.N. was heavy in the extreme, for though Amer. ships convoyed supplies over part of the distance from Amer. ports it was some time before the protection was adequate enough to relieve the Brit. fleet from tasks which precluded action wheresoever Ger. or It. ships of war might be encountered. Even though President Roosevelt had extended the 'combat zones' to the Mediterranean (June 1940) this protection could not in the nature of things compensate Britain for the loss of the Fr. fleet. Yet even in the Mediterranean the R.N. was always on the alert. Thus on April 21 units of the Mediterranean fleet carried out a 45-min. bombardment of Tripoli, some 530 tons of 15-in. and smaller calibre shells being poufied into the harbour and port installations, sev. supply ships being sunk and great fires and explosions caused on the Sp. Mole, railway station, and naval headquarters without either casualties or damage to the Brit. ships. In May, during the battle for Crete, the navy was engaged in most hazardous operations, their losses (three cruisers, one anti-aircraft cruiser, and six destroyers) demonstrating the inability of surface ships to defend themselves in narrow waters unless they held the mastery of the air. The great event, however, of this time was the naval action which began off Greenland and ended some 400 m. off Brest, resulting in the sinking of the *Hood* and of the Ger. battleship *Bismarck*, May 27 (see further under 'BISMARCK, THE'; 'HOOD, THE'). About the same time the monitor *Terror* (7200 tons) and the equally famous gunboat *Ladybird* (625 tons) were lost in Ger. air attacks off the Libyan coast, both putting up a most spirited resistance before going down before overwhelming fire (see under AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS 4N, *The Struggle for Libya*). The main event in June was the sinking by a Brit. submarine of

the *Garizia* (It. cruiser of 10,000 tons), the last of her class. N. O. under Vice-Adm. Sir James Somerville in the Mediterranean were responsible for many convoys sailing in safety to their destination. For instance, between July 21–24, a big convoy escorted by the *Renown*, cruisers, and the famous aircraft carrier *Ark Royal*, was repeatedly attacked by hostile aircraft, E-boats, and at least one submarine, which last-mentioned craft was sunk. One Brit. destroyer was damaged and had to be sunk, but the enemy lost at least sixteen bombers. By way of contrast to this comparative immunity of a Brit. convoy, a large Ger. convoy of twenty-six transports laden with troops, munitions, and equipment, and a sea-going barge laden with tanks, strongly escorted by destroyers, fighter planes, and mine-sweepers, was practically annihilated by the Russians in its vain attempt to make a landing on the Baltic coast, the Gers. losing four destroyers, thirteen transports, and a tanker, the rest of the convoy fleeing in confusion.

Italian Naval Attack on Malta.—The first naval attack on Malta was made by a swarm of E-boats on July 26. After an all-night bombing raid the It. E-boats were discovered off the Is. at dawn. Brit. aeroplanes at once attacked, showering bombs on the intruders, while the Valletta coastal batteries opened an intense fire. Enemy fighter patrols tried to assist their surface craft, but soon lost three machines. The Its. then launched torpedoes in the direction of the breakwater, but the R.A.F. destroyed four E-boats, while the coast defences accounted for five more. It then appeared that the E-boats were acting as a cover for small torpedo-carrying craft, which tried to break into the harbour. Eight of them were blown up and none succeeded in entering the harbour. During the engagement the Valletta bastions and every coign of vantage were crowded with cheering spectators, an evidence of the great heart of the Maltese throughout the war.

Enemy Losses up to August 1941.—It may be noted that at this date the Admiralty estimated the enemy merchant shipping losses since the beginning of the war, by capture, scuttling, and sinking, at 1,007,000 tons (including fifty-one ships of 200,000 tons sunk by the Russians), this total being made up as follows: Ger., 2,321,000; It., 1,533,000; Finnish, 34,000; other ships in enemy control, 119,000. Also, from the outbreak of war up to Aug. 1941, 1118 enemy aircraft had been destroyed or damaged by ships' gunfire and naval aircraft, 537 being shot down into the sea and 581 damaged (203 believed destroyed). Of the 537 definitely destroyed, 318 fell to the guns of the fleet, 122 to naval aircraft, 55 to merchant ships, and 12 to allied warships.

Convoy Battles in the Mediterranean.—**The 'Ark Royal' and 'Cossack' Sunk.**—**H.M.A.S. 'Sydney' Lost.**—In the Mediterranean again on Sept. 27–28 an important Brit. convoy beat off persistent attacks from the air. One merchant ship was

damaged and had to be sunk but without casualties. H.M.S. *Nelson* was hit by a torpedo but was not impaired. Thirteen enemy planes were destroyed by Swordfish aircraft from the *Ark Royal* and by naval gunfire. On Nov. 8 an enemy convoy of eight supply ships escorted by destroyers was sighted S. of Taranto by a Maryland aircraft, and a patrolling Brit. force under Capt. Agnew intercepted the convoy the following day, by which time it had been joined by two more merchant vessels and two more destroyers. Despite this disparity the Brit. force gave battle. Nine of the ten supply ships were sunk and the tenth, a tanker, became a total loss, while two Lt. destroyers were sunk and two seriously damaged. In this month too were lost the destroyer *Cossack*, famous for the rescue of Brit. prisoners from the *Altmark* (Feb. 1910), and the aircraft carrier *Ark Royal* (see further under 'ARK ROYAL'), off Sollum, and the old but reconditioned 31,000-ton battleship *Barham*, which was torpedoed and sank in four minutes in the Mediterranean (Nov. 25) (see under 'BARHAM, THE'). A few weeks later (Dec. 19) the battleships *Queen Elizabeth* and *Vindex* were severely damaged at Alexandria by human torpedoes which had penetrated the harbour. Brit. submarines in the Arctic inflicted heavy losses on Ger. ships carrying supplies to the Murmansk front, the *Tigrits* sinking five and the *Trident* three transports, many other vessels probably being sunk. Early in Dec. the famous Australian cruiser *Sydney* (7000 tons) was lost in action with a Ger. armed raider, *Steiermark* (9400 tons). The sole information concerning the action was obtained from the survivors of the Ger. boat, who numbered 330. The fight had evidently been at close range. After the *Steiermark* had been blown up the *Sydney* disappeared over the horizon and nothing more was heard of her.

'*Prince of Wales*' and '*Repulse*' Sunk by Japanese Aircraft. — Disaster overtook the Brit. Far E. fleet very soon after Japan, without declaring war, launched simultaneous attacks, on Dec. 7, on Pearl Harbour and on Siam (Thailand) with a view to invading Brit. Malaya. On Dec. 10 Britain's newest battleship, the 35,000-ton *Prince of Wales*, sister ship to *King George V.* (q.v.), flying the flag of Adm. Sir Tom Phillips, one of the most brilliant officers of the R.N., together with the battle-cruiser *Repulse*, were sunk by Jap. bombers off Malaya, thereby profoundly altering the balance of naval power in the Pacific. The attacks were pressed home with the greatest determination, but the enemy aircraft had not to encounter fighter resistance such as the Gers. and Its. encountered in similar attempts to sink battleships by bombs. The anti-aircraft defences of the two ships were certainly used to good effect, but this was not enough, though seven planes were brought down, and the lesson of the importance of protecting the skies above the seas where the navy operated was once more painfully learned. The

absence of adequate fighter protection was due to the fact that none was available for the operation. The bombs, which were dropped from a height of more than 15,000 ft., straddled both ships; one pierced the *Repulse's* aircraft hangar and penetrated to the marines' mess deck, starting a fire which the crew fought until the ship sank. Both warships opened a fierce anti-aircraft barrage when Jap. torpedo aeroplanes launched torpedoes in their path. The *Repulse* managed to avoid nineteen of them, but a torpedo hit the *Prince of Wales*, damaging her stern and putting her rear armament out of action. The final attack came from aeroplanes roaring down from all directions. The *Repulse* was hit on the bow and then on the port side and stern. She started settling quickly and the crew abandoned her. A few miles away the *Prince of Wales* belched great clouds of smoke from amidships and eventually sank. Some 2330 men of 2925 were saved.

Japanese Losses in Merchant Shipping. — To counterbalance allied disasters by land and sea in the E., Amer., Brit., and Dutch planes and Amer. ships were early taking toll of Jap. shipping. On Jan. 15, 1942, for example, an Amer. submarine sank a 17,000-ton liner, and on the following day three merchant ships, off Tokio Bay. This brought the tale of Jap. losses at the hands of Amer. forces in the Pacific to thirty-five vessels—fourteen being warships, including the 29,000-ton battleship *Haruna* (laid down in 1912 but entirely reconditioned since then). Between Dec. 13, 1941, and Jan. 16, 1942, Dutch submarines and aircraft also sank two cruisers, four destroyers, and other ships. On Jan. 23 Dutch bombers attacked a large Jap. convoy which was trying to pass through the Macassar Straits between Borneo and Celebes, direct hits being scored on a battleship, two cruisers, a destroyer, and four transports. The fight was resumed on Jan. 24-25 by Dutch and Amer. bombers and Amer. destroyers. Many Jap. cruisers, destroyers, and transports were sunk, the total loss being the heaviest sustained by the Jap. up to that point. The battleship, too, was probably sunk, for a large ship went down, leaving only the tip showing above the water.

The Amer. Navy won a considerable victory in an attack on the Marshall and Gilbert Is. on Feb. 11, their cruisers, carrier-borne aircraft, and destroyers sinking sixteen Jap. vessels aggregating 100,000 tons. The importance of a progressive reduction of Jap. shipping of all kinds so early was evident when account was taken of the wide commitment of the Jap. warships operating thousands of miles from Japan, and the comparatively restricted shipbuilding potential in their yards.

Escape of 'Grisenau,' 'Scharnhorst,' and 'Prinz Eugen.' — It was at this time (Feb. 12) that the Ger. pocket battleships *Scharnhorst* and *Gneisenau* and the 10,000-ton cruiser *Prinz Eugen* (see under 'BISMARCK, THE'), accompanied by destroyers,

torpedo-boats, E-boats, and mine-sweepers, and well escorted by fighter aircraft, came out of Brest harbour and escaped through the straits of Dover to Germany. Visibility was poor and the enemy ships, which hugged the Fr. coast and were protected by screens of fighters from Fr. and Belgian airfields, which formed an 'umbrella' over the whole squadron, were never visible from the Brit. coast. In face of intense fire by the warships and fighter planes, Brit. coastal aircraft and swordfish planes pressed home their attack on the squadron, six of the swordfish being lost. The commander of the swordfish squadron—Lt.-Cdr. Esmonde—was awarded the V.C. (post-humous). No Brit. warship was lost, but public uneasiness at the escape of the Ger. ships, coupled with the disasters in the Far E., evoked a critical tone in the press and in the Commons.

Great Naval Battle off Java (February 27-28, 1942). Late in this month there was a notable naval and air battle off Bali, exceeding in results even that of the Macassar Straits. Dutch and Amer. warships inflicting heavy losses on a Jap. invasion fleet; but as yet the strength of the Allies was inadequate to the prevention of invasion anywhere and everywhere in the S. Pacific and shortly afterwards the enemy landed on Bali. Another naval battle was fought on the night of Feb. 27-28 off the N. coast of Java but with severe loss to the Allies. In this action an allied force consisting of the Brit. cruiser *Ereter* (8,390 tons), the Australian cruiser *Perth* (6,830), the Amer. cruiser *Houston* (9,300), the Dutch cruisers *De Ruyter* and *Java* (each 6,000 tons), commanded by Adm. Doorman in the flag-ship *De Ruyter*, and accompanied by one Dutch and three Brit. destroyers, made contact with the Jap. ships half-way between Surabaja and Bawean Is., the Jap. force comprising sev. cruisers, some of 10,000 tons, and thirteen destroyers, organised in two flotillas. The Dutch destroyer *Kortenaar* was soon sunk; the *Ereter* was hit in the boiler room and dropped out of the line; the Brit. destroyer *Electra* joining in a counter-attack disappeared into an enemy smoke screen and was not seen again. Later the enemy broke off the action under a smoke screen, but shortly afterwards, near Rambang, two enemy cruisers were seen and battle was again joined (March 1), when both the *De Ruyter* and the *Java* were hit simultaneously, blew up, and sank. A similar fate seems to have befallen the *Perth* and *Houston* not long afterwards. The *Ereter*, her speed considerably reduced, the Brit. destroyer *Encounter*, and the Amer. *Pope* were all sunk later by three Jap. cruisers. In all the Allies lost five cruisers, seven destroyers, and a sloop (*Yarra*, Australian), against the Jap. loss of a 10,000-ton cruiser and one small cruiser for certain and probably four destroyers, while all the other cruisers were set on fire.

The Battle of Sirte.—Reverting again to the Mediterranean, the same month saw another successful convoy action

(March 22-24). A Brit. convoy, with supplies for hard-pressed Malta from Egypt, with the protection of a 6-in. gun cruiser, anti-aircraft cruisers, and destroyers under the command of Rear-Adm. Vian of *Cossack* fame, sighted and drove off four It. cruisers without loss to convoy or escort. Later the battleship *Littorio*, two 8-in. gun cruisers, and four 6-in. gun cruisers and some destroyers were sighted and, despite the disparity in strength, action was joined, a torpedo hit being scored on the *Littorio*, which was also hit by a Brit. cruiser's gun-fire. Other It. ships were also hit and the enemy force, thrown into confusion, withdrew.

Further Losses in Far East.—*Battle of the Coral Sea.*—In April further Brit. losses were sustained in the Far E., the cruisers *Dorsetshire* and *Cornwall* (each 10,000 tons) being lost through Jap. air attack in the Indian Ocean, over 1100 survivors being landed. About the same time the carrier *Hermes* was sunk off Trincomalee (see also under AIRCRAFT CARRIERS). But what was up to this date perhaps the biggest naval battle since Jutland—the battle of the Coral Sea—was fought (May 4-8) off the Solomon Is., some 1000 m. from the coast of Queensland, between Amer. and Australian naval forces and the Jap. fleet. This action certainly saved Australia from an immediate attempted invasion. The allied fleet and planes first sank a Jap. light cruiser, two destroyers, four gunboats, and, later, an aircraft carrier, three heavy cruisers, one light cruiser, and two destroyers—a total of fifteen warships sunk, and a grand total of thirty-seven ships sunk, damaged, or probably sunk. The Amer. lost one aircraft carrier, one destroyer, and one tanker. This great naval and air battle temporarily ceased on May 9. It represented the continued effort by the Jap. to extend their conquests towards the S. and S.E. Their first efforts were aimed at expanding their air bases, but the Allies' air forces had so effectively bombed their landing fields that Japan's plans were frustrated. In this battle of the Coral Sea the issue was decided between acrobats flown from the opposing aircraft carriers.

The Battle of Midway Island.—The battle was in effect a new kind of naval conflict and the experience was to be repeated a month later in the important battle off Midway Is., the Amer. naval base 1300 m. N.W. of Hawaii, when Amer. navy and army pilots from both shore bases and carriers dealt the blows which repelled attack by a powerful Jap. fleet, thereby confirming the significance of the naval revolution which had transformed warfare at sea. In the Midway battle four Jap. aircraft carriers were sunk, each with a complement of 1500 men. At least three transports, carrying 6000 troops, were torpedoed and sunk. This was the worst defeat in Japan's naval hist., for the spearhead of her naval and air striking power was broken by the loss of half her best aircraft carriers and she had now lost at least six of the eleven or more of the fully effective fleet of carriers

with which she began the Pacific war. At least 200, and probably 250, planes, together with their trained personnel, went down with the carriers lost at Midway. For this victory the Amer. Flying Fortresses, which repulsed and scattered the Jap. naval forces, were chiefly responsible. While the immediate results of these two battles was the removal of the Jap. threat to America's forward naval bases in the Pacific, the ultimate result was to shift the balance of naval power in the Pacific from its extremely one-sided bias in favour of Japan. The lessons of these battles, coupled with those of Crete and the loss of the two great Brit. ships, *Prince of Wales* and *Repulse*, was not lost on the Amer. House of Representatives, which at this moment had before it a Bill which, at a cost of more than £200,000,000, would add 1,900,000 tons of war-ships to the Amer. Navy. It was decided that roughly one-half the construction involved should go into carriers and cruisers of various types, the remainder into destroyers and escort craft and patrol craft. New battleships had, however, already been provided for and sev. were due to be launched in the ensuing months; but undoubtedly the construction of more capital ships was, for the reasons stated, postponed, though by no means abandoned; for, as Jap. aircraft carriers were sunk or disabled, battleships were likely again to become a mighty weapon on the high seas, whether for offensive action or for counter-attack against a raiding fleet, even if the days of Jutland battles were seemingly over so far as those battles meant only capital ships firing directly at each other.

Hazards of Mediterranean Convoys. During this period convoying in the Mediterranean had grown increasingly hazardous—more so even than to Murmansk; for Britain had lost the command of the sea in these narrow waters of the Mediterranean over which Nazi planes could operate freely from Sicily, Crete, and elsewhere. Consequently the problem of sending supplies to Malta and Libya became greatly aggravated and the ill fortune which awaited an important double convoy at this time had a most deleterious effect on the Eighth Army's battle against Rommel's army May–June 1942 (see under AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN, *Battle for Libya*). It had been decided to sail in two convoys so as to disperse the enemy's efforts to concentrate his attacks. The W. convoy got to Malta after destroying over sixty enemy planes. The E. convoy, under Rear-Adm. Vian, was also steering towards Malta when a force of 11 battleships, cruisers, and submarines tried to intercept it; and eventually, owing to the exhaustion of anti-aircraft ammunition, Rear-Adm. Vian decided to return to Alexandria. The R.N. in these two convoy attacks lost one light cruiser and four destroyers; the enemy had one battleship torpedoed and one 8-in. gun cruiser, two destroyers, and one U-boat sunk.

Naval Operations, July–December 1942.

—During this period the most outstanding event in the W. was the allied landing in N. Africa on the night of Nov. 7–8. Until forces were ashore the responsibility for the operation lay in the hands of the navy, whose success was measured by the fact that the initial convoys arrived at the right time in the right place practically unscathed. The only damage was one Amer. ship torpedoed, but all her troops were landed without loss. Until the U.S. and royal air forces were able to operate from captured air-fields the fleet air arm provided not only protection to the ships, but also tactical reconnaissance for the army ashore. Thereafter the allied navy continued to keep the armies supplied and reinforced in the face of heavy U-boat concentrations, and maintained the offensive at sea against enemy forces. Meanwhile important naval operations were taking place in the S. Pacific. With the defeat of the Jap. at the Coral Sea and Midway Is. battles, the initiative passed to the Amer. and, on Aug. 7, Amer. marines landed in the Solomon Is., seizing the harbour of Tulagi. Though taken by surprise, the Jap. sent cruisers and destroyers to attack on the night of Aug. 8–9 and they had decidedly the best of the battle. H.M.S. *Canberra* and the U.S.S. cruisers *Quincy*, *Vincennes*, and *Isford* were sunk. The Jap. escaped with little damage. Most of the Amer. personnel were saved. But the Allies achieved their object, since the Jap. were unable to interfere with the transports. Every subsequent Jap. attack on the Solomons was decisively repelled with heavy loss in transports. There was a major naval action, which raged for sev. days in Nov., particularly on Nov. 12–15, between surface ships, off the Solomons. It was precipitated by a strong Jap. attempt to reconquer a vitally important beach-head on Guadalcanal (q.v.). A large Jap. fleet of transports steamed southward from the Shortland area. Strong reinforcements for Amer. land troops had just been landed in Guadalcanal and the Amer. cruiser and destroyer screen covering the landing was manoeuvred so as to intercept the Jap. ships. The resulting action took place off Savo Is. between the Is. of Guadalcanal and Florida. The smaller Amer. ships attacked the Jap. battleships of the *Kongo* class at point-blank range. Their leaders, Rear-Adms. Daniel Callaghan and Norman Scott, were killed, but the Jap. force was heavily damaged and disrupted. The next night there was another clash between surface ships, two Amer. battleships of the new *North Carolina* and *South Dakota* class taking part. Sporadic and fierce fighting, between the ships and also in the air, went on for some days. This was the biggest naval battle of the war up to that time, and the Jap. losses were one battleship, three heavy cruisers, two light cruisers, five destroyers, and eight transports sunk, and one battleship, six destroyers, and four cargo transports damaged. The Amer. losses were two light cruisers and seven destroyers sunk.

It was during this period that the Fr. fleet at Toulon was scuttled. Following on the landing of Brit. and Amer. forces in Fr. N. Africa in Nov., Ger. forces entered Toulon. But the Fr. warships in the port were immediately scuttled by their crews. The battleships there were the *Dunkerque* and *Strasbourg*, each 26,500 tons, one old battleship, the *Provence*, four 10,000-ton cruisers, three light cruisers, one seaplane carrier, and some twenty-eight destroyers (Nov. 6, 1912).

tured at Tambach in the closing days of the war.)

N.E. of Finschhafen and in Huon Gulf, off New Guinea, on March 2-4, a large Jap. convoy of twelve transports and ten warships (cruisers and destroyers), representing an aggregate tonnage of 90,000 tons, was attacked continuously by allied air forces and completely wiped out, together with more than eighty Jap. planes. The ground forces, estimated at 15,000 men, who were destined for an

TRANSPORTS LYING OFF GIBRALTAR: PART OF THE GREAT ALLIED NORTH AFRICA EXPEDITION

Throughout the navy continued to provide escorts for the numerous convoys to Russia, Malta, the Persian Gulf, and elsewhere. One outstanding event was the successful passage of a large convoy to Russia on New Year's Eve, 1913. All the merchant vessels reached Russia safely, but the destroyer *Achates* was lost and the *Onslow* damaged. The Brit. destroyers were commanded by Capt. R. St. V. Sherbrooke (awarded the V.C.), whose escort was attacked by a greatly superior Ger. force consisting of a pocket battleship (*Lutzw*), a cruiser (*Hipper*), and six destroyers. The action was fought in snowstorms and in semi-darkness off the N. Cape, Norway. It appears that the admiral commanding the Ger. task force had mistaken the two Brit. cruisers *Kent* and *Jamaica*, which had come to the assistance of the convoy, for the vanguard of a battle squadron. He had therefore broken off the action and retired in accordance with previous orders (see *Fuehrer Conferences on Naval Affairs* (trans. by U.S. Naval Dept. and Admiralty), being trans. of documents cap-

attack on the Allies in New Guinea, were killed to a man. The Allies' total loss was only one bomber and three fighter aircraft, while a few other planes were damaged. This battle of the Bismarck Sea was so complete as to amount to a major disaster to Jap. arms and seacraft, besides demonstrating the superiority of allied fighter aircraft and pilots over the Jap.

It may be mentioned here that by the end of Jan. 1943 aggregate Brit. losses (as stated in the Commons, Feb. 4) were as follows: capital ships, 5; aircraft carriers, 7; cruisers, 25; armed merchant cruisers, 14; destroyers, 94; corvettes, 14; submarines, 44; monitors, 1; sloops, 8; mine-sweepers, 22; trawlers, 156; drifters, 14; mine-layers, 1; yachts, 3; gunboats, 5; cutters, 3. But in spite of losses the fleet was much stronger at that date than it was a year previously, and indeed during these three years of the war no fewer than 900 vessels of various classes had been added to the R.N. The ships lost in these three years by Germany, Italy, and Japan were: Germany, 1 battleship, 1

pocket battleship, 4 cruisers, 39 destroyers and torpedo-boats, 4 raiders, and 69 other miscellaneous warships, minesweepers, and small craft. Italy: 10 cruisers, 48 destroyers and torpedo-boats, and 35 other miscellaneous warships, etc. Japan: 2 battleships, 6 aircraft carriers, 17 cruisers, and 70 destroyers. (No official figures available for miscellaneous small craft, but the number was a high one apart of course from transport craft.)

Naval Operations, 1943—The most significant feature of sea operations in 1943 was the gradual reduction of the Ger. submarine menace. In the months May–July 1943 the Allies sank ninety U-boats. In the first six months of the year the number of ships sunk per U-boat operating was only a quarter that in the first half of 1942. Moreover during the first half of 1943 new ships completed by the Allies exceeded sinkings from all causes by more than 3,000,000 tons. Before the descent upon Sicily (see *Conquest of Sicily* in the article WORLD WAR, SECOND) an armada of warships, troop transports, supply ships, and landing craft proceeded through Atlantic and Mediterranean waters, with scarcely any interference from U-boats. Over 2,500 vessels were involved in those latter operations and the losses were only about 80,000 tons. In the months Aug.–Oct. approximately sixty U-boats were destroyed. This brought the total Ger. losses since Sept. 1939 to between 700 and 800 submarines. The loss of 150 submarines in the six months May–Oct. 1943 meant a loss of 6000 trained men of the submarine service, a fact which was found to have a profound effect on the morale of the crews. In addition to the sixty U-boats sunk between Aug. and Oct. there were also a large number of 'probables.' The Gers. had introduced new U-boat weapons and tactics; but the Allies were able to cope successfully with the changing situation.

Following the collapse of It. resistance after the conquest of Sicily the It. Navy surrendered under the terms of the armistice with Marshal Badoglio. On Sept. 11 the prin. ships of the It. Navy—four battleships, six cruisers, and seven destroyers—which had sailed from Spezia, came into Valletta under the escort of two Brit. battleships and a destroyer screen. Together with smaller ships, the total was thirty. One uncompleted battleship fell into Ger. hands. When the fleet started from Spezia it had another capital ship with it, the *Roma*, but this ship was sunk by Ger. bombers as the fleet proceeded southwards—a desperate daylight attempt to destroy the fleet of their former allies whose departure they were too late to forestall. The result of this surrender and of the Allied victories in N. Africa was that the It. N. once again completely dominated the Mediterranean with the great strategic advantage of greatly shortened sea routes.

Brit. midgeet submarines carried out a daring attack on main units of the Ger. battle fleet in their protected anchorages in Alten Fjord, N. Norway, on Sept. 22,

inflicting severe underwater damage on the battleship *Tirpitz*. The attack involved extreme hazards and three of the submarines were lost, but the attack as a whole was successful. The submarines had to penetrate a highly defended base and, to do so, they had to pass through the minefields guarding the approaches to the anchorage; and, after negotiating the intricate fords, always vigilantly patrolled by the Gers., had to carry out an attack in the strongly protected and confined waters where the ships lay moored and, finally, to regain their base, the same obstacles had to be overcome.

In the S. Pacific there was no great naval battle between the Allies and the Jap. fleet during 1943, but there was considerable activity on both sides in convoy work and in covering landings and, generally, in combined operations. Amer. warships co-operated effectively with the allied air forces in covering the allied landing near Lae in Huon Gulf, New Guinea, in Sept. 1943. A remarkable feature of these operations and others of subsequent months was that the Jap. Navy made no attempt to interfere with the Allies, a fact which probably meant that their previous losses were straining their resources. On Nov. 1 two heavy Jap. cruisers and three destroyers were sunk and many others probably sunk in a devastating raid on enemy shipping of all kinds in Rabaul harbour. This was the heaviest loss inflicted on the Japs. in this area since the battle of the Bismarck Sea (see further under PACIFIC CAMPAIGNS IN SECOND WORLD WAR).

The outstanding naval event of the year was the sinking of the 26,000-ton Ger. battleship *Scharnhorst*. She was brought to action off the N. Cape, Norway, on Dec. 26, when cruisers and destroyers supported the battleship *Duke of York*, under the command of Adm. Sir Bruce Fraser, in sinking her, the whole of the main action, which started in the late afternoon in the half-light of the Arctic dawn, being fought in the dark with the aid of radiolocation and starshells. The *Scharnhorst* was first seen at 9.30 a.m. steering towards a Brit. convoy bound for N. Russia which was protected by cruisers. The cruisers opened fire and the *Scharnhorst* turned away. Adm. Fraser's force, unknown to the Gers., was then many miles to the westward, steaming at speed in the hope of getting between the *Scharnhorst* and her base at Alten Fjord. Touch was lost with the Ger. ship shortly before 11 o'clock, but she reappeared, as was expected, sev. hours later, again making towards the convoy, which she could have disposed of very quickly had she been able to get near enough; but after the cruisers opened fire she fled southwards with the cruisers in pursuit. The chase lasted all the afternoon until the *Duke of York*, towards which the cruisers had driven the Ger. ship, was able to intercept her and open range at only 6 m. From 5 p.m. till 6.24 p.m. the two battleships fired at each other

continuously, when the *Scharnhorst*, though hit, gradually drew out of effective range. Then her speed slowed down owing to one hit from the *Duke of York* below the water line and sev. destroyers then turned in, heading straight for her, and fired torpedoes at close range. From then on the fate of the Ger. battleship was sealed, for the *Duke of York* was able to open fire again with her 14-in. guns, hitting her repeatedly until she started to circle and almost stopped. Cruisers now attacked with torpedoes from one side and destroyers from the other and soon after this she sank. Some thirty-six survivors of a crew of over 1400 were picked up, the Brit. casualties being seventeen killed and no ships lost. The loss was a severe blow to Germany, for it was on the *Scharnhorst* that she relied to prevent vital supplies reaching Russia at a particularly critical stage of the campaign on the E. front.

In the bay of Biscay on Dec. 27-28 three of eleven Ger. destroyers, which had emerged to convoy a Ger. blockade-runner, were sunk by the two Brit. cruisers *Glasgow* and *Enterprise*. The blockade-runner had been intercepted earlier by a Coastal Command (C.R.) aircraft, which set her on fire with bombs so that she was abandoned in flames. It was soon after dawn on the following day that a Liberator of the U.S. Navy sighted the eleven Ger. destroyers about 200 m. from the spot where a Czech Liberator had bombed the blockade-runner to destruction. This Ger. force consisted of five modern *Narvik* class destroyers with five 5.9-in. guns and six *Elbing* class destroyers with four 4.1-in. guns—eloquent evidence of the importance to Germany of the blockade-runner's cargo, which probably contained Malayan rubber from the Jap. occupying authority. In the ensuing battle the two Brit. cruisers, who got in between the Ger. ships and their bases in S. France, scored many hits, while Halifaxes, Liberators, and a Sunderland co-operated. Beaufighters and Mosquitos provided air cover for the cruisers. There was but little opposition from enemy aircraft. The armament of the Ger. *Narvik* class destroyers was little if at all inferior to that of the *Glasgow* (a 1937 cruiser) or of the much older *Enterprise* (1926), but their main purpose was to get away under a smoke screen after dividing up into smaller groups.

Naval Operations, 1941.—The chief naval event in 1944 was the Jap. defeat of the last week of Oct. during the Amer. invasion of Leyte Is. (Oct. 19). This menacing invasion of the Philippines tempted the Jap. Navy to emerge and risk an attack on Adm. Halsey's Third Fleet which, sailing westward across the Pacific, had already taken the Marshall, Mariana, and Palau Is. on the way and was now acting as general cover to the allied land operations; and also on Vice-Adm. Kincaid's Seventh Fleet, whose role was that of escort and close support of the military force on Leyte Is. On Oct. 22 ships of the Third Fleet took up positions E. of the Surigao and San

Bernadino Straits—the only passages through the Philippines—further N. off the Polillo Is., and E. of Luzon, as cover against any Jap. forces that might approach from those quarters. The Seventh Fleet continued in close support of the landing in Leyte Gulf, opening off the Surigao Strait. Next day Amer. carrier aircraft saw three Jap. forces approaching, two from the W. and one from the N. The first, coming through the Sulu Sea directly towards Surigao Strait, comprised two old battleships, three heavy cruisers, one light cruiser, and eight destroyers; the second, a stronger force, steaming through the Sibuyan Sea towards San Bernadino Strait, comprised two new battleships, one fairly modern battleship, two old battleships of the *Kongo* class, two light and ten heavy cruisers, and fifteen destroyers. The third squadron, coming from Japan, was seen 100 m. N. of Leyte Gulf, and comprised one large and three light aircraft carriers, two old battleships, three light cruisers, and eight destroyers. In the morning of Oct. 23, before the approach of this third enemy squadron was known, Amer. carrier-based planes attacked the other two enemy squadrons, while Jap. land-based planes attacked Adm. Halsey's carriers cruising to the eastward. In this cross-air attack the Jap. lost 150 planes to the Amers', eight, but succeeded in hitting a light Amer. carrier which blew up and had to be sunk, the majority of the crew being saved. Amer. torpedo-plane attacks were concentrated on the Jap. force in the Sibuyan Sea and sank one light cruiser outright and damaged a number of other vessels, but the bulk of this Jap. squadron went on through the San Bernadino Strait during the ensuing night. The Jap. squadron in the Sulu Sea was attacked by bombers and fighters only and many ships were hit, but this squadron too held on its course, entering the Surigao Strait at night. Here it was engaged by the Seventh Fleet and completely defeated, one if not both its battleships, sev. cruisers, and most of the destroyers being sunk, for the Amer. loss of only a few motor torpedo-boats. The survivors of this Jap. squadron turned tail and retreated westward through the Sulu Sea again, but were sunk to the last ship by air attacks the next day. Prior to these nocturnal events the Amers. had learned of the approach, from the N., of the Jap. carrier force and Adm. Halsey at once sent a number of his carriers to meet the enemy carriers at dawn of Oct. 24. This attack achieved complete surprise. The largest carrier and two of the three smaller ones were sunk outright by Amer. air attacks, which also sank a destroyer and crippled a cruiser and the third smaller carrier. Of these the cruiser was sunk the next night by submarine, while the remaining Jap. carrier was trapped and also sunk, together with another carrier which had escaped damage from the air, by the guns of Amer. cruisers and destroyers. Both enemy battleships of this carrier fleet were hit by bombs and one also by torpedoes as well; all the

remaining cruisers and destroyers were hit by bombs and gunfire. No Amer. ship was hit in this action in the N. Halsey's carrier-borne aircraft then turned S., being now more urgently needed there than in the N. Meanwhile the Jap. Sibuyan Sea Squadron, having passed the San Bernardino Strait and turned S. round Samar Is., came in contact with some of Kincaid's cruisers and sank two of them by gunfire. But the enemy was then brought to action by Kincaid's fleet fresh from its night victory in the Surigao Strait, with which Halsey's carrier-borne aircraft, hurrying back from the N., now co-operated. Every Jap. ship was badly damaged, one heavy cruiser being sunk and a destroyer disabled, while the remainder of the squadron turned back through the strait, one straggling cruiser being sunk by pursuing Amer. cruisers. Next day carrier aircraft from both Amer. fleets—together with Gen. MacArthur's shore-based aircraft—kept up the attacks on the westward-retreating Jap., sinking two more cruisers and (probably) one battleship. In all three battleships, four carriers, six heavy cruisers, four light cruisers, and seven destroyers were sunk; while four battleships, five heavy cruisers, one light cruiser, and two destroyers escaped in a damaged condition. Amer. losses were one light carrier, two escort carriers, two destroyers, one destroyer-escort (equivalent of a frigate), and a few lesser craft sunk. Eight escort carriers, two light cruisers and five destroyers damaged.

Another notable event was the sinking of the last great Ger. battleship, *Tirpitz*, by R.A.F. Lancasters on Nov. 12. Some twenty-nine Lancasters, led by W.-Cdr. J. B. Tait and Sqdn.-Ldr. A. G. Williams, attacked the ship in Tromsø Fjord with 12,000-lb. bombs. There were sev. direct hits and within a few minutes the ship capsized and sank. One bomber was lost, but the crew came down safely in Sweden. Previously the ship had lurked in Alten Fjord, a menace to allied sea traffic to and from Russia, but she was forced to leave her N. lair by the Russian advance late in the year into Petsamo and then anchored near the S. end of Hinakoy Is., 4 m. W. of Tromsø. This final attack was the climax of a long series, which had probably disabled the ship as a fighting unit, though air observation did not definitely establish that fact. On her first appearance at sea on March 9, 1942, a torpedo from an aircraft of the Brit. carrier *Victorious* off the Lofoten Is. sent her back to harbour for repair. Refitted she attempted to attack a Russian-bound Brit. convoy on July 8, 1942, but was hit by sev. torpedoes from a Russian submarine. She succeeded in reaching an anchorage in the Alten Fjord prepared for her but was unable to leave for fourteen months. In Sept. 1943 she joined the *Scharnhorst* in action against the very small Norwegian batteries in Spitzbergen, returning quickly to her lair for fear of a possible Brit. attack. Lying within a protective crinoline of nets, she was once more severely damaged, this time by the

torpedoes of midget Brit. submarines. In April 1944, when seen to be capable of moving again, the period of air attacks on her began. Numerous hits by home fleet bombers, including at least three with heavy bombs, put her out of action for another five months. Bomber Command then took up the task with a succession of attacks on Sept. 15, Oct. 29, and Nov. 12, the last being the only time that the attackers were able to see the ship properly. One 12,000-lb. bomb hit her amidships, another in the bows, and a third near the stern. The ship heeled over rapidly and capsized with 700 ft. of her keel sticking out of the water. The *Tirpitz* was as well protected against air attack as any capital ship could be. Her decks had the thickest possible armament. She had sixteen 4.1-in. anti-aircraft guns and sixteen others of smaller calibre. Her main armament was eight 15-in. guns and twelve 5.9-in. guns, and there were two catapults for aircraft. She was a vessel of 45,000 tons, 792 ft. long, with a speed of 30 knots and was completed in 1941.

The U-boat menace was very greatly reduced in 1944—so much so that in one month of the year only one ship was lost, while in sev. other months the number sunk was negligible. Up to the middle of the year the Gers. had lost since the beginning of the war more than twice as many U-boats as in the First World War, the total up to Aug. 1944 exceeding 500—the war memorial at Kiel recorded the loss during the First World War of 198 U-boats. In one month of 1944 (July) the number of U-boats destroyed was substantially greater than the number of merchant ships sunk by them. In March five Brit. sloops (*Wild Goose*, *Maggie*, *Starling Kite*, and *Woodpecker*) on escort duty destroyed six Ger. submarines in the space of twenty days, in one case capturing the whole crew of fifty-one of one large U-boat. Some seventeen U-boats were sunk while attempting to interfere with the Anglo-Amer. cross-Channel traffic since the first landing of the Allies on the beaches of Normandy. While the Ger. U-boat fleet was then still of impressive size, the U-boats were now the hunted rather than the hunters; for they had been attacked from the Arctic to the Indian Ocean, aircraft playing a great part, together with surface forces. This pressure was maintained until all chances of revival of the U-boat campaign were killed and this despite the development of new devices and methods by an ingenious and scientific enemy.

Naval Operations in European Theatre of War in 1945. *Admiral Scheer* and *Lützow* sunk. The Ger. pocket battleship *Admiral Scheer*, was sunk in an attack on Kiel by aircraft of the R.A.F. Bomber Command on the night of April 9, 1945. She was turned completely upside down in much the same position as the *Tirpitz* in Tromsø Fjord. She was the second of the three pocket battleships to be put out of the war, the first being the *Admiral Graf Spee* (q.v.). Germany's last pocket battleship, the *Lützow*, was sunk on

April 16 by a small force of Lancasters in an attack with 12,000-lb. bombs at Swinemünde. The *Lützow*, formerly the *Deutschland*, was observed in Danzig Bay at the end of March, but the capture of Danzig by the Russians compelled the Gers. to move the ship further W. and she was attacked very soon after, being detected at Swinemünde. Like the *Admiral Scheer* the *Lützow* was used for commerce-raiding early in the war and, later, moved to Norwegian harbours for use against Brit. convoys to Russia. She was torpedoed by a Brit. aircraft off the Norwegian coast in June 1941 and again by midget submarines in Alten Fjord in Sept. 1941.

Ger. Ships captured in the Port of Copenhagen.—The last two big Ger. warships still seaworthy at the end of the European war, the cruisers *Prinz Eugen* and *Nürnberg*, were found by Brit. cruisers lying in the N. port, Copenhagen, with their Ger. crews on board. They had evidently made no attempt to flee when Denmark was liberated by the Brit. forces. Only a few days previously they had been shelling Copenhagen. With them were three destroyers, two torpedo-boats, ten minesweepers, thirteen 'flak' ships, nineteen armed trawlers, and two armed merchant ships. Two Brit. cruisers, *Birmingham* and *Dido*, and four destroyers, having forced a passage through Ger. minefields in the Skagerrak and Kattegat, came in prepared to attack, but the *Prinz Eugen* was a defeated ship and there was no opposition. Altogether about 135 warships of various types and some 600,000 tons of merchant shipping were captured in Copenhagen, which in the later period of the war was used extensively by the Gers. for troop-transport to Norway and for the evacuation of wounded from the Russian front.

Toll of Midget U-boats.—During the closing months of the war the Ger. Navy made extensive use of midget U-boats in a determined but vain attempt to interrupt the flow of allied supplies across the Channel and the North Sea to the Continent. In the course of a series of actions, fought mainly in coastal waters, some eighty-one midget U-boats were either sunk or captured. A further twenty-eight were possibly sunk. Attacks were also carried out on seventy others, but it was not possible to observe the full results of these attacks. After the capitulation of Germany about 100 more midget U-boats were captured. The Gers. employed three types of these boats, the *Biber*, *Moleh*, and *Seehund*. The *Biber* was a one-man U-boat, 29 ft. 6 in. long, armed with two electric torpedoes and propelled by petrol engine and electric motor. The *Moleh*, also a one-man boat, was approximately 46 ft. long, but had a similar armament to that of the *Biber* and was electrically propelled. The maximum speed of both was about 6 or 7 knots and the average human endurance ranged from 24 to 48 hrs. only. The *Seehund* was a two-man boat and, unlike the other two types, was well designed and equipped. It was in fact a miniature

pre-fabricated U-boat, 39 ft. long, with a displacement of 16 tons, propelled by Diesel engine and electric motor and had a surface speed of 8 knots with a submerged speed of 3 to 4 knots. The armament was two 21-inch modified electric torpedoes fitted with magnetic pistols and net cutters. It had an estimated performance of 18½ knots up to 6000 yds. and an approximate endurance of 275 m. at 8 knots surfaced plus 50 m. at 3 knots submerged.

Summary of U-boat Losses in the Battle of the Atlantic.—With the surrender of Germany the grim battle of the Atlantic ended. It had been a long-drawn, relentless struggle extending over nearly six years and one which demanded not only the utmost courage and endurance, but also the highest scientific and technical skill. Losses were heavy both in lives and materials and, at the peak in 1941 and 1942, the issue of the struggle hung in the balance. On the other hand 662 U-boats were destroyed and many others were destroyed by the Gers. themselves in the final stage. Most of these successes were achieved by the combined allied naval and air forces working in the closest co-operation; others were due to mines laid from aircraft and ships; others to bombing in harbour, and a few U-boats were lost by marine perils.

Up to 1943 the rate of shipping destroyed in the battle of the Atlantic in relation to the number of U-boats lost had been very favourable to Germany, but in the first four months of 1943 allied counter-measures began to make themselves felt and U-boat losses mounted rapidly. R.A.F. Coastal Command and escort carriers of the R.N. provided air cover on a scale which could not be matched by the Gers., and in April the allied chiefs of staff initiated a series of combined sea and air offensives directed against U-boats in the bay of Biscay. Doenitz (q.v.) was to be attacked in his own waters. The result of these and other allied operations was that in the month of May 1943 thirty-seven U-boats were sunk, representing approximately 30 per cent of all U-boats at sea. Doenitz was forced to withdraw his U-boats from the N. Atlantic, and on June 24 allied ships of 15 knots or over were able to resume transatlantic passages, independent of convoy protection.

British Submarines in the War.—During the war Brit. submarines caused the following enemy losses: 6 battleships damaged; 6 cruisers sunk and 15 damaged; 12 destroyers sunk and 18 damaged; 46 U-boats sunk or probably sunk; 112 minor war vessels sunk and 26 damaged. That is the summary against warships alone, but the part played by Brit. submarines was often concerned chiefly with the interruption of the flow of reinforcements and supplies to enemy forces overseas. In this form of warfare Brit. submarines sank 1373 enemy supply and troopships, totalling 2,100,000 tons, and damaged a further 263 ships in these classes, with a tonnage of 790,000 tons.

British Naval Losses in the War against

Germany and Italy.—The Brit. Navy lost 730 ships during the war in the W., and the dominions forty-six others. Brit. losses included the capital ships *Royal Oak*, *Hood*, *Prince of Wales*, *Repulse*, and *Barham*, and the aircraft carriers *Courageous*, *Glorious*, *Ark Royal* (g.v.), *Audacity*, *Hermes*, *Eagle*, *Avenger*, and *Dasher*. There were also lost 134 destroyers, 77 submarines, 23 cruisers, 51 mine-sweepers, and 48 drifters, but numerically the highest losses were 240 trawlers. These totals do not include light coastal craft, and landing ships and craft. Losses of

became a co-belligerent are included in these figures. Fr. ships are included up to the collapse of France in June 1940. After that date Free Fr. ships are included, but not Vichy ships.

American Troop Losses at Sea.—Ship sinkings or damage to ships cost the lives of 3604 Amer. soldiers in the war against Germany and Italy, i.e. in the African, Mediterranean, European, and Atlantic areas, but excluding casualties suffered during the invasion landings. Official returns show that of 4,453,061 Amer. troops who embarked in the U.S.A. for

THE LAST BLOWS AT JAPAN

An effective attack by naval Avengers on Shimonoseki shipyard, Injo Shima, Inland Sea.

naval ships, ships of all sizes and sorts, amounted to 3282.

Allied Mercantile Marine Losses in the War against Germany.—During the war some 4280 allied merchant ships, totalling 19,720,000 gross tons, were lost by enemy action. Of these 2570, totalling 11,380,000 tons, belonged to the Brit. Empire. Neutral countries lost 190 ships, totalling 1,420,000 tons. U-boats accounted for 2770 ships, of which 1360 were Brit., 440 Amer., 670 other allied, and 300 neutral. 520 ships were lost through mines, including 310 Brit. and 15 Amer. The total losses through attacks by surface raiders were 330— including 210 Brit. and 13 Amer. Hostile aircraft sank 750, of which 140 were Brit. and 58 Amer. Some 400 vessels, including 220 Brit. and 12 Amer., went down through other or unknown causes. Altogether the U.S.A. lost 538 ships, totalling 3,310,000 tons, and the other Allies, excepting the Empire, 1172 ships, totalling 5,030,000 tons. In addition the Brit. Empire lost 610 ships of 1,120,000 gross tons. Losses of lt. ships after Italy

Europe, 1094 were lost at sea outbound. Assuming, however, that every soldier had to make at least two sea voyages, thus doubling the risk, it works out that, of every 10,000 embarked, four were lost at sea, a figure which compares favourably with the First World War losses of 7·2 out of every 10,000. This comparatively small loss was due to the work of the allied navies, the vigilance of convoy escorts, and to the skill of the gun crews on the transports. The sinking involving the heaviest loss was that of the *Rohna*, a Brit. troopship, sunk by air attack in Nov. 1943 off Jidelli, Algeria. Bomb damage and the heavy seas and darkness hampered rescue, resulting in a loss of 1015 men, more than half of the total complement of Amer. soldiers on board.

Naval Operations in the Far East in 1945.—The beginning of the year saw the U.S. Navy actively supporting the recapture of the Philippines. In the bombardments previous to the landings in the Lundayen Gulf on Jan. 9, Australian naval forces took part with those of the U.S.A. On Feb. 16 the Amer. advance

across the Pacific reached the mainland of Japan when a naval force moved up to within 300 m. of Honshu and subjected Tokio and Yokohama to 9 hrs. bombing by 1500 aircraft from about twenty carriers. This was followed by two further heavy raids towards the end of the month, when naval aircraft were supported by 200 Superfortresses. Meanwhile on Feb. 19 Amer. forces assaulted the is. of Iwo Jima with massive naval and air support, but the is. was not won until March 16, at the cost of 20,000 Amer. casualties, including over 1000 killed. The Brit. Pacific fleet now began to operate as a separate Brit. unit under Amer. command. It included five capital ships and four large carriers, besides numerous cruisers, destroyers, and other craft, and one of its first operations was an attack with Amer. naval aircraft on is. between Formosa and Japan. Attacks by 1500 allied aircraft were also made on the Jap. fleet in its home waters. On April 1, in the largest amphibious operation up to date, troops landed on Okinawa after a crushing naval bombardment and under an air umbrella of 1500 aircraft. The left flank was covered by a powerful Brit. naval force. In strong counter-attacks, the allied fleet suffered loss and damage from Jap. suicide aircraft. Meanwhile a fast Amer. task force brought a Jap. naval force under air attack, sinking the battleship *Yamato*, and Brit. carrier aircraft attacked Formosa. Throughout May hard fighting continued at Okinawa which was not finally captured until June 21. This gave the U.S. air force a base only 325 m. from the Jap. mainland. In the S.W. Pacific Australian forces supported by allied naval units had landed in N. Borneo and New Guinea, to be followed in June by the capture of Labuan Is. On July 14 Japan itself was subjected to the first naval bombardment when Amer. warships poured 1000 tons of shells into the port of Kamaishi (Honshu). Thereafter bombardments by Brit. and Amer. surface forces alternated with joint attacks by as many as 1500 naval aircraft. Towards the end of the month Brit. and Amer. air attacks were concentrated on the remnants of the Jap. fleet sheltering in the Inland Sea and, in three devastating assaults, did immense damage both to ships and shipyards. Shattering sea and air bombardments of the mainland continued in Aug. and were quite independent of the atomic bombs dropped on Aug. 6 and Aug. 9. On Aug. 15 allied aircraft were starting a further attack in the Tokio area when the cease fire order was received. Japan had surrendered. On Aug. 27 a large allied fleet, under the supreme command of Adm. Halsey, U.S. Navy, arrived in Sagami Bay and Adm. Sir Bruce Fraser signalled to the Admiralty: 'The fleet has anchored in Japanese waters.' Of the Jap. Navy there remained afloat only one battleship out of thirteen, and that was damaged, two severely damaged aircraft carriers out of twenty-one, four damaged cruisers out of forty. Jap. destroyers had been

reduced from 165 to 26, and her submarines from 140 to 16. No fleet had ever been more thoroughly defeated.

The Navy's Sacrifice.—In the whole course of the war nearly 51,000 officers and men of the R.N., excluding the navies of the dominions and the Royal Marines, were killed or missing. This number exceeded by over 20,000 the numbers killed in the First World War.

The more spectacular victories and successful actions fought at sea were really but a small part of the R.N.'s great contribution to the overthrow of Nazi tyranny; its real task lay in the unceasing vigilance, devotion, and toil that went to the maintenance of the sea communications of the Empire and Allies throughout the war. The navy's losses in this war were two and a half times as great as they were in the First World War, and losses of merchant shipping amounted to the figure of 20,000 tons a day for most of 1942. The magnitude of the navy's task is well illustrated by the fact that 998 U-boats were destroyed, an average of one every second day throughout the war. Of these U-boats one-third were destroyed within 500 m. of the United Kingdom. See F. Taprell-Porling (*Taffrail's Western Mediterranean*, 1942-1945, 1947; G. Stitt, *H.M.S. 'Widewater'*, 1943, and *Under Cunningham's Command*, 1941; Adm. Sir W. M. James, *The British Navies in the Second World War*, 1946; W. E. Benyon-Tinker, *Dust upon the Sea*, 1947; R. Naval Reserves. The reserves of the R.N. consist of: (1) The Royal Naval Volunteer Reserve (R.N.V.R.), which trains officers and men in their spare time. Some put in both evening and a period of amn. training with the fleet; others do the amn. training only. There are twelve R.N.V.R. divs.: London, Belfast, Hove, Dundee, Newcastle-on-Tyne, Bristol, Glasgow, Leith, Southampton, Liverpool, Hull, and Cardiff, and each div. has its own sea-going tender in which training cruises are carried out. In addition, the R.N.V.R. comprises four air squadrons: No. 1830 at Abbotsinch, near Paisley; No. 1831 at Stretton, near Warrington; No. 1832 at Oldham, near Abingdon, Berkshire, and No. 1833 at Bramcote, near Nuneaton, Warwickshire. The present strength of the R.N.V.R. is 3000 officers and men, but the target is 15,000. (2) The Royal Naval Volunteer Wireless Reserve (R.N.V.(W.)R.), which trains officers and men in the technique of naval communications at their homes and local centres. Two centres for this reserve have been estab. in London and Grimsby, but it is intended to open others

in another twenty-five tons. The target for the R.N.V.(W.)R. is 1250 officers and men. (3) Royal Naval Volunteer Supplementary Reserve (R.N.V.(S.R.)), comprises ex-temporary naval officers willing to serve in an emergency. No training is required. (4) Royal Naval Emergency Reserve (R.N.E.R.), estab. in 1919 for ex-naval ratings willing to serve in an emergency. No training is demanded. The target for this reserve, combined with the R.M.F.R. (see below), is 50,000. (5) Royal Fleet Reserve (R.F.R.), open to men with a minimum of three years' service in the R.N. or Royal Marines. It carries retaining pay of 1s. to 1s. 6d. a day according to rating and demands seven days' continuous training every two years. The intake (1949) is 700 per month, but it is desired to raise this to 1000. Provision was made in the 1949-50 estimates for an R.F.R. of 25,000. (6) Royal Naval Reserve, filled by officers and men from the Merchant Navy. (7) The Royal Naval Patrol Service supplied by the fishing fleets. The reconstitution of (6) and (7) is under consideration (1949). Note: All officers of the R.N. on retired pay are automatically on the reserve and liable to be called up in an emergency. (8) Royal Marine Forces Volunteer Reserve (R.M.F.V.R.) is the first auxiliary reserve of the Royal Marines, and the first two centres opened in London and Glasgow in Nov. 1948, two more in Liverpool and Bristol in 1949. Still more are intended. This reserve is run on the same lines as the R.N.V.R. and the initial requirement is 1500 officers and men. (9) Royal Marine Emergency Reserve (R.M.E.R.), a new Reserve (1949) of ex-Royal Marine officers and men willing to serve in an emergency. No training is demanded (see also R.N.E.R. above). (10) Women's Royal Naval Reserve (W.R.N.R.), comprises a list of ex-W.R.N.S. officers and ratings, with a minimum of one year's service, willing to serve in an emergency. Its strength (1949) is 3200, but a target of 10,000 is the aim.

Naval Scientific Service, Royal, comparatively new branch of the R.N. returned after the Second World War as a permanent service. During the First World War there were great developments in the application to warfare and the Admiralty found it necessary to bring in scientists to co-operate in the development of wireless, mines, gunnery systems, and devices for all sorts of purposes. The lesson of all this was quickly appreciated and a decision taken to retain in being a number of the experimental organisations which had sprung up during that war, and a number of the scientists in those organisations were persuaded to stay on permanently. The Admiralty Research Laboratory was built at Teddington, and the staff scattered about in the various establishments were brought under a single grading system and organised in what were known as the Admiralty Scientific, Technical, and Chemical Pools. During the inter-war period the situation remained comparatively static. Personnel was slightly increased during and after

the Abyssinian crisis of 1935, but it was not until 1939 that any substantial change took place. The Second World War being recognised as a scientist's war, the naval scientific organisation expanded correspondingly and the personnel increased tenfold over the 1935 level and even then could not cope with all its tasks adequately. The old permanent corps was reinforced by scientists of all kinds drawn from every source. The achievements of this force were great and may be exemplified in the speedy mastery of the magnetic mine, and in other services the nature of which may not yet be divulged. The net result was that the Board of Admiralty was impressed with the need to give more adequate recognition in its organisation to the scientific arm, and in Sept. 1944 they announced their intention to establish after the war the R. N. S. S. This was done in 1946 when the post of chief of the R. N. S. S. was created, with the oversight of four new depts., each under a scientist of the status of full director. Thus to-day the R. N. S. S. holds a very central and important part in the Admiralty organisation.

The scope of the work of the R. N. S. S. is of the widest, covering research and development of every kind in physics, chem., and engineering by way of promoting the fully up-to-date fighting efficiency of the navy. The greater part of the work of the R. N. S. S. is concerned with ships. In addition to ordinary seaworthiness naval vessels must be capable of withstanding altogether abnormal stresses and strains from attack by guns, torpedoes, and mines and bombs. The effects of blast and explosion, both on the surface of the sea or beneath, pose most difficult problems, in the solution of which the scientist can help the constructor. Again, the requirements of warships' and submarines' engines are stringent as compared with those of the mercantile marine and the problems correspondingly greater. There is also the problem of communications offering the widest field for the telecommunications engineer in radio reception, transmission, and direction-finding. As a further example of the value of the work done by the R. N. S. S. may be mentioned the fact that the navy possessed the Asdic device for countering the submarine menace at the outbreak of the Second World War, and throughout the war the R. N. S. S., in co-operation with certain univs. and industrial laboratories, kept the lead in the field of thermionic tubes, a success which was a major contribution to winning the war. The practical work of the R. N. S. S. is applied to civil life in industry in many ways. Examples of this are the development of the spectrographic method of analysis, which has in many cases replaced the old chemical method, and the application of radar as a navigational aid to the mercantile marine.

In the R. N. S. S. there are two main officer divs., the first consisting of the scientific officer grades, the second the experimental officer grades. The normal qualification for the scientific officer is a

first- or second-class honours degree and the entry rate of pay for officers without post-graduate experience is £400 a year. Following a satisfactory probationary period, a scientific officer may expect promotion to the senior scientific officer (S.S.O.) grade (£700-£900) and to the prin. scientific officer (P.S.O.) grade (£950-£1250), which he should reach in the early forties. Satisfactory entrants may expect to reach the senior (S.P.S.O.) grade (£1320-£1520) before the end of their careers. There is an appreciable number of posts in the deputy chief (D.C.S.O.) grade (£1600-£1800 and at £2000) and a very limited number at still higher pay. Special provision is made for what are known as 'special merit' appointments in the S.P.S.O. grade and very exceptionally in the D.C.S.O. grade for outstanding individual workers without any administrative responsibility. The experimental officer class is open to individuals with minimum qualifications of intermediate degree or higher national certificate. It is in three grades and pay ranges from an entry rate (£230-£390) rising to £490. The top grade is the senior experimental officer (S.E.O.) with a pay range of £735-£935. See 'The Royal Naval Scientific Service,' by F. Brundrett, in *The Central*, No. 99, June 1949.

Naval Treaty of London (1936), treaty concluded on March 25, 1936, between Great Britain, U.S.A., and France with a view to limiting naval armaments. It had been agreed under the provisions of the London Naval Treaty, 1930, to meet in conference in 1935 to frame a new agreement to replace and carry out the purposes of that treaty. As Japan had given notice of termination of the Washington Treaty (q.v.) it was necessary to summon a conference for that contingency too. The conference of 1935-1936, however, could come to no agreement on quantitative limitation. At the opening Japan tabled her proposal for a 'common upper limit,' but, as this was not acceptable to the other delegations, Japan withdrew from the conference. The further efforts of the conference were therefore directed to achieving the maximum measure of qualitative limitation and to obtaining agreement on provisions for advanced notification of construction programmes. The chief limitations agreed on were: capital ships, maximum displacement, 35,000 tons, maximum gun calibre, 14 in.; aircraft carriers, 23,000 tons, 6.1-in. guns; submarines, 2000 tons, 5.1-in. guns; together with provision for 8000-ton cruisers with 6.1-in. guns. The treaty framed on this basis came into force on Jan. 1, 1937, and was to remain in force until the end of 1942. It meant but little in the way of real limitation, for not only did it lack the adherence of both Italy and Japan, but it had 'escape' clauses allowing of earlier limitations if, in the meantime, the naval programmes of other nations should threaten the security of signatories. As Japan refused to reveal her programme and was reported to be building battle-ships of 40,000 tons, the three London

signatories raised the limit for capital ships to 40,000 tons by announcement on June 29, 1938.

Navan, prin. tn. of co. Meath, Eire, situated at the junction of the Boyne and Blackwater, 30 m. N.E. of Dublin. It manufs. a gric. equipment, carpets, furniture, and woollen goods. Pop. 4500.

Navarete, Juan Fernandez (1526-79), surnamed El Mudo (the Mute), Sp. painter, b. at Logroño. It is supposed that he was a pupil of Titian at Venice. In 1568 he went to Madrid as salaried king's painter to Philip II., and painted in the Escorial the three pictures of 'The Nativity,' 'The Baptism of Christ,' and 'Abraham receiving the Three Angels.'

Navarino, Pylos, or Neocastro, fortified seaport of Greece, on Navarino Bay, in the prov. of Messenia, 56 m. S.W. of Tripolis. To the N. are situated the ruins of the anc. Pylos. In the bay the Eng., Fr., and Russians united for the protection of Greece, and defeated the Turkish and Egyptian fleets (1827). See also PYLOS.

Navarra, or Navarre, prov. of Spain (formerly a kingdom with ter. to the N. as well as S. of the Pyrenees), is bounded on the N. by France, on the E. by Aragon, on the S. by Old Castile, and on the W. by the Biscays. Area 4056 sq. m. Pop. 371,500. The country is mountainous, being bounded and traversed by the Pyrenees, spurs of which occupy almost the whole of the prov. in its N. and E. parts. The highest peaks are Altovisear, Adi, Alcorruiz, and Ruña. Navarra is watered by the Bidassoa, the Anzo, and by the Ebro, together with its tribs, the Ega and Aragon, on the level shores of which corn, wine, and oil of good quality are produced. Some of the valleys which intersect the mt. ranges, as those of Roncesvalles, Leson, Bastan, and Roncal, have a fruitful soil and yield good crops; but in the mt. dists. husbandry is impracticable. The manufs. include textiles, soap, candles, leather, and paper. Iron, silver, lead, copper, and salt are the chief mineral products of the dist. The chief tn. is Pamplona (q.v.).

The ter. known from an early period of Sp. hist. under the name of Navarra was occupied in anc. times by the Vascones, who were subdued by the Goths in the fifth century. After having become gradually amalgamated with their conquerors, the people continued to enjoy a species of turbulent independence under military leaders until the eighth century, when they were almost annihilated by the hordes of Arabs who were rapidly spreading their dominion to all parts of the peninsula. In 1285 it became an appanage of the Crown of France, and continued a part of that kingdom during the successive reigns of Louis X., Philip V., and Charles the Fair; but on the death of this last in 1328 France fell to the family of Valois, and the daughter of Louis X., the rightful heir, succeeded to Navarra as Joanna II. Ferdinand seized Sp. Navarra in 1512, when it became part of Spain, and the small strip of ter. on the N. of the Pyrenees became merged in the Crown of France. After this act of spolia-

tion the kingdom of Navarra was reduced to the ter. N. of the Pyrenees, which was subsequently united to the Crown of France by Henri IV. of Bourbon, king of Navarra, whose mother, Jeanne d'Albret, was granddaughter of Queen Catharine, and hence the hist. of Navarra as a kingdom ends with his accession to the Fr. throne in 1589. The Navarrese S. of the Pyrenees were permitted to retain many anct. municipal charters and constitutional privileges, after their incorporation with the other domains of the Sp. Crown, and these prerogatives were not taken from them till the reign of Queen Christina, when the active aid which they had furnished to the Pretender, Don Carlos, drew upon them the ill will of the gov..

is generally the highest portion of the building. The term was anciently used to include the aisles, denoting all the part used by the laity.

Navew, or **Nave**, name for sev. cruciferous plants which, originally classified together as *Brassica campestris*, were divided by Sir Joseph Hooker into three sub-species, *B. rapa*, from which the turnip is derived; *B. rutabaga*, swede turnip; and *B. napus*, rape. The difference in the varieties probably results from the objects and methods of cultivation, whether for fleshy roots or oily seeds.

Navicert, system of naval control of neutral trade in time of war. The N. system implied the examination in neutral ports of outgoing cargoes and the issuance

NAVARRA: ESTELLA

and led at the close of the Carlist war to the abrogation of their *fueros*, or national assemblies, and to the amalgamation of their nationality with that of the kingdom at large. See P. Boissonnade, *Histoire de la reunion de la Navarre à la Castille*, 1893, and J. de Urabuen, *Geografia humana de Navarra* (Pamplona), 1929.

Navarrete, **Martin Fernandez de** (1765-1844), Sp. scholar and naval officer, b. at Abalos. He entered the navy in 1780, and became a captain in 1796. From 1789 to 1792 he was appointed to collect documents relating to the hist. of the Sp. Navy; he was made director of the hydrographic dept. in 1823, and senator and director of the Madrid Academy of Hist. in 1837. His works include *Coleccion de los Viajes y Descubrimientos que hicieron por Mar los Españoles desde fines del Siglo XV.* (1825); *Disertacion sobre la Historia de la Nautica* (pub. 1848); and *Biblioteca Maritima Española* (1851).

Nave, in eccles. architecture the main central div. of a church, having aisles on either side. It is separated from the aisles by rows of piers or columns and

of certificates to those free of contraband which would facilitate their passage through the naval control. The originator of the N. was Mr. Skinner, U.S. consul-general in London during the First World War, but the system adopted in that war in 1916, and which was revived in the early part of the Second World War to reinforce the system of control ports from Kirkwall to Haifa, differed in certain essentials from that which was in operation for the rest of the Second World War. The position in the Second World War was governed by the order in council of July 31, 1940, which provided that 'any vessel on her way to or from a port from which goods might reach or come from enemy territory or the enemy armed forces, not being provided with a ship navicert valid for the voyage on which she is engaged, shall, until the contrary is established, be deemed to be carrying contraband or goods of enemy origin or ownership, and shall be liable to seizure as prize'; and also that 'all goods consigned to any port or place from which they might reach enemy territory or the enemy

armed forces, and not covered by valid cargo navicert . . . shall, until the contrary is established, be deemed to have enemy destination.' The effect of these provisions was that any neutral shippers or shipowners who shipped unnavicerted cargo to or from European ports did so at their peril. They ran the risk of losing both cargo and ship. Also under the provision of the ship warrant scheme, the offending owner was liable to lose not only the warrant in respect of the particular ship concerned but also in respect of any other vessel in his possession.

Navicular Disease, or Groggy Lameness, inflammation and ulceration of the N. or shuttle-bone of the horse, invariably occurring in the forefoot, and due sometimes to hereditary causes or to overwork on hard roads, but more commonly to driving at excessive speed after the horse has been kept for some time without exercise. The inflammation causes a constant irritation in the foot, which sets up an extra growth of horn; the removal of this, and frequent shoeing, for preference with an indiarubber bar pad, and short shoe, affords much relief and enables the animal to work tolerably well, but the disease is practically incurable.

Navigation, name applied to the science of finding the position of a vessel at sea (or of an aircraft, as to which see AERIAL NAVIGATION) and so directing her from one point to another. During practically the first fifteen centuries of the Christian era sailors, such as the Phœnicians, the Carthaginians, Greeks, and Romans, depended entirely upon their observation of the skies and their proximity to the coast, out of sight of which they seldom ventured. The Vikings probably did most of their navigating under similar conditions, and their discovery of Iceland, and possibly of America, was a result of their being blown out of sight of land and of their inability to direct themselves. During the Renaissance the science of N. became a more or less exact one. This was due very largely to the discoveries of the Portuguese sailors and more especially to the work of Prince Henry the Navigator. The cross staff, an invention by which long, could be determined, was first made by Werner about the beginning of the sixteenth century, and, later, chronometrical observation in conjunction with the use of nautical instruments came into general use. Davis invented a back staff which seems to have been very generally accepted and this form of quadrant remained in use for a very long time. Much about the same time an instrument came into use for the determination of the height of the sun and stars (the astrolabe). The inventions and discoveries of Mercator did much to make N. more a matter of exactness. The inventions of Wright did much also in this direction, and finally towards the beginning of the seventeenth century arithmetic, trigonometry, and logarithms began to be used as methods of calculation. Probably the greatest work of this century was that of Martin Cortes, whose book was accepted as authoritative. Amongst

Eng. books on this subject may be mentioned—Cunningham's *Cosmography and Navigation*, the work of Davis and Mercator, and in 1751 J. Robertson's, *The Elements of Navigation*, 1796. The foundation of the Royal Observatory at Greenwich by Charles II. in 1675 was the direct result of the need for a reliable method of determining the position of a ship at sea. In 1763 the *British Mariner's Guide* was pub. by Dr. Maskelyne, and this really was the nucleus of the *Nautical Almanac*, which was first pub. in 1766 for the year 1767. Pub. has continued without interruption since that time. The author of the *British Mariner's Guide* had also, two years previous to this first pub., discovered a method by which long, might be determined by lunar observation.

PRACTICAL NAVIGATION: Coastal. In navigating a vessel along a coast the exact position is usually ascertained by reference to points of land, lighthouses, and beacons in conjunction with a chart of the vicinity. When it is possible to refer to more than one point the position is easily ascertained, because a ship's position is where compass bearings, after correction for deviation, intersect on chart. When only one point is available a bearing can be taken provided a sextant angle of the point or headland is also taken in day light, and the height of the point is shown on the chart. Another method adopted is to take a bearing of a point and then continue the vessel in the same course for some distance, at the end of which time another bearing is taken and these two bearings are marked down on the chart. By means now of a parallel rule placed in the same direction as the ship's course, it is possible to find and mark the exact position of the vessel when any current or leeway or both has been allowed for. Another variation of the foregoing methods of finding the position of the vessel is known as the 'four point bearing.' This is used when the ship is 'abeam' of the point of which observation is being made. A bearing is also taken when the point is four points on the bow. When it is possible to take observations of two points, these observations are taken simultaneously and marked on the chart; the point of intersection is the position of the vessel. With three points in view an instrument called a station pointer is used, and the angles between them found by means of its three arms. These three arms are attached to a circle made of celluloid, and when the arms have been placed in such a position that they correspond with the angles between the points, it is placed on the chart, and the centre of the circle gives the exact position of the vessel. In coastal N. when the weather is foggy the ship is navigated by means of 'feeling' round the coast with the lead or sounding machine (see *Modern Ocean Navigation* below). Naturally this is the most unsatisfactory of all methods, and soundings have to be continually taken in order to get even an approximate position. When using this method it is necessary to know the state

of the tide (*see* TIDES) and to reduce the soundings to low water, as all depths shown on a chart are given at low-water spring tides. In order to assist vessels safely to negotiate narrow channels when entering or leaving harbour, the leader system has been devised. A cable is laid along the sea bed in the channel and an alternating current is caused to flow through it. The constant variation in the current causes the magnetic field round the outside of the cable to vary in sympathy, with the result that radiations are produced which may be picked up by suitable apparatus on board ship. Two sets of coils are placed one on each side of the vessel and so arranged that they can be connected to earphones. By the strength of the signals from one side or the other it is possible to determine on which side of the cable the ship is passing; when directly over the cable the signal strength is the same from both telephones. In its latest form, instead of telephones, a small pointer is fitted which definitely indicates the ship's position relative to the cable.

It is necessary to bear in mind that all bearings taken from the compass must be converted into magnetic bearings before being marked on the magnetic chart, and even if the chart is a 'true' one, variation must still be allowed for. A bearing may be best defined as an observation by compass of the direction in which a point lies from the vessel.

Modern Ocean Navigation. The increase both in the size and the speed of ships has led to many developments in the science of N. Problems formerly regarded as purely theoretical have within recent years become very practical, and the science of N. to-day is much more intricate and precise than it was some decades ago. A long ocean voyage is first mapped out as carefully as possible on a great circle chart, the shortest possible route being chosen. The track thus chosen is followed also on a chart which shows probable wind directions and currents, and is modified according to the information therein given. In addition the track chosen would be also modified by such information as navigator's books relating to that region would give, and by the information supplied by the Admiralty's *Ocean Passage Book*. Next the route would be transferred from a great circle chart to a Mercator's projection chart, on which the great circles are shown, for convenience' sake, as straight lines, whilst the 'rhumb' line (the representation of the N. of the ship) is shown as a curved line. All meridians and the equator are shown on Mercator's projection as straight lines. The great circles are *not* followed in the steering of the ship; each circle is divided into chords which are followed instead, since that means only the alteration of the course by *one* or *two* degrees at the end of each chord, whereas to follow the great circle would involve the constant changing of the course. The general track to be followed having already been laid down, there are three methods by means of

which it is possible at any point during the voyage to ascertain the exact position of the vessel. These are: (1) The recording of the track on charts, a difficult matter owing to the constant errors which creep in and which cannot well be avoided; (2) by trigonometrical calculation, which is based on the course steered and the distance run; (3) by astronomical observation. As long as the ship is in sight of land, those methods which have been described under the heading coastal N. are used. In rough or hazy weather continuous soundings are taken when in localities which are known to be dangerous, and it is necessary to remember that the soundings must be continuous, since an occasional sounding is more dangerous than useful. Lord Kelvin's sounding machine, which is still used for that purpose, consists essentially of a drum round which is coiled *say*, thousand fathoms of fine wire, the free end carrying a specially designed sinker or lead (*q.v.*) which will enable a sample of the ocean bed to be brought to the surface. The wire passes over a registering wheel which indicates on a dial the length of wire run out. Two brakes are fitted to the large wire drum, one to control its rotation and the other automatically to stop the mechanism when the sinker reaches bottom.

A more modern method of ascertaining the depth of water is by echo-sounding. Broadly this is done by producing a sound in the water near the surface and accurately measuring the short interval of time which elapses before the echo reflected from the bottom is heard. This system requires sensitive time-recording instruments, but has the advantage that sounding can be conducted in all weathers at any speed of the vessel. During these periods the coast chart is used, this being on a very much greater scale than the ocean chart, which is usually known as the small scale chart. Before losing sight of land the lat. and long. (*q.v.*) are calculated by means of the methods already described, and the exact position is transferred from the coast chart to the small scale chart. After this the position of the ship is calculated by the methods given under the heading (2) above. This method is rectified wherever possible by means of astronomical observation and by a calculation of the changes of lat. and long. by means of plane trigonometry, frequent use being made of the traverse tables. These methods of discovering the exact position of a ship are known as dead reckoning, and the modern ship's compass, patented by Lord Kelvin, has done much to ensure its accuracy. The distance run by the ship is obtained by the patent log, the hand log being regarded nowadays as giving only the roughest estimate of the distance run. Nor is the patent log regarded as entirely accurate, the distance run by the ship being calculated more accurately nowadays by the number of revolutions of the engines. The most accurate means of ascertaining the exact position of the ship, however, is by astronomical observation,

and this is always employed wherever possible. Dead reckoning is only used during bad weather conditions. The astronomical observations are attended by many difficulties. The instrument used for making these observations is a sextant (*q.r.*); but this, owing to the conditions under which it has to be employed, must give rise to some little error. Navigators attempt, and to a great extent succeed, in rectifying such error by taking the average result of a number of observations made at different times. One of the greatest marvels of modern N. is the reliance which can be placed upon N. by star observation. The most accurate of all observations is probably the twilight observation, when the brighter stars are just visible and the horizon is visible also. For this purpose the armillary sphere is employed. This is a small celestial globe on which is marked all the prin. stars visible to the naked eye. By manipulating the sphere which is elevated, until

sidereal time is under the fixed meridian, a correct representation of the heavens is thus obtained. Astronomical observations are made at sea for the purpose of ascertaining lat., long., error of the compass, and lat. and long. simultaneously. The chief heavenly bodies observed are the sun, moon, Venus, Mars, Jupiter, Saturn, and the Pole star, together with all stars of the first magnitude. The *Nautical Almanac* gives the position of all these for fixed times at Greenwich, and gives also all necessary information for computing the position of these bodies at all times in all places. An important development is the application of directional wireless telegraphy to N., being particularly useful in foggy weather for establishing the position of a ship approaching the land. The principle of operation of a direction finder depends upon the fact that the antenna, or aerial, of a wireless transmitting or receiving installation emits or absorbs radiations most strongly in its own plane. In the direction finder used in practice the antenna consists of a flat coil of sev. turns of wire mounted on a vertical axis about which it is free to rotate so that its plane may be pointed in any direction of the compass. As a receiver it is turned until the signals are received at maximum strength, when it is known that the plane of the coil must point to the transmitting station. Direction-finding apparatus is either housed on land, when in response to a message from a vessel it can determine and signal to the ship its position; or it is carried on board and pointed towards a land station.

Another form is the rotating 'beacon.' This consists of a radio-transmitting station at some known point on land, having an antenna which is continuously rotated at constant speed and which is always automatically emitting a special Morse code signal. At a particular point in its rotation a characteristic signal is sent out. This system is declining in favour, although it has the advantage that no special wireless-receiving apparatus is required on the ship and the bearing can be taken on a broadcast receiver with the aid of a stop watch.

The gyroscopic compass has also been of great assistance to navigators. It has three important advantages: it is unaffected by magnetic effects of iron or steel in its vicinity; it always points to true or geographical north; and it is invaluable in high lats., where in a magnetic compass the card is straining to stand on its edge with consequent loss of efficiency. It is composed of a gyro-wheel rotated at high speed by electricity and this, if free to do so, will always set itself so that its axis lies in the true north and south meridian. A compass card and auxiliary parts are mounted on gimbals. The actual gyro-compass is mounted in a special room in the ship and repeaters synchronised with it are erected where required in other parts of the vessel. The gyroscopic compass is regarded by many seamen as the greatest of all modern aids to navigation.

SPERRY GYRO-COMPASS

The gyroscopic compass derives its north-seeking qualities from a combination of four natural laws, the first and second of which are properties of the gyroscope, the third gravitation, and the fourth the earth's rotation. These natural laws provide a source of directive force for a compass that indicates the true north and does so with a degree of steadiness comparable to that of an object on shore. In addition to indicating the true north, the Gyro-Compass is capable of operating, repeating, or indicating compasses wherever their indications may assist in navigating the vessel.

Sperry Gyroscope Co. Ltd.

NAVIGATION BY MARINE RADAR

Simplified plan or chart of the Solent, the strait between the Isle of Wight and Hampshire, England, shown. The ship's position is shown as a white circle in the centre of the plan or screen, and its direction is assumed to be north-east by north. The scale of display may be changed so that the screen covers 30, 12, 3, or 1/2 nautical miles. The last three are shown by the concentric circles on the plan.

The illuminated 12-mile display on the radar screen of the Solent equivalent to the whole of the simplified chart at the left, as it would appear on the screen at a scale of approximately 1/4 inch to 1 mile. With the ship in the centre, the surrounding coast-line can be discerned as a recognisable pattern of light with its many indentations, harbour entrances, etc. On the port quarter an elongated pencil indicates Ryde pier, and surrounding buoys appear as several points of light.

DIAGRAMS OF PLAN POSITION INDICATOR (P.P.I.)

In this second diagram the range switch has been turned to the 3-mile position and the display thus brought up to the correspondingly larger scale of 1 inch to 1 mile. Surrounding objects are defined with greater clarity and detail. Reference to the circular range scales super-imposed on the chart of the Solent shows the area which is embraced by the 3-mile range in relation to the above diagram.

The 1/2 mile position above gives an even greater expansion to the scale of the display, now covering the area within the smallest circle on the chart. The scale being 3 inches to 1 mile. Buoys are displayed with great accuracy. The thin bright line (thickened for the purpose of this reproduction) is the luminous ship's leading line, brought on the screen by a switch.

Cossor Marine Radar

Radar.—Radar (*q.v.*) is used for three main tasks in N.: (1) to provide warning of the approach of ships, icebergs, etc., and to avoid collisions; (2) to assist in the N. of coastal waters; (3) as an aid to the pilotage of restricted waters.

It is usual to provide scales of display so that the radar screen covers variously ranges up to 30 nautical m., 12 nautical m., 3 nautical m., and 1 2 nautical m. A set should provide a clear indication of coast-lines at 20 nautical m. when the ground rises to at least 200 ft., and at 7 nautical m. when it rises to at least 20 ft. Ships should be seen at 7 nautical m., fishing vessels at 3 nautical m., and buoys at 2 nautical m. It has been found that by fitting buoys with corner reflectors the radar response can be increased to 8 or more nautical m. By means of a chart comparison unit the picture may be viewed in coincidence with a chart. Another method is to project a magnified image of a microfilm transparency of the chart on to the face of the plan position indicator (P.P.I.). Shore radar can be used for port and harbour supervision as it provides instantaneous information of movements in the port area. It is also of value in enabling the port authority to know whether buoys or light vessels have moved from their charted position in bad weather and, if so, to know their new position. The ports of Douglas (Isle of Man) and Liverpool are both fitted with radar and at the latter place the pilots carry portable radio telephones which enable the control staff on shore to communicate instructions and advice concerning the pilotage of the ship; this is of particular value in foggy weather or when unusual conditions exist. The Liverpool-Wallasey and Gravesend-Tilbury ferries are also assisted in bad visibility by shore radar in conjunction with a radio-telephone link. Experimental Ramark beacons have been established at St. Catherine's, Isle of Wight, and Portland Bill lighthouses. When the ship's radar aerial points towards these places a broken bright line appears from the centre of the radar screen to its circumference on the bearing of Ramark in relation to the ship. To enable the navigator to identify the Ramark, small dots are used for St. Catherine's, large dashes for Portland Bill. The range of these beacons is 12-14 m.

Loran.—Long Range Navigational Air employs pairs of pulse-transmitting stations spaced up to 600 m. apart. The pulses are received and displayed on a cathode ray indicator from which the operator can determine the difference in arrival time between the two pulses. The ship's position is determined by taking a path difference reading from two pairs of stations. The observations and plotting take about 5 min. and the range over the sea is approximately 700 m. by day and double this distance by night. This system was used extensively during the Second World War and the whole of the North Atlantic and the Pacific was covered by Loran.

Gee is similar to Loran and consists of a master and two or three shore stations sited up to 80 m. apart and emitting continuous series of synchronised radio pulses from omnidirectional aerials. The range over the sea is 100-150 m. The equipment is comparatively simple to operate and a navigator can plot his position in a minute.

Decca, like Loran and Gee, employs the 'hyperbolic' system. A number of transmitting beacon stations have been erected in Great Britain and on the Continent and, by means of special receiving equipment, in a ship and special navigational charts on which are superimposed a lattice of lines of position, the ship's exact position can be ascertained. The range is approximately 300 m. and this system is practically confined to ships employed in the home and coasting trades.

Navigation Acts, long series of Acts of a protective nature which have been passed from time to time to prevent foreign competition on equal terms with Eng. ships. Although these Acts date back to the time of Richard II., the chief Act was that passed under Cromwell in 1651, directed principally against the Dutch. This provided that imports should be brought into England only in Eng. vessels or in vessels of the country actually producing the goods, and Eng. exports carried only in Eng. ships, the object being to monopolise as far as possible the carrying trade of the world. This restriction also applied to any Eng. dependencies. To a very great extent these laws accounted for much of the trouble between Great Britain and Ireland, and also between the Amer. colonies and the mother country. These restrictions on foreign trade were not totally withdrawn until the middle of the nineteenth century, and even in the withdrawal the right was retained to retaliate if restrictions were placed on Brit. navigation in foreign waters.

Naville, François Mare Louis (1781-1846), Swiss philosopher, b. at Geneva. He was pastor at Chaney in 1811, and founded there, and later at Vernier, a model school. He followed the philosophy of Maine de Biran. He pub. *De l'éducation publique considérée dans ses rapports avec le développement des facultés la marche progressive de la civilisation, et les besoins de la France* (1832) and *La Charité légale* (1836).

Navy and Navies. The general policing of the high seas has for a long time been assumed to be one of the prin. duties of the Brit. N. To this end the Eng. have in hist. maintained their supremacy of the sea, which in early times was a vital necessity when the Is. was open to the invasions of the vikings. The appointment of a 'count of the Saxon shore' was in

reality the forerunner of an efficient fleet to protect that shore from foreign invasion. The incursions of the vikings made it necessary to provide some force by means of which the Eng. could repel and in time stop the constant menace of invasion from the E. Practically since the time of Alfred the Great the hist. of the Brit. N. is continuous. Alfred fought the Danes on their own element, and in order to do so made what may be called a levy on each of the sea-border cos. for the provision of a certain number of ships, or a certain amount of money or men for the upkeep of those ships, to defend the coasts of the country from foreign invasion. Between Alfred's time and the Norman Conquest the 'levied' N. was supplemented by the possession by the king of royal ships, and during the years which followed the Norman Conquest the principles of feudalism were applied to the levying of a naval defence. The seaport tns. held their charters and privileges in return for men and ships which were to serve the king for fifteen days in the year at the expense of the tns. During the twelfth and thirteenth centuries the fleet of the Cinque Ports was practically the national fleet, but this rapidly sank into disrepute, and the R.N. came to be not the feudal array, but the mercenary N. In this respect may be compared the national N. and army, since both have come down not from the feudal array, but from the purely mercenary forces which formed part of the conqueror's supposedly feudal invasion army, and which, especially under the later Plantagenets, displaced the feudal array. The main nucleus of the R.N., however, was the king's own ships, which naturally were much more under his control than those sent him from the cos. These were controlled by royal officials, and were entirely at the command of the king. The crusade of 1190 had one result at least, that of ringing into use in the Eng. N. the title of Admiral, although it was not at first used in the supreme sense in which it is used to-day, and indeed an admiral in that sense was not appointed until 1360, and a First Sea Lord, as the title is known to-day, was not appointed until well into the fifteenth century. Even during the reign of weak Eng. kings the sovereignty of the seas was retained. In John's reign there were victories over Philip Augustus, and in Edward III.'s the victory at Sluys in 1340, and later over the Spaniards at Winchelsea in 1350. Up to this time, at any rate, the Eng. had suffered no great defeat, and their claim to sovereignty in the narrow seas could not easily be disputed, as their retention of Calais for so long a period does much to prove.

During the Hundred Years war the Eng. seldom found difficulty in invading France, and that perhaps was the supreme test. The N. led a somewhat chequered career during the period 1399-1485, but it still remained in existence, and fluctuated in strength according to the strength or weakness of the reigning king. During the Tudor period the N. increased in strength. Henry VII. added to its

numbers, not very greatly, it is true, but nevertheless he laid the foundation for the greater N. which his son was to build. He employed many of the royal ships on merchant ventures also. Henry VIII. took a deep interest in the N. He spent at least some proportion of the plunder of the monasteries in raising an efficient fleet, built according to the latest ideas. As far as the fleet is concerned, the Tudor period was a period of transition, but even during the reign of Elizabeth it never became larger than it was during the reign of Henry VIII. Henry was also responsible for the estab. of a N. Board, under the direction of a Lord High Admiral, and this administrative reform remained in existence down to the time of William IV. The early hist. of the personnel of the fleet shows us that it was regarded very much more as a 'military' force than as anything else. The sailors who navigated the ship were not held of the same importance as the soldiers who defended it. They were also very much in the minority. By the time of Henry VIII. this had to a very great extent changed, nor was this surprising. The era of discoveries had given the ships a very much wider scope than they had previously had. It was necessary now to have a majority of men who were capable of sailing and navigating the vessel. The fighting force, therefore, diminished very largely in numbers. Further the great strides which had been made in the science of navigation rendered it necessary that the men in command should be trained men, and not merely the favoured nominees of the king. It was fortunate that the same modernisation did not take place in Spain, so that the Armada battle was a conflict between the old and the new ideas of ships and sea warfare. Further during the Tudor period the size of the ships increased, and although the number of ships in the N. of Elizabeth was less than in that of Henry VIII., nevertheless the actual tonnage was greater.

The Stuart period is of vast importance for the development of the N. During the reign of James I. many great improvements were made. The position of Lord High Admiral was taken from the hands of Nottingham, perhaps not so much for inefficiency as for corruption, and was put into commission. Although the N. was not maintained at a very great strength, these commissioners nevertheless took steps to see that the fleet was efficient. Further the king himself took great interest in the development of the N., and especially in naval construction. This work was continued during the reign of Charles I., and many reforms were made in the matter of the personnel of the fleet, which was increased, and which received very much better wages. The ships that were constructed were of good quality, and it should be remembered here that Charles's first levy of ship money was in fact employed for the construction and increase of the N. The N. was, however, still small. At the outbreak of war the king had only about forty ships, and these were handed over to Parliament by the

newly created Lord High Admiral. During the period 1642-60 the N. passed into the hands of Parliament, and was controlled by admirals appointed by it. The N. did much good work, and under Cromwell it revived the days when it claimed the sovereignty of the seas. By 1660 the N. had more than trebled in size, and had nearly trebled in tonnage. Further the naval service was no longer regarded as of necessity a service by pressed men; the admirals of the Commonwealth, realising the error of this, opened the service to voluntary servants as well as pressed

over 100,000 tons, a personnel of 42,000 men, and nearly 7000 guns, a vast improvement on the previous reign.

When the revolution came in 1688 the control of the N. passed almost entirely into the hands of Parliament. The title of R.N. was still maintained, and occasionally the form of appointing a Lord High Admiral was gone through, but as a purely royal force the N. ceased to exist. We must remember, however, that it is because the N. was under royal control for so long that it has maintained an unbroken hist., and that it would probably often

crews. In view of the ever-increasing trade of England, and the necessity to protect the merchant service, the increase of the N. was essential to the well-being of the nation. During the reign of Charles II. the N. did at last become truly national. The work of Samuel Pepys was of vast importance: as clerk of the Acts and later as secretary to the Lord High Admiral he spent his life in a constant and successful endeavour to put the administration of the N. upon a sound, ordered, and disciplined footing, and to provide ships and men for war and peace. The later hist. of the N. is a continuation of the rules which he laid down. Officers received a proper training from the time that they were boys, and special corps were founded in order to have an ever-increasing number of officers prepared for the service. The commerce of the country was much more amply protected, and piracy was put down with a strong hand. Up to the passing of the Test Act (1673) the Lord High Admiral was James, duke of York (afterwards James II.), who, whatever his other faults, proved to be both interested and capable. The N. consisted of about 170 ships of

have fallen into decay had it not been kept together as a royal force. The N. was controlled by the Navy Discipline Act of 1660, which was, at the end of the War of the Austrian Succession, supplemented by an Act of George III.'s reign. In 1793, when war broke out with the Fr. republic, decisive command of the seas was not yet estab., though the N.'s line-of-battle strength numbered ninety-five ships, with a section of which Howe defeated a Fr. fleet off Ushant on 'the Glorious First of June,' 1794.

Few great changes took place in naval construction until the reign of Queen Victoria. Many experiments were made, and the ships increased in size and in the number of guns which they carried; but it was not until the beginning of the nineteenth century that the basic form of wooden ships with sails was changed. The first steam warship was constructed in 1811. After 1834 ships began to be armour-plated, a tribute paid to the ever-increasing power of shells. The year 1860 saw the launching of the first ironclad of Great Britain, but this had been preceded by a vessel of like build launched by

France in the previous year. Guns were, however, quickly invented which could pierce the armour carried by these vessels, and so later ships had a greater thickness of armour, and carried guns which were powerful enough to pierce the armour of the opposing vessels. The ordinary iron-clad was about the year 1862 superseded by the turret ship, and under the direction of Sir E. T. Reed, the constructor of the *N.*, a ship was produced which was capable of firing in all directions from central batteries, and did not depend entirely upon its broadsides. Turret and mastless warships were now regarded as the latest thing in naval construction, and the turrets carried an armour-plating of from 10 to 14 in. thick. The turret ships were in the course of time replaced by ships of the cruiser type. These were armoured and protected, and were speedier than the ordinary line-of-battle ships, but did not carry so much armour-plating and were not so well protected.

After 1880 Great Britain began a definite programme of naval construction calculated on a two-power standard, i.e. up to the equality of the next two strongest powers in the world which, at that time, meant Europe. From this programme developed the race in naval armaments which was a feature leading to the First World War, but it was the other nations who set the pace, because in their building programmes lay the threat to the Brit. Empire. From it evolved the super-dreadnought, ships of 20,000 tons upwards, with a maximum speed of 25 knots, carrying up to eight 16-in. guns, a formidable secondary armament, with armour plating of 14-in. thickness or more. In the First World War the Brit. N. played a dominant part, preserving the country from invasion, keeping open the lines of sea communication, blockading the enemy, and making possible supplies and reinforcements to enable the final decision to be reached on land. As an indication of this vital part played by the Brit. N., Mr. Churchill spoke of Adm. Sir John Jellicoe, its commander afloat, that he was the only man on either side who could lose the war in an afternoon. The casualties sustained by the Brit. N. during this war were 254 warships of all types lost as against 937 total enemy warships destroyed, and 39,766 officers and men of whom over 33,000 were killed, while the N. expended from 2,419,043 tons in Aug. 1911 to 4,087,950 tons in Oct. 1918.

After the war Great Britain announced that she had adopted a one-power standard in view of the building programmes in Japan and the U.S.A., and proceeded to lay down four new battleships of 48,000 tons each. Such was the state of affairs when President Harding invited nations to the Washington Conference (q.v.), which attained a measure of success by eliminating the factor of competition in naval armaments from the field of international relationship. Limitations imposed on the size of battleships (35,000 tons) now produced novel designs of which the *Nelson* and *Rodney*, of 33,500 tons,

with their main armament of nine 16-in. guns all forward were the most unusual. Meanwhile the possibilities of air power were being appreciated, and it was argued that the day of the capital ship was over, but the building by Germany, limited by the Versailles Treaty (q.v.), of three 10,000-ton pocket battleships of the *Deutschland* class, revived interest in this type of ship. These Ger. ships mounted six 11-in. guns, eight 5.9-in. and five 3.4-in. anti-aircraft, and were designed for a speed of 26 knots. Electric welding was employed in their construction, and internal combustion machinery adopted for propulsive purposes. France replied with the *Dunkerque*, 26,500 tons, 29 knots, eight 13-in. guns, sixteen 5.2-in. guns, which was built during the negotiations for the London Naval Treaty, 1930 (q.v.), held to extend the provisions made at Washington. As a result of this treaty Great Britain, U.S.A., and Japan scaled down capital ship strength, agreed to a six years' building holiday, and put further limitations on cruiser design. France, incensed at Italy's insistence on naval parity with her, refused to approve these limitations, and began to build *contre-torpilleurs* of 12,570 tons, while the U.S. produced their *condottieri* which were small cruisers of over 10 knots speed. Meanwhile Brit. cruiser strength was steadily reduced, while that of all other maritime nations increased. A striking indication of the way in which Great Britain had reduced her naval power compared with that of other countries was given by the First Lord in Nov. 1933, when he stated that, since 1911, the U.S.A. had increased her naval personnel by 39,700 and Japan by 40,000, whereas Great Britain had reduced hers by 55,000. In 1934 Japan gave notice of termination of the Washington Treaty, claimed the right of equality, and, now independent of the League of Nations, began pursuing a virile course of her own in naval construction. In the U.S.A. a programme of new construction up to the limits permitted by the treaty, together with a general modernisation of her ships, was going forward. France was about to launch her first post-war battleship, Germany was asserting her old independence, and any numerical superiority possessed by Great Britain lay in semi-obsolete and obsolete ships. Such were the conditions when Great Britain negotiated a naval treaty with Germany (q.v.) on June 18, 1934, when it was agreed that the latter country could build a surface fleet up to 35 per cent of Brit. naval tonnage, and possess a submarine tonnage of equal strength. She was, however, prepared to adhere to Article IV, of the London Treaty which forbade the torpedoing of merchant ships on sight. Fr. opinion was incensed at this agreement, regarding it as a blow to the unity announced at Stresa (q.v.), and it hardened her determination to have nothing to do with Washington ratios. Within a few months Mussolini awoke Great Britain from her dream of disarmament by his campaign in Abyssinia, which brought a concentration of Brit. naval strength in Alexandria. The

answer to the question whether sea power was still effective before the air might of another nation seemed imminent. But hostilities were avoided, though events demonstrated the necessity for Britain to uphold her old position at sea.

During this crisis the second London Naval Conference opened in Dec. 1935 (see LONDON NAVAL TREATY, 1936), as the powers had agreed to meet within a year of the termination of the Washington Treaty by one of them. Japan withdrew, while France and Italy were unable to associate themselves with the agreement reached between Great Britain, the dominions, and the U.S.A. This limited capital ship armament to 14-in. guns, reduced the size of aircraft carriers, and imposed still further limits on cruiser construction. But the growth of international tension soon made the treaty abortive, and advantage was taken of the 'escape' clauses to meet the war which threatened. Could the N. still defend the vital interests of the empire in view of the new air menace? Had it the right type of ships? Were they properly armed? Were its functions adequately co-ordinated with those of the other Services? And had the development of asides reduced the threat from submarines which had nearly brought defeat in the First World War? All these questions were now to be answered, and lessons were to be learnt at great cost. It was soon apparent that, although a warship well manoeuvred was a more difficult target for an aircraft to hit with a bomb than had been expected the ships themselves were woefully deficient in anti-aircraft guns. In many destroyers the torpedo tubes were removed, and combined low high angle guns substituted as they became available; cruisers, such as the *Dido* class, were solely armed with these dual purpose guns, which also formed the secondary armament of the new battleships of the *King George V.* class (see further KING GEORGE V.), and gradually numerous light, close-range anti-aircraft guns were mounted on their decks. Thus a few warships in company could eventually put up a heavy anti-aircraft barrage that both deterred and destroyed enemy aircraft. It was nevertheless clear that no warship, however armed, could operate with impunity within range of shore-based aircraft without the protection of some sort of air umbrella, and that insufficient attention had been paid to sea air co-operation. In 1939 the Fleet Air Arm had been regarded as little more than a long-range telescope for the fleet, useful perhaps to hinder an escaping fleet, and it had been accepted that carrier-borne aircraft must inevitably be slower and less powerful than its land-based equivalent.

This here-very took a long time to die, but from operations off Norway, in the Atlantic against the *Bismarck*, in the Mediterranean and in the Pacific (see NAVAL OPERATIONS IN SECOND WORLD WAR), emerged the modern conception of what is now known as the Naval Air Arm, with its fleet, fighter, and reconnaissance carriers (see AIRCRAFT CARRIERS). The

war indeed proved that naval aircraft could even win a sea battle before the guns on either side had fired a shot (see NAVAL OPERATIONS IN SECOND WORLD WAR, *Battle of Midway Island*). The elements of the air arm are now integrated with the fleet and, known as naval aviation, comprise between one-quarter and one-third of the total strength of the N., and incorporate such modern aircraft as the Vickers Supermarine Attacker, the Sea Vampire Jet fighter, Sea Hornet, Firefly, Sea Fury, and the Helicopter, each with its allotted task. The aircraft carrier has thus superseded the battleship as the most important fleet unit, although battleships in the Second World War, when operated properly, justified their existence and confounded the inter-war critics who prophesied their doom (see BATTLESHIPS). Protecting convoys against powerful surface raiders, hurling hundreds of tons of high explosive into enemy positions ashore in N. Africa, Italy, and Normandy, and in protecting carriers themselves from both surface and air attack, they fulfilled their purpose in modern warfare. There were also occasions when weather conditions prevented the operation of aircraft, such as when a Brit. battleship, the *Duke of York*, destroyed the powerful Ger. battleship *Scharnhorst*, which menaced the convoys to Russia. Against submarines the early confidence in asides was at first misplaced. The apparatus could certainly detect submerged U-boats in general conditions, but it was not designed to seek out the enemy on the surface at night. Thus U-boats were often enabled to approach on the surface without detection and attack convoys in darkness, causing heavy losses. These attacks could only be overcome by more escort vessels and, in due course, the corvette and frigate were developed. Not differing greatly from sloops, they possessed advantages in respect of handiness, economy of personnel, and, most important of all, they could be built quickly and in numbers. They carried depth charges and H.A./L.A. guns. But it was not until the development of radar that the measure of the submarine menace could be taken, when they were once more subject to detection, whether on the surface or submerged. In countering the U-boat the N. developed a close association with Coastal Command (q.v.) of the R.A.F., while escort carriers sailed with nearly every convoy. These were merchantmen converted by the U.S.A. under lend-lease and returned at the end of the war. Towards the end of the war Germany had developed a device where, by fitting U-boats with a *Schnorkel* (or breathing device), they need never surface, and could thus escape both aircraft and the radar screen. Fortunately the war ended before this invention could influence the battle of the Atlantic to any great extent. In spite of the great battle against U-boats, however, and the development in the mine and torpedo, it is a fact that these weapons did not influence the tactics of warships to the same extent as they did in the First World War.

In general it can be said that the Ns. of Great Britain and the U.S.A. achieved their strategic objectives (see STRATEGY). They maintained the flow of shipping across the oceans, without which the strongest armies and air forces would have been powerless to act; they denied to the enemy his ability to use the sea, and imposed an effective blockade on his coasts; they successfully transported powerful armies across thousands of miles of ocean with barely a loss, making possible the

the Brit. N. expanded from 123 effective fighting vessels of all kinds in 1939 to 2040 in 1945, without including hundreds of landing craft and motor launches; and its personnel increased from 133,000 to 864,000. On the conclusion of war these figures rapidly decreased, warships were scrapped, sold, or transferred to dominion Ns., others placed in reserve, 4500 merchant craft employed on naval service were dispersed, over 1200 fishing vessels released, and by April 1950 the personnel

The battleship is seen firing her main armament of 15-in. guns during target practice off Malta.

campaigns in Africa and Europe; they guarded the flow of oil to feed the growing air forces; and, with the N. of the U.S.A. as the major partner in the area, carried the war across the Pacific to the threshold of Japan. Meeting the threat from the air they challenged it by absorbing and making the air their ally, changing their tactics without fundamentally altering their strategy. But at a cost. The losses to the Brit. N. (including dominion navies and Royal Marines) were more than two-thirds greater than they were during the First World War: over 73,000 officers and men lost their lives, 1500 Brit. warships of all kinds were lost and, although over 2000 merchant ships were sunk in the N. Atlantic alone, this figure represented less than 2 per cent of the numbers conveyed. On the other hand, the axis powers lost 990 submarines (Ger. 781) against the Brit. losses of 76, and almost 1700 other war vessels (including 627 in the Pacific destroyed mainly by the U.S.A.). Meanwhile, in spite of its losses,

reduced to 146,000. This rapid reduction in personnel caused such a lack of balance from the loss of experienced men that in 1947-1948 it was necessary to immobilise the greater part of the fleet. But the build-up to peacetime strength proceeded slowly, and the Brit. fleet, including those vessels in reserve, stood in 1949 at 5 battleships (reserve), 6 fleet carriers (3 in reserve), 6 light fleet carriers, 29 cruisers (12 in reserve), 118 destroyers (65 in reserve), 173 frigates (129 in reserve), 65 submarines (31 in reserve), and 66 minesweepers (50 in reserve). Ten carriers, including 2 fleet, were under construction in 1949, as well as a few cruisers and destroyers, but no new construction on capital ships was then contemplated until a decision on their future had been reached. Of the battleships on the stocks at the end of the war only the *Vanguard* (12,500 tons) was completed in 1946. She carries eight 15-in. guns, sixteen 5.2-in. H.A.A.A., seventy 40 mm. A.A., and has a speed of 28 knots.

Since the Second World War the Brit. N. has resumed its peacetime functions of showing the flag as well as carrying out duties in connection with the occupation of ex-enemy countries. It has quelled disturbances in Aden, Mogadisho, and the Solomons, and restored stability in many another troubled area; it has played an active part in coastal operations against Communist bandits in Malaya; brought succour to distressed areas; swept the sea of thousands of mines laid during the war; continued to chart inadequately surveyed coasts, and carried out investigations in the polar regions. (For the *Amethyst* incident see under YANGTZE-KIANG.) But its prin. function has not been neglected, the preservation of sea communications in time of war. Changed conditions produced by the growth of air power, the atom bomb, the development of high-speed submerged submarines, the extension of radar, have in no way altered this conception of the N.'s function, though they have demanded a different and more scientific approach to it. This has been recognised in the growth of the Royal Naval Scientific Service (*q.v.*), and the encouragement given to research. In constantly exercising to test new tactics the Brit. N. has not worked alone, but in co-operation with other nations of W. Union and the N. Atlantic Treaty. For the first time in hist., during a period of peace, an international fleet assembled in Brit. waters in the summer of 1949, when warships of countries belonging to W. Union carried out combined manoeuvres and exercises under the command of a Brit. commander-in-chief. Recognising the vital importance of inter-service co-operation, much attention is also paid to the training of officers and men in the technique of combined operations, and in the joint naval-air anti-submarine school the problems of anti-submarine warfare are being investigated on a two-service basis. To-day, owing to the technical developments, and the growth of naval aviation, a greater part of the N. is quartered ashore than ever before. Conditions have improved. Married quarters for naval personnel serving abroad in shore establishments, for the first time, been provided; more attention has been paid in ships themselves to better messing accommodation and ventilation; a new pay code was introduced on July 1, 1946, and more opportunities given to those in humble circumstances, who prove themselves worthy, to rise in the service (see NAVAL EDUCATION; RANK). The total figure of 146,000 for the peacetime N. is to include 14,000 Royal Marines (*q.v.*) who, in addition to their traditional functions, now provide and train the permanent peacetime amphibious commando units; 1400 Royal Marine Police for the dockyards and 7200 W.R.N.S. (*q.v.*) are also included in this figure, but the reserves (see NAVAL RESERVES) could probably provide another 100,000 at short notice in an emergency.

On the future of Ns. there is considerable speculation. They have grown up in the past in a world composed of sovereign states, many of which had a common

standard of material strength. But the Second World War left the world with only three great powers that counted, the Brit. Empire, the U.S.A., and the U.S.S.R. The first two powers have so many ideals in common that war between them is unthinkable, and the Brit. Empire naturally makes no attempt to compete with her transatlantic partner in naval competition. Indeed, in the event of hostilities, the two fleets would probably be integrated under the N. Atlantic Treaty. Russia is essentially a land power, but now developing her N., especially submarines. It is argued that the atom bomb has destroyed the effectiveness of fleets, but, on the other hand, it has been pointed out that this weapon is unlikely to be used against ships at sea where, by spacing them at greater distances apart, the damage can be so reduced as to make its employment uneconomical. The atom bomb has, however, modified the methods of sea warfare without altering its conception. Large fleets concentrated in harbours, as they were in the First World War, face annihilation, but, by dispersing ships in many different bases when in harbour this menace can be minimised. It can also be countered by the development of the 'fleet train,' composed of auxiliaries of all kinds, used in the Pacific to supply and maintain ships at sea for periods of months if necessary. It may be that command of the sea as previously understood will, in future, only be confined to specified strategic areas. But the fact remains that, apart from internal disruption, only the denial to the Brit. Empire of its ability to move its ships across the sea can cause its defeat in war. It is appreciated, however, that air power has robbed the N. of its ability to shelter the United Kingdom against attack, and allow the country time, in the event of war, to gather its strength in comparative tranquillity. It may also be that the design and material of warships will be modified. Aircraft carriers will remain, as they are to-day, the most important units in a fleet. But they cannot always defend themselves against naval attack, and aircraft are still subject to immobilisation through heavy weather. They will need cruisers and destroyers, probably faster and armed with rockets as opposed to guns, to protect them. Submarines will always be required (and methods to counter them), and it is possible that need will still be felt for some form of capital ship, in reduced numbers, to provide heavy armament or launching sites for possible rockets. Finally the only effective answer to the atom bomb, or any other form of attack, is by the direct human control of the enemy stronghold, which must require the use of all arms in union and collaboration. This process must involve the movement by sea of large armies and their equipment, perhaps halfway across the world. So long as such transport, involving command of the sea, is indispensable to the operation of armies, Ns. can never be obsolete. See also SEA POWER, and the section *Defence* in articles on countries.

See A. T. Mahan, *Influence of Sea Power upon History, 1660-1783*, 1890; Adm. Sir W. M. James, *The British Navies in the Second World War*, 1946; G. Holman, *The King's Cruisers*, 1947; A. Bryant, *Peppas* (3 vols.), 1947-49; M. Lewis, *The Navy of Britain*, 1948; and *Jane's Fighting Ships*, pub. annually.

Navy Board, The, board estab. in the reign of Henry VIII. to superintend the administrative work of the navy. It remained in existence between the years 1546 and 1832, when it was abolished and its work taken over by the lords of the Admiralty.

Navy Department of the U.S.A., gov. dept. of the U.S.A. Naval affairs are administered by an advisory council under a chief of operations, who is directly responsible for fleet operations and readiness during war emergencies. Other personnel of the naval staff includes an assistant secretary, the chief of the bureau of navigation—in whose control are the officers and non-commissioned ranks—and the chiefs of construction and repair; engineering; aeronautics; supplies and accounts; yards and docks; ordnance; and medicine and surgery. There is also a commandant of the marine corps and a judge-advocate general. Questions of policy are discussed by the Naval General Board, composed of senior officers under the chief of operations. The President of the U.S.A. is the commander-in-chief.

Navy League, The, organisation founded in 1895 for the purpose of advocating the building of an adequate navy for the protection of Great Britain and the maintenance of sea-power. It is on the strictest of non-party lines, and aims at the educating of Parliament and the people on the lines laid down in its programme. It propagates information concerning the navy, past and present, by means of monthly, quarterly, and ann. pubs., by lectures, and by the pub. of many pamphlets.

Navy, U.S.A., see NAVY DEPARTMENT OF THE U.S.A.; UNITED STATES, *Army and Navy*.

Navy Yards, see DOCKYARDS, GOVERNMENT.

Nawanagar, or **Jamnagar**, seaport tn., cap. of N. dist., on the gulf of Cutch, India, and also the name of a state in India of 3790 sq. m. (pop. 504,000), in Saurashtra Union. The chief manufs. are silk and embroidery. Pop. 71,588.

Naxos: 1. Is. of Greece in the Aegean Sea, the largest of the Cyclades (q.v.), has an area of 175 sq. m. It is mountainous and fertile, and produces quantities of wine, for which reason it was chosen as the centre of the worship of Bacchus. It was colonised by the Athenians, conquered by Persia in 540 B.C., and recovered its independence in 471 B.C. In the thirteenth century it became part of a Venetian duchy, was taken by the Turks in 1566, and now belongs to Greece. The other products are cotton, grain, and fruits; there are granite and marble quarries. Emery is found in abundance in the S. of the is. Pop. 15,000. 2. Cap. of the

above is., is a port on the N.W. coast and the seat of a Gk. and of a Lat. bishopric. Pop. 2100. 3. Name of the first Gk. colony in Sicily, founded 735 B.C., and destroyed by Dionysius of Syracuse in 403 B.C.

Nayant, state of Mexico, cap. Tepic, stretching along the Pacific coast, with Sinaloa to the N., Durango to the N.W., and Jalisco to the W. and S. Tobacco is grown. Area 10,444 sq. m. Pop. 216,600.

Naylor, James (c. 1617-60). Eng. Quaker, b. at Ardsley in Yorkshire. He joined the parl. army in 1642 and was present at the battle of Dunbar, 1650. In 1651 he became a Quaker, and gathering round him a party of followers travelled from place to place. He was imprisoned in 1653 at Appleby, and again in 1656 at Exeter, and on his release from Exeter jail made a triumphant procession into Bristol, giving out that he was Christ. He was arrested at the High Cross and brought to trial, and on being convicted of blasphemy was sentenced to be whipped, branded, and imprisoned.

Nazarenos, name applied by Tertullus (Acts xxiv. 5) to the early Christians, but later applied to a Jewish Christian sect, better known as Ebionites (q.v.).

Nazareth: 1. (Modern al-Nasira) (tn., of Galilee, Palestine, situated about midway between the Mediterranean and the S. end of the lake of Galilee. It is important only for its connection with the life of Jesus Christ, where His early years were passed in the house of Joseph and Mary. No mention of N. occurs in the O.T. and in the time of Christ it was so insignificant that the term Nazarene was applied to him in derision. To the reign of Constantine N. was inhabited by Samaritans; it declined rapidly after the Arab conquest, revived during the Crusades and again in the seventeenth century when the Franciscans estab. a church on the supposed site of the House of the Virgin. It is now a tn. of 15,500 inhab., and around its hills are orphanages and hospitals. The Franciscans have reconstructed the churches of the Annunciation and of St. Joseph. The church of the Melkites is claimed to be the synagogue where Christ preached (Luke iv. 16). The general aspect of N., with its hilly background, orchards, cypresses, and churches is that of some Tuscan hill tn. See 1. and K. Roach, *Palestine Handbook*. (See illustration, p. 598.)

2. Tn. of Bahia, Brazil, on the l. b. of the Jaguarape. Pop. 8000. 3. Tn. in Brazil in the state, and 35 m. N.W. of the tn., of Pernambuco. Pop. 15,000.

Nazareth Islands, see CARADOS.

Naze, The: 1. Cape on the E. coast of Essex, England, 5 m. S. of Harwich. 2. Or **Lindesnas**, a cape of the extreme S. of Norway, near the entrance to the Skagerrak (Skager Rack).

Nazianzen, see GREGORY NAZIANZEN.

Nazim Bey (d. 1926), Turkish agitator and leader of the Young Turks. A medical doctor by profession, he early abandoned this career to take up the cause of the Young Turks. This he did by going about disguised as a dervish among the

Turkish garrisons and suborning the soldiers. After the grant to Turkey by Abdul Hamid of a constitution, N. was made a member of the executive gov. and of the Committee of Union and Progress, but at once made use of his position to intrigue for his own ends. He made great efforts to exclude all other than Turkish education from the Macedonian schools, and to force the Arabic written language on Albania. In the First World War he led the Turkish Red Crescent on the Macedonian front, but was subsequently

the Lord and separated from the rest of the people. The Nazirite vow demanded: (1) Abstinence from intoxicating liquor and from all the produce of the vine; (2) that the hair should not be cut at all but suffered to grow to its full length; (3) avoidance of all ceremonial defilement, such as that involved by contact with a corpse. If the Nazirite vow were taken only for a period of time, its expiration was marked by a ceremonial sacrifice. Other N. (e.g. Samson, Samuel, and the Rechabites) were vowed for life.

NAZARETH

Canadian Press.

arrested by the Gks. for conniving at the escape of prisoners of war. A zealot for the Altair or Turanian tongue, he organised massacres of Armenians. In 1926, in the hope of finally destroying their culture, but was hanged in the same year at Ankara for plotting against the life of Mustapha Kemal Ataturk.

Nazimuddin, Khwaja (b. 1894), second governor-general of Pakistan. A member of a prominent Dacca family, he was educated at Cambridge Univ. and called to the Bar. He was an influential collaborator with Dr. Jinnah (q.v.) in the Muslim League, where he was successively minister of education (1929-31), home minister (1937-41), chief minister (1913-1945), and, after the estab. of Pakistan, Premier of E. Bengal. He was knighted by the Brit. Gov. in 1934, but, in common with other prominent Muslim League members, he renounced the title in 1946. He succeeded Dr. Jinnah on the latter's death, as the second governor-general of Pakistan, being sworn in on Sept. 14, 1948. After taking office he announced that the national memorials to the late *Quaid-i-Azam* (Dr. Jinnah) would take the form of a mausoleum, a mosque, a univ., and a national institute of technology.

Nazira, see NAZARETH.

Nazirites, or **Nazarites**, among the anc. Israelites those specially consecrated to

Nazis, popular contraction for the Ger. National Socialists (see NATIONAL SOCIALISM). The word seems to have originated as a parallel to 'Sozi,' the label given to the Ger. Socialists by their opponents. National Socialists were at first styled 'Nazi-Sozi,' but the second half of the style was omitted later. The N., under the inspiration of Hitler, represented the revival of the *Nationalgeist* of the fatherland, the regeneration of the national and social life of Germany, and the rekindling of Ger. patriotism after a decade and a half of weak gov., which were sometimes strongly influenced by Communism. During this period unemployment was rife; there was corruption in public life, and the people as a whole suffered from an inferiority complex. Hitler succeeded in rallying the nation against the Communists and, in the elections, completely overwhelmed their leader Thaelmann. The incident of the Reichstag fire, too, enabled him to stage a dramatic trial of the alleged Communist incendiaries and thereby emphasised his ascendancy over them. Under Hitler the N. then carried out the 'Hitler revolution,' in which they assumed control of most of the police in Germany, banned the Social Democratic press, persecuted the Jews, issued emergency decrees for 'high treason,' instituted a Ministry of

Propaganda under Goebbels (*q.v.*), replaced Braun as Prussian Prime Minister by Goering (*q.v.*), dissolved the Catholic party, confiscated the funds of their chief political opponents, and disbanded the trade unions. After the official declaration that the revolution was accomplished a reign of terrorism ensued in which the N. mercilessly assailed all schools of thought opposed to their social and political outlook, driving thousands of persons into concentration camps. But the most characteristic feature of the Nazi persecution was Hitler's unremitting persecution of the Jews (*see under* 'MEIN KAMPF') which began in 1933 and continued during the Second World War. The swastika or crooked cross, the symbol of the N., is related to Hitler's theory of Aryanism (*q.v.*); but the Nazi claim that the swastika was an ariet. Teutonic or Nordic device is ill founded, for it is virtually a symbol of the sun and occurs in the relics of many earlier civilisations. The uniformed bodies of the N. played an important part in their success in gaining control of the reins of power. They include Storm Troops (*Sturmabteilung*), Security Corps (*Schutzstaffel*), and Hitler Youth (*Hitlerjugend*). *See also* GERMANY; HISTORY; HITLER, ADOLF; S.S. AND S.A.

Neagh, Lough, *lough*, Ulster N. Ireland, largest in the Brit. Isles (17 by 10 m.). It receives the Blackwater and Ballinderry Rs. and is drained N. to the Atlantic through the Bann R. The shores are mostly flat and marshy, and its waters have a petrifying quality. There are canals to Belfast, Newry, Tyrone, and Lough Erne. The lake abounds in fish. There are a few is. in the lake. Area 153 sq. m.; average depth 10 ft. *See* Moore's ballad, *Let Erin Remember*.

Neale, John Mason (1818-66). Eng. divine and hymn writer. *b.* in London. He belonged to the extreme High Church party, and in 1854 estab. at Rotherfield the sisterhood of St. Margaret, afterwards transferred to E. Grinstead. He wrote or trans. nearly one-eighth of *Hymns Ancient and Modern*, and pub. *A History of the Jews* (1841); *A History of the Holy Eastern Church* (1847-73); and *Medieval Hymns and Sequences* (1851, 1863). *See* J. Julian, *Dictionary of Homology*, 1907, and memoir by E. A. Towle (with list of writings), 1907.

Neander, Johann August Wilhelm (1789-1850). Ger. theologian and historian. *b.* at Göttingen. In 1812 he became prof. at Heidelberg and the following year at Berlin, where he devoted himself to the advancement of Christianity. He lectured on Church hist., ethics, and systematic theology, and was the founder of modern Church hist. His prin. work is the *General History of the Christian Religion and Church* (1852), trans. by J. Torrey, and widely circulated in England and the U.S.A. Among his other publs. may be mentioned *The Life of Jesus Christ in its Historical Relations* (1848); *The Emperor Julian and his Times* (1850); and *Memorable Occurrences from the History of Christianity and Christian Life* (1852); etc. *See* life by A. Wiegand, 1890.

Neanderthal, valley of the Rhine Prov., Germany, in the dist. of Düsseldorf, near the vil. of Mettmann. Here in 1856 was found the skeleton of a prehistoric man whose cranium has formed the subject of much discussion among anthropologists on account of its peculiar formation. Other skulls, bearing similar characteristics, have been found in the caves and quaternary strata in France, Belgium, Bohemia, Italy, Moravia, and Gibraltar, and in Asia Minor, the Malayan Archipelago, and S. Africa. The skull had a low forehead, was large and thick, with large protuberances of the occipital region. It is believed to have belonged to a troglodyte or primitive cave-dweller, and representative of the earliest dolichocephalic or long-headed race in Europe. Some authorities deny that the skull has any similar racial indications, but that the abnormalities were caused by disease during lifetime.

The N. man is generally thought to be unrelated to modern or Aurignacian man (*see* Moustérien). The discovery in 1925 at Ehringsdorf, near Weimar, of a skull embedded in a travertine quarry seems to indicate that the men who lived in Germany in the preceding temperate period before the last or Würm glaciation set in must be assigned to the N. type in structural details. The Ehringsdorf man has generally been assigned to the Acheulean culture, but his tools are more akin in type to those of the Mousterian culture. Prof. Wiedenreich found that there was clear evidence of many wounds inflicted either before or after death and arrives at the gruesome conclusion that the skull had been cast away by a party which had feasted on the brain. There seems no doubt that the skull and other fossil remains found at Ehringsdorf are representative of the people who lived in Germany in the protracted period which preceded the last glaciation. Sir Arthur Keith emphasises that N. skulls are usually low-roofed, but that the Ehringsdorf skull has a lofty vault, its height being due not to the thickness of the cranial vault, but to its massive size. He points out that as a rule we may regard skulls with thick bony walls and restricted brain space as being primitive in character, and those with thin walls and expanded brain chambers as highly evolved. Yet when we apply this test to the Ehringsdorf skull we find that it is less primitive than are most N. skulls, and yet it is the oldest representative of the N. type known to us so far. It is not only the size but also the characters of the brain of the Ehringsdorf man which impress us. It was apparently not lack of brains which caused N. man to perish in Europe. Weighed by geological, palaeontological, and archaeological evidence, we must conclude that in point of antiquity there is probably no great difference between the age of Australopithecus and of Ehringsdorf man, both having been found in comparable sites. In following N. man across Europe, from Spain to Italy and S. Russia, all the evidence points to the extinction of the type before the climax of the last ice age, for no

evidence of the N. man's persistence after the earlier phase of this glaciation has been found anywhere. While the skull found at Ehringsdorf represents an early phase of Mousterian man the skulls found in Gibraltar and La Quina represent a late phase. If Ehringsdorf produced one of the latest finds in Europe, Gibraltar yielded the first N. skull--the skull of a woman known as Gibraltar I., found in a quarry at the base of the N. face of the Rock in 1848--though its true significance was not appreciated until the published description of Prof. Sollas in 1908. The parts of a second Gibraltar (Gibraltar II.) skull were found in 1926 after an organised search in a rock-shelter, the possibility of such a find being suggested in 1919 by the Abbé Breuil, whose coadjutor, Miss Dorothy Garrod, carried out the necessary excavation work. This was the skull of a child in sev. parts, casts of which were made by Prof. Arthur Thomson of Oxford Univ., and presented to the museum of the Royal College of Surgeons. According to Sir Arthur Keith N. children must have assumed the appearance of maturity at an earlier age than modern children. He estimates the age of the child to have been about five at death, and that for this age it had a head and brain of truly remarkable size, and a larger jaw than the modern child of comparable age. The N. type has been found near Tabgha, in Palestine (1925), or, at all events, a variant of the extinct N. type, and there is presumptive evidence that once the shores of the Mediterranean were inhabited by people of the N. or Gibraltar type. The man of La Chapelle-aux-Saints, also a modern discovery, is the largest-brained member of the N. species known to us. The cranial capacity of this skull measured 1825 c.c., nearly 150 c.c. more than in the average European man of to-day. But if their capacity was great the N. skulls are mostly low-roofed and their tendency is to compensate in width what they lack in height. Two N. skulls found at La Quina in the dept. of Charente lay in deposits assigned to the upper or later Mousterian culture. As in the case of Gibraltar, one skull is attributed to a woman while the other is thought to be that of a child; but in the shape of head--particularly in the length and narrowness of the skull--the two pairs of skulls differed greatly. Modern anthropologists conclude that these skulls of children from Gibraltar and La Quina suggest that in the regions of the forehead and occiput the N. and neanthropic types differed much less in early childhood than in adult years; but the essential characteristics of the N. race show that the differences between the N. and neanthropic species of mankind are deep, real, and probably of very anct. date. Up to now anthropologists have not traced the dolicocephalic N. man by his fossil remains into the W. of Europe beyond the Channel Is., and, although his work-floors have been found in England, no skull or bone has yet been discovered there (see Sir Arthur Keith, *The Antiquity of Man*, 1915, and especially his *New Discoveries relating to the Antiquity of Man*, 1931). In 1938

Prof. Okladnikov discovered in a grotto in the Hissar mts. in Uzbekistan the skeleton of a child of Neanderthaloid type, the only relic of the kind yet found in central Asia. See ANTHROPOLOGY and MAN.

Neanthropic Man, name given by anthropologists to the proto-Europeans or forerunners of modern Europeans, who colonised Europe after the disappearance of the Neanderthal man. Their origin and lineage are very conjectural, and the fact that the differences between them and their Neanderthaloid predecessors are very marked enhances the difficulties on the problem (see NEANDERTHAL). On the other hand, some suggest that there was no absolute break between the Neanderthal and Neanthropic periods of culture and that the Neanderthal man underwent evolutionary changes which transformed him into modern man. The main problem is to account for the divergence of N. M. into races and for the geographic distribution of these races in past times. Sir Arthur Keith suggests that men of the Neanthropic type of the later palaeolithic period came from the S.W. of Asia, where later the early pioneers of civilisation also made their appearance. It seems to be conceded that an early pleistocene ancestor of the modern type of N. M. came to light with the discovery of *Sinanthropus* (the Peking man). For a statement of the present state of knowledge concerning these important critical changes in the hist. of Europe see Sir Arthur Keith, *New Discoveries Relating to the Antiquity of Man*, 1931, chapters xxiv-xxvi.

Neapolis: 1. Anct. seaport of Philippi in Macedonia, the modern Kavalla (pop. about 5000) being near the site. The tn. was almost opposite Thasos Is. St. Paul landed here (see Acts xvi. 9-11). 2. Anct. name for Naples (*q.v.*) in Campania, Italy.

Neap Tides, see TIDES.

Nearchus, commander of the fleet of Alexander the Great in his Indian expedition, 327-326 B.C. He received command of the fleet ordered by Alexander to be built on the Hydaspes, and conducted it from the mouth of the Indus to the Persian Gulf, the whole journey taking from Sept. 325 to Feb. 324. Fragments of his own narrative of his voyage have been preserved in the *Indica* of Arrian.

Neartic, see under GEOGRAPHICAL DISTRIBUTION.

Neath, municipal bor. and riv. port of the co. of Glamorganshire, S. Wales, on a navigable riv. of the same name, 7 m. N.E. of Swansea. It contains the remains of an anct. castle, and in the vicinity are the ruins of Neath Abbey. There are at Neath sev. copper, tin, and steel works. Until recently there has been only inference to connect Neath with the third-century Rom. station of Nidum mentioned in the Antonine Itinerary; and the proved Rom. road system left Neath to the S. But fragments of Samian pottery (assignable to A.D. 70-80, the period of the Rom. conquest of S. Wales), unearthed in Aug.

1949 near the site of Neath Abbey, together with traces of stone walls and broken Rom. floor tiles, afford evidence of an early military occupation of Neath and of the estab. there of an auxiliary fort. Pop. 33,300.

Nebo, **Nabu**, or **Nabium** ('the proclaimer'), one of the chief deities of Babylonia and Assyria, originally worshipped at Borsippa in his temple, E-Zida.

Nebraska, one of the N.W. central states of the Amer. Union known as the 'tree-planter's state,' bounded on the N. by S. Dakota and Iowa, on the E. by the R. Missouri, separating it from Iowa, on the S. by Kansas and Colorado, and on the W. by Wyoming and Colorado. Area 77,237 sq. m. There is much prairie land, a strip of 'bad lands' and sandhills (N. and N.W.), and high land in the W. towards the Rockies, Niobrara Summit, and Gabe Rock rising over 5000 ft. The Platte, Missouri, Itapublican, and Niobrara are the chief rvs.; Omaha (223,800) and Lincoln (cap., 81,900) are the chief tns. Omaha has an air-mail aerodrome. Agriculture is the leading industry, oats, maize, and wheat being the chief cereals. Irrigation is practised in the W. The livestock industry is only second in importance to agriculture. The chief mineral products are limestone, sand, potash, and clays from which bricks and tiles are made. Slaughtering and meat-packing, centred at Omaha, are important industries, also dairying and flour-milling. Omaha is also the largest butter-producing tn. in the world. There is a state univ., founded at Lincoln, 1871. What is now known as Nebraska was ceded by France to Spain in 1762, returned to France in 1801, and purchased by U.S.A. in 1803 as part of the Louisiana purchase. Nebraska ter. was organised in 1854; the state was admitted to the Union in 1867. There are ninety-three cos. Since 1937 Nebraska has had a single-chambered legislature of forty-three members. Two senators and four representatives attend Congress. Pop. 1,515,800. See J. S. Morton, *History of Nebraska*, 1913; A. E. Sheldon, *Nebraska Old and New: History, Stories, Folklore*, 1937; and G. E. Condra, *Geography, Agriculture, and Industries of Nebraska*, 1942.

Nebraska City, co. seat of Otoe co., Nebraska, U.S.A., on the Missouri, 40 m. S. of Omaha. Pop. 7300.

Nebuchadnezzar, or **Nebuchadrezzar**, king of the Neo-Babylonian Empire, from 604 B.C. to 561 B.C., the son of Nabopolassar, during whose reign N. defeated Necho at Carchemish. At the beginning of his reign N. had to subdue Jehoiakim, who had rebelled against him. Jehoiakim was succeeded by his son, Jeconiah, and N. now besieged and took Jerusalem and took Jeconiah captive to Babylon. After an unsuccessful attempt on Tyre, N. again laid siege to Jerusalem, which submitted after two years. Not long after this he invaded and conquered Egypt. N. rebuilt Babylon. Koldewey's excavations of 1899 to 1911 revealing the palace, temples, walls, etc. In his latter years he was afflicted with madness and had to be put under restraint. He reigned

forty-three years, and with him departed the glory of Babylon.

Nebulae. The invention of the telescope made possible the recognition of many stars invisible to the naked eye. Nevertheless if the sun is excepted, the stars are at such enormous distances from the earth that they appear as mere points of light even when viewed by the most powerful of modern telescopes. In the eighteenth century, however, the telescopes of Herschel and others led to the discovery of celestial objects that presented a cloudy appearance, and they were designated N. During the twentieth century much has been discovered about N., which here can only be summarised. N. are divided into two main classes: those within our *galactic system* (g.r.) and those outside the galaxy, known as the *extra-galactic N.* In the galactic system two types of N. are found, known as the planetary N. and the diffuse N. The former have relatively small angular dimensions and are wisps of gas enveloping very hot stars which render them luminous. Most of them have disks which are elliptical shaped, hence their designation as 'planetary N.' It is believed that they were once novae (q.r.) which they resemble in some ways. Two well-known examples of this type are the Owl Nebula in Ursa Major and the beautiful Ring Nebula in Lyra. Diffuse N. are irregular in shape and have larger dimensions than the planetary N. They consist of gases in an extremely attenuated form, some of them presenting the appearance of dense clouds, while others appear as a faint haze. One of the finest of them, in the constellation of Orion, is visible on a clear night to the naked eye, surrounding the middle star of the Giant's sword. To the modern astronomer and philosopher the extra-galactic N. are the most important, because they are island universes on the same footing as our galaxy, of which the solar system is only a very minute part. The Great Nebula in Andromeda is one of this class and can be seen with the naked eye; the light from it takes nearly 900,000 years to travel to the earth, yet it is one of the nearest of the extra galactic N. The number of stars in these N. varies but is comparable with the number in our galaxy, i.e. about 100,000,000,000. The largest telescope to-day (the 200 in. at Mt. Palomar) will probably be able to photograph N. 1,000,000,000 light years distant and the number contained in this space is estimated to be sev. hundred million. It is impossible to see individual stars in these very far off N., which appear as a faint luminosity due to the combined light of the stars composing them. See NEBULAR HYPOTHESIS.

Nebular Hypothesis, attempt to explain the origin of the solar system as an evolution from a nebula. Swedenborg and Kant both put forward tentative explanations of this kind, but Laplace (q.r.) was the first to develop a N. H. on strictly scientific lines. Briefly his hypothesis imagined that rotating nebulae were first formed by the condensation of gaseous

matter, and that the sun was originally a nebula of this type. As the nebula continued to shrink, it rotated faster and faster, until fragments broke away from the main body of the sun. These fragments condensed under their own gravitational attraction, and became the planets that continued to describe orbits round the sun under its gravitational attraction. Laplace's hypothesis has since been abandoned. While it may be true that stars originate from nebulae in

ment based by laws of reason on other propositions already accepted, or, more particularly as axiomatic, resulting from the evidence of 'common sense.' Mathematical conclusions are thus necessary; in the latter case, e.g. that two straight lines cannot enclose a space. Among the ancients, philosophers and medieval schoolmen appeal to N. was extremely frequent, but with the advent of natural science and its inductive processes, dating from Bacon's *Novum Organum*, a vast class of

THE GREAT NEBULA IN ORION
as in reflector at Mount Wilson.

the manner indicated by Laplace, this accounts only for the creation of our sun. According to Sir James Jeans's tidal theory the solar system was created from the original sun by the close approach of a larger star that raised tides of such violence in the sun as to cause fragments to be torn off it to form the planets, comets, etc., that with the sun constitute the solar system (*q.v.*). Many years ago this theory was shown by Prof. H. N. Russell, an Amer. astronomer, to be untenable. Although sev. other theories have been advanced, these have not been accepted, and the origin of the solar system still remains one of the unsolved problems of astronomy.

Necessaries, see INFANT AND HUSBAND AND WIFE.

Necessity, specialised term in philosophy, religion, and logic implying causality and certainty when not deduced by restricted laws of formal reasoning. Logically the law of N. compels us to admit the truth of a conclusion or judg-

necessary truths has been brought within the realm of logical demonstration, or embraced within the realm of theory, i.e. subject to further investigation. It is, however, in philosophy and religion that the doctrine of N. assumes importance, greater perhaps since the rapid rise of the theory of evolution and its popular exaggeration over too wide a sphere. N. would imply mechanical processes, as it were, in the whole universe a view generally held to be incompatible with the operations of human and divine will. But for moral N. see WILL, DETERMINISM, KANT, LEIBNIZ, CALVIN, etc.; also PSYCHOLOGY.

Neck, portion of the body joining the head and trunk, also a constricted portion of any structure serving to join its parts. The bony structure of the N. is the cervical portion of the spinal column, consisting of seven vertebrae. The spinal column contains the spinal cord, which in the cervical region is oval in section; the amount of grey and white matter becomes

increased in quantity. The blood is carried to the skull by the right and left common carotid arteries, and is returned by the jugular vein, which may be felt a little below and behind the angle of the jaw, after which it penetrates rather more deeply into the tissues. The N. also contains the gullet or food passage and the windpipe. The larynx, or organ of voice, occupies a position where the windpipe connects with the pharynx, and the form of one of its cartilages produces the projection known as Adam's apple.

DIAGRAMMATIC SECTION OF THE NECK

A, cervical vertebrae; B, spinal cord, C, larynx, D, trachea; E, oesophagus.

Neck, in geology, the name given to columns of cooled lava which fill up an old volcanic chimney or crater. Up these passages or conduits volcanic materials were forced. Ns. are characterised by a more or less circular pipe filled with consolidated ashes, or with crystalline lava. They vary considerably in size, from 20 yds. in diameter to six miles, and may be simple or complex in structure. They occur in all old volcanic dists., examples existing at Largo Lave, Fifeshire; Arthur's Seat, Edinburgh; Dumbarton Hill; the Lothians; Derbyshire; in Auvergne; the Elbe; Bohemia; St. Lucia (W. Indies, 'the Pitons'); Texas; California; and many of the W. states of N. America. The famous diamond mines of Kimberley, S. Africa, are another example, the blue-ground (serpentine breccia) occupying great funnels. See Sir A. Geikie, *Textbook of Geology*, 1882, 1924.

Neckar, Ger. riv., trib. of the Rhine, rising in the Black Forest, S.W. Württemberg, and winding N.W. past Cannstadt, Ludwigsburg, Heilbronn, through Baden to Heidelberg and Mannheim, where it joins the Rhine. It is navigable, for small vessels, as far as Cannstadt. Length 246 m.

Necker, Jacques (1732-1801), Swiss financier and statesman of France, b. at Geneva. Sent to Paris in his youth he joined the house of Thellusson, the banker, who took him into partnership. In the course of twelve or thirteen years N. acquired a large fortune and retired. He

then began to aspire to official situations, and wrote sev. works on financial affairs. His *Éloge de Colbert* obtained a prize from the Fr. Academy. He afterwards wrote a memoir upon the Fr. finances, which so delighted Maurepas that he obtained for him the appointment of director of the Treasury (1776) and director-general of finances (1777), when, being averse to imposing new taxes, he endeavoured to make up the deficiency in the income by economy and loans. In 1781 he pub. *Compte rendu présenté au roi*, which disclosed the state of the revenue and expenditure of France. Being refused a seat at the council, he resigned in 1781, withdrew to Switzerland, and wrote *De l'Administration des finances de la France* (1784). N. returned to Paris in 1787 and wrote against Calonne; in 1788, on the resignation of Brienne, Louis XVI. appointed N. director-general of finances. His second ministry was short, and he retired to Switzerland, but after the taking of the Bastille the National Assembly demanded the recall of N. and Louis complied. He resigned in 1790, and spent his remaining days in Switzerland, writing political tracts. His daughter was the celebrated Mme de Staël. The memoirs of his private life were written by her, and the *Notice sur la vie de M. Necker*, by his grandson (1820-21). See C. A. Sainte-Beuve, *Causeries du Lundi*, (vol. vii.), 1853; P. de Segur, *Le Comte de la monarchie Louis XVI. et Necker*, 1776-81, 1913; O. d'Haussonville, *Mme de Staël et M. Necker d'après leur correspondance inédite*, 1925.

Necker, Suzanne Curchod, Madame (1739-91), Fr. writer, b. at Geneva Switzerland, noted for her beauty, wit, and wide learning. After her marriage in 1764 to Jacques N., her house in Paris was the rendezvous of all the distinguished men of the day. She wrote *Réflexions sur le divorce*, and *Mélanges*, pub. by her husband after her death. She was the mother of the famous Mme de Staël. See G. Parry, *Mme Necker, her Family and her Friends*, 1913.

Necklace Diamond, see DIAMOND NECKLACE

Necromancy, mode of divination practised by the ancients by which the spirits of the dead were conjured up to answer certain questions about the future. In Homer's *Odyssey* the shade of Tiresias is brought up and consulted by Ulysses, and the witch of Endor is an example from O.T. hist. See DIVINATION.

Necropolis (Gk. νεκρός, and πόλις, city of the dead), cemetery or burying-ground. The name was formerly applied to cemeteries in the vicinity of auct. cities, especially to a suburb of Alexandria, but is now used in a more extended sense for any large burial-ground. Auct. examples remain in Africa (Cyrene and the Egyptian Pyramids), Asia Minor, Greece, and Italy. See A. Bruckner, *Friedhof aus Eridanos*, 1909; R. Pagenstecher, *Nekropolis*, 1917; and G. Karo, *An Altie Cemetery*, 1943.

Necrosis, death of cells surrounded by living tissue, more properly the death of

an aggregation of cells, since individual cells are constantly dying in the normal course of bodily activity. The causes of N. are direct injury, obstruction in the circulation of the part, or incompetence in the nutritive agencies in the tissues affected. Cheesy N. is produced by the action of the tubercle bacillus. In coagulative N. an amount of fibrin is formed; this occurs in the blood and on the surface of mucous membranes, where a false membrane may be formed, as in diphtheria. In liquefactive N. the action of the cells gives rise to the formation of liquid. See also CARIES and GANGRENE.

ventilation and liberal watering are provided, and over-cropping is avoided. See PEACH.

Nectary, usually a gland-like nectar-secreting body or disk on the receptacle of a flower, either between the petals or between the stamens and pistils. In some cases the N. occurs on the summit of the ovary; in others it lines the inside of the calyx-tube; and occasionally sepals or petals are modified, and in a few cases (such as the monkshood, Christmas Rose, and hellebore) are entirely converted to serve as Ns. The accessibility of the N. is perfectly adapted to the structure of the

NECTARIES

A, sepal; B, petal; C, ovary; D, style; E, nectary; F, scale covering B.

- (1) Section of Umbellifer: the nectary is a disk formed from the swollen bases of the styles; (2) Wall-flower: nectaries lie internal to the base of the stamens; (3) Christmas Rose: nectaries are tubular petals; (4) Tubular petal from (3); (5) Petal of Lesser Celandine, front view; (6) Side view of (5). (7) Coltsfoot: disk floret; nectary lies within the corolla tube at the base of the style.

Nectar, sweet juice which many plants secrete in special gland-like bodies called nectaries. Its real use seems to be to attract insects and thus to secure cross-pollination. N. is composed of cane-sugar and uncrystallizable sugar. It should not be confused with honey, which is formed from N. in the stomach of the bee, by the action of the enzyme invertase, which converts the cane-sugar into glucose and fructose. The resulting honey is then regurgitated into the cells of the comb. Also the drink of the gods, described by Homer as a red wine which Hebe pours out for the immortals (*Iliad* ix. 38 and iv. 3). N. in Gk. mythology, had the power of conferring immortality on all who partook of it. The term is applied figuratively to any delicious drink, such as that made from sweet wine and honey.

Nectarine, smooth-skinned and generally more crimson-coloured variety of the peach, which can often be grown successfully outdoors against a S. wall, in a well-drained border of fibrous loam containing a good proportion of lime. Protection at the time of flowering against spring frosts and cold winds is very essential, as the flowers appear early and before the leaves. Planting is best done in Sept., against walls, trees trained fan-shape are best. The culture of Ns. under glass, particularly when grown in pots, is attended with excellent results, if free

insect or other agent on which the pollination of the flowers mainly depends.

Nedim (fl. c. 1700–30 under Ahmed III.), Turkish poet of the eighteenth century, of the old Ottoman school. His 'ghazels' and 'kasidas' are marked by grace and originality. He was custodian of the library at Constantinople, founded by Ibrahim Pasha. See L. F. Poole, *Story of Turkey*, 1888.

Needham, tn. of Massachusetts, U.S.A., in Norfolk co. 12 m. S.W. of Boston, with hosiery manufs. Pop. 12,400.

Needle Gun, see under GUN and RIFLE.

Needle, Magnetic, see COMPASS.

Needles. There are seven different groups of N. which may be listed as follows:

Hand-sewing Needles.—Prior to the Second World War these were manufactured in quantity in Japan (6,500,000,000 per month); Germany (2,000,000,000 per month); and the United Kingdom (650,000,000 per month). Since the Second World War manuf. of N. in China has very greatly increased, but no reliable figures are available. Eng. manuf. of N. is concentrated at Redditch in Worcestershire. Sewing N. are made from fine-gauge carbon steel rod, which is drawn down to the requisite thickness by a series of holing and annealing operations. The resultant wire is then cut into two-needle lengths, sharpened at both ends by automatic grinding, and passed into the making shop, where the N. are loaded into

combine machines, set up for the particular type and gauge required; these grip each needle individually in a wormed feed, and carry it between two stamping dies, which mark the impression of two eyes, facing in opposite directions, in the centre of the two-needle length. The wire is then carried forward on the same feed and the centre of each eye is punched out cleanly, the flash clipped off, and the wire broken apart in the centre to form two N. Tied into bundles of approximately 50,000 the N. are then passed over rotary grinding wheels which, working with extreme accuracy, remove all remaining roughness around the head and eye. Hardening and tempering are done in electrical furnaces which, by being kept air-sealed, keep the surface of the needle bright throughout the heat treatment. To remove all signs of grinding, stamping, or scale, the needle is then submitted to a particularly individual process known as 'scouring.' The N. are wrapped in long cylindrical parcels of hessian with a dressing of liquid soap and emery powder. This parcel is then bound together with cord and placed between one stationary and one sliding surface, which roll the parcel backwards and forwards between them under very considerable pressure for many hours. On their removal the N. are polished in a similar machine, cleaned, and nickel plated. Each needle is then inspected by hand and any necessary finishing, such as gilding, bluing, etc., is carried out. Finally the N. are either stuck in cloth, or packed loose into packets for final dispatch to the customer.

Hardware Needles.—Prior to the Second World War Germany was the greatest manufacturer of these, followed by Great Britain; but since the Second World War China has also started their manuf. The term covers all special N. used by trades other than tailoring or dressmaking, such as shoemakers, upholsterers, mattress makers, sail-makers, etc. Their manuf. is comparable to hand-sewing N., with which they overlap at certain points.

Hosiery Needles, or Latch Needles.—The chief manufacturer of these N., used on industrial knitting machines, is Canada, followed by Germany, Great Britain, and Switzerland. In the finer sizes their production calls for great accuracy and craftsmanship, but it is not individual in the same way as needle making, and has more in common with normal light engineering.

Surgical Needles, or Suture Needles.—These are made in Germany, Great Britain, and in small quantities in America. All surgical needles have triangular cutting points, similar to glovers needles. This is to minimise tearing of the skin. They may either have an eye, similar to hand-sewing N., or be eyeless, as in non-traumatic N., where the gut is attached permanently to the body of the needle so that no eye is necessary.

Knitting Needles.—Manuf. of these is confined to no particular country, since the processes are very simple, particularly when worked in plastic. For ordinary

domestic knitting they are made of anodised aluminium, plastic, nickel-plated steel, bone, or wood.

Machine Needles.—Manuf. of these N. is in many ways comparable to that of hand-sewing N., and prior to the Second World War 80 per cent of the whole production was concentrated in Germany, the remainder being made in the U.S.A. and a few in Great Britain.

Gramophone Needles.—These are really a by-product of the hand-sewing needle industry, and are manufactured wherever these are made, notably in Japan, China, Germany, and Great Britain.

Needles, The, name given to five remarkable rocks lying immediately off the W. extremity of the Isle of Wight in N. lat. 50° 39' and W. long. 1° 34'. Their origin is attributable to the sea heating on the sharp cliffs which form the W. point of the is., and the same influence is gradually wasting them away; the largest of them which was 120 ft. in height, was undermined and fell during a storm in 1764. They are white, but black at their bases, and curiously streaked throughout with black strata of flints. A lighthouse standing on this extremity of the is. rises 715 ft. above the sea.

Needlework, work done with a needle and thread on cloth. Since sewing machines, invented in 1830, came into general use at about 1870, machine-sewing has superseded much that was done in the past by hand, but plain hand-sewing is the foundation of all other needlecraft. N. is one of the oldest crafts, and though it is primarily employed to join pieces of material to make a garment, it is also used for forms of decoration, e.g. tucking. Two classes of stitches are used in garment-making, temporary and permanent. The temporary stitches are straight-tacking, and tailor-tacking or thread-marking, the latter being used for marking the fitting line on two identical parts at the same time. There are a number of permanent stitches: these are used for joining parts of garments, for holding down turned edges, for protecting raw edges, for disposal of fullness, and for decoration. Permanent stitches include running, oversewing, ordinary hemming, slip hemming, invisible hemming, herringbone stitch, and buttonhole stitch. Feather-stitching and scalloping are particularly decorative forms of permanent stitching. The same form of seam is used throughout a garment, the choice of seam depending on the nature of the material and the purpose of the garment. Fr. seams, for example, are used in materials that are not too thick and bulky, such as thin lingerie and outer garments of transparent material, e.g. nylon. A run and fell seam is used when a strong flat stream is required, one row of stitching being visible on the right side. Flat seams should always be used on garments which are to be worn next to the skin in order to avoid friction, and the seams should fall to the back. Open seams are frequently used on outer garments, and no stitching shows on the right side, and the seams can be pressed

open so as to be almost invisible. Raw edges inside the garment can be made neat by cutting a tooth-like edge, or by using a narrow binding.

Darning and Patching.—Some knowledge of patching and darning is indispensable in the home. Patching is generally applied to outer garments and large repairs to under-garments; darning is used on knitted fabrics. In all repair work the general condition of the garment, the cost of replacing it, and the time to mend it, are factors in governing the choice of method, which is as important as suitability of material. Special attachments, which can be used on a sewing machine, e.g. a darning foot, facilitate repair work. Darning is a method of replacing worn threads, as distinct from patching, which is the insertion of whole pieces of material, and can often be made less obvious than patching. The hole or thin place is filled with threads carefully chosen to reproduce as nearly as possible the original web. Swiss darning is frequently employed to repair a hand-knitted garment, as actual new knitting stitches are made. The general principles of patching are similar to those of darning, i.e. the material of the patch is chosen to match that of the garment in colour, texture, and age. The patch is generally placed on the wrong side of the garment. Adhesive patches can now be bought.

Good N. is an essential foundation for the more exacting and complex stitches used in various types of embroidery and other needlecrafts. See also DRESS-MAKING; EMBROIDERY; LACE; SAMPLER. See E. Griffith, *A Manual of Plain Needlework*, 1931, 1944; Gladys Fry, *Embroidery and Needlework*, 1935; Anna L. Hird, *Principles and Practice of Needlework and Dressmaking*, 1942, and *The Vogue Manual of Dressmaking*.

Neenah, city and summer resort of Winnebago co., Wisconsin, U.S.A., on Fox R., N.W. of Lake Winnebago. Pop. 10,600.

Neer, Aernout van der (1603-77), Dutch landscape painter, b. at Gorkum. He was particularly successful in rendering moonlight effects among the canal scenery of Holland, and in painting winter landscapes, with skaters on ice.

Neer, Egion Henrick van der (1634-1703), son of Aernout, b. at Amsterdam. He was a pupil of Vanloo, and became celebrated as a painter of historical pieces, landscapes, etc.

Neerwinden, vil. of Liège, Belgium, 5 m. S.E. of Trillemont. It was the scene of two battles fought in 1693 and 1793.

Ne Exeat Regno. At common law (q.v.) every subject may go out of the realm whenever and for whatever purpose he pleases; but because constitutionally every man ought to defend the realm, the sovereign has the prerogative (see under Crowns) of commanding him by the writ of N. E. R. not to leave the country, on pain of punishment for disobedience. This auct. writ was originally used to prevent the clergy from going to Rome, and was afterwards extended to laymen who were suspected of concerting schemes against

the state. It has now become a part of the ordinary process of the high court by virtue of which bail (q.v.) may be obtained from any person about to go abroad with the object of evading the jurisdiction of the court. The legality of this application of the writ was settled in the time of Charles II.

Nefertiti, wife of Sakere, king of Egypt in the eighteenth dynasty. A remarkable sculptured head of the queen, one of the finest extant specimens of Egyptian art, was discovered at Tel el Amarna, and is now preserved at Berlin. Reproductions have made her perhaps the most dramatically real of all the great beauties of the past.

Negapatam, or **Nagapattanam**, chief seaport of Madras, India, one of the earliest Portuguese settlements on the Coromandel coast. It is in the delta of the Cauvery, 48 m. from Tanjore. Oil and textiles are manufactured, rice and paddy exported. The S. Indian Railway has extensive workshops here. N. is an important coolie labour exchange. Pop. 49,000 (mostly Hindus and Muslims).

Negaunee, city of Michigan, U.S.A., 11 m. S.W. by W. of Marquette. It is a summer resort. Pop. 6800.

Negeb (Négév), The, semi-desert, triangular-shaped region of Palestine, extending from a base S. of Beersheba to an apex at the head of the gulf of Akaba. In name the Negeb means, in Heb., the 'south country' and tradition has linked it with early biblical hist., as, for example, in the story of the casting out of Hagar in the 'wilderness of Beersheba', the 'wilderness of Judah' in relation to David; and Solomon's navy of ships in Eziongeber - a site on the coast N. of Akaba. In the time of the Nabatean kingdom which occupied what is now S. Transjordan, trade routes were developed across the Wadi Araba and the waterless desert of the Negeb, and along its length, in the N. Negeb, townships sprang up. The ruins of their civilisation - with great cisterns for the storage of drinking water - were excavated forty years ago by Sir Leonard Woolley (q.v.) and T. E. Lawrence (q.v.). But thereafter the Negeb and its inhab. dwindled into obscurity, the modern nomads, to the number of about 10,000, wresting a hard living from goats and camels, and, up to the time of the Brit. mandatory rule in Palestine, no attempt was even made to register the lands of these tribal nomads or their limits. The area of the Negeb is about 1500 sq. m. The Negeb stands comparatively high on a wind-swept sun-scorched plateau which slopes up gradually from the foothills of the Sinai frontier to the high cliffs to the E. that overlook the Wadi Araba. It tapers from the S. Judean hills around Beersheba down to its narrow sea-frontage on the gulf of Akaba 70 m. distant, the width of the plateau varying from 40 m. in the N. to only a few miles on the gulf of Akaba itself. It is a most unattractive region, but circumstances have combined to make it politically and economically significant. In 1930 Sir John Hope Simpson, on

behalf of the Brit. mandatory gov., visited Palestine to report on the availability of cultivable lands for close settlement by the Jews in relation to the national home. His report declared that there was an inexhaustible supply of such land in the Beersheba area given the possibility of irrigation. The Palestine Gov. built a dam and reservoir in Beersheba but this proved ineffective; it then tried to develop water supplies from well-boring, but the supplies were so impregnated with mineral salts as to be useless for crop irrigation or human consumption. The Jewish experts, however, do not accept these findings and Zionist opinion still claims that the Negeb can be the great settlement area of the future. The original United Nations Assembly's resolution of Nov. 1947 on the partition of Palestine gave W. Galilee to the Arabs and the Negeb to the Jews. As a result, however, of the first fighting between the Jews and the Arabs, the Jews occupied most of Galilee and lost most of the Negeb. In this situation Count Bernadotte (see *PALESTINE, History*) went to Palestine as mediator and recommended in his subsequent report to the United Nations that the Jews should keep W. Galilee in return for the Negeb, which would be given to the Arabs. After that the Jews determined to fight for the Negeb. In Oct. 1918 the truce arranged through Bernadotte was broken and in two short almost bloodless campaigns they occupied nearly all the Negeb and, in spite of resolutions of the United Nations against it, claimed the rights of a victor nation to retain what they had won. The question may be asked why the Jews are anxious to retain so inhospitable and unattractive a land. The reasons were stated by Mr. Shertok, Israeli foreign minister (Nov. 15, 1918). He said that Israel needed the Negeb because it was the only area in Palestine with large-scale colonisation and the development of the Negeb was decisive for the future of Jewish immigration into Israel. Further, Israel was entitled to access to the chemical wealth of the Dead Sea which the Jews had made productive. The Negeb was also vital to Israel because of the outlet for Dead Sea produce through the gulf of Akaba, which was Israel's gateway to the E. seas. Roads in the Negeb are few and the wastes of sand dunes are marked only by goat and camel tracks. But under the barren hills with their thorny scrub are buried such forgotten civilisations as the ant. city of Lachish (*q.v.*). Where yesterday the only human life was an occasional cluster of Bedouin black tents, to-day thousands of young Jewish men and women are sinking wells and cementing great ruin traps. But here, as elsewhere in Palestine, the physical problem is allied to the political. No real development is possible in the Negeb until a lasting settlement has been reached with Transjordan and the waters of the Jordan can be tapped to irrigate the parched soil. On the Arab side, however, it is thought that this Jewish settlement talk is a mere pretext and that the state

of Israel has deep expansionist Middle E. (*q.v.*) designs— for which Beersheba and Akaba are needed as bases. See also ISRAEL.

Neghelli, Marchese de, see GRAZIANI.

Negligence. In Eng. law the commonly accepted definition of N., which is a tort (actionable wrong) remediable by an action of damages, is that it is the omission to do something which a reasonable man, guided by those considerations which ordinarily regulate the conduct of human affairs, would do, or doing something which a prudent and reasonable man would not do. The two cardinal facts of importance about N. are that it denotes a standard of conduct and not a state of mind, and that liability from it arises only where a duty is owed to the person aggrieved. In regard to duty, liability for N. may arise from the breach of duty owed to a particular individual, or to all persons indiscriminately. In the former case the personal duty may either be incident to some fiduciary (*e.g.* trustee and beneficiary), parental, or tutelary (guardian and ward) relationship, or exist by reason of a purely contractual relationship. In the case of N. manifested in the performance or omission to perform the terms of a contract, difficult questions arise as to whether the injured party should sue in contract or in tort, the practical difference being that the measure of damages in the former case will be the loss he may be reasonably supposed to have sustained as a proximate consequence of the breach (*q.v.*), but in the latter case he may get anything a sympathetic jury sees fit to award. In regard to duties 'owed to all the world,' it is to be observed that these are necessarily of a restricted nature; and the bond of duty in most cases where the courts have held it to exist will be found to depend really on an antecedent voluntary act of the party held liable; *e.g.* if I observe a cart and horse, the driver of which (a personal enemy of mine) has temporarily left it unguarded, proceeding to the brink of a steep cliff, I am not liable for damages for N. because I did not take the trouble to stop the horse from walking over the cliff. But if, for example, I choose to run motor-buses or any other vehicle along the streets, I am responsible for any injury sustained therefrom by passers-by which a jury or judge of fact is satisfied were due solely to the N. of my drivers. This example is useful to illustrate the meaning of 'contributory' N.; a person who might otherwise be entitled to damages for injuries or loss sustained by the N. of another was disentitled to recover a farthing if, notwithstanding the other's N., he himself could, at the decisive or last moment in the transaction, have by the exercise of reasonable care and prudence averted such injury or loss. By the Law Reform (Contributory Negligence) Act of 1915, however, such a person is now entitled to recover damages though the amount is reduced proportionally to his share of responsibility. It is commonly said that N. is divisible into gross, slight, ordinary, and so forth. But the div. is unsound and

illogical. No doubt what would be gross N. in a bus driver would be usually far less so in the case of an inexperienced man who was learning how to drive. But this will not affect the liability, for the law requires the standard of care or skill of the expert in a case where special skill is ordinarily to be expected; though, of course, in the above example the inexperienced driver would probably incur no liability if, for example, he were a passenger who had tried to stop a bus in the sudden illness of the regular driver.

Negombo, tn. of Ceylon, on the W. coast, 20 m. N.W. of Colombo. There is trade in cinnamon and a fishing industry. Pop. 25,200.

Negotiable Instrument. The distinguishing features of a N. I. are: (1) It can be sued on by the holder in his own name; (2) the holder in due course is not affected by defects in or lack of title of his transferor or previous holders; (3) property in it passes by mere delivery; and (4) the holder in due course is not affected by certain defences which might be available against prior holders, e.g. fraud, undue influence, provided he himself were no party to such vitiating element. The law of N. Is. depends mainly upon statutes which themselves have been framed exclusively on the custom of merchants. The earliest forms of N. Is. were bills of exchange (*q.v.*), borrowed from the practice of Venetian and Florentine merchants in the Middle Ages, and, though much later, promissory notes. The list of N. Is. tends to increase, one of the latest additions being debenture bonds payable to bearer. In the majority of cases it is essentially a question of fact to be proved by evidence whether or not a document is negotiable, though in cases where the negotiability is established, the court takes judicial notice of that fact, i.e. recognises it as a matter of law. The following documents, in addition to those already mentioned, are N. Is.: bank-notes (*see also* CURRENCY), cheques, exchequer bills, dividend warrants, E. India bonds, circular notes, certain scrip and bonds, e.g. debenture scrip and various Amer. railway bonds (as to the marks of a valid custom *see* under that title). The law of N. I. in so far as bills of exchange, promissory notes, cheques, and bank-notes are concerned has long been codified in the Bills of Exchange Act, 1882. Postal orders are not negotiable if crossed for collection by a bank, though otherwise they can be freely transferred from hand to hand; nor are share certificates, share warrants, and share transfers, hence the forgery of the true holder's signature will not affect his rights; nor an IOU (*q.v.*); nor most kinds of scrip and bonds. Bills of lading can be transferred so as to give the transferee a right to sue in his own name, but otherwise they are not N. Is., because the transferee gets no better title than that of his transferor; and the same observations apply to policies of assurance. The holder in due course of a bill of exchange or any other N. I. is he who takes the instrument in good faith or without knowledge or notice of previous

defects of title in it, and gives valuable consideration (*see* under CONSIDERATION) for it. But a holder is not put to the trouble of proving consideration unless the party resisting liability on the instrument establish the existence of some defect, e.g. fraud, duress. In the previous negotiation of the instrument. Sometimes bills or other N. Is. are marked 'not negotiable.' The effect of this is that the person receiving it will not have, and is not capable of giving, a better title to the instrument than that which the person from whom he took it had. But though the true owner is thus protected, the negotiability of the instrument is not otherwise affected.

Negri, Ada (1870-1945), the only Italian poetess to whom the critics of her native land have given the title of 'great,' b. at Lodi. She came from a working-class family and was a school teacher at first in a Lombardy vil. and later at Milan. She married a rich business man, from whom she soon separated. Her first book of verses was pub. when she was only seventeen, and her success was rapid. Her early books were the chants of an authentic daughter of the people, and were filled with a sense of revolt at things as they are. In her later vols. her rhymes lost some of their spontaneity and became more classical in form, although her themes were still humanitarian and feminist. Among her books of poems were (titles trans.) *Futility* (1892); *Tempests* (1896); *Maternity* (1904); *Eclat* (1914); and *Prayers* (1918). The shock of the First World War turned her talents to prose. *The Book of Mara*, which appeared in 1919, recites with feminine audacity the death of a young lover. In *Stella Mattutina* (1923) she gave a lyrical evocation in poetic prose of her infancy. *See* studies by N. Podenzani, 1930, and V. G. Galati, 1930.

Negrillo, *see* NEGRITO.

Negri Sembilan, smallest of what were once classified as the four Federated Malay States under Brit. protection. It is situated on the W. coast of the Malay Peninsula to the S. of the Malay states of Selangor and Pahang. Its area is about 2600 sq. m. Its pop. of about 240,000 consists of Chinese, Malays, Tamils, Europeans, and Eurasians. It is bordered on the N. by Selangor, S. by Johore and Malacca, E. by Pahang, and W. by the straits of Malacca. It has a coast-line of about 29 m. Its surface is diversified. The upper valleys and mts. are densely wooded, the lower are fertile, producing rice and fruits in abundance. The main mt. range of the Malay Peninsula ends in Negri Sembilan and the watershed between the E. and W. coasts in the S. part of the state is not mountainous. Gunung Bear Hantu, on the Pahang border, is the highest peak (4799 ft.), while the highest peak within the borders is Telapak Burok (3915 ft.). The country is drained eastwards by the R. Moar, but there are no large rivers, and the state does not suffer from disastrous floods which at times affect the riv. valleys of Malaya. There is only one port, Port Dickson, which

is connected with the seat of government, Seremban, by a railway 24½ m. in length. Agriculture is the main industry. Tin is worked in considerable quantities and large numbers of elephants, buffaloes, and other cattle are reared. Negri Sembilan is a confederation of 'nine states,' Sungel Ujong, one of the larger of these, is mentioned in a Javanese poem in A.D. 1365 as being subject to the Javanese empire of Majapahit (see also under MALAYA, History). In the fifteenth century it was ruled by chiefs of the old kingdom of Malacca. Most of the Malays are descendants of immigrants from Manangkabau in Sumatra and have an interesting exogamous and tribal social organisation. This immigration seems to have begun in the sixteenth century. After the capture of Malacca from the Portuguese by the Dutch and Johore Malays in 1641, Johore took a leading part in the politics of Negri Sembilan until 1773, when the chiefs of the present-day leading states of the confederation invited a Sumatra prince, Raja Melewar, ancestor of the present ruler, to preside over the confederation. In 1874 the president or *undang* of Sungel Ujong (the most important of the nine small states) invited the assistance of the Brit. Gov. to maintain his rule, and a Brit. resident was appointed, and various others of the nine states followed this example. Later was formed a confederation known as Old Negri Sembilan, and in 1895 the resident of this confederation took charge of Sungel Ujong and of Jelebu, and the modern Negri Sembilan was constituted. Finally in 1898 the Yang Di-pertuan of Sri Menanti (who at one time presided over the whole of Negri Sembilan) was again elected titular ruler of the whole state.

Negrito, or **Negrillo**, name originally applied by the Spaniards to the Negro-like inhab. of the Philippine Is., an aboriginal race, somewhat dwarfed, inhabiting the mts. They are of an extremely low type, having no dwellings, living on wild fruits and roots, and on animals they can procure with their only weapon, the bow and arrow. The name has been extended to cover many other peoples. Besides the Aëtas or Philippine Negritos, there are many tribes scattered over the mountainous regions of the Malay Peninsula, such as the Jakuns, Sakais, and Samangs, and the Andaman Islanders or Minicopics, who are much purer than the others who have intermixed with the Malay races. These form the E. div. of the race. In Africa there are sev. tribes inhabiting the equatorial forests and the mountainous regions round the great lakes, the pygmies of the Congo and Ogway. Among these are the Wochua and Akka, inhabiting the basin of the R. Welle, N. of the Congo; the Batwa, about the R. Kasa and its tribs.; the Obongo, in the W. forests of equatorial Africa; in Masailand the Wandurobo; and in S. Gallaland the Dume. As in the case of the Negroes, this race appears to have spread originally over the Indo-African continent, now submerged. There is marked likeness to the Negro in colour,

nature of the hair, protruding jaws; they are, however, of low stature, 3 ft. 6 in. to 4 ft. 10 in., and have 'brachycephalous' heads. In intelligence and morality they show marked similarity to the Negro, but are very much lower in the scale. See A. B. Meyer, *Über die Negriten oder Artas der Philippinen*, 1878; E. Tyson, *Essay concerning the Pygmies of the Ancients*, 1894; A. H. Keane, *Man, Past and Present*, 1900; W. Junker, *Travels in Africa*, 1900-1902; H. Spencer, *Descriptive Sociology*, 1925; I. H. Evans, *Negritos of Malaya*, 1937; and P. Schebesta, *Revisiting my Pygmy Hosts*, 1937.

Negro-African Languages. The African natives speak very many different languages and dialects, whose relationship has, as yet, not been estab. Nor is the exact number of the languages certain, as it is not always easy to distinguish between language and dialect. Various estimates ranging from 500 to 1000 have been made, but a great majority of them are confined to quite small tribes, and only about 250 have been written down. Besides, migration has produced mixed languages and dialects which cannot be easily classified. Finally a few languages may be considered as a kind of lingua franca: they are understood over wide areas and serve as a common language between groups belonging to different linguistic families. Such are Hausa in W. Africa, Swahili in E. Africa, and Yoruba and Ybo in Nigeria. However, for convenience we can classify the African native languages into five linguistic families. One of them, extending in broad lines to the N. and E. of the Sahara, forms a great part of the Semitic-Hamitic family (see under SEMITIC-HAMITIC LANGUAGES). The following are the other four.

Bushman and Hottentots.—Their language is of a most primitive form, primarily monosyllabic, and characterised by a curious 'click' prefixed to most of their words. It gives their spoken tongue a staccato sound.

Bantu.—According to Sir Harry H. Johnston, there are to-day 226 distinct Bantu languages spoken over nearly the whole of the S. third of Africa, and constituting a very distinct type of speech. Contrasted with others among the groups of Negro tongues, 'it is remarkable as a rule for the Italian melodiousness, simplicity, and frequency of its vowel sounds, and the comparative ease with which its exemplars can be acquired and spoken by Europeans.' The Nyanja dialects, which employ Rom. characters, are spoken by over 1,500,000 people, and are the most interesting group of this linguistic family. They are mainly spoken in the Nyasa Protectorate, lying between Lake Nyasa, N. Rhodesia, Tanganyika Ter., and Portuguese E. Africa. The most important Bantu language is Swahili, mainly spoken in Zanzibar; it employs the Arabic alphabet and has become a kind of lingua franca in E. Africa.

The Bantu and the Sudanese (see below) languages are remarkable for the fact

that they are prefix-pronominal tongues, that is, they employ prefixes instead of suffixes to indicate tense, declension, and so forth, to an extent unparalleled in any other linguistic family. These prefixes, constituting the concord class, recur in exact agreement in the subject noun, and in the other members of the sentence, i.e. in the adjectives, verbs, verbal objectives, and all the other qualifications. In other words, the prefix of the first word of the sentence (that is, the basic nominal concept) must also be the prefix of all the other words of this sentence, thus producing an alliteration similar to but much more monotonous than that of old Eng. poetry. Another important characteristic of Bantu and Sudanic is that the conjugation of verbs shows aspects of action rather than the time relations as in Indo-European languages. Thus it shows completeness, emphasis, continuity, negation, and other relations, but not very many temporal ones. There is a certain parallel to this in Semitic languages.

Sudanic, or Sudanic, or Sudanic-Guinean.—Languages belonging to this linguistic family are mainly spoken in the area between the Sahara and the equator, from the upper Nile to the Gambia and Senegal. There is a great mass of what are rather dialects than languages, and the interrelations of these forms of speech, and their relations with the Bantu languages and other tongues of the African continent, are very obscure.

The Yoruba, a higher-grade and commercially minded people, numbering about 3,000,000, inhabit the S.W. corner of Nigeria from the sea to Jebba and from Dahomey to the borders of the Bini state. Nago of the Dahomey coast region, and the Bini tongue, seem to be related to Yoruba. Ybo, spoken in E. Nigeria, ranks as another chief language of Nigeria. Twi (originally Kwi or Ekwi or Okwi), also known as Ojii, Odshi, Tyi, Chweo, Tshi, Amira, Ashanti, etc., is another 'typical' Sudanic language. It is spoken by about 1,000,000 people living in the Gold Coast colony and in part of the Fr. colony of the Ivory Coast. Like most African languages, it is divided into a number of dialects, the most important of them being Akuapem, Asante, Akvian. The Twi group of languages and the closely related Fante tongue belong to the Akan linguistic group. Efik, another interesting Sudanic language, is spoken by some 50,000 people in Calabar, Nigeria. Yoruba, Twi, and Efik were reduced to writing over a century ago. Mandingo, Kru, and Kpwe represent the three main types of Nigeria. There are many other languages and dialects belonging to this linguistic family, but the majority of them, though important from the linguistic or anthropological points of view, have no great importance for practical purposes.

It has not yet been estab. whether the Bantu and the Sudanic languages actually form distinct families or should be considered as sub-families of one family. While they have common characteristics of grammatical structure (see above),

their phonology and vocabularies are quite distinct.

Nilotic Languages.—This group also offers many problems, especially with regard to its relationship with the Hamitic Cushitic tongues (see SEMITIC-HAMITIC LANGUAGES). Mention may be made of some of the Nilotic-speaking tribes, such as the Nuer, living S. of the Sudan, in the flat country watered by the White and Blue Nile (N.E. Africa), and the allied peoples Dinka and Shilluk, also living in the upper Nile region. The important people of the Masai (E. Africa and E. Central Africa) and some other tribes are considered as representing a fusion of Hamites with Nilotic Negroes. The Ba Hima and Wa Tusi tribes (Uganda-Karagwe-Urundi) are considered as a mixed Hamitic-Bantu people.

Negro, Bush, see MAROONS.

Negro, Rio: 1. Riv. of Argentina formed by the union of the Limay and Neuquen Rrs., which rise in lakes in the Andes. It flows E. and S.E., and after a course of 400 m. enters the Atlantic. 2. Riv. of S. America, rising in Colombia, under the name Guinúa. It flows E. and S., joining the Amazon as trib. below Manaus. It is navigable for steamers about 150 m., for canoes 680 m. Total length about 1400 m.; breadth $1\frac{1}{2}$ to 15 m.

Negroes form one of the four great classes of the human race. In their purest form they are probably found along the Guinea coast, in the Gaboon, the basins of the Shari and Benue, and the lower Zambesi; but the Sudan is considered the home of the race. It is possible that they peopled Schaller's 'Lemuria,' a continent covering a large portion of the Indian Ocean, and became divided on the subsidence of the region in early and middle Tertiary times. The term is now generally restricted to the S. or African branch, those of the E. region, of S. India, Malaya, New Guinea, etc., being Papuans or Malaysians. The former present various mixed types due to Caucasian migration, the latter have been affected mostly by Mongolian movement. The Negro characteristics are deep brown, almost black, skin, cool, velvety, and emitting a peculiar odour; short, black woolly hair of elliptical section; short, flat, broad, snub nose with depressed base and dilated nostrils; black eye, black iris, and yellow sclerotic coat; prognathic jaws, facial angle 70°; thick lips, protruding and showing the inner red; high and prominent cheek bones; very thick skull, dolicocephalic (index 70°); cranial capacity, 35 (average European, 45); long arms, weak legs; flat, broad foot with low instep, and 'lark heel'; yellowish palms and soles; height (average 5 ft. 10 in.) above the average. A marked feature is the early closing of the cranial sutures, a premature ossification appearing to prevent a full development of the brain.

The Negro races in Africa comprise the Fulah and Nuba groups, the Bantus, the

Hottentots, and the Malayo-Polynesian groups. In these negroid types there are wide variations, due to differences of climate. The Negroes have been described as unprogressive, lethargic, and without initiative, but unjustly, as Negro labour has always been valued. Slavery has impoverished Africa of some millions of her inhab., and this has checked the progress of the Negro race, while the morale of all connected with slavery - slave and slave-owner alike - was inevitably lowered. The status of women among the Negroes is low. Women are bought in marriage, and are expected to work to provide food for the men and the children. Polygamy is customary. Their religion was very debased and cruel, fetishism, cannibalism, and slavery being the chief characteristics and outcomes, but many have become Muslims. In U.S.A. and S. Africa they are largely christianised. They have been described as non-moral, rather than immoral, which aptly expresses their undoubted lower stage of development. They are gay and passionate, of rapidly changing moods; thievish and indolent by nature, their ready submission to authority and their apparent devotion to their masters is unreliable. The number of non-Christian Negroes amounts to about 90,000,000. The education of the Negroes was originally undertaken entirely by the missionaries, but of recent years education has been more systematised and secular schools report considerable progress. It is unfortunate, however, that in the Negro republic of Liberia, with a pop. of some 2,000,000 freed slaves, the Negroes have shown themselves incapable of self-education or of equity. The same applies to the older Negro republic of Haiti. The Negro pop. of Africa is estimated at over 200,000,000.

The Negroes in America. The Negro pop. of America numbers 12,865,500. Most of these are the descendants of the African slaves who were brought to the ter. of the U.S.A., although in the period following the First World War there was a large influx of Negroes from the Brit.-owned W. Indian is. Slavery existed in all the thirteen original colonies which became the first states of the Amer. union, but at least four-fifths were owned in the S. In the cold climate of the N. colonies slavery was not profitable. The small number held, therefore, never presented an acute social problem. It was otherwise in the S., where the Negro could be usefully employed in the great heat of the cotton, rice, and sugar plantations. In none of the colonies did the slaves have many legal rights. In the N. they were mainly domestic servants, humanely treated and instructed in religion and elementary schooling. In Virginia and Maryland they were mainly employed as body servants or as mechanics and artisans on the plantations. They lived in their own huts with their families, and were fairly contented. In the far S. not only was the labour given them harder, but in many cases they suffered under harsh task-masters and overseers,

who were often as cruel to them as depicted in *Uncle Tom's Cabin*. But even in those early colonial days a sentiment began to rise against human slavery, chiefly fostered by the Quakers and Ger. settlers of Pennsylvania. The blame for slavery originally was shared between Eng. traders and the colonists. Various Eng. companies found it profitable to ship slaves to America, even though slavery was not allowed on Eng. soil. At various times Pennsylvania, Virginia, S. Carolina,

E.N.A

A NEGRO COTTON-PICKER OF ALABAMA

and Massachusetts attempted to restrict the importation of slaves, but in each case this movement was summarily checked by the Brit. Gov. Thus at the outbreak of the War for Independence there were about 600,000 slaves in the colonies. After they had won their independence, some of the original N. states began to abolish slavery by law, so that by 1804 the institution had disappeared in Massachusetts, Pennsylvania, New Hampshire, Rhode Is., Connecticut, and New York. The ordinance of 1787 kept slavery out of the N.W. There followed the long troubled period in which N. and S. fought each other politically over the question of admission of slaves to the new states and ter., ending in various compromises. The contest ended with the civil war, one of the results of which was that slavery was forever extirpated in the U.S.A. The 13th amendment to the constitution, adopted in 1865, made this the law of the land. The 14th amendment, ratified in 1868, and the 15th, ratified in 1869, sought to confer full civic rights on the Negro. It was thought by optimists that the results of the civil war had ended the Negro problem. The converse was true, and, indeed, President F. D. Roosevelt

said that the Negroes in the S. were America's problem number one. During the terrible reconstruction period in the S. states, 'carpet-baggers' from the N. (see KU-KLUX-KLAN) led the ex-slaves to the polls, and for a period almost all the S. states were ruled by Negro legislatures made up for the most part of illiterate blacks. With the withdrawal of federal troops, the whites turned the tables and secured control of all the political machinery of the commonwealths. By various state laws the Negroes were practically disfranchised, despite the plain reading of the amendments to the federal constitution. In some states property and educational qualifications were invoked. In others there was the 'grandfather clause,' whereby anybody whose ancestors had the vote in 1867 continued to have it. The U.S. Supreme Court has never declared these laws null and void. To this day in the real S. the Negroes are largely disfranchised, although they have the full right of the ballot in the border states like Missouri, Maryland, and Kentucky.

The story of the Negro in the S. is a long one of a humble but determined struggle to rise in the scale. The Negro in the S. does not go to the same schools or churches as do the whites. He has his own churches, and the various states have increasingly given facilities for education. In many of the states there are laws prohibiting the Negroes from travelling in any other than 'Jim Crow cars,' i.e. railway coaches reserved exclusively for Negroes. On the trams they must sit in the back seats. The Negro is still the main labourer on the big cotton, sugar, and rice plantations, and in 1930 nearly 2,000,000 Negroes were working on the farms; but in the cotton fields more and more jobs the Negroes used to do by hand are now being done by machinery, and a machine has even been invented for picking the cotton. A great many Negroes are 'share-croppers': that is, they till a little plot of the plantation and share their crops with the owner, paying part of them to him as rent and selling the rest for subsistence money until the next harvest. But they have to buy their seed, tools, and food at the landowner's store and often at excessive prices, with the result that many are in debt before the next harvest comes round.

With their gradual rise as property owners aided by some education, two schools of thought arose among the Negro leaders. Booker T. Washington, head of Tuskegee Institute, was in favour of a slow, but steady rise. According to him the Negro should learn to be a good farmer or a good artisan. He would thus by patience, industry, and usefulness make a better place for himself in the communities of the S. The other school was more impatient and more militant. It advocated fighting for all its rights. The First World War wrought a profound change in the Negro question. The N. as well as the S. was now confronted with it. With immigration into the U.S.A. stopped by the war, the great industrial

plants of the N., working to full capacity, were in serious need of more labourers, and the S. states were canvassed by agents, who induced Negroes by thousands to move N., where there were good jobs, high wages, the vote, and no colour discrimination in the public schools. The Negro pop. of cities like Chicago, Akron, and others was increased to a great extent. New York became the greatest Negro city in the world. In the Harlem dist. of New York city there are about 400,000 Negroes of all classes, from the intelligentsia and the professional classes to the poorest day labourers. Negro industrial workers, numbering more than 1,750,000, were, before the depression of the 1930's, engaged very largely in the steel and building industries, but had more than a proportionate share of their members in the soup lines that were common in the country in 1932; but for that very reason all the measures for workers passed and administered by the gov. have been of greater relative benefit to the Negro workers. There are Negro police, shops run by Negroes, and theatres, cinemas, dance-halls, and night-clubs run by Negroes for Negroes. This new condition of things resulted in race riots in Chicago, Washington, and of her cities.

But with all the drawbacks, N. and S., with all the dark chapters of lynchings and riots, the Negro race has made marvellous progress since the civil war. To-day there are about 950,000 Negro farmers in the U.S.A. The majority of these are, of course, in the S., Georgia, S. Carolina, and Alabama. The thirst for education among the Negroes has grown immensely. The individual states of the S. have done much to foster this, and wealthy N. people have endowed many schools. In the N. and W. states (where there were, at the last census, 2,750,000 Negroes, or 20 per cent of the pop.) there is practically no separation of schools for Negro and white youth. In the eighteen S. states and the dist. of Columbia the children of 9,500,000 Negroes, or 80 per cent of the pop., attend separate schools, and Negro education for the segregated 80 per cent is decidedly behind white education in every respect. The institutions for Negro education doubled in the decade from 1917 to 1927. To-day there are upwards of eighty colleges for Negroes with endowments of about \$21,000,000. There are more than 50,000 teachers in the Negro schools, and two-thirds of the children of school age are enrolled. Professional schools of medicine and law now exist in the S. states for the training of Negroes. A Negro graduate of the Harvard Law School was recently appointed as a federal judge. Similar striking progress has been made in the churches. The Negro has always been deeply religious, as is evidenced by the lovely Negro spirituals, many of which had their birth in slave days. There are to-day over 42,000 Negro churches, with upwards of 5,250,000 members and property worth \$200,000,000. The Negroes are mainly Baptists, Methodists, and Presbyterians.

Negro Art. Literature, etc.—In the arts, e.g. building, spinning, weaving, pottery, agriculture, the working of metals, the Negroes are moderately advanced but have probably learnt these under Semitic influence. It is in sculpture, however, that the most important contribution of primitive Negro art was made to art. Negro sculpture exhibits great plastic freedom, showing that the artist was capable of feeling in three dimensions, whereas much European sculpture shows a two-dimensional limitation. On European sculpture of the twentieth century the influence of Negro art has been considerable: the example of Jacob Epstein's work may be cited. For song and dance the Negroes have a natural aptitude, which, especially in America, and emanating thence to Europe, has set the example for much modern syncopated music and for the styles of ballroom dancing in vogue among the white races. Apart, however, from the prevalence of Negro jazz in white civilisation, Negro songs and spirituals have had a lasting popularity, due to the appeal of their simplicity, their dialect, and their naïve emotionalism. Negro singers such as Roland Hayes, Marian Anderson, and Paul Robeson have won for the Negro a high place in that art; and their musical ability has also shown itself in gifted compositions. The work of Wm. C. Hardy has been carried on by, among others, Wm. Grant Still, whose symphony has been played by great orchestras. Negro painters, sculptors, and architects are not so well known in the world but are none the less significant.

Literature among Afro-Amer. writers is naturally the result of education and of contact with the white races. Their literature is often mystical, or is directed towards the social betterment of the Negroes. Two important Afro-Amer. writers may be mentioned: Phillis Wheatley (1753-84) and Paul Laurence Dunbar (1872-1926). The Negro as subject was not overlooked by the white writers, particularly those of the S. Joel Chandler Harris with his 'Uncle Remus' stories virtually made himself the amanuensis of the cheery Negro peasant. Thomas Nelson Page in some of his most perfect short stories showed the sentimental attachment between the Virginian gentleman and his old Negro slave or servant. But among the whites in recent years there has been more of a tendency to come to grips with realities. A bold treatment of the Amer. Negro was given dramatically in *The Nigger* by Edward Sheldon (1909), and the one-act plays of Ridgely Torrence (*Granny Mamma*, *The Rider of Dreams*, and *Simon the Cyrenian* 1917) are also concerned with the Negro, while the controversial play, *Green Pastures*, may be mentioned. Among novels, *Torgny*, by du Bose Heyward, gives an accurate picture of Negro life in America. But the most significant development has been the creation of literature by Negroes themselves, fully race-conscious and impatient of the old sentimental and humorous aspects. The danger of this new school is that they may

think more of propaganda than of art. There are realists who objectively try to describe Negro life, and they alone can know it, with full details of dialect, superstition, and religious ecstasy. There are the symbolists, more concerned to express the real racial feeling buried deep in the Negro's soul. These men for the most part eschew dialect. They try to do in literary Eng. what Irish writers have done for their peasant folk. This is best illustrated in the various 'blues' by Langston Hughes and the versified Negro sermons written by James Weldon Johnson. In Claude McKay there is presented the defiant Negro poet who resents the slights and injuries put upon his race. Countee Cullen's *Black Christ*, dealing with a lynching, is famous among Amer. students of Negro poetry. International fame as scientists has come to George W. Carver and Dr. Ernest Everett Just. Dr. Louis T. Wright, the surgical director of Harlem Hospital in New York, is a fellow of the Amer. College of Surgeons.

In France, which country possesses great colonies with Negro pops., interest in Negro literature was stimulated sev. years ago by a *Negro Anthology* in which Blaise Cendrars gave Fr. renderings of Negro rhymes and chants which he had collected in Africa. The art of Negro poets in Haiti is not so important because the Fr. influence is too potent.

West African Indigenous Art.—There is an individuality in W. African indigenous art and a genuine tradition that justify its special consideration. The aesthetic aspect of African culture is a discovery of the present generation. Yet the basis of African art, far from being primarily aesthetic, was essentially religious, and its tradition in W. Africa is threatened by the crumbling of the religious and tribal systems under which it grew up. Educational reform, it is hoped by Brit. colonial authorities, may go far to check the evil influence of bad European models on indigenous arts; but it is evident that, if the ritualistic beliefs which dictated the forms of the older carvings are yielding to new conceptions of life and death, form and style will require careful and sympathetic guidance. The monumental heads of Gabon, the bronzes of Benin, the masks of the Portuguese Congo, and the sculpture of the Ivory Coast all prove that in the sphere of art W. Africa is coherent and as a whole has regional unity in its plastic art. There are signs of external influences, as for example in the designs of the state chairs of the tribal chiefs of Ashanti, which betray a European influence, while some carvings in the Fr. Sudan show Nilotic traces; but, generally speaking, W. Africa has made its own characteristic contribution to the artistic creations of the world. But in order to appreciate the mystic beauty of the *chefs-d'œuvre* of W. African sculpture we need to realise the worship and awe of those for whom the artist carved his figure. Much that is implicit in the work, the meaning of its symbolism, the ancestral associations of its forms, much of all this is necessarily lost on the European

observer, and indeed, belonging to a passing age, there is danger that soon they will hardly be understood by any but the older African generations. The outstanding achievements in the sculpture include masks for ceremonial use; the long-necked heads from Gabon; a red terra-cotta head called 'Mia' found by Leo Frobenius in Ife, Nigeria; the head of the great fetish Baluba from the Belgian Congo; a fetish head from Man'yema in the Fr. Congo; an antelope's head from the Bambarra country on the Niger; a brass figure of a man with clenched teeth from Duhomey; and the ancestral figure of a woman from Urua, E. Congo. For photographic reproductions of these see *Arts of West Africa*, ed. by Michael Sadler (pub. for the International Institute of African Languages and Culture by the Oxford Univ. Press, 1935). See also ETHNOLOGY; PHILOLOGY.

Negro Lethargy, see SLEEPING SICKNESS. **Negros** (formerly **Bugias**), is. of the S.W. Visayas group, Philippines, between Cebu (S.E.) and Panay (N.W.), with the active volcano, Mt. Malaspina or Canlaon (c. 8200 ft.). The mt. ridge forms a continuation of Mindanao (Dapitan). Sugar cane, coffee, tobacco, and grain are produced. Sugar-sacks, cabanegro, and abaca manufactured. Bicolod and Dumaguete, caps. of the occidental and oriental provs., are the chief tns. Area 905 sq. m. Pop. 562,000.

Negro Spirituals, Afro-Amer. religious songs so named in the time of the civil war, though slavery is seldom mentioned in the songs and there is no spirit of vindictiveness in their words. The spirit of the Negro spiritual is informed by a

doile melancholy, a patient yearning, and a naïve confidence in the glory awaiting the singer in the next world. God, Jesus, Satan, and the great figures of the O.T. and the N.T. are dramatised in many N. S. Sometimes marching enters into Negro religious services, coupled with noisy religious exercises—a legacy, it is supposed, of the early Methodist revival meetings of the white masters. From a literary standpoint the words of Negro songs are mostly crude; picturesque and expressive phrases may occur, but their metrical arrangement is primitive, though the singers soon learn how to keep time and rhythm (see, e.g., W. Jekyll, *Jamaica Song and Story*, 1907). As may be inferred from the origin of N. S. no less than from the gay and carefree character of the Negro, the emotional part is out of all proportion to the intellectual in their songs. This no doubt explains why the attempt to replace N. S. by the standard hymns of the white man's churches has, generally speaking, failed, excepting in the N. states and with the more educated and sophisticated congregations of the cities. See also JAZZ; RAGTIME. See P. A. Scholes, *The Oxford Companion to Music*, 1941.

Négus, title of a king or ruler in Abyssinia, the emperor being *N. nagash* (king of kings). In the last two centuries the rulers of Amhara have claimed it.

Negus, name of a drink consisting of wine (especially port) mixed with hot water, spiced and sugared.

Nehemiah. The book of N. is closely connected with that of Ezra, and in the Jewish canon the two form a single book under the name of Ezra. It tells how N., cup-bearer to Artaxerxes, learnt of the condition of Jerusalem, obtained leave to visit it, and set about its restoration; and of the actions of Ezra in restoring the observance of the law. The whole book is a compilation from various sources made some long time after the events which they narrate. See commentaries by S. Patrick, 1706, and C. F. Keil, 1873.

Nehru, **Motilal** (1861-1931), Indian Swarajist. Advocate in high court at Allahabad, where he had a magnificent residence; in 1919 he turned his house into a free school which eventually became Congress headquarters. He founded the *Independent*, and presided over Congress, 1919 and 1928, supported non-co-operation and was imprisoned. In 1923 he entered the Legislative Assembly and became president of Swaraj party, 1925. In 1928 he presided over the All Parties Conference at Bombay, which produced the N. report recommending dominion status. He endorsed Gandhi's civil disobedience in 1930 and was sentenced to six months' imprisonment.

Nehru, **Pandit** ('Wise Man') **Jarwahrial** (b. 1889), Indian Nationalist statesman, b. in Kashmir of Brahmin stock, son of Motilal N. (q.v.), a wealthy lawyer. N. had an Irish tutor and, later, was educated at Harrow and Trinity College, Cambridge. He became a barrister of the Inner Temple, practised law at Allahabad, and continued his father's work as a prota-

gionist of Indian nationalism. He became secretary of the Indian Home Rule League in 1918 and, in the same year, a member of the All India Congress Committee, of which body he became general secretary in 1929. He was president of the Indian National Congress, 1929-30. He co-operated with Gandhi and was imprisoned for taking part in the public distilling of salt from sea-water on the shore, thereby violating the unpopular salt monopoly of the gov., and again was imprisoned at various times for civil disobedience activities. He was Congress president in 1936-37. He was strongly anti-Brit.

Press Portrait Bureau

PANDIT NEHRU

as may be gathered from his *Glimpses of World History*, but the achievement of Indian independence in 1947 enabled his naturally W. outlook to come to the fore, and he stands for the Indian partnership, even as a republic, in the Commonwealth. In 1946 he was chosen to be Vice-president of the All Indian Interim gov. N. wielded the greatest influence in India and is hero-worshipped by the masses; even his enemies agree as to his political integrity. He has less of the mysticism of Gandhi and more practical sense. Once won over to Nationalism he converted his father to more extreme methods and the latter gave up his position, fortune, and social contacts with the leading Englishmen in India to follow his crusading son into jail. In 1947 N. became the first Prime Minister of the new dominion of India or Hindustan. His wife, Kamala, died from tuberculosis which she contracted in prison. His sister was the first woman in India to reach ministerial rank, being minister of local government of the United Provs. and India's first delegate to the United Nations Assembly. N. lives at Allahabad, his original mansion becoming the headquarters of the Congress party.

Despite his thirteen years in all in prison and his life of revolutionary agita-

tion, there is no bitterness in his character. His appeal, like that of his great associate Gandhi, is to the affectionate rather than the aggressive side of human nature, though he is both passionate and imperious and impatient of incompetence and hypocrisy. This note of temperamental impatience has sounded throughout his lifelong agitation against Brit. rule in India, (the agitation of a highly educated and highly intellectual man of action chafing at an outworn tutelage. Yet he never emphasised the foreignness of Brit. rule and, in many respects a westerner himself, he did not wish India to go the opposite way from that prescribed by Brit. statesmen, but rather in the same way but under her own impulse. During the Punjab (a.r.) massacres of 1947 he threw himself into the most troubled areas with utter disregard of his personal safety, not to incite but to restrain violence. The veneration in which he is held to-day among the millions of India and of Asia beyond India serves to explain why he was the greatest single influence in quelling the riots and stopping the bloodshed. Since then his greatest achievement has been the extraordinary transformation of the atmosphere of India, for there have been no more communal riots. He is to-day the unchallenged ruler of the greatest Asian state and at the same time a W. liberal, a secularist, with an almost Christ-like influence, a lifelong rebel against Brit. rule, and yet Britain's greatest pupil and her friend.

His work, *The Discovery of India* (1947), was written during his years of detention in wartime and much of it is based on knowledge communicated by his fellow detainees. Other pub.: *Autobiography* (1936), *India and the World* (1936); and *The Unity of India* (collected writings) (1941, 1948). See Anup Singh, *Nehru: the Rising of India*, 1933.

Neilo, Richard (1562-1640), archbishop of York, b. at Westminster. Having taken his doctor's degree in divinity in 1600, he became in 1605 dean of Westminster. In 1608 he was made bishop of Rochester and appointed Laud his chaplain, and in 1610 was translated to Lichfield, removing to Lincoln, 1614, Durham, 1617, and Winchester, 1628. He sat regularly on the High Commission and in the Star Chamber, and in 1631 was made archbishop of York.

Neilgherry Hills (S. India), see NILGIRI HILLS.

Neilson (Neilson-Terry), Julia (b. 1869), Eng. actress; she studied music with success but abandoned it for the stage, playing Galatea to Lewis Waller's Pygmalion. She married Fred Terry, and appeared generally under Herbert Tree's management, until Terry began management in 1900, after which she appeared with him. Her best-known parts include Ann Page in the *Merry Wives*, Nell Gwynn in *Sweet Nell of Old Drury*, Hester Worsley in *A Woman of no Importance*, Lau, Blakeney in *The Scarlet Pimpernel*, and Rosalind in *As You Like It*. See her memoirs, *This for Remembrance*, 1940.

Neilson, Lillian Adelaide (c. 1848-80), assumed name of an Eng. actress, Elizabeth Ann Brown, also known as Lizzie Bland (Bland being her stepfather's name). She made her debut at Margate (1865). Her most celebrated role was that of Juliet, and in 1870 she scored a success in London as Amy Robsart in a dramatic version of *Kenilworth*, and also played Rebecca in *Frankoe*. She was popular also in America, appearing at Booth's Theatre, New York (1872). See J. W. Marston, *Our Recent Actors*, 1890.

Neilston, tn. in Renfrewshire, Scotland, 10 m. S.W. of Glasgow. Thread manuf. and bleaching are carried on. Pop. 5,000.

Neisse (Polish Nysa), tn. of Poland on the Glatzer N., 30 m. S.W. of Oppeln (Opole). It was formerly the chief tn. of a principality and the residence of a bishop; the episcopal palace is now used for municipal offices. There are manufs. of firearms and machinery. Pop. 38,000.

Neitharat, Mathias, see GRÜNEWALD, MATTHIAS.

Neiva, tn. of Colombia, S. America, cap. of Huila dept., on the right shore of the Magdalena. 7½ m. from Girardot and 218 m. from Bogotá. Produces cattle and coffee. Its industries include the manuf. of Panama hats. Pop. 35,000.

Nejd (Najd), country of Arabia, making, with the Hejaz and Asir, the kingdom of Saudi Arabia (q.v. and see also SA'UD, ABDUL ASIZ IBN). The area of N. (i.e. 'the plateau') is about 800,000 sq. m. (including the Nafud and Dahna deserts), and the pop. about 2,275,000, the majority being Muslims of the Wahabite movement. The N. is the general name applied to the central portion of Arabia. Most of its surface is an elevated sandy desert, broken by deep water-courses, which are dry most of the year, and interspersed with many fertile spots. Large numbers of sheep, camels, and horses are reared. Oil has been found in commercial quantities at Dammam (or Dhanran), in Hasa. The climate, despite the great heat, is salubrious. At the close of the eighteenth century the Wahabis conquered the N. tribes and their state still survives in the unified kingdom of Saudi Arabia. The chief tns. of N. are Riyadh, the cap. (pop. 60,000), Hufuf, a trading centre on the Persian Gulf, with a pop. of 30,000, Shagra, Anaisah, Hafl, and Buraida, none with a pop. of more than about 20,000. The only ports (Persian Gulf) are Qatif and Uqair, which are suitable only for sailing craft (dhows). Riyadh is notable for its large Wahabite mosque. The people of N. are chiefly Bedouins. The main occupation is pastoral, camels being exported to Egypt, though this trade is much reduced by the development of motor transport; while dates and some cereals are raised for domestic consumption. Other products are hides, wool, oil, clarified butter (ghee), and abas (or Arab cloaks). Dates, hides, and ghee are exported to some extent. The revenue of N. is derived from the customs duty collected in the Hasa prov. and from a tithe on dates and corn. For the hist.

of N. (and the Hejaz) in the First World War see ARABIA.

Nekrasov, or Nekrasoff, Nikolai Alexeievich (or Alexeyevich) (1821-c. 1878), Russian poet and Nihilist. He owned (1847) and conducted the monthly magazine *Sovremennik* (The Contemporary), by means of which Nihilistic opinions were spread among the students of St. Petersburg Univ., and *The Annals of the Fatherland*. In 1840 he pub. *Dreams and Elves*. Other poems are *Peasants' Children*; *Russian Women*; *Hero for an Hour: Who can be Happy and Free in Russia?* (1879); and *Last Songs*.

Nellore, or Nellur (anc. Sinhapur, Hon city), cap. of N. dist., Madras, India, on the R. Pennar. In the dist. are mica mines and saltpetre refineries; cotton textiles are manufactured. Pop. (dist.) 1,617,000 (tn.), 56,320.

LORD NELSON

Nelson, Horatio, Viscount Nelson, Duke of Bronte, in Sicily (1758-1805), England's greatest admiral, fifth son of Edmund N., rector of Burnham Thorpe, Norfolk, was b. there Sept. 29. On his father's side he came of a family of clergymen; his grandfather was rector of Hilborough, as his father had been, and two of his brothers were clergymen, one, Wm. N., after Horatio's death at Trafalgar, being gazetted Earl N. of Trafalgar, with remainder to the heirs male successively of his sisters, Mrs. Bolton and Mrs. Matcham. His mother, Catherine Suckling, was grand-daughter of Dr. Maurice Suckling, prebendary of Westminster and rector of Wootton, Norfolk, and grand-nephew of the poet Sir John Suckling. The name Horatio came into the N. family from the Walpoles and Townshends, for though there was no consanguinity, N. was connected by the rites of the church with those historic families. Of N.'s childhood little is known. He himself has written that he was at the grammar school at Norwich and afterwards at N. Walsham, where a brick in the wall covered by glass is still pointed out, marked with the

initials 'H. N.' On Nov. 17, 1770, Capt. Suckling, having been appointed to the command of the 64-gun ship *Raisonnable*, entered his nephew on Jan. 1, 1771, as a midshipman. Soon afterwards he went with his uncle to the *Triumph*, guardship of the Medway, in the rating of 'captain's servant,' this being a recognised practice to secure training as a naval cadet. Early in 1773 he was transferred at his own request to the *Carcass*, which was going on a voyage of discovery in the Arctic, an education of trial and hardship for a boy of fifteen. Later he was rated as a midshipman 'aged 18' (a gross fiction to conceal irregularities) of the *Seahorse*, a frigate which was fitting out for the E. Indies. In this vessel he visited almost every part of the E. Indies, but under the trying climate his health gave way, and on March 14, 1776, the commander ordered him to be discharged to the *Dolphin* for passage to England. N. himself said that the kindness of Capt. Pigot of the *Dolphin* saved his life and indeed he seems to have regained his health as soon as he reached England. Some days later he was appointed lieutenant of the 64-gun ship *Worcester* by order of Sir James Douglas, commander-in-chief at Portsmouth, and, no doubt, through the interest of Capt. Suckling, who was now comptroller of the navy. Mark Robinson, captain of the *Worcester*, a good and brave officer, treated N. as an equal rather than a very young acting lieutenant, and some few years later in an action off the Chesapeake R. strongly influenced N.'s tactical studies.

Meanwhile, having passed the necessary examination at the Navy Office, he was promoted to be lieutenant of the *Lowestoft*, April 10, 1777, a 32-gun frigate fitting out for the Jamaica station. We are told that at this time he received a letter from his uncle, Suckling, which is significant as showing the low standard of order prevailing in the navy at this time. But this standard hardly applied to the *Lowestoft* which had the good fortune to have for its captain Wm. Locker, who had distinguished himself in the Seven Years war and afterwards joined Hawke's flagship, the *Royal George*; and the valuable lessons Locker had learned from Hawke he now passed on to N. There is no doubt of the great influence he had on N., whom he found avid of knowledge, zealous for the service, and restlessly energetic, qualities which won his heart as a sailor and as a man. Probably the great debt which N. owed to Locker and through him to Hawke has only been adequately recognised in later years and could only be recognised by those who realised what manner of man Locker was, a man who in his leisure collected a vast store of information respecting the service, which was later to form the basis of Charnock's *Biographia Navalis*. In 1778 N. was moved on probation into Sir Peter Parker's flagship *Bristol*, but his probation did not last long and on Dec. 8, 1778, he was promoted to be commander of a brig and, six months later, to be

captain of a Fr. prize re-named *Hinchinbroke*. In this vessel he led an expedition against Grenada on the extremely unhealthy Lake Nicaragua, but was afterwards prostrated by malaria and apparently near to death when he was recalled to Jamaica by his appointment to the *Janus*, a 44-gun ship (being succeeded on the *Hinchinbroke* by Collingwood). At Jamaica he lay for some time in the gravest danger, his life being probably preserved by the unremitting care and nursing of Lady Parker. After recuperating for some months in England he was appointed to command the *Albemarle*, a 28-gun frigate. He cruised for many months without any particular success, but gave satisfactory proof of his ability as an officer, and earned the approval of Lord Hood. He was placed on half-pay in 1783, but not long after was appointed to the *Boreas*, and went to the W. Indies, where he captured five Amer. ships engaged in irregular trading, in defiance of the instructions of Sir Richard Hughes. Actions for illegal detention were brought against N., who had, perforce, to remain a prisoner on board his own ship. Eventually an order came out for N. to be defended at the cost of the Crown and so, for the time, his share in the affair might seem to have ended, but for some years afterwards new writs were issued which, though always defended by the Crown, were a source of great annoyance to N.

While on half-pay he took up his residence at St. Omer and, while studying Fr., fell in love with a Miss Andrews, daughter of an Eng. clergyman. His uncle, Wm., brother of Charles Suckling, now deceased, agreed to allow him £100 a year so as to enable him to marry, but his suit was rejected. It is interesting to note that when the *Boreas* sailed from Spithead, Lady Hughes, wife of the commander-in-chief, and her daughter took a passage in her and that N.'s brother Wm. went out as her chaplain. For Lady Hughes N. conceived a strong dislike, considering himself imposed upon in being asked to take her out; he curtly described her as having 'an eternal clack.' Indeed he seems also to have somewhat despised the admiral because 'he bows and scrapes too much for me.' In March 1783 he sailed for St. Kitts, being there for sev. months. Here he fell in love with a young widow, Frances Nisbet, niece of Herbert, president of Nevis, and daughter of Wm. Woolward, a judge of the is. But contrary to the common assumption of a love match, the tone of his letter to Frances suggests esteem rather than passion. They were not married until March 1787. Prince William, who had come out as captain of the *Pegasus*, giving the bride away. In the summer of 1788 N. went to Norfolk and made his home with his father at Burnham Thorpe, where he lived for four and a half years, during which time his applications for employment met with no response beyond a formal acknowledgment, possibly because he was regarded as a man likely to give trouble in time of peace by excess of zeal, as witness the law-suits over the seized Amer.

traders. At this time he was in straitened circumstances, for in addition to his uncle's allowance of £100 a year, he had only his half-pay of £120. It was not until a war with France was threatened in 1793 that he was given the command of the *Agamemnon*, in which in Aug. he conveyed troops to Naples, where he became acquainted with the Eng. minister, Sir Wm. Hamilton, and his beautiful and notorious wife, Emma. In the following year the commander-in-chief, Lord Hood, attacked Corsica, and gave N. the command of the landing party. N. was successful in the operations at Bastia and Calvi, but at the latter engagement lost the sight of one eye. N. gained valuable experience in this, his first real action against the Fr., off Genoa (1795) in which the *Agamemnon* was the Eng. ship most closely engaged. The memory of the action is notable for N.'s criticisms in his letters of Adm. Hotham's conduct of the battle, and posterity may be justified in assuming that had N. been in command most of the Fr. ships would have been captured. He was promoted commodore in 1796, and in the following year, for his share in the victory off Cape St. Vincent, was raised to the rank of rear-admiral.

He had waited eighteen years for his flag rank but was still under forty. (Collingwood reached flag rank at fifty, Howe at forty-five, St. Vincent at fifty-three, and Saumarez at forty-four.) In the same year in an engagement he lost his right arm. For his successful attack on the Fr. fleet in Aboukir Bay (1798) he was created Baron N. of the Nile. His attachment to Lady Hamilton was now very strong, and he was at Naples whenever he could possibly be there, Sir Wm. Hamilton proving himself a most complacent husband, though it is to be remembered that he was thirty-five years older than his wife and that N. was but thirty-five. In Lady N.'s letters there is evidence enough of a somewhat colourless womanly affection but not of a thrill of response to the greatness of her husband's daring even when witness herself of the acclamations it called forth; and what N. had never yet found in woman, Lady Hamilton gave him, admiration and appreciation, undisguised and unstinting, and, by the admission of even her unfriendly critics, in giving that admiration she lent reality and grace to the part she was playing. She had, of course, profited by the efforts of Charles Greville, a former lover and nephew of Hamilton, and of Hamilton himself, to educate her in the social accomplishments; she was lovable and had an intense love of admiration, but was unquestionably spoilt by the indulgence of caprice. Yet with all her native coarseness—she was born of extremely poor parents in the humblest walk of life—she possessed an intuitive and perfect sense, amounting to genius, for what propriety and good taste demanded in the presentation of an ideal, the true gift of a born actress.

After his return to England in company with the Hamiltons, a return necessitated

by ill health, N. and his wife separated. In 1801 he was promoted vice-admiral, and was in command of the attack on Copenhagen, for his services being raised to the dignity of a viscount. At this famous battle N.'s flagship, the *Elephant*, commanded by Capt. Foley, who had distinguished himself at the battle of the Nile, was in the centre opposite the Dan. commodore Fischer's ship *Dannebrog*. As to the popular incident of the telescope and N.'s blind eye, it is well confirmed that Sir Hyde Parker, through Otway, his flag-captain, made it clear that the signal to discontinue the action should be understood as permissive and Foley also so understood it. But Col. Stewart (who told the story), who stood beside N. when he lifted his glass, was not aware of the tenor of Otway's message and failed to appreciate that N.'s action and words were jocular. He lived with the Hamiltons in London and at their country house, and after the death of Sir Wm. in 1803 continued his intimacy with the widow. Lady Hamilton told Lord Minto that their relations were 'platonic.' 'Lady Hamilton,' he wrote, 'talked very freely of her situation with Nelson, and of the construction the world may have put upon it; but protested that their attachment had been perfectly pure.' However, she bore him two children, both daughters, but the second d. soon after birth and N. never saw her. N. left it to her to buy the house at Merton, the only home they ever had in England, for he was unable to get leave from the Admiralty even for a few days. All N. stipulated was that everything in the house should be his 'even to a pair of sheets, towels, etc.,' apparently because he wanted to avoid debts. In this manner was conducted the purchase and setting up of his Eng. home, where he spent his happiest hours and from which he set out to fight his last battle. In May 1803 N. was appointed to the command of the Mediterranean fleet, and made the *Victory* his flagship. He lay off Toulon in the hope of the Fr. fleet coming into the open, and so being able to engage it. Napoleon's plan was for the Fr. and Sp. fleets to meet in the W. Indies and there combine into an overwhelming force. Villeneuve, now in command of the Fr. fleet at Toulon, managed to evade N., but a storm drove him back to the shelter of the forts; but later he was able to get away, while N. was delayed at Maddelena by contrary winds. He eventually, on Oct. 21, engaged the allied fleets off Trafalgar, and shortly before the action began hoisted from the flagship the famous signal, 'England expects that every man will do his duty.' The victory was complete and decisive, but when the fate of the action was determined, N. was shot down on his quarter-deck and d. a few hours later. It may be noted here that Adm. Mahan and most authorities state that it had been laid down by N. in his memorandum of Oct. 9, that if the Eng. fleet should be to the windward of the enemy, it would be his object to bring it, in three lines, parallel to and within gunshot of the

enemy, from which position the lee line of ships would bear up all together and attack the enemy's rear, while the weather line and advance squadron threatened the van until such time as it became expedient for them too to bear up and attack the enemy's centre. But the lightness of the wind made it impossible to manoeuvre into the requisite position without risking the loss of a whole day and of the opportunity to attack at all. N., however, had no doubt foreseen and discussed the contingency, so that the modification of his plan, which was apparent, was no doubt at once understood by his subordinates. Ideally the Eng. fleet was in two lines perpendicular to the Allies' single line, but in fact the lines on both sides were very irregular, and on the part of the Eng. were rather elongated clusters. This modification of the plan did not, however, affect the essential part of it, and as Mahan writes: 'It is not to the discredit but greatly to the credit of his conception, that it was susceptible of large modification in practice while retaining its characteristic idea.' On N.'s character it is agreed that at twenty-one he had charm of manner which reflected a kind and generous nature. There is abundant evidence that N. not seldom displayed the self-assertion, vanity of a boy, with all a child's love of praise and a woman's love of flattery, which Lady Hamilton knew how to give. But that he could also act as an officer, judge, and statesman we know from the record of his life and on the evidence of the famous duke of Wellington (who once and only once met N., at the Colonial Office in Whitehall). He was of delicate health and diminutive figure, which gave no external hint of his intellectual powers or of the eagerness for glory, or rather honour, which he possessed from his earliest years as a midshipman.

His affection for Lady Hamilton remained unimpaired even in his dying moments. 'Remember, I leave Lady Hamilton and my daughter Honoria as a legacy to my country,' he said, as he lay dying. (As a fact Lady Hamilton and her daughter were left well provided for both by her husband's will and by N.'s but she speedily ran through her £2000 a year.) His last words were: 'Thank God, I have done my duty.' His body was brought home, and, after lying in state at Greenwich, was publicly buried in St. Paul's Cathedral on Jan. 6, 1806. There are many memorials to him, the most notable being the lofty monument in Trafalgar Square, London. He was one of the greatest, if not the greatest, of Brit. naval commanders, and his bravery and skill were beyond all question. The Commons liberally endowed the title, which, as said above, passed to Wm. N., gave £15,000 to each of the sisters, and £200 a year for life to Lady N. upon whom N. had settled £1200 a year when they separated. A N. annuity of £5000 a year was paid by the State from 1806 until 1946, when the gov. introduced a Bill (entitled the Trafalgar Estates Bill) to terminate it on the death of the then

earl or his heir. At the same time the Trafalgar estate was freed from certain statutory restrictions and put in the same position as an ordinary settled estate under the Settled Land Acts. Up to 1946 the State had paid some £700,000 to successive holders of the peerage since the annuity was instituted in 1806.

Bibliography.—There are many biographies. The most popular was for long that by Robert Southey (1813). The voluminous *Life* by Clarke and McArthur (2 vols. 1808) has been the foundation of most later lives, but should be read with considerable reserve on account of the uncritical attitude of the authors; many of its anecdotes are mere sailors' yarns resting on doubtful authority. Numerous of the anecdotes in common circulation are taken from the *Life* (2 vols., 1806) by Harrison, who wrote it at the instance of Lady Hamilton by way of inflating her alleged claims on the bounty of the gov., and the book has been described as little better than a pack of lies. Capt. A. T. Mahan's *Life of Nelson: the Embodiment of the Sea Power of Great Britain* (2nd ed., 1899), is valuable for its handling of naval technique. The prin. authority for N.'s private life is *The Hamilton-Nelson Papers* (2 vols., 1894), which were privately printed; many of these have been used in J. C. Jeaffreson's *Lady Hamilton and Lord Nelson* (2 vols., 1888), and *The Queen of Naples and Lord Nelson* (2 vols., 1889). The best short life is John Knox Laughton's *Nelson* (1905) which contains an excellent historical background. The prin. authorities for N.'s professional life are his dispatches and letters, which were ed. by Sir Nicolas Harris Nicolas (7 vols., 1844-46); James's *Naval History*; the official correspondence of Adm. Hood, St. Vincent, and others (now in the Public Record Office) and E. Chevalier, *Histoire de la marine française sous le Consulat et l'Empire*, 1886. See also G. A. Stephen, *Horatio, Viscount Nelson*—a catalogue of books, pamphlets, articles, and engravings relating to Nelson in the Norwich Public Library, 1915; C. Wilkinson, *Nelson*, 1931; R. Capes, *Poseidon: a Personal Study of Admiral Lord Nelson*, 1947; the authoritative and excellent life by Carola Oman, 1947; and G. Rawson, *Letters from Lord Nelson*, 1949.

Nelson, Thomas, & Sons Limited, Scottish publishing house founded at Edinburgh in 1798 by Thomas N., son of a Shropshire farmer, who first issued eds. of Bunyan and Baxter. The business grew under the direction of his son Thomas, who invented the first rotary printing press. N. also invented a surfaced paper suitable for half-tone blocks. The firm has always specialised in educational and children's books, and their output was greatly increased by the Education Act of 1870. They have also issued cheap eds. of the Eng. classics in various languages. N. is probably the only firm which is directly responsible for every stage in the making of its own books, even growing its own bamboo in Trinidad for pulp, which is converted into paper at the Edinburgh

mills. N.'s earliest premises in Edinburgh at Hope Park, built in 1846, was burned down in 1878 and rebuilt on a larger scale at Parkside. The London premises in Paternoster Row were destroyed in the Ger. raids in Dec. 1940. N. also have houses in Paris and New York. The latter is well known for its issue of the *American Standard Bible*, and loose-leaf encyclopedias of medicine and surgery.

Nelson: 1. Mun. bor. of Lancashire, England; 3½ m. N. of Burnley, granted its Charter of Incorporation in 1890. It is one of Lancashire's prin. cotton tns., the home also of iron foundries, brick yards, confectionery manuf., surgical appliances, and other industries. The council owns the water undertaking, covered market, public library, cemetery, public baths, an open air swimming pool in Marsden Park, civic restaurants, sewage and refuse disposal works, and three recreation parks. Pop. 34,500. 2. Prov. dist. of the S. Is. of New Zealand. There are many mineral deposits awaiting development; dolomite, feldspathic clay, cement, marble, and limestone are produced. The prov., particularly the N. portion, is best known for its fruit, tobacco, and hops. Apples are the main crop with pears next, though peaches, plums, cherries, and small fruits, including raspberries, currants, etc., are produced in abundance. In 1948 the apple and pear crop reached 1,250,000 bushels. There is a large canning factory in Nelson city and a modern state fruit-processing plant in Motueka, which is a centre of the fruit industry about 35 m. from Nelson city. Nelson is the only dist. in New Zealand where tobacco is grown, commercially, and in 1947 more than 4300 ac. were planted and over 5,000,000 pounds of leaf produced. From the Kent hopfields more than a century ago, early settlers brought hop sets which flourished in the dist., where the industry has continued ever since. It is the only dist. in New Zealand in which hops are grown, and from it the commercial needs of the dominion are supplied. The ann. yield is about 3300 bales. Tomatoes, grown mainly in and around Nelson city, have developed into a major industry which is supplying the markets in many centres throughout the dominion. In 1947 the crop value was about £220,000, 22 ac. being grown under glass. Another big industry is that of timber production. The prov. probably has the largest area of standing native bush in New Zealand. Milling of the timber is extensive but reliance is being placed more and more on exotics. Some 50,000 ac. have been planted, mainly in the state plantation, and there are in addition 25,000 ac. of privately owned plantations. Milling of this timber is proceeding. The cap., Nelson city, up to the date of the abolition of prov. gov., was the seat of the Nelson Prov. Parliament. In 1858, by letters patent, Queen Victoria constituted Nelson a bishop's see and ordained that it be a city. Nelson was founded in 1842 as a centre of the Nelson Settlement under the direction of the New Zealand Company, and was the third of the settlements estab.

by Edward Gibbon Wakefield's famous company. Its institutions include one of the oldest secondary schools in the dominion. Nelson College (for boys) was founded in 1856 and has a roll of over 700 of whom nearly 300 are boarders from other parts of New Zealand and even from abroad. Nelson Girls' College, under the same board of governors, has a roll of over 500 of whom nearly 100 are boarders. Another of Nelson's notable institutions is the Cawthron Institute, which is well known throughout New Zealand and the scientific world for its valuable work on soils, mineral deficiencies, and the control of fungus and insect pests. The institute owes its origin to Thomas Cawthron, an old Nelson resident, who left practically the whole of his fortune, amounting to £210,000, for the promotion of scientific research in its application to the primary industries of New Zealand. In its work the institute has the co-operation of the gov. dept. of scientific and industrial research. Nelson is the chief port of the prov., having a good harbour capable of berthing ships 550 ft. long and drawing up to 22 ft. Area of prov. 10,870 sq. m. Pop. 57,200. Pop. of Nelson city, 18,000. 3. Tn. in the S.E. of Brit. Columbia, Canada. It stands on the W. arm of the Kootenay Lake, and is the chief tn. of the silver-mining dist. of W. Kootenay. The tn. was incorporated in 1897, and has fine schools, churches, etc.; smelting is the chief industry; there are saw-mills, marble and veneer works; granite is quarried and jam is manufactured. Nelson is a tourist resort. Pop. 6000.

Nelsonville, vil. and the centre of a coal-mining dist. in Athens co., Ohio, U.S.A. Pop. 5368.

NELEMBIUM: LOTUS

Nelumbium, species of *Lotus* (*g.v.*) which grows in Australia and Asia Minor. The flowers are pink and white, and grow on long stems. The fruit, which is edible, is small and grows in clusters. It is sacred to the Chinese and Indians. To the Egyptians it was symbolic of the Nile, and in India it was believed that the whole universe rested on a lotus blossom. It is a symbol of beauty, purity, the sun, and of life.

Nematodes, Nematoides, Threadworms, or Round-worms, order of unsegmented round-worms with a mouth, a swollen gullet, and a digestive canal running the whole length of the body. They vary in size from *Eustrongylus gigas*, of which the female exceeds a yard in length, to the very minute *Heterodera*s, parasitic on plants and less than $\frac{1}{16}$ of an inch. In some N., notably the Strongyle, which causes 'gapes' in chickens, the male is attached to the female, the whole resembling in form the letter Y. A large proportion of N. are parasitic in animals, including man. *Trichina spiralis* enters the human system from badly cooked pork, and millions of the worms of this species have been found in the body of a man. Many N. are the causes of very heavy losses amongst domesticated animals. Apart from intestinal N., one of the most serious parasites is *Strongylus vicirrus*, which causes verminous bronchitis ('husk' or 'hoose') in calves that are put out during the autumn months on wet pastures. This and many other parasitic worms are checked or eradicated by the presence of salt in the soil. One of the most serious plant parasites is *Heterodera radicleola*, which causes root knot disease in tomatoes and cucumbers. *Ascaris lumbricoides* is a common parasite in pigs and man. See also ANKYLOSTOMIASIS; ASCARIS; FILARIASIS; PARASITES; TRICHINOSIS. See W. York and P. A. Maplestone, *The Nematode Parasites of Vertebrates*, 1926, and B. G. and M. B. Chitwood, *An Introduction to Nematology*, 1937.

Nematus, see SAW-FLIES.

Nemea, anct. name of the valley of Argolis, between Cleone and Philus in the Peloponnesus. In it were celebrated every two years the Nemean games of which Pindar sang in his *Nemean Odes*. According to Gk. mythology, Hercules slew the Nemean lion there. The valley contained a sacred grove and a temple to Zeus.

Nemean Games, one of the four great national festivals of the Gks., held at the beginning of the second and fourth year of each Olympiad at Nemea in Argolis. There were the usual athletic contests, horse-racing, and a competition for players of the cithara; palm branches and crowns of parsley were bestowed on the victors. They were celebrated under the presidency of Cleone, Argos, and Corinth in turn. Many of the victors of the N. G. have been immortalised in the Nemean Odes of Pindar. See E. N. Gardiner, *Greek Athletic Sports and Festivals*, 1910.

Nemecky-Brod, or Deutschbrod, tn. of Czechoslovakia and the cap. of the dist. of that name. It is situated on the R. Sazawa, 60 m. S.E. of Prague. The manufs. are cloths, machinery, and glass. Pop. 9000.

Nemertea, subdivision of unsegmented worms allied to, and by some authorities arranged among, Platyhelminthes, the flat-worms. They are long, ribbon-shaped animals. Most of them are marine, but a few occur in fresh water and a few also on land. It is doubtful whether any are true parasites.

Nemesianus, Marcus Aurelius Olymptus (fl. c. A. D. 280), Rom. poet, b. in Carthage. He wrote poems on hunting, *De Venatione* and *Cynegetica*; on fishing, *Halieutica*; and on aquatics, *Nautica*. See E. Hährens, *Poetae Latini Minores* (vol. iii.), 1881.

Nemesis (Gk. *Nemesis*, distribution, retribution), in anct. Gk. mythology the daughter of Night, and goddess of vengeance and chastisement. She personifies the indignation felt at all disturbance of proportion, punishes arrogance or boastfulness (*hybris*) accompanying extraordinarily good fortune, and brings things once more within normal bounds. She was also called Adrasteia, 'she whom none can escape.'

Nemesius (fl. c. A.D. 390), Christian philosopher, was bishop of Emesa in Syria. Very little is known about the facts and dates of his life. He is chiefly remembered as the author of *ἡ περὶ φύσεως ἀνθρώπου* (On Human Nature), a treatise on anthropology from the Christian standpoint. It was first ed. by Valla (1538), and was trans. into Eng. by George Wither (1636). See Bender, *Untersuch über Nemesius*, 1898.

Nemetodorum, see NANTERRE.

Nemophila, genus of hardy annuals (order Hydrophyllaceae) with blue or white flowers and pinnatifid leaves. *N. insignis* is a brilliant blue with a white centre or eye.

Nemours, Louis Charles Philippe Raphael d'Orléans, Duc de (1813-86), second son of King Louis Philippe. The title of duc de N. was first borne by the Arnauld family, and was revived in Louis Philippe. He was offered, but refused, the throne of Greece (1825) and of Belgium (1831). He fought in the Algerian expedition (1836-1841), and after the revolution of 1848 lived in England till 1870. See R. Bazin, *Le Duc de Nemours*, 1907.

Nemours, tn. in the dept. of Seine-et-Marne, France, 10 m. S. of Fontainebleau. There is a sixteenth-century church and a castle. Pop. 5000.

Nemptodorum, see NANTERRE.

Nen, or Nene, riv. rising in the W. of Northamptonshire, England, and flowing past Northampton and Peterborough into the Wash. Length 90 m. The N. is connected with all the central waterways of England by canal.

Nenagh, mkt. tn. of co. Tipperary, Ire. 11 m. E.N.E. of Killaloe. It has slate quarries and the remains of a Norman keep, called N. Round. Pop. 4517.

Nennius, historian (fl. 796), the traditional author of the *Historia Britonum*, of which there are sev. versions; the chief MSS. are the Cambridge, the Vatican, and the Harleian. He lived on the borders of Mercha, and was a pupil of Elbod, bishop of Bangor. The book commences with a fabulous account of the colonisation of the is. Its chronological blunders and the many other proofs of its want of authenticity render it a very unsafe historical authority. It is chiefly valuable for its stories of King Arthur, Merlin, and other heroes.

Nennius, Saint (fl. sixth century), Irish abbot, one of the 'Twelve Apostles of Ireland.' The details of his life are

unknown, except that he was a disciple of St. Flavian of Clonard.

Neocastro, see NAVARINO.

Neodymium, metallic element, symbol Nd, atomic number 60, atomic weight 144.3. Didymia is one of the oxides known as the gadolinite earths; it was formerly supposed to be the oxide of a metal didymium. Didymium was, however, split up into two components, N, and praseodymium, in 1883. The former gives rise to pink salts and the latter to green.

Neo-Kantianism, or **Neo-Kantism**, is the philosophy of Kant (*q.v.*) as taught and interpreted by his successors. Notable among these in modern times are Meyerson, Helmholtz, Riehl, and Hermann-Cohen. Meyerson approaches philosophy from the direction of natural science, whose aim, he holds, is the discovery of rationality in things, that is, the reduction of differences to an identity which absorbs them all. His work, which may be termed a theory of knowledge, is supported by Einstein, and may briefly be described as a belief in the uniformity of nature and its response to speculative inquiry. Helmholtz, with whom may be mentioned Hannequin, declares that the principle of causality is nothing else than the supposition that all phenomena of nature are subject to law, that the cause of a phenomenon is therefore the law, though he later modified the somewhat dogmatic statement by an acknowledgment that he has followed Kant too closely, maintaining finally that the principle of causality was only a hypothesis of the reign of law in all phenomena. See his treatise *Über die Erhaltung der Kraft* (1847). Colding, the Dan. physicist, a year after Meyerson's first treatise, brought forward an independent proof of the axiom of the conservation of energy and confirmed it experimentally; he also assumed it to be a law of reason. It is in connection with present-day ventures into psychological study that a revival of interest in Kant's theories has most extensively occurred; and in the confusion which many thinkers to-day experience between psychology and theory of knowledge, Kant's clear doctrines propounded in his *Critique of Pure Reason* serve to dispel the difficulty of demarcation. He definitely stated that the *Critique of Pure Reason* was not to be regarded as an inquiry into psychological phenomena, but rather as a study of the criticism and possibilities of experience. See H. Helmholtz, *Wissenschaftliche Abhandlungen*, 1882, and *Verträge*, 1896; L. Rouvier, *Philosophy and the New Physics*, 1922; H. Höffding, *History of Modern Philosophy*, 1921; E. Meyerson, *Identity and Reality*, 1930.

Neolithic, see STONE AGE.

Neon, chemical element, symbol Ne, atomic number 10, atomic weight 20.2. N. is one of the constituents of the atmosphere, of which it forms about 1 part in 100,000 by volume. It was discovered in 1898 by Sir W. Ramsay and Prof. M. W. Travers. N. is used in gas-filled electric lamps, and for advertisement purposes in electric discharge tubes, in which a variety of shapes and colours is possible. N.

discharge tubes are also used in aerodrome beacons, because of the fog-penetrating powers of the light they produce. Chemically N. is completely inert; it forms a member of the group of inactive gases.

Claudgen

NEON LIGHTING

An installation in which 3000 ft. of tubing are employed. The vertical name sign is in 2-ft. letters illuminated by ruby red tubing.

Neophyte (Lat. *neophytus*, from Gk. *neophytos*, newly planted), name given by the primitive Church to the new Christians, that is, to the pagans who had newly embraced Christianity and had been baptised. The term is still used by Rom. Catholic missionaries to denote a convert from heathenism. In general language, newly entered upon, e.g. Ben Jonson's "neophyte player".

Neoplatonists, name given to an illustrious succession of ancient philosophers who claimed to found their doctrines and speculations on those of Plato. It is not easy to say with whom Neoplatonism commenced. Scholars differ as to how much should be included under that term. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy, first, of Philo Judaeus and of Numenius the Syrian; second, of the Christian Fathers (Clement Alexandrinus, Origen, etc.); third, of the Gnostics; and fourth, of Ammonius Saccas and his successors. Others, again, would exclude the second of these (though the Alexandrian divines frequently Platonise), while a third party is disposed to restrict the application of the term to the fourth. The last of these modes of regarding Neo-

platonism is the one most current. A fresh stream of life was first poured into the old channels of Platonic speculation by Ammonius Saccas and Plotinus, and it is this fact which gives the school which they estab. its best claim to the exclusive title of *Neoplatonist*. The essence of all the Alexandrian speculations consists in the blending of Platonic ideas with oriental mysticism; the peculiarity of the N., strictly so called, lies simply in the novelty, audacity, and ingenuity of their reasonings. They aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the Highest by assuming the existence of a capacity in man for passing beyond the limits of his personality and acquiring an intuitive knowledge of the absolute, the true—that which is beyond and above the fluctuations and dubieties of 'opinion.' This impersonal faculty is called *Ecstasy*. Plotinus, in fact, set out from the belief that 'philosophy' (i.e. 'Absolute Truth') is possible only through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. The God of Plotinus and the other Alexandrians is a mystical Trinity. The Divine Nature contains within it three *Hypostases* (Substances); its basis, if we may so speak, is called Unity, also poetically Primitive Light. From 'Unity,' as the primordial source of all things, emanates 'Pure Intelligence' (*Nous*); its reflection and image, that by which it is intuitively apprehended; from Pure Intelligence, in turn, emanates the 'Soul of the World' (*Psyche tou panτος*), whose creative activity produces the souls of men and animals and 'Nature'; and finally, from Nature proceeds 'Matter,' which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness. Unity, Pure Intelligence, and the World-Soul thus constitute the Plotinian Triad. Other Neoplatonic philosophers were Porphyrius, Iamblichus, Eudæsius, and Proclus.

Bibliography.—A. Richter, *Neoplatonische Studien*, 1864-67; C. Bigg, *The Christian Platonists*, 1886; and *Neoplatonism*, 1895; A. Drews, *Plotin*, 1907; T. Whittaker, *The Neo-Platonists*, 1921; W. H. Inge, *The Philosophy of Plotinus*, 1923; N. A. Robb, *Neoplatonism of the Italian Renaissance*, 1935; and R. E. Witt, *Athanasius and the History of Middle Platonism*, 1937.

Neoprene, form of synthetic rubber produced in America, the first to be commercially successful. It is obtained from butyl chloride, and may be vulcanised with zinc oxide.

Neoptolemus, in anct. Gk. legend, the son of Achilles and Deidamia, also called Pyrrhus. At the death of his father he was taken by Ulysses to Troy, and was one of the Gk. heroes who entered Troy in the wooden horse. At the fall of Troy he slew the aged Priam. On the distribution of captives Andromache, widow of Hector, was given to N. Ultimately he wedded Hermione, daughter of Menelaus, who had been previously betrothed to Orestes, and was slain by the latter.

Neosho: 1. Co. seat of Newton co., Missouri, U.S.A., in the centre of a zinc and lead-mining dist. Pop. 5300. 2. Riv. rising in Morris co., Kansas, U.S.A., and flowing through Indian ter. into the Arkansas R., near Fort Gibson. Length 400 m.

Neottia, Nidus-Avis, see *ORCHIDS*.

N.E.P., Russian contraction for Novaya Ekonomicheskaya Politika (New Economic Policy), the policy adopted by the Soviet Union following the civil war, in 1922, with a view to promoting the recovery of production and trade. It admitted a certain amount of private initiative and profit; private enterprise, domestic and foreign, was encouraged in commerce and in minor industries. The N.E.P. was liquidated in 1927 and succeeded by strictly Socialist five-year plan policy. See further under *RUSSIA, Economic System and History*.

Nepal, independent native kingdom on the N.E. frontier India, comprises a portion of the S. slope of the Himalayas; it is bounded on the N. by Tibet, on the S. and W. by the United Provs. and Bihar, India, and on the E. by Sikkim and Bengal. The state is separated from the plains of India by the long, narrow strip of land, resembling an Eng. down, but unhealthy, called the Terai, which extends along the whole S. border. N. of this, and running parallel with it, is the great forest of Nepal, from 8 to 10 m. broad, abounding in wild animals. Still further N. is a tract of hilly country, and above that are two tracts of greater elevation, which include among their peaks Mt. Everest (29,141 ft.), Dhaulagiri (26,286 ft.), and Makalu (27,800 ft.). The prin. rivs. are the Kurnali, the Rapti, the Gunduk with its great tribs., and the Sun Kosi. The climate, most unhealthy in the Terai, is healthy and pleasant in the hilly and mountainous dists., suggesting that of S. Europe. The soil is extremely rich and fruitful. Barley, millet, rice, maize, wheat, cotton, tobacco, sugar-cane, pineapple, vegetables, and various tropical fruits are cultivated in the higher areas, whilst rhododendrons flourish between 8000 and 9000 ft. Gold, silver, lead, iron and copper mines are worked. Exports include cattle, hides, opium and other drugs, jute, dyes, rice, glue (clarified butter), oil-seeds, spices, sulphur, and timber. The Gbarkas (Gurkhas or Nepalese) are divided into numerous tribes, the largest being Magars, Gurungs, Newars, and Bhutias (Bhotias), the aboriginal stock being Mongolian. Hinduism is the predominant religion. Since the treaty of Sagauli (1815) Brit. relations with Nepal have been friendly. Hostilities between Nepal and Tibet broke out in 1851 and ended in a treaty in 1856 under which Tibet paid an ann. tribute and promoted trade relations with Nepal. The cap. is Khatmandu (q.v.) (pop. 108,800). The state is administered by the maharajah and his Prime Minister, and there is a Brit. president at the cap. A new treaty of friendship was signed in 1923, but the policy of seclusion is still consistently adhered to by Nepalese rulers. The real political power rests

with the Prime Minister, who is always a member of the ruling family (Hindu Rajputs). In 1934 the status of the Brit. representative was raised to minister plenipotentiary and a Nepalese representative of equivalent rank was accredited to London. In the First and Second World Wars Nepal gave unstinted aid to the Brit. Gov. in men, money, and material. Since 1920 the gov. has constructed a good carriage road from Amlekhajung to Bhimphedi, and a railway was opened in 1927, connecting Amlekhajung with the Brit. and N.W. Railway at Raxaul (25 m.). Nepal is of great archaeological interest, being connected with the life of Buddha. Area 51,000 sq. m. Pop. 6,282,000. See Col. W. Kirkpatrick, *Account of the Kingdom of Nepal*, 1811; W. Hamilton, *An Account of the Kingdom of Nepal*, 1819; B. Hodgson, *Essays on the Languages, Literature, and Religion of Nepal and Tibet*, 1874; Sir H. B. Edwards, *Life of Sir Henry Lawrence* (Brit. resident at Nepal), 1875; *History of Nepal* (trans. by Wright), 1877; H. A. Oldfield, *Sketches from Nepal*, 1880; C. Bendall, *A Journey in Nepal and Northern India*, 1886; F. Brown, *Picturesque Nepal*, 1912; F. Landon, *Nepal*, 1928; W. B. Northey, *The Gurkhas: Manners and Customs*, 1928, and *The Land of the Gurkhas*, 1937; H. Davis, *Nepal, Land of Mystery*, 1942; and S. Cutting, *The Fire Ox and Other Years*, 1947.

Nepenthes, genus—the only one of the order Nepenthaceae—of remarkable shrubby plants with small green or brown flowers, borne in long racemes, and with leaves dilated at the ends into pitcher-shaped appendages with a lid-like lamina. The broad, strap-shaped portion of the plant, which resembles a leaf blade, is the wing petiole or leaf-stalk. The size of the pitcher varies from that of a thumb to about 20 in. in length, with a capacity of about two quarts. The pitchers act as traps for insects and larger animals, attracted both by the bright colours of the pitchers and by a honey-like secretion round the entrance. Their function is to provide nitrogenous food for the plant. About thirty species are known, mostly natives of tropical Asia and the Malay Is. The culture of *N.* is easy if abundance of moisture and a tropical temp. can be provided. The pitchers must be kept partly full of water. The roots should be set in well-drained baskets containing peat fibre and sphagnum.

Nepheline, rock-forming mineral whose formula is $\text{Na}_2\text{KAl}_2\text{Si}_2\text{O}_{10}$. Its crystals are transparent, have a hardness of 5½, and sp. gr. 2.6. Two varieties of the mineral are found: glassy *N.*, in small, transparent crystals occurring in late volcanic rocks, and alcolite, large crystals or massive with varying colours owing to the presence of other minerals. When of a good colour, examples of alcolite are cut as gems.

Nepheline Syenite, rock of plutonic origin containing essentially alkali-feldspar and nepheline, together with other accessory minerals. The nepheline often

assumes the form of alcolite. The feldspar is often rich in both soda and potash, whilst the alcolite is often found in large colourless crystals. Sodaite often accompanies it. The only important *N. S.* found in Great Britain occurs in parts of Sutherland. It contains nepheline, feldspar, and smaller amounts of green biotite, as well as some black garnet. A second type of *N. S.* is to be found in the S. of Norway. It gives rise to the Lardal type, in which nepheline, alkali feldspars, brown mica, augite or aegirine, apatite, and sometimes olivine are present. Other localities where *N. S.* is found are Portugal, Arkansas, Brazil, Montreal, etc.

Nephelium, genus of Sapindaceae. They have generally pinnate leaves, flowers in panicles, and round or ovate warted or prickly fruit. *N. litchi* is the Litchi; *N. longanum*, the Longan; and *N. lappaceum*, the Rambutan.

Nephrite, also known as Jade (*q.v.*) or Axiestone, is a hard mineral (hardness 7 and sp. gr. 3), massive, compact, very tough, and without any cleavage. In colour it varies from white to bluish-green, and may be blotched or veined. It is sometimes translucent, and is greasy to the touch. In composition it is a silicate of magnesia and lime, although some alumina and oxide of iron are often present. The composition is very variable, and some mineralogists regard it as a massive form of tremolite. It is found in granite, gneiss, greenstone, etc. It was confused with jadeite until Damour (1863) showed that jadeite was silicate of alumina and lithia, which is fusible, whereas *N.* is infusible. *N.* takes a beautiful polish, and is highly prized for ornaments, especially the bright green varieties. The Turks made it into handles for sabres. Many imaginary virtues have been ascribed to it. Thus people once wore it as a charm against epileptic fits and nephritic (Gk. νεφρός, the kidney) ailments; hence its name. The principal sources of the mineral at the present day are New Zealand, China, N.W. America, Corsica, and Egypt.

Nephritis, inflammation of the kidneys. There are many forms of kidney inflammation, due to a wide variety of causes. In most cases poisonous substances are brought to the kidney by the bloodstream, so that kidney disease is a frequent complication of such diseases as gout, typhoid and scarlet fevers, tuberculosis, etc. In chronic interstitial *N.* or granular kidney, the muscular coat undergoes fibroid and hypertrophic changes, and becomes uneven in surface. There is a marked increase of connective tissue about the tubules and glomerules. The symptoms, as of *N.* generally, are anaemia, weakness, digestive disturbances, and bloody urine. Acute Bright's disease is characterised by enlarged and congested kidneys. Many tubules contain casts, and these are thrown off in the urine, giving a characteristic indication. The symptoms are fever, lumbar pains, dropsy with albumin, blood, epithelial cells, and casts in the urine. See also under HORSE (DISEASES).

Nephrodium, see **MALF FERN**.

Nepigon Lake, see **NIPIGON**.

Nepomuk, or **Pomuk**, John of, patron saint of Bohemia, see **JOHN**, St.

Nepos, Cornelius, contemporary and friend of Cicero, Atticus, and Catullus. N. wrote historical works, and there is extant under his name a work entitled *Vite excellentium imperatorum*. But in all MSS. this work is ascribed to Æmilius Probus, with the exception of the lives of Atticus and Cato the Censor, which are attributed to N. It is probable that Probus abridged the work of N., and that the biographies, as they now exist, are epitomes of lives actually written by N.

Nepos, Flavius Julius (d. 480), last but one of the emperors of the W., b. in Dalmatia. He was the nephew of Marcellinus and the son-in-law of Leo I., emperor of the E., who proclaimed N. emperor of the W. in 474. He crushed his rival Glycerius and made peace with the Visigoths by ceding to them the Gallic prov. of Auvergne. He was driven out of Italy by Orestes, but retained his power in Dalmatia until his murder in 480 at Salona.

Neptune, see **POSEIDON**.

Neptune. The discovery of N. is the most triumphant record of mathematical astronomy. Adams of Cambridge (1845) and Leverrier of Paris (1846) both determined its position from no other data than certain perturbations of Uranus. Galle, instructed by Leverrier, found the planet on Sept. 23 1846, within half an hour. The magnitude lies between 8 and 9, and it is invisible to the naked eye, though visible through a good opera glass as a greenish disk; apparent at mean opposition diameter, 2.52, real diameter, 33,000 m., but uncertain; vol., seventy-two times that of the earth, its mass seventeen times; density, 0.24. The mean distance does not follow Bode's law, being 2,796,600,000 m. from the sun; the orbit has an eccentricity of 0.0086, the least with the exception of Venus, making a difference of solar distance of 48,000,000 m. Inclination of orbit, 1 $^{\circ}$; revolution completed in 164 years at a velocity of about 3 $\frac{1}{2}$ m. per sec., rotation not yet determined, though probably 16 hrs. The spectrum, the light being feeble, is difficult to determine, and indicates the presence of a dense atmosphere similar to that of Uranus; a dark band in the red was identified in 1932 by Dunham as due to methane. *Satellites*: (1) Triton, discovered by Lassell in 1846; distance 223,000 m.; period 5 days 21 hrs. 2.7 min.; orbital inclination, 34 $^{\circ}$ 53', moving backwards like those of Uranus. (2) Nereid, discovered May 1, 1949, by Kuiper at the McDonald Observatory, Fort Davis, Texas. Distance from N. 5,000,000 m., diameter 200 m.; period, about 2 years; moving backwards close to plane of ecliptic.

Nerbudda, see **NARRADA**.

Nerchinsk, or **Nertchinsk**, tn. in the Chita Region of the R.S.F.S.R. on the Nercha R., 135 m. E. of Chita. Pop. 10,000.

Nerchinski Zavod, tn. and mining dist. in the Chita Region of the R.S.F.S.R.,

184 m. S.E. of Nerchinsk. It has a meteorological observatory and is the centre of a mining area. Pop. 3000.

Nereids, in Gk. mythology, the nymphs of the sea, the daughters of Nereus and Doris. The most famous of them were Amphitrite, the wife of Poseidon, Thetis, the mother of Achilles, and Galatea. The N. were the marine nymphs of the Mediterranean, in contradistinction to the Naiades, the nymphs of fresh water, and the Oceanides, the nymphs of the great ocean. See also **NYMPHS**.

Neretva (formerly **Naro**, or **Narenta**), one of the few considerable rvs. flowing into the Adriatic. It belongs mainly to Herzegovina, which state is wholly bisected by the riv. The valley of the N. and its tribs. forms the main artery of the state. Mostar (q.v.) is situated on it. A good highway follows the riv. bank from the Dalmatian frontier to the Bosnian. The riv. discharges between the peninsula of Sabioncello and the mainland and forms a large marsh.

Nereus, in Gk. mythology, a god of the sea, the son of Pontus and Gaia. He married the Oceanide, Doris, by whom he became father of the Nereids. He had the gift of prophecy and the power to change his form at will. He is generally represented as a calm and gentle old man bearing a trident.

Nergal, Assyrian god of hunting, was also identified with the planet Mars. This god was represented in sculpture as a winged lion with a human head.

Neri, Philip (1515-95), saint of the Rom. Catholic Church, b. in Florence. In 1550, with sev. of his friends, he estab. a confraternity for the care of poor pilgrims visiting Rome, as well as of the sick generally, which has numbered among its associates many of the most distinguished members of the Rom. Catholic Church. This confraternity was the germ of the more celebrated Congregation of the Oratory, which was founded by St. Philip in concert with his friends Baronius and Turigio, both afterwards cardinals, Sabrinetti, and some others. The main object of this association was the moral instruction and religious training of the young and uneducated. Sacred musical entertainments (thence called by the name of *oratorio*) were held in the oratory. He was canonised by Gregory XV. in 1622. His best-known church in Britain is that at Arundel, Sussex, completed in 1876 in early Gothic style by the fifteenth duke of Norfolk. See life by P. J. Bacci, 1622 (Eng. trans., 1902); and L. Pennelle and L. Bordet, *Saint Philip Neri and the Roman Society*, Eng. trans. 1932.

Neris-les-Bains, see **MONTLUÇON**.

Nero (A.D. 37-68), Rom. emperor, b. at Antium, the son of Cn. Domitius Ahenobarbus and of Agrippina, the daughter of Germanicus Caesar. His mother becoming the wife of the Emperor Claudius, Claudius adopted him (A.D. 50), and his name, originally L. Domitius Ahenobarbus, was changed to N. Claudius Caesar Drusus Germanicus. After the death of Claudius (A.D. 54) the Pretorian Guards, at the instigation of Atrianus Burrus, their

prefect, declared him emperor, instead of Claudius's son Britannicus. His reign began with the semblance of moderation and good promise, under the guidance of Burrhus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be treacherously poisoned at the age of fourteen, and afterwards (A.D. 59) caused his own mother, Agrippina, to be assassinated, to please his

NERO
Vatican, Rome

mistress, Poppaea Sabina (the wife of his prin. boon-companion, Otho, afterwards emperor), in order to marry whom he also divorced and afterwards put to death his wife Octavia, the sister of Britannicus. The low scrology into which the Rom. senate had sunk at this time may be estimated from the fact that it actually issued an address congratulating the hateful matricide on the death of Agrippina. The affairs of the empire were at this time far from tranquil. In A.D. 61 an insurrection broke out in Britain under Queen Boadicea, which was, however, suppressed by Suetonius Paulinus. At home matters were not much better. The emperor was lampooned in verse; the senate and priesthood, alike venal, were also satirised by audacious malcontents. Burrhus, a valuable friend, *d.*; and even Seneca, though not a great moralist, out of his books, thought it only decent to remove from court. In July 64 occurred a great conflagration in Rome, by which two-thirds of the city was reduced to ashes. N. himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance reciting verses about the burning of Troy, but many scholars doubt whether he

really had any hand in it. At all events, he laid the blame on the Christians, and persecuted them with great fury. He rebuilt the city with great magnificence, and reared for himself on the Palatine Hill a splendid palace, called, from the immense profusion of its golden ornaments, the *Aurea Domus*; and in order to provide for this expenditure, and for the gratification of the Rom. populace by spectacles and distributions of corn, Italy and the provs. were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppaea by kicking her when she was pregnant. He then proposed to Antonia, the daughter of Claudius, but was refused, whereupon he caused the too fastidious lady to be put to death, and married Statilia Messalina, after killing her husband. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer, and he received sycophantic applause, not only in Italy, but in Greece, to which, upon invitation of the Grk. cities, he made a visit in 67. But in 68 the Gallic and Sp. legions, and after them the Praetorian Guards, rose against him to make Galba emperor, and N. fled from Rome to the house of a freedman, Phaon, about 4 m. distant. The senate, which had hitherto been most subservient, declared him an enemy of his country, and the tyrant ended his life by suicide on June 9, 68. See G. Ferrero, *Characters and Events of Roman History* (ch. IV.), 1909; and lives by B. W. Henderson, 1903; A. Weizsäcker, 1930; and G. Wartenberg, 1947.

Nero, Gnaeus Claudius, Rom. general who was consul in 207 B.C. In that year he intercepted Hasdrubal, who was crossing from Spain to Italy with reinforcements for Hannibal, and severely defeated him at the battle of the Metaurus. Over 50,000 Carthaginians perished, and amongst them Hasdrubal himself. N. was censor sev. years later.

Nero, Tiberius Claudius, Rom. soldier, served as questor under Caesar in 47 B.C., was on the side of Brutus after the latter's death, but was later reconciled to Octavian. He is principally known as the husband of Livia Drusilla, and father of her two sons Drusus and Tiberius, the latter of whom became emperor. In 38 Octavius divorced his wife, Scribonia, and married Livia, who had obtained a divorce from N.

Neroli, Oil of, see ORANGE.

Nertchinsk, see NERCHINSK.

Nerthus, see HERTHA.

Neruda, Madame, see HALLÉ, LADY.

Nerva, Marcus Cocceius (c. A.D. 35-98), Rom. emperor for scarcely two years. He had previously served the Rom. state as praetor, then as consul. He was appointed emperor upon the death of Domitian in 96, but his honours sat heavily on him, and he gladly reigned jointly with Trajan until his death.

Nerval, Gérard de (1808-55), adopted name of Gérard Labrunie, a Fr. man of letters. In 1828 he pub. a trans. of

Goethe's *Faust*, and later on he collaborated with Théophile Gautier. He was a great traveller, and narrated his adventures in the *Itinéraire des deux mondes*. His most interesting literary contribution is his *Aurélien, ou le rêve et la vie* (1853), a record of his own insanity, and perhaps his best work is his collection of stories, *Contes et facéties* (1852). See R. Bizet, *La Double Vie de Gérard de Nerval*, 1928, and K. Haedens, *Gérard de Nerval, ou la supposée romantique*, 1939.

Nerves, see NERVOUS SYSTEM.

Nervi, in, and seaside resort in the prov. of Genoa, Italy, 6 m. S.E. of Genoa. Pop. 9000.

Nervous System, that part of the mechanism of the body whose special function is the co-ordination and control of the activities of the organs. The system is composed of nerve-cells or neurons, which are linked together and capable of sending impulses from one to the other. In other words, the nerve-cell has a life or metabolic existence of its own, which is modified in a particular manner by certain stimuli received from outside itself, and which modifies the metabolism of an adjacent nerve-cell or certain other cells, such as those of muscle. In this way impulses are conveyed from the exterior to centres within the body, and from such centres to other centres or to other tissues. The effects of what may be called nerve-currents are divisible into three classes: those changes which involve movements in certain structures, as the contraction of a muscle; those changes which involve modifications in consciousness, as a special or general sensation; and those changes which are merely chemical, that is, which stimulate the production of certain substances, as in the various secretory organs. The different nerves are responsive to different stimuli, and each nerve transmits its impulse in one direction only. The latter property has given rise to the distinction between efferent and afferent nerves: those that conduct impulses outwards from a nervous centre, and those that conduct impulses towards the centre. The chief kinds of efferent nerves are: (1) Motor nerves, which convey currents to voluntary or involuntary muscles and excite them to contract; (2) accelerator nerves, which produce an increase in the rate of rhythmical action, such as those which make the heart beat at a greater speed; (3) inhibitory nerves, those which retard the rate of rhythmical motion, or stop it altogether; and (4) secretory nerves, those which cause secretion to flow out from the various glands. The chief kinds of afferent nerves are: (1) Those which convey impulses to the central system and there give rise to impulses to be carried away by efferent nerves, as in reflex action; (2) those which convey impulses giving rise to the special sensations of sight, hearing, etc.; (3) those which convey general or non-localised sensations; and (4) those which give rise to the experience of pain. The N. S. is also to be classified according to the anatomical disposition of the nerves and nervous

organs. The most convenient classification involves three divs.: the central N. S., the peripheral N. S., and the sympathetic nerves. These divs. are somewhat arbitrary, but are sanctioned by custom and convenience. The central N. S. consists of the brain and spinal cord. The peripheral system consists of the cranial nerves, the spinal nerves, the sense organs, e.g. the eye and ear, and the motor end-plates. The sympathetic system consists of the ganglia situated on either side of the spinal column, with their connections. Before describing these systems in detail the properties of nerve-substance in general must be discussed.

Nervous Tissue is of three kinds: nerve-cells, nerve-fibres, and neuroglia, or connecting tissue. Nerve-cells vary greatly in form and size. The form of cell which makes up the brain and spinal cord consists of a protoplasmic nucleated body, from which arise certain processes. One process is known as the axis cylinder process or axon, and the others are collectively called the dendrites. The axon possesses a uniform diameter and throws off collateral branches without diminishing in section, the dendrites divide into numerous branches, which taper off as they pass from the cell-body. The axon appears to be the structure by which communication is made between cell and cell, and it is an essential part, not only of a nerve cell, but of a nerve-fibre. In some fibres the thread-like axon becomes sheathed with a substance called myelin; it is then called a medullated fibre; if the sheath is absent, it is called a non-medullated fibre. Whether medullated or not, the fibre may possess a thin sheath called the primitive sheath or neurilemma, placed externally to the myelin if the fibre is medullated. The part of the brain and cord which contains nerve-cells is called grey matter, while the white matter of the brain and cord is made up of medullated fibres without a primitive sheath. The nerve-fibres which proceed to the various parts of the body are bound up in bundles which we call nerves.

Central Nervous System.—The central or cerebro-spinal system consists of the brain and the spinal cord, both of which are elsewhere described. The most important part of the brain is the cortex, which is made up of grey matter. There are subsidiary masses of grey matter in the interior of the brain, in the cerebellum, and in the spinal cord. It is in this grey matter that voluntary action arises, and to it are also brought the impulses which give rise to sensation. The subsidiary masses of grey matter are concerned with involuntary and reflex actions, while the white matter may be looked upon as a communicating medium only.

Cranial Nerves.—These nerves are concerned mainly with the supply of the head. There are twelve pairs of them, and they are spoken of by their numbers as well as their names: (1) The *Olfactory* nerve is purely sensory; it comes from the nose and proceeds to the cerebrum; it is the nerve of smell. (2) The *Optic* nerve is purely sensory; it enters the eyeball at the rear

and connects with the cerebrum by way of subsidiary masses of grey matter called the *corpora quadrigemina* and *corpora geniculata*. (3) The *Oculomotor* nerve is purely muscular, and supplies most of the muscles of the eye. (4) The *Trochlear* nerve is muscular, and supplies the superior oblique muscle of the eye. (5) The *Trigeminal* nerve is mainly sensory. It divides into three main branches for the upper, middle, and lower portions of the head and face region. It has a smaller motor branch for the muscles of mastication. (6) The *Abducens* nerve is motor and supplies the external rectus muscle of the eye. (7) The *Facial* nerve is a motor nerve, supplying the facial muscles. Injury to this nerve causes the loss of all power of facial movement and expression. (8) The *Auditory* nerve is divided into two parts: the *cochlear* nerve, which is the true nerve of hearing, and the *vestibular* nerve, which connects with the semicircular canals and conveys those impulses which enable the body to be kept in equilibrium. (9) The *Glossopharyngeal* nerve is mixed sensory and motor. Certain muscles of the pharynx are impelled to action by it, while other fibres are concerned in sense of taste. (10) The *Vagus* or the *Pneumogastric* nerve has varied functions; it contains fibres which convey motor impulses to the stomach and intestines, afferent impulses from the lungs, etc. (11) The *Spinal Accessory* nerve contains motor fibres for the larynx and some inhibitory fibres for the heart; it also supplies a few muscles in the neck and back. (12) The *Hypoglossal* nerve is the motor nerve for the tongue muscles.

The *Spinal* nerves arise from the spinal cord and run out through holes between the vertebrae to supply the trunk and limbs, though some of the upper ones are concerned with the head and face. The div. into spinal and cranial nerves is arbitrary and not real. There are thirty-one pairs of spinal nerves, whose names depend on the part of the spinal column from which they pass. Thus there are eight cervical, twelve dorsal, or thoracic, five lumbar, five sacral, and one coccygeal. Each spinal nerve is a mixed nerve, containing both motor and sensory fibres. As they emerge from the spinal cord, the motor and sensory bundles are separated. The sensory fibres come from the back of the spinal cord; their point of emergence is called the posterior root, and a spinal ganglion is situated at that point, consisting of a collection of nerve-cells which have two axis-cylinders proceeding from them, by which the cells communicate in one direction with the skin, and in the other with the spinal cord or brain. The motor fibres sprout from the grey matter of the spinal cord, and proceed by way of the anterior roots to the mixed nerves, and thence to their destination in the end-plates of the voluntary muscles.

Sympathetic System.—Some of the anterior root fibres pass to a chain of ganglia running down on each side of the vertebral column and called the sympathetic chain. These ganglia consist of nerve-cells, and the fibres from the an-

terior roots branch round these cells and stimulate them to send out impulses by their own axis-cylinder processes to the involuntary muscles. The medullated fibres which carry the impulses from the spinal cord to the ganglia are termed pre-ganglionic; those which start from the ganglia are non-medullated and are called post-ganglionic. The impulses which affect the involuntary muscles must not be understood to originate in the ganglia. The ganglia serve as redistributing stations, where an impulse received from one afferent fibre may be communicated to a number of cells in the ganglion which convey by their own axis cylinders the impulses to the various involuntary muscles. Among muscles served are those which effect the peristaltic movements of the alimentary tract, those which constrict the arteries and regulate the circulation, including the muscles of the heart to some degree, the unstriped muscles of the lungs and windpipe, those which control the size of the pupil of the eye-ball, those connected with the sweat glands of the skin, etc.

See Sir C. Sherrington, *Integrative Action of the Nervous System*, 1908, 1947; F. Tilney and H. A. Hiley, *Form and Functions of the Central Nervous System*, 1920, new ed. 1938; C. U. A. Kappers, *Evolution of the Nervous System in Invertebrates, Vertebrates, and Man*, 1929 21; K. E. Hower and G. M. Sanders, *Introduction to the Study of the Nervous System*, 1923; K. D. Adrian, *The Basis of Sensation*, 1928; J. W. Papez, *Comparative Neurology*, 1929; V. M. Bekhterev, *General Principles of Human Reflexology*, 1933; and A. Kuntz, *The Automatic Nervous System*, 1934.

Nesfield, William Eden (1835-88), Eng. architect, b. at Bath. He led the Gothic revival, and his book, *Sketches from France and Italy* (1862), is a text-book on the subject. He designed Kimmel Park, Cloverly Hall, Loughton Hall, and Westcombe Park.

Ness (Eng. *nose*, A.-S. *næss*, Ger. *nase*, Icelandic *nes*, Lat. *nasus*, Fr. *nez*), geographical termination, signifying promontory. Names in -ness abound among the Orkney and Shetland Is., and on the coast of Caithness; and along the E. coast of Great Britain as far as Dungeness in Kent. As the corresponding termination -ness prevails in Scandinavia, the existence of names in -ness in Britain is held as an evidence of Scandinavian colonisation.

Ness, Loch, long, narrow lake in Inverness-shire, Scotland, extends N.E. and S.W., and is 23 m. in length and 1½ m. in average breadth. It receives the Morriston, the Oich, the Foyers, and other streams, and its surplus water is carried off to the Moray Firth by the H. N. In many places it is 130 fathoms in depth. In 1934 there was much controversy over the reported appearances of a supposititious 'monster' in the loch. The Linnæan Society with a telephoto lens took a film of the 'creature' at a distance of 1 m. The general opinion was that it

was a seal; others believed it to be a shoal of otters.

Nesselrode, Karl Robert Vassilevich, Count (1780-1862), Russian statesman, b. at Lisbon, of Ger. descent. He took an active part in the negotiations for the peace of Tilsit in the Napoleonic campaign and acted as intermediary between Alexander I. and Talleyrand, always maintaining a policy of moderation. At one time he was attached to the Russian embassy in Paris. He was a member of the Congress of Vienna (1814-15), Russian minister of foreign affairs (1816), vice-chancellor (1829), and chancellor (1844). After signing the peace of Paris at the close of the Crimean war (1856) he retired.

could be truly called the 'Mother of God,' being in truth only the mother of the man Christ. N. warmly defended Anastasius, espoused this view, and elaborated it into the theory which has since been known by his name and which in practice exaggerated the distinction of two natures in our Lord into a distinction of two persons—the human person of Christ and the Divine Person of the Word. An animated controversy ensued, which drew from Cyril, patriarch of Alexandria, a formal condemnation of the doctrine of N. in twelve anathemas still preserved, and a similar condemnation, accompanied by a threat of deposition and excommunication, from Celestine, bishop of Rome. N.

LOCH NESS AT FORT AUGUSTUS

British Railway.

In the background is the Glengarry Forest, with the peak of Sron a Choire Ghaibh (3066 ft.), in the middle distance is the Caledonian Canal (River Quich).

Nessus, see **HERCULES**.

Neston, dist. of Cheshire, England, part of the urb. dist. of N. and Parkgate, 12 m. from Chester, on the London Midland Region railway. It stands on the estuary of the Dee and is a coal-mining area. Pop. (with Parkgate) 7000.

Nestor, in Gk. legend, was the son of Neleus, king of Pylos, the husband of Eurydice, and father of Perseus. When his father's kingdom was invaded by Hercules he alone of his brothers was spared. He fought against the Arcadians, Eleans, and Centaurs and took part in the siege of Troy. In his old age he was renowned for his wisdom.

Nestorian Church, see under **NESTORIUS**.

Nestorius (d. c. A.D. 450), native of Germanicia, a city of N. Syria, in the patriarchate of Antioch, was probably a disciple of the celebrated Theodore of Mopsuestia. Having received priest's orders at Antioch, he was selected by the emperor, in A.D. 428, as patriarch of Constantinople. Soon after his consecration, a controversy arose as to the divine and human natures of our Lord. One of the priests who followed N. to Constantinople, Anastasius, having in a sermon, which was by some ascribed to N. himself, denied that the Virgin Mary

remaining firm in his opinions, a general council was convened at Ephesus in 431, at which Cyril took the most active and prominent part, and at which, notwithstanding the absence of the patriarch of Antioch and his bishops, N. was condemned and deposed. Considerable opposition was offered to this, but ultimately N. was confined in a monastery near Constantinople, whence, after four years, he was banished to the Greater Oasis in Upper Egypt, and after several changes in his place of confinement, d. in exile. Nestorian communities, now called Chaldeans, still exist in Iraq, Syria, Persia, Russia, and America. See G. P. Badger, *Nestorians and their Rituals*, 1852; F. Nau, *L'Expansion nestorienne en Asie*, 1911; J. Stewart, *Nestorian Missionary Enterprise*, 1928; and P. Y. Saeki, *The Nestorian Monument in China*, 1928.

Nests, in natural hist., are the places chosen or constructed by birds or any other animal for incubation, hibernation, or general residence. They vary enormously, from mere saucer-like hollows in the ground to some of the most elaborate and beautiful structures found in nature. They originated primarily in the desire for concealment and protection, and birds that are content with slight depressions

in the ground, such as terns and plovers, lay eggs which so closely resemble the ground that they generally escape detection. A decided advance on this kind of nest is the burrow, such as that occupied by the sand-martin, kingfisher, or puffin. In many cases these underground N. are made in burrows left by rabbits or voles. Many birds and some animals make their N. in the hollows of trees; the female of the Bornean rhinoceros hornbill is sealed up by the male for many weeks, and thus absolutely protected. The mud N. of the swallow family and other birds are wonderful examples of industry. Some of these weigh as much as eight or nine pounds. Among the crudest N. that are made with collected material, such as sticks, leaves, blades of grass, or hair, are those of the wood-pigeon, which are so loosely put together that the eggs are visible through them. The evolution of such N. to the complex structures of the finches or the wrens and their choice of site is plainly due to the instinct of concealment. Some fish and some insects and spiders have developed great nest-building craft.

Swallows, martins, sparrows, and flycatchers prefer houses as nesting sites; the thrush tribe, finches, and linnets use evergreen bushes and hedges. Most species construct N. which are highly distinctive, and chaffinches produce those of the highest quality. The better builders also prefer a particular sort of site, especially the warbler, which adapts its nest perfectly to its position, preserving a uniformity of height above the water or marsh. Generally the N. of home birds are more solid than those of visitors, the former having more time at their disposal. The blackbird's is one of the heaviest, and the lesser whitethroat's is of the lightest.

Nests, Edible, are produced in the Malay Is. and Australia by species of swifts, or swiftlets. In most of the mud-nest-building birds saliva is secreted to mix with the mud. In these swiftlets the secretory glands are so developed that the use of mud and other matter is abandoned, the nest being formed almost or entirely of the bird's own secretion. These N. are in great demand by the Chinese for making bird's-nest soup. From the Malay Is. millions of N. are annually imported into China.

Nesus, see LOLOS.

Netball, popular game in England for girls and women. It is played by two teams of seven players each, with an inflated ball (resembling a football) between 27 and 28 in. in circumference and 14-15 oz. in weight. N. is usually played out of doors on a concrete or grass court 100 ft. long by 50 ft. wide. The object of the game is to score goals by dropping the ball through a metal ring, 15 in. in diameter, which is placed at the top of a 10-ft.-high post. There is a post at each end of the court. Only two players on each side may 'shoot' for goal. The ball must be passed from one player to another without running with the ball. Kicking the ball and other rough play is penalised

by a free shot from the goal circle for the opposing side. The duration of play is decided by the captains of the two teams before the start of a game: it is usually 15 min. each way, with a few minutes' interval at half-time. The controlling body in England is the All-England Women's Association of Netball and other handball games.

Net Book Agreement, see under BOOK-SELLING.

Nete, riv. of Belgium, trib. of the Rupel (q.v.). The N. is formed at Lier (q.v.) by the confluence of the Great and Little N., the main rivs. of the Campine region, both flowing from E. to W. The N. supplies the drinking water for the Antwerp agglomeration. The main filtering works are at Walem, 7 m. S.W. of Lier.

Netherlands Guiana, see DUTCH GUIANA.

Netherlands, The, see HOLLAND.

Nethou, see PYRENEES.

Netley, vil. in Hampshire, 3 m. S.E. of Southampton. There are ruins of a Cistercian abbey (Early Eng. and Decorated) dating back to the early thirteenth century. N. Hospital was opened in 1863 for invalided soldiers.

Nets are fabrics in which the threads cross each other at right angles, leaving a comparatively large open space between them. Netting differs essentially from weaving in that the threads are knotted at the intersections. The open spaces in N. are called meshes, and these correspond in size with an instrument used in net-making, consisting of a flat piece of wood or other hard substance, usually about the shape and size of a common paper-knife. In addition to this, a peculiar kind of needle is used, upon which a large quantity of the thread is placed, by winding it from end to end between the forked extremities. The art of net-making has been practised from the earliest times by the most savage as well as the most civilised nations. It is easy to see that the human race learned the value of this art from noticing how frequently land and water animals became entangled in the shrubs and weeds through which they attempted to pass. There are many illustrations of the uses of N. in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt. Until recently N. have been always made by hand. Hemp is the chief material for net-making. After the net comes from the loom it goes to the finishers, who, by hand, make the addition of a kind of selvage, consisting of sev. thicknesses of twine, to give strength to the edges. A great variety of N. are in use amongst fishermen, but the prin. are the seine, trawl, and drift N. See further under FISHERIES.

Nettle, name given to a number of ann. and perennial herbs, characterised by stinging hairs on leaves and stems. The great N. (*Urtica dioica*) is a perennial with small green flowers in long, branched clusters. The tender tops are sometimes boiled and eaten as a vegetable in spring. Its fibre yields a yarn, said to be superior to jute and hemp, though inferior to

flax, and is valuable for damasks and brocades. Some species are used in the manuf. of ropes and textiles. The small *N. (U. urens)* is an annual, with flowers in a short seldom branched cluster. *U. pilulifera*, a doubtful Brit. native, found on the E. coast of England, is more virulent than the others. Dead-N. (*q.v.*) is of a different species, even though the white dead-N. (*Lanum album*) resembles in appearance the stinging N.

Left Leaf of Stinging-nettle.
Right Leaf of Dead-nettle.

Nettlerash, or *Urticaria*, disease of the skin characterised by the development of raised red or white weals similar to those produced by the sting of a nettle, and accompanied by a burning and itching sensation. The cause is some digestive disturbance, due to the ingestion of certain food, such as shell-fish, strawberries, cheese, etc. The best treatment is the administration of a purgative combined with an antacid, such as magnesia.

Nettuno, seaport of Italy, 32 m. S.E. of Rome. Pop. 12,800.

Neubrandenburg, walled tn. of Germany, in Mecklenburg, 74 m. N. of Berlin. It contains four handsome Gothic gates of fourteenth-century workmanship. The former grand-ducal palace of Belvedere stands on a hill overlooking Lake Tollense. Pop. 15,200.

Neuburg, tn. of Bavaria, on the Danube, 45 m. N. by W. of Munich. Pop. 7,800.

Neubvzdov, tn. of Bohemia, Czechoslovakia, 50 m. E.N.E. of Prague. Pop. 7,000.

Neuchâtel, or **Neufchâtel**, known also as **Neuenburg**: 1. Canton in the W. of Switzerland, between Lake N. and the Fr. frontier. N. lies in the midst of the Jura Mts., four chains of which, running from N.E. to S.W., traverse the canton. The greater number of the numerous streams which water the canton flow into the Rhine. Among these mt. torrents the prin. are the Reuse, the Seyon, and the Serrière. The lake of N. is 25 m. long, and from 3 to 54 m. wide. It is 1420 ft. above the sea and has a depth of 400 or 500 ft. The natural products are iron ores, coal, asphalt, fruit, including

grapes—from which good red and white wines are made—timber and corn. The rearing of cattle constitutes an important branch of industry, and large quantities of cheese are exported; but the speciality of the canton is watch-making and the chief centres of this industry are La Chaux-de-Fonds and Le Locle. Area 309 sq. m. Pop. 131,000. N. joined the Swiss Confederation in 1815. Five representatives are sent to the Nationalrat. 2. The chief tn. of the canton occupies a magnificent site on the N.W. shore of the lake of N. 25 m. N.W. of Bern, and is noted for its many charitable institutions and for the beauty of its charmingly situated environs. It has had a univ. since 1909. It is the seat of the watch-making industry, and also manufs. jewellery and condensed milk. Pop. 23,000.

Neudamm, tn. of Polish Debno, 11 m. from Kustrin (now Kostrzyn). The chief manufs. are cloth and hats. Pop. 7,600.

Neudorf, tn. of Silesia, Poland, 5 m. W.S.W. of Königshütte. Pop. 6,000.

Neudorf, see IGLO.

Neudorf, vil. in the Rhineland, Germany, 2 m. from Koblenz.

Neuern, com. of Bohemia, Czechoslovakia, 10 m. from Carlsbad. Pop. 22,000.

Neufahrwasser Harbour, see DANZIG.

Neufchâtel, Switzerland, see NEUCHÂTEL.

Neufchatel-en-Bray, tn. of the dept. of Seine-Inférieure, France, on the Bèthune, 50 m. N.E. of Rouen. It is noted for its cheese and cider. Pop. 4,000.

Neuhaldslieben, tn. of Saxony-Anhalt, Germany, on the Ohre, 15 m. N.W. of Magdeburg. Pop. 7,000.

Neuhausel, tn. of Neutra com., Czechoslovakia, 16 m. N. of Komorn. The Hungarian name is Ersekújvár. Pop. 13,500.

Neuhoff, Theodor von (c. 1690–1756), Ger. adventurer. He entered the service of Charles XII. of Sweden, and was an ardent supporter of the Jacobite cause. His fame rests upon his assisting the Corbans against the Genoese, and ultimately ascending the throne as Theodor I. He was soon obliged to abdicate, and was on more than one occasion thrown into prison for debt.

Neuilly-sur-Seine, suburb of Paris. The castle of St. James, situated here, and dating back to 1775, has been converted into a lunatic asylum and the Galezniak Institution. There is a great mid-summer fair. Pop. 60,200.

Neu-Kölin, see KÖLIN.

Neukölln, tn. of Germany, formerly called Rixdorf, a S.E. suburb of Berlin, in the Potsdam dist. Has textile industries. Now part of the city of Berlin. Pop. 311,700.

Neumann, Alfred (b. 1895), Ger. novelist and dramatist, b. at Lautenburg, Prussia. Educated at the Gymnasium, Berlin, and Rostock. Reader for Georg Müller, Munich publishers. Playwright for Little Theatre, Munich. (1918–20). Known chiefly for his many historical novels, in which he uses the lessons of the past to illustrate present-day political situations and problems. *Der Patriot* (1925),

exploiting the assassination of the Tsar Paul of Russia, was dramatised in London as *Such Men are Dangerous* (1928). Literary recognition and the Kleist prize came with *Der Teufel* (1926) on the despotism of Louis XI. *Rebellen* (trans. as *The Rebels*, 1928) and its sequel *Guerra* (1929) had the Carbonari and It. independence respectively as their theme. *Der Held (The Hero)* (1930) is founded on the murder of Rathenau (q.v.) in 1922. Historical portrayal is again the background of *Königin Christine von Schweden* (1926) (Eng. trans., 1935), but the thrill lies in the erotic peculiarity of the queen—her early Lesbian experience and her love for Cardinal Azzolino and Mondaleschl. *Narrenspegel* (1932) departs from the unalloyed historic manner by reason of its coarse Rabelaisian humour as instanced by the hero's enormous pendulous stomach. N.'s plays include *Königsmaske* (1928), *Frauenschuh* (1929), and *Hans Danieli* (1931). With the Nazis' advent to power N. went to America, writing there *Neuer Caesar* (1934) and *Kaiserreich* (1936) (trans. as *Gauley Empire*, 1937). He has also written a biography of Musset (1925), novelettes, short stories, trans. of Musset, Molière, and Lamartine, essays, and poems.

Neumann, Balthasar (1687–1753), Ger. architect. Pioneer of the Ger. baroque style. Among the buildings he designed were the archiepiscopal residence at Würzburg (1719–44), the summer schloss at Werneck (1731–36), and the abbey, church at Neresheim (1745–92).

Neumann, Therese (b. 1898). Bavarian visionary, b. at Konnersreuth. She received the stigmata, i.e. marks, of the five wounds of Christ, during Lent 1926, experiencing on every Friday a vision of Christ's Passion. The reason for her stigmatisation has been explained in various ways. See A. Lechler, *Das Rätsel von Konnersreuth im Lichte eines neuen Falles von Stigmatisation*, 1933; Pacificus, *The Story of Teresa Neumann*, 1947; and Hilda Graef, *Difficulties in the Case of Teresa Neumann*, 1950.

Neumünster, tn. in Schleswig-Holstein, Germany, 50 m. N. of Hamburg. It is an anct. city, and was originally called Wlendorp. Pop. 46,900.

Neunkirchen: 1. Tn. of the Saarland, Germany, on the R. Blies, and 12 m. distant from Saarbrücken. Pop. 35,000. 2. Mkt. tn. in Lower Austria, about 8 m. distant from Wlener-Neustadt. The prin. trade is in woven goods and metals. Pop. 12,000.

Neuquen, ter. of Argentina, between the Colorado and Limay Rs., with an area of 37,245 sq. m. and a pop. of 590,550. The surface on the whole is mountainous and the prin. riv. is the N. N. is also the name of the cap. of the ter. It is situated in the N.W. corner of Patagonia on the Roca railway, 700 m. from Buenos Aires. Near at hand is the great Rio Negro barrage. Pop. 10,000.

Neuralgia (Gk. *νεῦρον*, nerve; *ἄλγος*, pain), pain along the course of a nerve not associated with any demonstrable change in structure. This definition is not always

applicable, for the pain is often accompanied by swelling, redness, etc.; but in the large majority of cases the cessation of the neuralgic pains leaves the patient as he was before the attack, with the exception of a degree of exhaustion. The pain is of a paroxysmal character; its onset is sudden, and its cessation no less so. It may even take on a periodic character, recurring at the same time of day for weeks or recurring at fairly regular intervals of a few weeks. There is usually a fair degree of localisation; the patient feels the most intense pain at particular points, though it may often be felt diffused throughout the area served by a nerve. It is often difficult to assign a cause to a neuralgic attack. Generally speaking, hereditary influences, poor nutrition, fatigue, or worry are predisposing causes. Persons of gouty or anemic tendencies are apt to suffer from N. Occasionally it follows periods of excitement or overwork, and is often associated with the abuse of drugs, as alcohol and tobacco. It is a regular accompaniment to malaria, and cold, damp conditions are favourable to its development. In some cases it can be seen to be due to the pressure of a tumour or of inflamed matter in the course of a nerve, and some of the most obstinate varieties are attributed to the pressure of a bony structure upon the nerve as it passes through a foramen. The immediate cause of a paroxysm may be any sudden shock or jar, change of temp., sudden movement, or any marked change in consciousness, such as the mere dread of a recurrence. Neuralgic pains are usually classified according to their anatomical situation. *Tic douloureux* is a distressing variety affecting the trigeminal (5th cranial) nerve. The paroxysm is unusually sudden, and is usually of short duration. The pain is felt at the side of the head, and is seldom experienced on both sides at once. The skin may become red and swollen, and tender points can be located where the pain is extraordinarily intense; these are situated where the nerves emerge from the deeper-lying tissues. *Supra-orbital* N. affects the brow. The pain is less intense in character than that of tic douloureux, but tends to remain for a longer period. It is often associated with the condition called *migraine*, in which symptoms of an hysterical nature are observed. *Intercostal* N. affects the nerves which emerge from the front of the spinal cord. The difficulty of localising it exactly sometimes gives the impression that a pleuritic affection is the cause of the trouble. It sometimes occurs with herpes zoster, or shingles. *Sciatica* is an obstinate form of N. affecting the great sciatic nerve; it is most distinctly felt in the neighbourhood of the joints, and is usually caused by exposure to wet or cold, or to the over-long maintenance of a fixed position of the lower limbs.

The treatment of N. should aim at eliminating the predisposing cause. Good hygienic conditions with plenty of rest and absolute freedom from worry are indispensable. Of drugs, morphia, antipyrin, phenacetin, and aspirin are most satis-

factory. Lotions and plasters of belladonna, aconite, laudanum, and chloroform are recommended as soothing applications. Electrical treatment can also be tried. Operative measures are seldom called for, but success in obstinate cases has been achieved by exposing the nerve and stretching it. A purely sensory nerve, such as the trigeminal, can be inactivated by an injection of alcohol; surgical extirpation of the trigeminal and its Gasserian ganglion are sometimes carried out.

Neurasthenia (Gk. *νευρωσ*, nerve; *αδυναμία*, weakness) is a comprehensive term which was formerly very loosely applied to a large number of psychogenic disorders characterised by nervous exhaustion, difficulty of concentrating attention, predisposition to fatigue and disinclination for bodily effort, loss of memory, sensation of pressure on the head, spinal irritability, insomnia, disturbance of digestive functions (including constipation, sense of fullness after eating, and flatulent dyspepsia), disturbance of sexual functions (involving amenorrhoea and dysmenorrhoea in women, and impotence and spermatorrhoea in men), disturbances of the special senses (involving headaches, blurring of vision, regional anaesthesia, etc.).

The outlook upon N. has completely changed of late years. It is now recognised that many of the conditions which were formerly labelled N. were either anxiety states or hysteria-syndromes, and the term is now reserved for conditions presenting a clinical picture in which fatigue is the sole or at least the leading symptom. The result is that, compared with formerly, the term is now rarely used. Views regarding its aetiology have also undergone a complete change. It is increasingly realised that though, in a number of cases, the onset of N. corresponds to a period of worry and overwork, or to a shock, these are merely the occasion, not the cause, of the illness. The neurasthenic suffers from an arrest of psycho-sexual development; remaining at a level of preoccupation with himself and his interests, unable to adjust himself to the need of open and outward manifestation which is essential to success and happiness. He suffers from a fixation at an auto-erotic level of development which hinders him from the activities which win social esteem and self-respect. This state is reflected in the feeling of guilt which plays an important role in the psychological make-up of the neurasthenic. The modern concept of its aetiology has inevitably led to a readjustment in the views formerly held regarding its treatment. On the assumption that overwork was the prin. cause and that the symptoms were therefore due, almost directly and wholly to fatigue, treatment was formerly aimed at enforcing absolute rest. In the Weir-Mitchell treatment, for example, in order to prevent even the slightest expenditure of unnecessary energy, the patients were not allowed even to feed themselves. While the importance of suitable diet and adequate rest in hygienic surroundings is,

of course, still recognised, psychotherapy is now regarded as essential if a complete cure is to be achieved. See G. 1. Bulet, *Neurasthenia*, 1911; R. Vittor, *Treatment of Neurasthenia by Means of Brain Control*, 1928; D. M. Armitage, *Challenge to Neurasthenia*, 1935; and D. K. Henderson and R. D. Gillespie, *A Text-book of Psychiatry*, 1944.

Neurath, Baron Konstantin von (b. 1873), Ger. politician and diplomatist. He was ambas. in Constantinople (1914), minister to Denmark (1919), ambas. to Italy (1922), and to Britain (1930). Ger. minister of foreign affairs (1932-38), president of the privy council from 1938. Reich 'protector' for Bohemia and Moravia (1939-41). On resignation from the latter position he retained formal relationship with the Nazi Gov. as minister without portfolio. N. advised Hitler to withdraw from the disarmament conference under the League of Nations and played an important part in Hitler's decision to reoccupy the Rhineland. As 'protector' of Bohemia and Moravia, he set up an administration similar to that in Germany. He abolished political parties there and trade unions, introduced Nazi racial laws, and compelled Czech industry to work for the Ger. war effort. The Nuremberg tribunal (q.v.) found that in administering these tasks he played a prominent part in the wars of aggression which Germany was waging in E. Europe, and that war crimes and crimes against humanity were committed under his authority; but in mitigation the tribunal noted that he had intervened with the security police and secret service for the release of many Czechoslovaks who had been arrested when war broke out, and it was also noted that in 1941 N. was summoned before Hitler, who complained that his regime had not been harsh enough. N. was sentenced by the tribunal to fifteen years' imprisonment.

Neuritis, inflammation of a nerve, may be localised or multiple. In localised N., caused by injury, cold, pressure, etc., there is considerable pain along the course of the nerve. Multiple N. is the simultaneous inflammation of nerve trunks, often symmetrically situated on both sides of the body. N. may result from the toxins of micro-organisms, *fig.* those of diphtheria, influenza, syphilis, malaria, smallpox, dysentery, etc. Poisoning by alcohol, arsenic, lead, copper, phosphorus, carbon monoxide, and anilin compounds, or auto-intoxication through diabetes or anaemia, may also be exciting causes of N. The symptoms vary according to the cause. There is numbness, loss of power and atrophy of muscle in certain parts. In milder cases the atrophy disappears, but in other cases there may be ultimate paralysis of the parts. At first the superficial reflexes may be exaggerated, but are later lost as a rule. Treatment deals, in the first instance, with the relief of pain. Cathartics and diaphoretics may be useful, and sometimes massage and muscular movements of various types. The only cure, however, is the elimination of the poison, and hence the treatment

followed depends upon the real cause of the N. See S. E. Jelliffe and W. A. White, *Diseases of the Nervous System* (fifth ed., 1930).

Neurosis (Anxiety Neurosis, etc.), see **PSYCHONEUROSIS**.

Neusalz, see **NOWA SÓL**.

Neusatz, see **UJVIDEK**.

Neusatz, Yugoslavia, see **NOVI SAD**.

Neusiedler-See (**Fertő-tava**), lake of Hungary, between the cos. of Oedenburg and Wieselburg, 19 m. from Pressburg. It has an area of about 120 sq. m., but it is of varying size, and sometimes dries up in part. Eastward it is united with the extensive marsh called the **Hänság**, through which it is in communication with the R. Raab and with the Danube.

Neuss (the Rom. **Novesium**), tn. in the N. Rhine-Westphalia, Germany, on the Rhine at the confluence of the Ertt, about 3½ m. from Düsseldorf. There are manufs. of soap, paper, chemicals, and engineering products, and the tn. is an inland port. Pop. 30,000.

Neustadt: 1. Tn. in Poland, 24 m. N.W. of Danzig. Pop. 7000. 2. Seaport of Schleswig-Holstein, Germany, on the Baltic, 18 m. N.N.E. of Lübeck. Pop. 5000. 3. Tn. of Bavaria, Germany, about 9 m. N.E. of Coburg. Pop. 6000. 4. Tn. of Silesia, Poland, 33 m. from Ratibor. The chief industries are tanning, dyeing, and the manuf. of damask linen, woollen stuffs, leather, and beer. Pop. 20,000.

Neustadt-an-der-Hardt, tn. in the Rhineland, Germany, 17 m. S.W. of Mannheim. There is a trade in wood, grain, fruit, and wine. Its church, with sev. curious monuments of the counts palatine and with some anct. frescoes, was finished in the fourteenth century. Pop. about 24,000.

Neustettin (Polish **Szczecinek**), tn. of Poland, 55 m. S.E. of Kolberg. Noted before the Second World War for a considerable trade in cattle and agric. products, iron founding, and dyeing and brewing industries. Pop. 20,000.

Neu Strelitz, tn. of Mecklenburg, Germany, between Lakes Ticker and Glambeker. It was founded in 1773, is built in the form of an eight-rayed star, and contains the ducal palace, with a large library, and having magnificent gardens attached. Pop. 26,000.

Neustria, name given to the W. div. of the Frankish Empire to distinguish it from the E. div., **Austria**.

Neutralisation, Heat of, see under **HEAT OF FORMATION**.

Neutrality, in international law (*q.v.*) the condition of states which stand aloof from a war between other states, the essential feature of the condition being this negative attitude and not the positive attitude of offering impartial treatment to the adversaries. The word itself is of recent origin, as in the olden times when states were at war, all other states concerned were considered as on one side or the other. Late in the seventeenth century it was recognised that neutral states should give no assistance to belligerents, but such points as to what

extent neutrals could prevent their ter. being used for hostile purposes, etc., were by no means clearly understood. The development of opinion gradually imposed stricter obligations upon neutral powers; *e.g.* it was once common for neutrals to supply troops to one of two belligerents under a previous treaty, and the practice was followed as late as 1828. The Hague Conventions of 1907 contain no specific prohibition of the supply of troops in land warfare, though the practice became extinct until the Sp. civil war, 1936, when Germany and Italy, though nominally neutrals, sent troops to aid the insurgents against the republicans. In regard to naval warfare, it was agreed that the supply, in any manner, directly or indirectly, of warships, supplies, or war material of any kind by a neutral power to a belligerent power be forbidden. But a neutral is not bound to prevent the export or transit, for either belligerent of arms, munitions of war or, in general, of anything which could be of use to an army or fleet. In matters which do not relate to war a neutral must not refuse to one belligerent any advantage which she grants to the other. The question in regard to N. which has caused more controversy than any other is that respecting neutral goods on belligerent vessels, and vice versa. It was at first held that the ownership of the goods on board the vessels was the only thing to be considered; thus merchandise belonging to the enemy was seized on a neutral ship, but neutral merchandise seized under a hostile flag was restored. This system led to so much inconvenience and irritation that the opposite principle was adopted, and neutral merchandise under a hostile flag was seized, and hostile merchandise was safe under a neutral flag. See on this **CONTRABAND**; **DECLARATION OF LONDON**; **DECLARATION OF PARIS**.

It is a violation of N. for a neutral state to make a money loan to a belligerent, but it is more open to doubt in cases where the loan issues from neutral individuals. Though neutral states are not bound to prevent their subjects from lending money to belligerents in the ordinary way of business, they have, in circumstances of grave difficulty, deemed it right to impose restrictions, as in the First World War, when the U.S.A. declared that loans from Amer. bankers to any foreign nation which was at war was inconsistent with the true spirit of N. This declaration was deprecated in America, but the secretary of state adhered to it. As to the use of neutral ter. for fitting out warships, the *locus classicus* is the declaration of Jefferson, who held that it was incompatible with the sovereignty of the U.S.A. and tended to interrupt the peace and good understanding between America and Great Britain to allow Fr. ships to be fitted out in Amer. ports; and the soundness of this opinion has never been seriously questioned. The dividing line between acts which the neutral is bound to restrain and those in which its subjects can engage at their peril is not always

easy to decide. The distinction came into prominence in the famous *Alabama* case, where ultimately it was agreed, by the treaty of Washington, 1871, to refer the matter to arbitration (for the facts see *ALABAMA*, THE). By the decision of the arbitration board in the *Alabama* case, it was laid down that a neutral gov. is bound to use due diligence to prevent the fitting out in, or departure from, any of its ports of a vessel which it has reasonable ground to believe is intended to carry on war with a power with which it is at peace; and that it is bound to prevent a belligerent making use of its ports as a basis of naval operations, or a source of recruitment of men or military supplies. It is the belligerents' duty to respect neutral ter. and territorial waters, but it is hardly necessary to point out that Germany in 1939 and after respected the rights of no neutral, either in these or in any other respect. Neutral states have the right to repress the intercourse of neutral citizens with citizens of either belligerent, if desired. Belligerents have the right of blockade, of anjany (Lat. *anjaria*, forced sale), of visit and search, and of the confiscation of contraband of war. Neutrals must prevent any recruiting, etc., for either belligerent, and must grant impartially no privileges, etc., which are not considered as intervention in the struggle.

The right of anjany was considered by the privy council in 1916, when the Crown claimed to requisition neutral property taken in prize. It was decided that the right is to be enforced only by application to the court, which must determine whether, under the particular circumstances, it is exercisable. In 1918 Great Britain and the U.S.A. had recourse to the right in the case of property not in the control of the prize court, by requisitioning a number of Dutch vessels that were in Brit. and Amer. ports. A neutral is allowed to give asylum to the troops or vessels of belligerents in circumstances which ensure that the use of its hospitality will be unaggressive. Thus, in 1871, a Fr. army sought asylum in Switzerland, and in the First World War Brit. and Ger. troops both sought refuge in Holland. Such troops must be interned as far as possible at a distance from a theatre of war, but officers may be released on parole. It is agreed that belligerents may not erect on the ter. of a neutral a wireless telegraph station or apparatus intended to serve as a means of communication with belligerent forces, nor use any installation of the kind estab. by them before the war on the ter. of a neutral exclusively for a military end and which has not been opened for the service of public correspondence. Thus, in 1911, Great Britain and France successfully protested against the use by Germany of wireless installations in Ecuador and Colombia.

American Neutrality Legislation.—Even the most powerful states are compelled sometimes to make sacrifices of neutral rights in order to keep out of war. This has been the case in Amer. hist., as in 1807 when Jefferson induced Congress to pass the Embargo Act, forbidding foreign

commerce altogether by way of retaliation to Britain for her practice of searching Amer. vessels for refugee naval ratings and to France for the Berlin and Milan decrees; and again in 1935-37 when Congress passed laws giving up certain maritime rights. The freedom of the seas was, therefore, voluntarily sacrificed in the hope of keeping out of war. It was largely in vindication of the freedom of the seas that the U.S.A. fought the war of 1812 and that it entered the First World War in 1917. It would seem that trading with a belligerent is hardly consistent with N. in fact, though it may be allowed by the theory of international law. In the First World War Amer. sentiment was strongly pro-Ally before the abandonment of N. Amer. industry geared itself rapidly to Anglo-Fr. war needs, and Amer. banks acted as purchasing agents for the Allies, floated loans for them, and estab. allied credits, but Amer. trade with the central powers was reduced to negligible proportions. Consistently with its strong element of isolationism or nationalism, coupled with disillusionment with the results of the First World War, Congress strove from 1934 onwards to legislate a cast-iron N. In 1934, when war between Italy and Ethiopia was imminent, Congress wanted to erect insuperable barriers against the export of arms, and laid down rigid rules applicable to all belligerents. Roosevelt, on the other hand, wished to be in a position to carry out a policy of helping in 'collective effort' against 'the responsible and guilty party' or, in other words, he wished the N. laws to give him a wide discretion, enabling him to deter or cripple aggressors and to help their victims. No fewer than fifteen N. Bills were introduced and the resultant was a measure which prohibited the export of arms or implements of war to any belligerent nation, or to any country which might tranship to a belligerent, made it unlawful for an Amer. vessel to carry arms for or to any belligerent; and authorised the President to warn Amer. citizens that they travelled on the ships of belligerents at their own risk. The President was allowed no power to differentiate between righteous and wicked, aggressor or victim. He was permitted some discretion in defining the terms 'arms, ammunition, and implements of war' and in extending the embargo to states which might become involved in the conflict; but otherwise his hands were tied. There is but little doubt that President Roosevelt ought to have vetoed the measure, for there is evidence that when the Brit. Gov. was weighing the chances of war with Italy its cautious tendency was accentuated by the existence of this Amer. N. law. The Neutrality Act, however, was silent on civil wars, or on wars partly civil and partly foreign, like the Sp. civil war, and when Germany, Italy, and Russia all took a free hand in that war, Congress tried to repair the omission by means of a joint resolution forbidding the export of arms to Spain (Jan. 8, 1937). This, however, operated unfairly to the Sp. republicans, for the Brit. and Fr. Govs. had failed to

get other govts. to observe the 'non-intervention' agreement which they had signed. Germany and Italy broke their neutral or 'non-intervention' pledges and sent not only munitions but men to the insurgents. Thus the embargo did not safeguard Amer. N. because that was never threatened; it merely played into the hands of the aggressor nations. The N. law of 1935 expired on May 1, 1937. America's belief in collective security had gone. Congress was again resolved on a rigid statute, especially one which should include such vital war commodities as scrap metal, copper, and cotton. The N. law of May 31, 1937, retained the embargo on arms, etc., for all belligerents and the provision making it unlawful to deal in belligerents' securities; and it made travel by Amers. on belligerent ships unlawful. It allowed the President to extend the embargo to any civil war which threatened the N. of the U.S.A. Its most striking provision, however, was the introduction of the 'cash-and-carry' clause, which in effect meant that after a war had begun those who wanted certain prescribed commodities or goods must come and get them and in effect pay for them. This Act, which was limited to two years' duration, marked the zenith of isolationist sentiment and was justifiably condemned by Mr. Cordell Hull as substituting 'a wretched little bob-tailed, sawed-off domestic statute for the estab. rules of international law.' Subsequent events, which need not be detailed here, showed that it utterly failed of its purpose and in any case it was not flawless, for it was not truly neutral. The Act was in fact an encouragement to Germany's aggressive policy, as the Nazi Gov. naturally hoped that Britain and France would not be able to get war material from America in wartime. Roosevelt urged repeal of the arms embargo early in 1939, and partial repeal was approved by the House of Representatives in July 1939; but the President insisted on full repeal and, eventually, Congress passed the Neutrality Act of Nov. 4, 1939, which provided that Amer. arms, etc., might be sold to belligerent countries only on a cash-and-carry basis. It was forbidden to any person within the U.S.A. to buy bonds or other obligations of a belligerent country gov., issued after the outbreak of war, or to extend credits to such gov. with the exception of certain commercial credits of a character ordinarily used in peacetime. Amer. ships were forbidden to carry supplies to belligerents or to enter combat zones; the coasts of the Brit. Isles, France, Belgium, Holland, Germany, Scandinavia, and the Mediterranean were declared combat zones. Amer. citizens were not to travel on ships of belligerents. Licences were required for arms exports. The Act did not apply to Amer. republics.

See W. Hall, *International Law*, 1880; L. Jones, *Law and Commerce*, 1907; F. Birkenhead, *International Law*, 1927; L. Oppenheim, *International Law* (vol. II., *Disputes, War, and Neutrality*), 1928; and N. G. Politis, *Neutralité et la paix*, 1935.

Neutrality, in chem., is the state of a

substance that has no effect on indicators (q.v.). More strictly, a neutral aqueous solution is one in which the equivalent concentration of hydrogen (q.v.) is exactly equal to that of the hydroxyl ions. On adding an acid to an alkali, a substance is at length formed that shows no reaction of either an acidic or an alkaline character; the alkali and acid are then said to have neutralised one another.

Neutrality Zone, American, zone of 300 m., and in some places up to 600 m., around the whole Amer. continents except Canada, estab. by the 'Declaration of Panama' at a conference of the twenty-one Amer. republics at Panama on Oct. 3, 1939. It was suggested at this conference that all warlike acts at sea or in the air should be prohibited in this 'zone of security,' and in case of necessity enforced by joint action. The zone of security, however, was estab. only in theory and provision was made for mutual consultation on practical measures should hostilities occur in it. After the battle off Monte Video (Dec. 13, 1939), in which the *Admiral Graf Spee* (q.v.) was sunk, consultation was initiated, and naval experts recommended that the republics should intern all belligerent warships calling at Amer. ports. The Brit. Gov. protested against the estab. of the N. Z. as incompatible with international law, and as likely to lead to the Gers. using the Amer. ports as a sanctuary for their ships. In fact, the zone did not come into practical existence.

Neutron, one of the elementary constituents of matter, a particle with the mass of a proton (q.v.) but no electric charge. The idea that such a particle existed was suggested by Lord Rutherford in 1920. It is perhaps a combination of a proton with a negative electron. Ns. may be obtained by the bombardment of (e.g.) beryllium by alpha particles, i.e. rapidly moving helium atoms which have lost two negative electrons and are therefore charged with two units of positive electricity. It was the fact that the N. hits protons, the nuclei of hydrogen atoms, and the nuclei of other sorts of atoms that led to its discovery. The probability of interaction between a N. and an electron is according to the square of the ratio of their masses, and as the N. is over 2000 times as massive as the electron this probability is over a million to one; and hence the chances of interaction between Ns. and electrons are a million times less than between Ns. and protons.

Neu-Ulm, tn. of Bavaria, Germany, situated opposite Ulm on the Danube. Pop. 12,700.

Neuve Chapelle, vil. in the dept. of Nord, France, 8 m. S.W. of Armentières. There was an important battle around N. C. in 1915, in which the old vil. was almost entirely destroyed. The battle lasted from March 10 to March 12, 1915. Brit. and Indian forces began the attack, in an effort to prevent Ger. reinforcements going to the E. front, and to assist the Fr. The Brit. won initial success, but by March 12, Ger. reinforcements had been brought up and no further ground was

captured, although the Brit. held the positions gained earlier. Brit. and Indian casualties totalled over 11,000, of which 2527 were dead. In 1927 a memorial to the Indian dead was unveiled at N. C.

Neuville, Alphonse Marie de (1836-85), Fr. painter, pupil of Delacroix and Picot. His large canvas depicting an episode in the siege of Sebastopol made a great sensation in 1859. This was followed by a series of military pictures dealing with the Crimean and Franco-Prussian wars.

plateau with an elevation of 5000 ft., but in the S. it descends abruptly to the level of the Colorado R. (600 ft. above sea level). The extreme S. boundary is formed for about 150 m. by the Colorado, and the Humboldt R. flows across over 300 m. of the N. dist. but this and other smaller streams end in salt lakes known as sinks. The climate is very dry and the soil barren except where irrigation has been effected. There maize, wheat, barley, and potatoes are grown, but crops are chiefly sub-

E.N.A.

NEVADA: THE STATE HIGHWAY BETWEEN VICTORY AND LINCOLN

His most famous picture is 'The Last Cartridges.' He also collaborated with Detaille in the panorama of Rezonville, one of the best works of the kind.

Neuwied, tn. of the Rhineland, Germany, on the Rhine, 8 m. N.N.W. of Koblenz. It possesses an anct. castle famous for its Rom. antiquities. There is manuf. of iron goods, tobacco, and soap. Pop. 21,500.

Neuzen, or Terneuzen, *see* TERNEUZEN.

Neva, riv. of Russia, which flows W. from the S.W. corner of Lake Ladoga to the bay of Kronstadt, in the gulf of Finland. Its length, including windings, is about 40 m., and it is an important commercial riv.

Nevada: 1. One of the W. mt. group states of the Amer. Union in the great Cordilleran plateau, between the Rocky Mts. and the Sierra Nevada, bounded on the N. by Oregon and Idaho, on the E. by Utah, Arizona, and E. Colorado, on the W. and S. by California. The surface is a

sidary to the grazing of sheep and cattle. There are some 5,000,000 ac. of forest. The leading occupation is mining, especially of silver and gold. Other minerals are copper, lead, zinc, iron, mercury, tungsten, gypsum, graphite, sulphur, vanadium, magnesite, antimony, nickel, cobalt, and borax. In 1945 the value of the mineral output was \$31,517,000. Copper smelting is the chief industry. The mts. have yielded over \$1,000,000,000 of mineral wealth, of which the former Comstock lode has produced 60 per cent. The chief tns. are Reno (21,300), which has a state univ. and an aerodrome, Las Vegas (8400), Sparks (5300), and Carson city, the cap. (2400). Nevada was admitted to the union in 1864, and is represented in Congress by two senators and one representative. Its legislature consists of a senate of seventeen members and an assembly of forty-one members. It has a land area of 110,540 sq. m., 1300 of which is Indian reservation. In this

state the death penalty is inflicted by means of lethal gas. The short period of residence for divorce, six weeks, makes Reno a favourite resort for this purpose. Pop. (1940) 110,200; estimated pop. in 1944, 156,445, an increase of over 41 per cent. See J. G. Scruggam, *A History of Nevada*, 1935, and D. L. Morgan, *The Humboldt: Highroad of the West*, 1943.

2. City and co. seat of Vernon co., Missouri. U.S.A., 88 m. S. of Kansas city. The chief industries are the smelting of lead and zinc and the manuf. of paper, lumber, sheet metal, and bricks. Coal is mined in the vicinity. Pop. 8100.

Nevers (anc. Noviodunum), chief tn. of the dept. of Nièvre, France, on the r. b. of the Loire at its confluence with the Nièvre. It is the seat of a bishopric. The cathedral of St. Cyr dates back to the fourteenth century. Manufs. include iron goods, chemical products, footwear, and porcelain. Pop. 116,700.

Neveu, Ginette (1919-49), Fr. violinist, b. in Paris. She studied at the Paris Conservatoire and with Karl Flesch, first appearing in public with the Colonne orchestra, when she was seven years old. She appeared with leading Brit. orchestras many times between 1945 and 1949. Her interpretation of Beethoven was particularly outstanding: at her death she had estab. a reputation as the leading woman violinist of the century. Her talent could only be compared with that of Yehudi Menuhin. She was killed in an aeroplane accident in the U.S.A.

Neviansk, tn. of the Sverdlovsk Region of the R.S.F.S.R., on the Neiva R., 50 m. N.N.W. of Sverdlovsk. It is known for its metallurgic riches. Pop. 16,500.

Neville, Henry (1620-94), Eng. author, interested himself in politics. His activities displeased Cromwell, who banished him from London in 1654. He entered Parliament on the death of the Protector and sat at Westminster for some years. He was, in 1663, arrested, and acquitted, on the grounds of complicity in the Yorkshire rising. His trans. of Machiavelli's works (1675) is well known, and he was the author of many effective lampoons. Including *Shuffling, Cutting, and Dealing in a Game of Pique* (1659), being directed against Oliver Cromwell and others.

Neville, Richard, first Earl of Salisbury (1400-60), son of Ralph N., first earl of Westmorland. He acquired his title through his wife in 1429, laying claim to it on the death of his father-in-law. He was warden of the W. Marches, and as such persuaded York to lay down his arms in 1452, and when the latter gained control of the gov., during Henry VI.'s madness, gave him his support and was made chancellor. He was defeated by the Lancastrian forces at Ludford (1459) and fled to France, but returned in 1460 and remained in charge of London while Warwick went to meet the Lancastrians at Northampton. He was captured after the battle of Wakefield and murdered in Pontefract Castle.

Neville, Richard, see WARWICK, EARL OF.

Neville's Cross (Durham), see DAVID II.

Nevin, Ethelbert Woodbridge (1862-1901), Amer. composer, b. at Edgeworth, Pennsylvania. He studied at Berlin, Boston, and Paris, lived in France many years, but returned to America twelve months before his death. Among his works are *Water Scenes* (1898) and *The Rosary* (a song which had a tremendous vogue, 1898).

Nevinson, Christopher Richard Wynne (1889-1948), Eng. painter, etcher, and lithographer, b. in London, son of Henry Woodd N. (q.v.). He studied art at St. John's School of Art, the Slade School, and in Paris. Becoming known for war paintings, his first exhibition of these being in 1916, in 1917 he was appointed an official war artist. Some of his war pictures were bought by the Imperial War Museum and the Canadian War Memorials Fund. His subjects cover a wide range, but he is concerned less with artistic effects than with emphasising his comments on life. He made use of cubist, futurist, and similar expedients in design, though less from intellectual conviction than as an experiment. Among his best works are 'The New Forest' and 'Autumn Sunshine,' both of which give the effect of depth. His etchings include 'Manor Gates,' 'Looking through Brooklyn Bridge,' 'Cornish Landscape,' 'Ebb Tide, Nye,' 'Barmouth Estuary,' 'Steam and Steel,' and 'The King is Dead' (a pastel head). Some have been bought by the Brit. Museum, Tate Gallery, Birmingham and other city art galleries. Harvard Univ., etc. He pub. an autobiographical vol., *Paint and Prejudice* (1937).

Nevinson, Henry Woodd (1856-1941), Eng. journalist, b. in Leicester and educated at Shrewsbury, Christ Church, Oxford, and Jena. He wrote 2 vols. of sketches and a *Life of Schiller* (1889) which distinguished him as a writer of rare quality. As a war correspondent for the *Daily Chronicle* in the S. African war, he shared all the horrors of the siege of Ladysmith. Meantime his *Plea of Pan* (1901) and *Between the Acts* (1903) had won him fame. A journey to Angola on commission from *Harper's Magazine* resulted in the revelations of *A Modern Slavery* (1906). He investigated the revolution in Russia, which he described in *The Dawn in Russia* (1906). He was correspondent for the *Manchester Guardian* in the First World War on the W. front, and later at the Dardanelles, Salonika, and Versailles. His *Dardanelles Campaign* (1918), together with *Essays in Freedom* (1909) and *Essays in Rebellion* (1913), will be remembered as among his finest work. He also wrote *Lines of Life* (a book of verse) (1920); *Original Sinners* (a gallery of portraits) (1920); a critical study of Goethe, 1931; *Running Accompaniments* (essays) (1936); and, in 1939, *Films of Time* (fantasy). His last work was a book of criticism and recollection with Thomas Hardy as the subject (pub. posthumously).

Nevis (formerly Nevis or Mevis), one of the Leeward Is., Brit. W. Indies, in the presidency (formed in 1882) of St. Kitts, Nevis, and Anguilla. It lies in 17° 14' N. and 62° 33' W., and is separated from St.

Kitts by a narrow strait. It has an area of 50 sq. m. and a pop. of 15,000. Like St. Kitts the is. is volcanic but, unlike St. Kitts, it is to a great extent covered with volcanic ashes from former eruptions; it is in fact one large mt. cone, rising to a height of 3000 ft. Sugar-growing was formerly the prin. industry, but the cultivation of Sea Is. cotton has taken its place. Coco-nuts, yams, sweet potatoes, etc., are also cultivated. The climate, for a tropical is., is bracing and healthy, the average ann. rainfall is 53 in., and the temp. ranges between 70° and 85° F. There are practically no streams, and the water supply is derived from a catchment area high up on the mt. and stored in public reservoirs, which furnish Charlestown, the cap. (pop. 1200), and some country dists. In Charlestown, which lies on the shore of a wide-curving bay, are the remains of the house in which Alexander Hamilton, who drafted the constitution of the U.S.A., was b. (Jan. 11, 1757). The ancestral estate to the S.E. of the tn. is still known as 'Hamilton's.' The old Bath House Hotel is a conspicuous building near by and serves as a link with the past when Nevis was a fashionable health resort noted for its hot springs. The house is so solidly built that it has resisted the hurricanes of over a century. Many old writers testify to the merits of the waters from the thermal springs, including Richard Blome and the Rev. Mr. Smith, author of the *Natural History of Nevis* (1745). It was in Nevis that Nelson met and married his bride, the widow of Frances Nisbet and niece of Herbert, president of Nevis. Nelson and Mrs. Nisbet were married at Montpelier, March 11, 1787, and the record of the marriage is still to be seen in the register at Fig Tree Church. Nelson's memory is also perpetuated by Nelson's Watering-place, a creek 3 m. N. of the cap. Nevis was discovered by Columbus in 1493 and was so named by him because its cloud-capped summit resembled *niere* or snow. The is. was included in the grant to the earl of Carlisle in 1627 and colonised by Eng. settlers from St. Kitts in 1628. The settlement was nearly destroyed by the Spaniards the following year, and in 1706 it was laid waste by the Fr., who took away some 3000 slaves. The is. was captured by the Fr. under the Marquis Bouillé in 1782, but was restored to England by the treaty of Versailles in 1783.

Nevis, Ben., see BEN NEVIS.

New Amsterdam: 1. Tn. of Brit. Guiana, on the Berbice, 63 m. S.E. of Georgetown. The tn. is traversed by canals. Pop. 10,000. 2. The old Dutch name for what is now New York city.

Newark, Lord., see LESLIE, DAVID.

Newark: 1. municipal and parl. bor. of England, in the co. of Nottingham, on a navigable branch of the R. Trent, 16 m. S.W. of Lincoln. The par. church, a large and elegant edifice, though often rebuilt, still shows traces of its original Norman character. There is manuf. of machinery, and iron and brass foundry, as well as a large trade in corn, malt, and cattle. There are manufs. of a

special kind of plaster. The castle of N., in which King John d. in 1216, was built early in the twelfth century. The ruins now form an attractive feature of a public pleasure ground. Pop. 22,800. 2. City and the co. seat of Licking co., Ohio, U.S.A., 33 m. E. of Columbus. It is the trade centre of an agric. region, and manufs. stoves, steel, and furnaces, bottles, glass, crockery, etc. Denison Univ. is situated here and it is a summer resort. Pop. 31,400. 3. City and port of entry of New Jersey, U.S.A., co. seat of Essex co., on N. Bay, about 8 m. W. of New York. There is a Rom. Catholic cathedral, and the city is the see of a Rom. Catholic and of a Protestant episcopal bishop; 30,000 workers are employed in nineteen assurance companies. The manuf. of shoes and other leather products, especially patent leather, became an important industry early in the nineteenth century. Other manufs. are felt hats, carriages, chairs, jewellery, clothing, brass- and iron-work, machinery, chemicals, varnish, enamelled goods, corsets, cigars, buttons, and art pottery. There is an airport. Pop. 429,700.

Newbattle, par. in the co. of Midlothian, comprises the vills. of Newtonrange (pop. 6000) and Easthouses (pop. 1800), principally mining. Newbattle Abbey, 1 m. S. of Dalkeith, was built by David I. in 1140.

New Bedford, seaport city of Bristol co., Massachusetts, U.S.A., on Buzzard's Bay, 55 m. S. of Boston. It was once the centre of the Amer. whale-fisheries. Oil refining, tanning, boot and shoe making are carried on, besides the manuf. of silk and woollen goods. It has oil and candle factories, soap factories, sev. large cotton-mills, hoop-iron manufactories, and barrel factories. Of late years the oil business has declined, but N. B. has become one of the chief raw cotton concentration points in the E. It manufs. also cotton-spinning machinery, cotton goods, silk, and cut glass. It is a summer resort and has a textile school. Pop. 110,300.

New Bern, city and co. seat of Craven co., N. Carolina, 85 m. N.E. of Wilmington. Its chief manufs. include lumber, turpentine, and cotton goods. Pop. 11,800.

Newbery, Francis (1743-1818), Eng. publisher, was the son of John N., whose business he inherited in 1767. Subsequently the firm was N. & Harris, and in later years it was known as Griffiths & Farran. As a publisher N. did not show the acumen or industry of his father.

Newbery, John (1713-67), Eng. publisher and bookseller, b. at Waltham St. Lawrence, Staffordshire. When seventeen years old he went to Reading and procured employment in the *Mercury* offices. In 1745 he opened a publishing house in St. Paul's Churchyard; here he started newspapers, and amongst his contributors were Johnson and Goldsmith. He had often meditated a library for young people, and the venture, when made, proved a great success. The well-known books, *Goody Two Shoes* and *Tommy Trip and his Dog Growler*, may be recalled, also the *Lilliputian Magazine*. It seems

that the writers of these stories under the titles 'The Renowned Story of Giles Gingerbread' and 'Miss Margery Two Shoes' were the brothers Giles and Griffith Jones. They appeared in N.'s Juvenile Library and also in the 'Lilliputian Histories' written by the Jones brothers.

Newbold and Dunstan, see WHITTINGTON and NEWBOLD.

Newbolt, Sir Henry John (1862-1938), Eng. barrister, author, and poet, b. at Bilston, Staffordshire, where his father was vicar. He was educated at Clifton College, Bristol, and Corpus Christi, Oxford. Called to the Bar in 1887, he practised for two years. He edited the *Monthly Review*, 1900-4. In 1892 his first book, *Taken from the Enemy* (a Napoleonic novel), was pub., and in 1895, *Mordred*, a tragedy. But his fame rests chiefly on the poems in *Admirals All* which appeared in *Longman's Magazine*, in 1897. He was knighted in 1915 and became a C.H. in 1922. He also wrote *The Island Race* (1898); *Stories from Froissart* (1900); *The Sailing of the Longships* (1902); *Songs of the Sea* (1904); *The Year of Trafalgar* (1905); *The Old Country* (1906); *Songs of the Fleet* (1906); *The Twynmans* (1911); *Poems, New and Old* (1912); *Book of the Blue Sea* (1914); *Book of the Thin Red Line* (1915); *Tales of the Great War* (1916); *Book of the Happy Warrior* (1917); *Book of the Long Trail* (1919); *Book of Good Hunting* (1920); *Naval History of the War* (1920); *Studies, Green and Gray* (1926); and *New Paths on Helicon* (1927). N.'s romances had their own charm, but they were not altogether successful in challenging the conventional methods of the historical novel. His *The Year of Trafalgar* (1905) works out a convincing explanation of Nelson's and Collingwood's tactics in the battle, and, with its appendix of Trafalgar poems and ballads, made him a reputation as a naval historian as well as a naval poet. Some years later he was invited to complete the work of Sir Julian Corbett as the official naval historian of the First World War. His own unofficial naval hist. is written with more freedom. He was prof. of poetry in the Royal Society of Literature from 1911 to 1921. See W. Archer, *Poets of the Younger Generation*, 1902, and C. Kernahan, *Six Famous Living Poets*, 1922.

Newbridge, tn. in co. Kildare, Eire, on the Liffey, 4½ m. N.E. of Kildare. Pop. 4000.

New Brighton: 1. Bor. of Beaver co., Pennsylvania, U.S.A., 27 m. N.W. of Pittsburg, connected with Beaver Falls by a bridge. Its chief manufs. are flour, lumber, pottery, carriages, nails, bricks, and machinery. Pop. 10,000. 2. Tn. on Staten Is., New York city, incorporated with the bor. of Richmond in 1898. 3. Watering-place in the co. of Cheshire, England, 4½ m. N.W. of Birkenhead. Pop. 11,000.

New Britain: 1. largest is. of the Bismarck Archipelago in the Pacific Ocean, off the coast of Papua, has a mean breadth of 50 m. and is 300 m. long. It is very undeveloped except on the Gazelle

Peninsula in the N. and in the S., where there are some plantations. The interior is but little known. A mt. chain traverses the entire length of the is. and there are active volcanoes, including the peak called the Father (7500 ft.). There are some good harbours, but Simpson harbour, in Blanche Bay, is the only one visited regularly by oversea shipping. Copra is the chief product, and coffee and cocoa are also cultivated. Gasmata, on the S. coast, is a gov. station, and Rabaul (non-native pop. 4700) has a good anchorage. It was repeatedly bombed by aircraft, both Jap. and Australian, in the Second World War. The tn. was badly damaged, and in 1947 it was decided to make Kokopo, 14 m. S.E. of Rabaul, the administrative cap. in its place. N. B. was discovered by Dampier in 1699. The natives are Melanesians. Area of N. B. and adjacent is. is about 14,600 sq. m. Pop. (indigenous) 90,000. 2. city of Hartford co., Connecticut, U.S.A., 9 m. S.W. of Hartford. Its chief manufs. are hardware, household electrical appliances, bearings, tobacco, foundry and machine shops' goods, hosiery and knitted goods, and cutlery. Pop. 69,000.

New Brunswick: 1. E. prov. of the dominion of Canada, is bounded on the N.W. by the bay of Chaleur, on the N.E. by the gulf of St. Lawrence and the strait of Northumberland, on the S. by Nova Scotia and the bay of Fundy, and on the S.W. by the state of Maine. These waters provide the prov. with a very extensive sea coast, 500 m. in extent, and indented by spacious bays, inlets, and harbours, which afford safe and commodious anchorage for shipping. The chief are Fundy, Chignecto, and Cumberland Bays, the last two being merely extensions of the first; Passamaquoddy Bay in the S.; Verte, Shediac, Cocagne, Richibucto, and Miramichi Bays on the N.E.; and the bay of Chaleur, 80 m. long by 27 m. broad, in the N.W. The surface is for the most part flat or undulating. With the exception of the dist. in the N.W. bordering on Canada and the R. Restigouche, no portion of N. B. is very high. The shores on the E. coast, and for 20 m. inland, are flat. The most S. point is a little S. of 45° N. lat., and its most N. a little N. of 48°. To the S.W. is a group of is. belonging to the prov., the most important of which are Grand Manan, Campobello, and the W. Isles. The prov. of N. B. abounds in rivers. The prin. are the St. John and the St. Croix, the former 450 m. and the latter 100 m. in length, and both falling into the bay of Fundy; and of the rivers that flow eastward into the gulf of St. Lawrence are the Richibucto, the Miramichi, and the Restigouche. The prov. contains numerous lakes, one of which, Grand Lake, is 100 sq. m. in area. The soil is deep and fertile, over 950,000 ac. being agric. land, producing a variety of crops amongst which oats and barley are prominent. The fisheries are valued at about 5,000,000 dollars annually. The climate is remarkably healthy, the autumn, especially the season called the Indian summer, being

particularly agreeable. There is a wide variety of minerals, such as iron, copper, antimony, lead, zinc, tungsten, manganese, bituminous coal, and gypsum, but by no means all of these are worked, and the chief active mining in recent years has been in coal and gypsum. The most important iron deposits so far discovered are those in the Austin Brook dist. of Bathurst co. Limestone is abundant in the S. and the freestone of the prov., unsurpassed for beauty and durability,

Newburgh: 1. Royal and municipal burgh and seaport in Fifeshire, Scotland, on the firth of Tay. Its chief manufs. are linoleum and oilskin. It is also engaged in salmon fishing. Pop. 2,500. 2. City in Orange co., New York, U.S.A., on the Hudson R., 60 m. N. of New York. Its chief manufs. are cotton and woollen goods, silk, paper, machinery, and flour. Pop. 31,800.

Newburn, vil. and dist. in Northumberland, England, on the Tyne, 5½ m. N.W.

New Brunswick Government: Information Bureau

A RANCH IN ALBERT COUNTY, NEW BRUNSWICK

commands a high price in the U.S.A. The value of mineral production was \$4,409,064 in 1946. Lumbering and the manuf. of wood-pulp are the leading industries, but woollen goods, machinery, sugar, and paper are also manufactured. Oil and natural gas are produced. The water-power resources of N. B. are great and it is estimated that the available and developed power is as much as 169,000 h.p. The prov. is represented in the Dominion Senate by ten members and in the Commons also by ten. N. B., together with Nova Scotia, originally formed one Fr. colony, called Acadia, or New France. It was ceded to the Eng. in 1713 and was first settled by Brit. colonists in 1764. Twenty years subsequently, in 1784, it was separated from Nova Scotia, and made an independent colony. The cap. is Fredericton (10,062); the largest tn. is St. John (51,741). Area 27,985 sq. m. (Crown lands 7,500,000 ac.). Pop. 457,400. 2. City of New Jersey, U.S.A., lies on the S. bank of the Raritan R., at the head of navigation, 15 m. from its mouth and 30 m. S.W. of New York. It manufs. cotton, leather, and machinery. Pop. 33,180.

of Newcastle. It is engaged in coal-mining and iron-founding. Pop. of urban dist. 19,900.

Newbury, municipal bor. and mrkt. tn. of Berkshire, England, on the R. Kennet, 17 m. S.W. of Reading. Close by is the hamlet of Speen, built on the site of the Rom. Spina. The tn. has excellent shopping facilities and there are a few light industries. There is a well-known racecourse. During the Civil war the neighbourhood of N. was the scene of two battles, neither of them being decisive. During the second of these battles, Donnington Castle, resisted the Parliamentarians, being held by its governor Sir John Boys. One mile S.W. of N. on the Andover Road is a memorial to Lucius Carey, second Viscount Falkland, who fell in the first battle of N. Pop. 18,000.

Newburyport, city, port of entry, co. seat of Essex co., Massachusetts, U.S.A., on the Merrimac R., 37 m. N.N.E. of Boston. The prin. industries are the manuf. of boots, shoes, celluloid collars, cotton and woollen goods. The city has a safe harbour and a fishing industry. N. is a summer resort. Pop. 13,900.

New Caledonia, is. of the S. Pacific Ocean, belonging to France, and lying about 720 m. E.N.E. of the coast of Queensland in Australia, in lat. 20°-22°, 30' S., long. 164°-167° E. It is about 200 m. in length, 30 m. in breadth. It is of volcanic origin, is traversed in the direction of its length, from N.W. to S.E. by a range of mts., which in some cases reach the height of about 8000 ft., and is surrounded by sandbanks and coral reefs. There are secure harbours at Port Balade and Port St. Vincent, the former on the N.E., the latter on the S.W. part of the is. In the valleys the soil is fruitful, producing the coco-nut, banana, mango, breadfruit, etc. The sugar-cane is cultivated, and the vine grows wild. The coasts support considerable tracts of forest, but the mts. are barren. N. C. is rich in minerals: nickel, chrome, cobalt, silver, gold, lead, manganese, antimony, platinum, and zinc are all found in various parts. Copper has been worked in the N., and iron and lead exist in considerable quantities.

Polynesian immigrants have impressed themselves deeply on these Melanesian is. On the W. coast the negroid face and hair predominate; on the E. coast the finer features and the taller stature of the Polynesians are strikingly more apparent, while the tufts of the original negroid hair are lengthened out into curls or long undulations. The matrilineal exogamy-social system has evidently yielded to a system of father-right, and tribal divs. with hereditary chieftains. It is believed that the New Caledonians have been deeply influenced by the Maoris, who came to N. C. for the greenstone. The stonework and petroglyphs also seem to indicate some former immigration from the E. One of the most striking things about N. C. is the swarms of children: the average family is seven or eight and a dozen is not uncommon. One of the factors in the tranquillity of the life and the contentedness of the colonists, if not also in the ample birthrate, is the excellence of the climate, especially on the E. coast where the trade winds blow most of the year. The cap. is Noumea (10,400). N. C. is administered by a governor and privy council. There is also an elective council-general of fifteen members. There is a narrow-gauge railway from Noumea to Iuta (20 m.).

N. C. was discovered by Capt. Cook in 1774. In 1854 the fr. took official possession of it and made it a convict station. Its area is 8548 sq. m., and it has a pop. of 61,250. Dependencies of N. C. are the is. of Pines, Wallis Archipelago, Futuna and Alofi, Loyalty Is., Huon Is., Bélep Archipelago, and Chesterfield Is. See J. Macmillan Brown, *Peoples and Problems of the Pacific*, 1927.

New Castle, see CASTILLA LA NUEVA.

New Castle: 1. Co. seat of Lawrence co., Pennsylvania, U.S.A., on the Shenandoah R., 50 m. N.W. of Pittsburgh. The region is rich in coal, iron, and other minerals, and the chief manufs. are tin-plate, fire-brick, flour, steel wire, glass, and iron goods. Its shipping trade is also extensive. Pop. 47,600. 2. Co. seat of

Henry co., Indiana, U.S.A., 41 m. N.E. by E. of Indianapolis. Pop. 16,600.

Newcastle, Duke of, see CAYENDISH, WILLIAM.

Newcastle, Thomas Pelham Holles, first Duke of (1693-1768), eldest son of the first Baron Pelham, assumed the name of Holles in 1711, on succeeding to the estates of his uncle, John Holles, duke of N. He was in 1715 created duke of N. He was appointed lord chamberlain in 1717, and secretary of state for the S. Dept. in 1724. Thirty years later he succeeded Pelham as Prime Minister, and in 1757 formed a coalition with Pitt, but resigned as Bute came into prominence. He was lord privy seal in Rockingham's first administration (1765-66).

Newcastle: 1. Tn. of Natal, S. Africa, near the Drakenberg Mts., about 130 m. N.W. of Pietermaritzburg. It produces coal and petroleum. Pop. (whites) 2800; (others) 4000. 2. Tn., York co., W. Australia, 52 m. N.E. of Perth. Pop. 600. 3. Or Greater Newcastle, city and port on the Hunter R., New S. Wales, 73 m. N. of Sydney. It is the largest tn. of New S. Wales outside the metropolis, and is dependent mainly on coal-mining and the iron and steel industries. Newcastle Harbour (Port Hunter) is the second port of New S. Wales and the fourth port of Australia in regard to the volume of its shipping trade. It ships coal, iron, steel, wheat, wool, and frozen meat. Newcastle is primarily a coal-loading port, and the proximity of the coalfields has led to the estab. of important industries, including the very up-to-date iron and steel works, in the dist. (a decade ago the pop. was only 12,000). The city of Greater Newcastle is 36 sq. m. in area, including the former city of Newcastle, and ten former suburban municipalities, the union of the city with the municipalities being formed on April 2, 1938. Pop. (Greater Newcastle) 127,200. 4. Tn. of New Brunswick, on the Miramichi R., close to its mouth. Pop. 3800. 5. Seaport tn. in co. Down, N. Ireland, on Dundrum Bay, 11 m. S.W. of Downpatrick. It is engaged in fishing. Pop. 2000. 6. Mktd. tn. in co. Limerick, Eire, 26 m. S.W. of Limerick. Pop. 2800.

Newcastle under Lyme, mktd. tn. and parl. and municipal bor. of Staffordshire, England, on the Lyme brook, 2 m. W. of Stoke-on-Trent. The par. church of St. Giles has a square tower of red sandstone dating from the twelfth century, the remainder having been rebuilt between 1873 and 1876. The tn. was formerly noted for its manuf. of hats. Now the chief industries are brewing, malting, tanning, and the manuf. of army clothing, paper, cotton, etc. Pop. 77,200.

Newcast e upon Tyne, city and co., and a co. and parl. bor., of Northumberland, England, situated on the north bank of the R. Tyne, about 8 m. from the mouth of the riv. and the North Sea, and 272 m. north of London. The city is within the geographical co. of Northumberland, but was created a co. of itself by charter of Henry IV. in 1400. It was made a city in 1882. It is a quarter sessions bor.

and an assize tn., with a lord lieutenant appointed for the city apart from the co. of Northumberland. The chief magistrate of the city has been styled mayor since 1216; the title of lord mayor was conferred by letters patent in 1906. The area of the city is 11,401 ac. and it is divided into four parli. constituencies. There are nineteen municipal wards, each returning three councillors to the city council, and there are nineteen aldermen. The city is the seat of the bishopric of N., created in 1882 by the severance of Northumberland and N. from the anct. see of Durham. The city is connected with Gateshead on the opposite bank of the Tyne by a number of fine bridges.

N. has an interesting hist. and remains of its antiquity may still be seen. The lines of the Rom. station of *Pons Ælii*, situated on Hadrian's Wall (*q.v.*), are marked on the ground: many Rom. relics are in Blackgate (the Castle) Museum. According to John Leland 'the strength and magnificens of the Waulles of this towne for passith all the Waulles of the Cities of England and most of the Townes of Europa.' Of the walls so described by Leland in 1538, the greater part has now gone. Considerable portions have, however, been preserved, though for the most part in somewhat squalid surroundings. The work of building the wall, which was over 2 m. long, was begun in the latter part of the reign of Henry III. Before the Conquest the city was known as Monkchester. It owes its present name to the Norman castle built by Henry II. on the site of an older Rom. fortress. The castle belongs to the corporation, which has placed it under the charge of the N. Society of Antiquaries, whose museum of antiquities is in the Black Gate of the castle. As a port and coaling centre N. came into prominence towards the end of the fifteenth century, though coal was dug up in the reign of Edward III. According to a charter of the reign of Elizabeth, forty-eight persons were appointed to load coal here, and in 1699 200,000 chaldrons were exported. N.'s commercial prosperity is due to its position on a tidal riv. and to the large quantity of excellent coal found in the neighbourhood. The prin. docks are the Northumberland, the Albert Edward, and the Tyne. The quay (2436 yds. long), which is equipped with all mechanical appliances and communicates with Brit. Railways, forms a fine thoroughfare (Quayside) over a mile in length. It is the property of the corporation and some of the berths are of a depth of 30 ft. at low water. The banks on both sides of the Tyne are lined with wharves, factories, warehouses, and shipbuilding yards. Between the Scotswood Road, W. of the Central station, and the riv. are the Elswick shipyard, ordnance, and engineering works of Sir W. G. Armstrong, Whitworth & Company Ltd., now Vickers-Armstrong Ltd. (see also ARMSTRONG, SIR WILLIAM GEORGE, first BARON). The chief industries, apart from shipbuilding and ship repairing, are iron and steel manufactures, engineering and boiler-

making shops, locomotives, chemicala manufactories, and lead and copper works. The exports, apart from coal, are iron and steel goods, machinery, chemicals, copper, cotton, canvas, linen, woollen and jute goods, firebricks and fireclay goods, oils, oil fuel (as cargo and bunkers), pitch, tar and resin; the chief imports are burnt ore, sulphur ore, chemicals, cement, grain, fruit and vegetables, iron manufs., iron ore, petroleum, steel manufs., and timber.

Radiating from the Grey monument—an imposing 'Rom. Doric column' surmounted by a statue of the second Earl Grey, Viscount Howick, erected in 1838—Grey Street and Grainger Street are two of the most important of the streets laid out early in the nineteenth century by Richard Grainger (1798–1861), a native of N., as part of his scheme for the development of the centre of the tn. Close to the Grey monument is Eldon Square (named after the lord chancellor) containing the city memorial to the men of N. who fell in the First World War. It is an equestrian bronze representation of St. George, the patron saint of the Northumberland Fusiliers. The Central railway station was opened by Queen Victoria in 1850. Grainger's street plan was laid out before the building of the Central station in Neville Street, and at that time the most important of the approaches to the tn. from the S. was across the old Tyne bridge or from the quay; hence Grey Street was made the widest and most imposing street in the Grainger scheme. A full-length bronze statue of George Stephenson (*q.v.*) by John Lough of N. stands near the station. Here too is the Wood Memorial Hall (1870).

Among the most notable of the public buildings is the cathedral dedicated to St. Nicholas of Myra and formerly the par. church of N. It is built in the Decorated and Perpendicular styles. The earliest documentary evidence of the existence of the church dates from about 1123, but though tradition has it that the church of St. Nicholas was founded by Osmund, bishop of Salisbury, in 1091, it is believed that a church stood on the site long before then. The Norman church was destroyed by fire in 1216 and was replaced by a building in the Early Eng. style. The church as it exists to-day is, apart from the tower and steeple, mainly the work of fourteenth-century builders. The Perpendicular tower and steeple were built about 1430 by Robert Rhodes, a N. lawyer, but the name of the architect is unknown. The nearly square tower is 'singularly plain and massive in design; the whole effort of the master mason who conceived it was concentrated upon leading the eye up to its crowning feature of a central pinnacle borne by flying buttresses' (Hamilton Thompson); but the design of the tower has also been severely criticised, notably by Prof. Edward Augustus Freeman (*q.v.*). Other churches: St. Mary's Rom. Catholic Cathedral, built in 1844 from the design of Pugin. Its tall graceful spire was added in 1872. All Saints' Church was erected in

1796 on the site of an earlier church which was demolished; the most important object which survived the demolition is the magnificent brass of Roger Thornton (d. 1430), who was ten times mayor of N., and Agnes his wife (d. 1411). St. Andrew's Church dates from the middle of the twelfth century. The church of St. John the Baptist is mainly of the fourteenth and fifteenth centuries. The W. aisle of its north transept was constructed early in the fourteenth century, the nave

Remains of the Norman wall of the castle are still to be seen, for it is certain that in early Norman times a stone wall was built which, with the mound and buildings within, constituted the castle or *castellum*; but to-day the expression 'the Castle' denotes only the keep or tower. The Black Gate is a later addition built by Henry III. about 1249. Of the S. wall more extensive remains are extant, including the Eastern Gate. The keep, which is in Castle Square, was built by

Valentine and Sons Ltd., Dundee

NEWCASTLE UPON TYNE: THE BRIDGES

The Tyne bridge, the swing bridge, and the high level.

being later fourteenth-century work. On the S. wall is a memorial tablet to Richard Grainger, who was the son of a quayside porter. St. Ann's Church was built in 1768 with stones from part of the tn. wall. The church of St. Thomas à Becket was built in substitution for the old chapel of St. Thomas on Tyne bridge, which was pulled down in 1828.

The castle, which stands at the junction of Westgate Road and St. Nicholas Street, was probably called the New Castle to distinguish it from the older royal Northumbrian castle of Bamburgh, though it has been suggested that the name indicates that there was an older castle, of which nothing is known on the site, or again, that 'new' was used in relation to the *Pons Ælii*. The first castle, on the site of which we have any knowledge, was that built by Robert, the son of William the Conqueror, in 1080, of which structure, however, probably nothing survives.

Henry II. between 1172 and 1177. The original appearance of the building has been altered by the erection of battlements which were added in 1810, a feature wholly alien to the style of architecture of the twelfth century. The roof of the spacious great hall of the castle is modern. The chapel of the castle is a fine example of late Norman architecture, the arches and arcading being decorated with elaborate chevron ornamentation. In the vaulted chamber known as the guard-room is a collection of interesting relics. From the roof is an extensive view of N. and Gateshead and, between them, the Tyne spanned by five bridges: the Tyne bridge, opened in 1928 by King George V., with two main piers of steel and granite and a parabolic arch of steel lattice framework rising to a height of 193 ft. above high-water mark; the swing bridge which was opened in 1876; the high-level bridge, designed by Robert

Stephenson, son of George Stephenson, and opened in 1849; King Edward VII. bridge, opened in 1906; and the Heddergh bridge, built in 1870 but reconstructed in 1900.

The gildhall on the 'Sandhill' is the ant. centre of municipal gov. of the tn. Here also were held the sittings of the local courts of record. There is evidence of the existence of a gildhall as early as the thirteenth century. The old gildhall was rebuilt and enlarged in the middle of the seventeenth century and the new building was opened in 1658, and most of the interior of the present building dates from that time. The ground floor is now a commercial exchange. The upper floor has a large hall in which the freemen of the city still hold their gild meetings, and in which the commissions of assize are opened by the circuit judges, though all cases are actually tried at the Co. Moot Hall (1810). Opposite the gildhall is the house, No. 41 Sandhill, in which Alderman Aubone Surtees lived, and from a window in which his daughter Bessie eloped in 1772 with John Scott, son of a coalfitter and merchant, who afterwards became Baron Eldon, the famous lord chancellor. In both the 'Sandhill' and the 'Skew' may be seen some interesting old Elizabethan houses.

Opening on the quayside are a number of narrow lanes called chares (from a Saxon word meaning 'to divide'). Near the top of Pilgrim Street is High Friar Street, formerly called Greyfriar Chare, the sole topographical reminder of the existence of the once famous monastery of the Grey Friars of N. Duns Scotus is said to have been a brother at this monastery. In Northumberland Street or vicinity are many public buildings, including the Mansion House of the city, and the new city hall and baths opened in 1928. At the top of this street is the site of the Barras bridge (a small bridge over a small stream), probably a corruption of the word 'bars' or 'barriers' indicating that here were the barriers of the tn. Here is the traditional site of the long-drawn-out single combat (1388) between Harry Hotspur and the earl of Douglas before the battle of Otterburn. The Hancock Museum of Natural Hist. in Barras Bridge, opened in 1884, is a fine building containing the collections of the Natural Hist. Society of N., Northumberland, and Durham. In the galleries is a large series of the original work of Thomas Bewick (1733-1828), the famous wood engraver, who was b. near N. There are colleges of medicine and science belonging to the univ. of Durham, the Rutherford College and Commercial Institute, and the Royal Free Grammar School (1525). The King's College was founded in 1871 as Armstrong College, the title being changed in 1937. The main block of buildings was opened by King Edward VII. in 1906. Among the scholars of the grammar school were Adm. Lord Collingwood, Lord Eldon, Lord Stowell, and Mark Akenside. The old school buildings were demolished in 1844, the new buildings in Jesmond being occupied in 1906. The

Central Public Library contains over 90,000 vols., apart from MSS. Behind the library is the Laing Art Gallery containing a permanent collection of Brit. water-colour drawings dating from the late seventeenth century.

The chief residential suburb is Jesmond (Jesus Mt.). There are a number of parks and recreation grounds, including Jesmond Dene, Brandling, Armstrong, and Heaton Parks, the Town Moor and Castle Leazes. Among the societies founded in N. are the Tyneside Naturalists' Club (1846), the North of England Institute of Mining Engineers (1852), the N. Society of Antiquaries, and the Fine Arts Society. Pop. (estimated 1949), 390,400. See J. Brand, *History and Antiquaries of Newcastle*, 1789, and F. A. Wills (ed.), *The City of Newcastle upon Tyne*, 1949.

Newchwang, Nuiehwan, or Yingkow, treaty port in S. Manchuria, China. The tn. proper stands on the Liao R., 40 m. from the coast, but the name is usually applied to the port, 30 m. nearer the coast of the gulf of Laotung, which was originally called Muh-kow-ying. The Liao R. is here about $\frac{1}{2}$ m. wide, but the port is ice-bound in winter. The surrounding country is flat and marshy. The chief industry is the manu. of bean oil and bean cake which form the chief exports, with raw beans, ginseng, and raw silk. There are gold, iron, and silver mines. The U.S.A. and Great Britain abrogated their extra-territorial rights in 1943. Pop. 106,000.

New College, Oxford, founded by Wm. of Wykeham in 1379 as the college of St. Mary of Winchester, the other title arising from the existence of St. Mary's College. The fine buildings still retain much of the founder's design, and are notable for the chapel containing his pastoral staff, also for the cloisters (consecrated in 1400), and the massive detached tower. New buildings have been added. The lovely grounds contain portions of the old city wall. The original link with Winchester is maintained by the reservation of five scholarships to boys from Winchester College. Five fellowships are known as Wykeham professorships.

New Columbia, see WRANGEL ISLAND.

Newcomb, Simon (1835-1903), Amer. astronomer, b. in Nova Scotia. In 1859 he was appointed prof. of mathematics to the U.S. Navy, and later astronomer at the naval observatory, Washington, where he superintended the erection of the 26-in. equatorial telescope. From 1871 to 1874 he was secretary to the U.S. commission for observing the transit of Venus, and in 1882 observed the same at the Cape of Good Hope. From 1881 to 1893 he was prof. of mathematics and astronomy to Johns Hopkins Univ. He interested himself in the eclipses recorded by Ptolemy in the *Almagest*, and by the Arabian and later astronomers to the eighteenth century. N. studied chiefly the problems of gravitational astronomy. He wrote numerous books on astronomy and sociology, *Popular Astronomy* (1878) having a wide circulation. His *Reminiscences of an Astronomer* was pub. in 1903.

Newcomen, Thomas (1663-1729), Eng. inventor of the atmospheric steam-engine, b. at Dartmouth. In 1705, together with Savery and John Calley, he took out a patent for a 'fire-engine' notable for its safety and economy. The engine of James Watt improved upon this by the use of a separate condenser. In 1723 he set up an engine for drawing water at Griff, near Coventry.

New Deal, policy adopted by President Franklin Roosevelt in 1933 to overcome the crisis which threatened the collapse of the economic system of the U.S.A. Up to the time of the N. D. the states were presumed to have jurisdiction over almost all matters of a social character; thus the hours and wages of labour, the conditions of factory work, the welfare of women and children, education, etc., were all matters of state, not federal, concern. The N. D. changed this, but it required a national catastrophe to justify, and a bold administration to attempt, the change; and it was carried out only over the determined opposition of the supreme court. The N. D. legislation, which President Roosevelt's administration introduced, consisted partly of measures for recovery and relief, partly of measures for reform. It comprised a series of far-reaching economic and social measures, which reversed previous attempts to end the depression by ordinary deflationary means, and it was largely designed by a body of profs. and other expert advisers (nicknamed the 'Brain Trust') in 1932. The starting-point was the National Industrial Recovery Act of 1933, which, together with its agric. corollary, the Agricultural Adjustment Act (providing for large-scale assistance to farmers), placed control of industry and agriculture in the hands of the President. It set on foot a generous programme of expenditure on public works, so as to stimulate business and provide employment; aims which were helped by devaluation of the dollar by 40 per cent., and by the formation of the Reconstruction Finance Corporation, which granted the necessary loans, and by the abandonment of the gold standard. It inaugurated a comprehensive programme for the conservation of natural resources, one of the chief instruments of which was the Civilian Construction Corps, which gave work to some 3,000,000 young men. It set up elaborate systems of unemployment relief, and, by 1940, some sixteen billion dollars had been spent on direct relief and seven billion on public works. Workers were encouraged to form trade unions by the Wagner Labor Relations Act, 1935, which Act, with the Fair Labor Standards Act, 1938 (designed to provide reasonable hours and wages), were improvements on the labour provisions of the National Industrial Recovery Act of 1933, which latter Act had been voided by the court in 1935. A scheme of social insurance was introduced by the Social Security Act. The Banking Act and the Securities Exchange Commission placed financial control in the hands of the administration, thereby breaking the power of Wall Street. The N. D.

raised taxes on the incomes of the rich and of corporations. It set up the highly successful Tennessee Valley Authority to develop the resources of one of the great interior basins of the country through the use of state-owned hydro-electric dams. In the field of labour, the N. D. enacted a series of epoch-making laws; while among reforms in administration was the Hatch Act, which was directed against 'pernicious political activities' on the part of gov. employees and the corruption and extravagance of political parties. Essential parts of the National Industrial Recovery Act were declared invalid by the supreme court on May 27, 1935, and part of the Agricultural Adjustment Act on Jan. 6, 1936, but the chief economic institutions inaugurated on the basis of those Acts remained in existence and exerted a considerable influence on Amer. developments. The N. D. policies did not end unemployment, but certainly reduced the numbers (17,000,000) by anything up to 10,000,000.

To many contemporaries the N. D. seemed like a revolution, but in reality it was conservative in the same sense that the democratic policy of Jefferson and Wilson had been conservative. Its aim was to protect, against violation from the left or the right, the essentials of Amer. democracy, namely, the balance of interests under the constitution and security for property and for men. If in its philosophy the N. D. was democratic, in method it was evolutionary. 'Because for fifteen years legislative reforms had been dammed up, they now burst upon the country with what seemed like violence, but when the waters subsided it was clear that they ran in familiar channels (Nevins and Commager). The conservation policy of the N. D. had been begun by Theodore Roosevelt; railroad and trust regulation was initiated some fifty years earlier; banking and currency reforms had been advocated by Bryan and, to some extent, achieved by Wilson; farm relief programme owed much to the Populist party of the nineties; while in the sphere of international relations its policies were really continuations of the traditional policies of strengthening national security, maintaining the freedom of the seas, supporting law and peace, and championing democracy in the W. world. See A. M. Bingham, *Challenge to the New Deal*, 1934; T. E. Dewey, *The Case Against the New Deal*, 1940; J. T. Adams, *The Epic of America*, 1940 ed.; A. Nevins and H. S. Commager, *America; the Story of a Free People*, 1912; and Frances Perkins, *The Roosevelt I Knew*, 1947.

Newdigate, Sir Roger, fifth Baronet (1719-1806), Eng. antiquary, was a collector of ant. marbles, vases, and books. He is, however, now principally remembered as the founder of the N. prize for Eng. verse at Oxford.

New Economic Plan, see *RUSSIA, History*.
New England, collective name applied to the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Is., and Connecticut, in the N.E. of the U.S.A. Area 61,976 sq. m. The coasts were

explored by Sir Humphrey Gilbert in 1583, and the dist. in 1614 by Capt. John Smith, who suggested the name.

New English, *see under* ENGLISH LANGUAGE, *Old English*.

New European Order, *see* NEW ORDER.

New Forest, name of a dist. in Hampshire (*q.v.*), triangular in shape, and bounded on the W. by the R. Avon, on the S. by the coast, and on the N.E. by a line running from the borders of Wiltshire along Southampton Water. Area about 145 sq. m. This triangle appears to have been a great wooded dist. from the earliest times and its present name dates from the Norman Conquest, when it was regularly afforested. Since that period it has remained a possession of the Crown. The prin. trees in the forest are the oak and beech, with large patches of holly as underwood. The oaks have been much used as timber for the Brit. Navy. The afforestation of this dist. by the Conqueror, enforced by savage forest laws, was regarded as an act of the greatest cruelty, and the violent deaths met by both of his sons, Richard and Wm. Rufus, both of whom d. from arrow wounds in the forest, were looked upon as judgments of Providence. A small breed of ponies wild under its shelter. Among the places of interest in the forest are the vil. of Minstead, and its church with a three-towered pulpit and two galleries; Lyndhurst (*q.v.*) and its Vorderers Hall; Wilverley Post, with fire watch-tower; Winchelsea Moor; Brockenhurst; and Beaulieu, with its ruined abbey of King John's time. Under a Bill introduced in the House of Lords at the end of 1948 the verderers may authorise, on terms, the enclosure by the Forestry commissioners of up to 5000 ac. of forest land for the growth of timber; and also the enclosure, temporarily, of the auct. and ornamental woods so as to secure their preservation for regeneration. The verderers may also agree with the Ministry of Agriculture for the enclosure of up to 3000 ac. for cultivation and the improvement of grazing. Finally, the Bill provides for the reconstitution of the Court of Verderers. Of the ten verderers one will be the official verderer, five will be elective, and four will be appointed by the Ministry of Agriculture, the Forestry Commissioners, the local planning authority, and an amenity preservation society to be designated. The Bill extends the purposes for which the verderers may make or alter by-laws. *See* J. R. Wiso, *The New Forest, its History and Scenery*, 1883; R. L. P. Jowitt, *Hampshire*, 1949; and B. Vesey-Fitzgerald, *Hampshire and the Isle of Wight*, 1949.

New Forest Pony, *see under* HORSE.

Newfoundland, is. prov. of Canada, formerly a Brit. dominion, situated between 46° 37' and 51° 39' N. lat., and 52° 35' and 59° 25' W. long., on the N.E. side of the gulf of St. Lawrence; the greatest length from N. to S. is 350 m., and average breadth about 130 m. Its estimated area is 42,734 sq. m. and pop. at the last census 318,177 (including Labrador). In

shape it resembles an equilateral triangle, of which Cape Hault on the N., Cape Race on the S.E., and Cape Ray on the S.W. form the angles. By the decision, on March 1, 1927, of the Judicial Committee of the Privy Council, the Atlantic watershed of the Labrador peninsula, including the basin of the Hamilton, was awarded to Newfoundland (*see* LABRADOR). The remainder of the Labrador peninsula forms part of Quebec prov. The boundary was fixed as follows: A line drawn due N. from the E. boundary of the bay of Ance Sablon as far as 52° N. lat., thence W. up to the Romaine R., and then N. along the l. b. of that riv. and its head waters to their source, thence due N. to the crest of the watershed, and thence W. and N. along the crest of the watershed of the rivs. flowing into the Atlantic until it reaches Cape Chidley, at the entrance to Hudson Strait. The is., as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mts., marshes, barrens, ponds, and lakes. The mts. in the Avalon Peninsula (stretching S.E. from the main portion of the is., and connected with it by an isthmus of only about 3 m. in width) rise, in some cases, to 1400 ft. above sea level; and along the W. shore the height of 2500 ft. is frequently reached. The number of lakes is remarkable, and it has been estimated, though perhaps with some exaggeration, that about one-third of the whole surface is covered with fresh water. The 'barrens' occupy the tops of hills. The coast-line is everywhere deeply indented with bays and estuaries affording safe harbours. Of these inlets the prin., beginning from the N. extremity of the is., are Hare, White, Notre Dame, Bonavista, Trinity, Conception, St. Mary's, Placentia, Fortune, St. George's, and St. John's Bays. The rivs., none of which are navigable for any distance, link the lakes of the interior with the shore, and are narrow and winding; occasionally they are used to drive machinery. The main streams are the Exploit, with its trib. the Great Ratling, and the Humber. The soil is sterile and unproductive, although there is considerable cultivation along the seaboard of the settled dists. As regards the strip of Labrador assigned to Newfoundland in 1927, the outside coast-line is bleak, but the shores of the bay and rivs. are well wooded, and in some cases densely so, the timber being high and sound. The temp. of the interior is similar to that of N. Canada.

There are in Newfoundland about 4000 permanent inhab. (1300 Eskimos, the remainder being of Brit. descent), occupied in the fisheries and in trapping. The pop. is greatly increased in summer by fishermen and sportsmen. The Newfoundland cod fishery is world famous and has been the mainstay of the is. since first it became permanently settled. Salmon, halibut, lobster, herring, caplin, and seal are also caught; the whale fishing has declined. Battle Harbour (strait of Belle Isle) is the chief port. The chief exports consist of dried cod (10,000,000 lb. in 1940), halibut (396,000 lb.),

pickled herring (7,500,000 lb.), lobsters (2,440,000 lb.), salmon (3,440,000 lb.), iron, fish oils, zinc and lead and copper concentrates, sealskins, and pulpwood. The chief export to the United Kingdom and the U.S.A. is paper; to Canada, iron ore. The total value of exports, 1946-47, was \$62,427,305. Great beds of hematite iron ore have been found at Bell Is., Conception Bay, and large quantities are being exported. Buchan's Mine, Red Indian Lake, produces lead and zinc concentrates. Copper is worked in Notre Dame Bay, coal is known to exist in St. George's Bay and in the Grand Lake dist., and silver, nickel, chromium, antimony, asbestos, and vanadium are also found, but they have not yet been shown to be commercially workable. Over 20,000 tons of fluor spar were exported in 1946. The estab. of large and well-equipped paper mills at Grand Falls by the Anglo-Newfoundland Development Company opened up a very large industry. This company also operates a large mill at Bishop's Falls. The paper is shipped to the United Kingdom and used in the prin. London printing offices. A model tn. has been laid out with all necessary public utility services. Botwood is the prin. port for summer shipments from the Grand Falls mills. There are also large paper and pulp mills at Corner Brook. These were formerly owned and operated by the International Paper and Paper Company, but were taken over by a subsidiary of the Howarth's Paper Mills. The total export of newsprint in 1938 was 263,000 tons, and of pulpwood 99,000 cords. Local secondary industries carried on at St. John's and outposts include aerated waters, breweries, boots and shoes, leather, and mattresses. By the Education Act, 1927, the central administration is vested in the Bureau of Education, presided over by the Prime Minister. A general training school for teachers was opened in 1921, and in 1925 the Newfoundland Memorial Univ. College was opened. Chief tns., St. John's (cap.), 56,700; Bell Is., 7020; Corner Brook, 5400; Grand Falls, 4500; Bonavista, 4200; Carbonear, 3400; Twillingate, 3400, and Harbour Grace, 2300.

History.—The early hist. of Newfoundland is obscure. It was discovered June 21 1497, by John Cabot. It was visited by the Portuguese navigator, Gaspar de Cortereal, in 1500, and within two years regular fisheries had been estab. on its shores by the Portuguese, Biscayans, and Fr. Sir Humphrey Gilbert, with his ill-fated expedition, arrived in St. John's harbour, Aug. 1583, and formally took possession of the is. in the name of Queen Elizabeth. On the return voyage the expedition was scattered by a storm, and the commander lost. The hist. of the is. during the seventeenth and part of the eighteenth centuries is little more than a record of rivalries and feuds between the Eng. and Fr. fishermen; but by the treaty of Utrecht (1713) the is. was ceded wholly to England. A representative assembly was created in Newfoundland in 1832. In 1846 a terrible fire destroyed half the cap.,

a hurricane overwhelmed a large number of fishing craft, and the potato crop failed through blight. In 1855 the is. was given responsible government. In 1860 the fishery partly failed, a reminder that Newfoundland depended primarily on the bounty of nature, and this period of adversity only ended in 1869. Two years previously Newfoundland seemed to be enthusiastic for membership of the Canadian Confederation and provision to that effect was actually made in the draft of the British North America Act. Opposition to the Federal party in Newfoundland, however, resulted in the is. refusing to join, the reasons being a fear of Canadian dominance, the is.'s interests as a fish producer, and the vagueness of the terms offered. In 1880 the first Railway Bill was passed for the construction of a light railway from the cap. to Hall's Bay, and by 1884 the line was completed as far as Harbour Grace, but it was not until 1891 that it was extended to Trinity and Bonavista Bays. In the eighties there were difficulties with the U.S.A. over fishing rights in Brit. N. Amer. waters and the ensuing negotiations resulted in a treaty which provided for delimitation; but it was only in 1912 that this question was finally settled by a new treaty. Meanwhile Amer. fishing vessels had been given, as from 1888, the right to facilities and amenities by ann. licence at a fee of \$1.50 a ton. In 1894 the banks failed owing to the failure of customers to realise on their catches of fish, and one effect of this crisis was to expose the weakness of the credit system on which the fishing industry was conducted, and the distrust engendered in the confused conditions of this period has never been wholly dispelled, while the effect on the morale of the people was both deep and permanent. In this period of economic adversity Newfoundland sought admission to the Dominion of Canada (see also *Federal Union with Canada* below).

The period from 1890 to 1914 was one of abundant promise, marred at first by a lack of statesmanship which nearly prejudiced the future of the is., and in its final stages by a programme of public expenditure which, if well intentioned, was economically unsound. Long previously the is.'s gov. should have realised the disadvantages resulting from dependence on a single industry, the fisheries. With the estab. of the Anglo-Newfoundland Development Company's pulp mill at Grand Falls, the development of the iron-ore mine at Bell Is., the completion of the railway, and the opening up of the W. coast to settlement, it was felt that Newfoundland had gone far towards freeing itself from complete dependence on the fishery, but this could only be the case if the price of the chief fish, the cod, remained high in the world's markets. After the First World War an illusory prosperity from the high price of cod was to prove the undoing of the is.'s whole economy when the world depression of the 1930's hit Newfoundland. Newfoundland had lived beyond its means and continued to do so in spite of the fall in the price of

its fish. Furthermore the natural resources of the is. had been recklessly dissipated, the land mostly being held for speculative purposes instead of being developed. Moreover there were political malpractices, and it was the rule rather than the exception that members of an administration and their supporters obtained what benefits they could during their party's tenure of office. Hence the budget remained unbalanced for twelve successive years, and the interest charges on the public debt amounted to over 50 per cent of the average ann. revenue, there being no provision for a sinking fund.

The Brit. Gov. then appointed a commission of gov. of six (three from the United Kingdom and three from Newfoundland) under the chairmanship of the governor, and this new form of government assumed office on Feb. 16, 1934, and was still in being, albeit with changes in personnel, when the Second World War broke out.

The loyalty of the Newfoundlanders is proverbial. They are exclusively Brit. and native born, and the overwhelming majority are of Eng. or Irish descent, and not more than three or four generations removed from those born in the mother

NEWFOUNDLAND: DRYING COD IN WITLESS BAY

R.N.A

In 1928 Newfoundland was rapidly approaching insolvency, but there was no change in policy and further external loans were raised in 1928, 1929, and 1930. There was in fact a continuance of misgovernment which only served to increase the burden on the fisherman and on the poorer members of the community (see the report of the Amulree Royal Commission, 1933). This commission was sent out to investigate the financial situation. Its report recommended that the existing form of government should be suspended and that a special commission of government should be formed with full legislative and executive authority, subject to the supervisory control of the Imperial Gov. in London. In fact, the Brit. Gov. assumed responsibility for the is.'s finances until such time as Newfoundland might again become self-supporting.

The call of Britain's danger has always stirred the blood of the fishermen and lumbermen of Newfoundland. The outstanding seamanship of their fishermen has long been known in the R.N., and the special branch of the R.N.R., recruited exclusively from the is. seamen, was formed at the beginning of this century. Newfoundlanders were present at the historic exploit of the *Vindictive* at Zeebrugge and at Suvla Bay in the First World War. On the W. front in that war they fought at Beaumont-Hamel, Monchy-le-Preux, and Ypres. At Beaumont-Hamel—where there is a memorial to them—on July 1, 1916, they went into action 753 strong, but next day only sixty-eight answered the roll-call. In the Second World War men were recruited for heavy artillery brigades, for the Newfoundland Regiment, and as air pilots.

Owing to wartime employment revenue became more buoyant, but the surplus of \$2,250,000 owed something to the suspension of expenditure on the gov.'s plan for rural reconstruction.

In the Second World War some 7000 men joined the Brit. forces, in addition to 1000 enlisted in other dominion contingents and 3600 who served as lumberjacks in the forestry unit in Great Britain. Many of the islanders enlisted in brigades of heavy artillery, rendering distinguished service. Facilities for the estab., use, and protection of naval and air bases on the Avalon Peninsula and on the S. coast of Newfoundland were granted to the gov. of the U.S.A. in Sept. 1940. Under an agreement made in May 1946 between the govts. of Canada, Newfoundland, and the United Kingdom respecting defence installations constructed in the Is. during the war, Canada gave back the control and operation of the airport at Gander and the seaplane bases at Glen Eagles and Botwood to Newfoundland, and with a view to facilitating the development of the Gander airport as a civil airport, Canada gave up its rights under the lease granted in 1941. In consideration of taking over all the buildings, hangars, and works constructed by Canada at Gander the Newfoundland Gov. agreed to pay by instalments the sum of \$1,000,000. Under the same agreement the title to the lands of Torbay airport, in accordance with the understanding between the two govts. at the time that airport was constructed, was vested in the gov. of Canada for operation as a commercial airport for the air service between Newfoundland and Canada, but with equal facilities to the civil and military aircraft of both countries. The last article of this agreement provided for joint consultation between all three parties to the agreement on the co-ordination of defence requirements in the Is. Canadian and United Kingdom military aircraft have the right to fly over Newfoundland and use its airports without payment of landing fees.

Federal Union with Canada.—In 1947 representatives of the Canadian Gov. and of the Newfoundland National Gov. met at Ottawa to determine whether an equitable basis could be found for federal union between the two countries. During the war, in July 1943, Mr. Mackenzie King (q.v.) in the Canadian House of Commons stated that his gov. would give sympathetic consideration to any request by Newfoundland for incorporation in the dominion. The door was thus reopened for consideration of an old and difficult controversy, perhaps under more hopeful auspices than on previous occasions. In 1864 Newfoundland had been invited to join the provs. of Brit. N. America, which, in view of their strategic situation during the Amer. civil war, were then contemplating the federal union that subsequently evolved into the dominion of Canada; but after attending the preliminary negotiations Newfoundland withdrew. Thirty years later (1894) the position was reversed. Canada was advancing in pop.

and wealth, whereas Newfoundland was insolvent; and a delegation went to Ottawa to discuss the possibility of terms of admission; but when Canada was asked to assume the whole public debt of Newfoundland, which was then standing at \$16,000,000, the negotiations again broke down. Thirty years later still the position was again reversed following the Privy Council award in 1927 to Newfoundland of a large strip of Labrador. Newfoundland thus technically became a continental power and Canada suggested union, but this time Newfoundland objected. Within ten years the Is. was again insolvent, as shown earlier in this article. From 1934 Newfoundland was administered by a commission appointed from London and under this body the economic position improved, but politically it could hardly be more than an interim solution and the time therefore seemed opportune for a renewal of the discussion. The public debt had by 1943 increased from \$16,000,000 to \$100,000,000, but what was an insuperable objection in 1894 appeared less in proportion to the dominion of 1943, while on the other hand the potential resources of Newfoundland in timber, fish, and minerals are considerable, and while their development may be beyond the power of the 300,000 islanders the support of the great dominion may well remedy that difficulty within a few years.

Question of the Status of Newfoundland.—From 1941 there was a decided change in the employment situation and this was reflected in the revenue returns, which showed a surplus for the first time for many years, the surplus in 1943 44 being nearly \$10,000,000 on a revenue of \$28,601,000. This change was not due to any industrial revival but merely because of the Allies' use of the strategical advantages of Newfoundland as a defence base, which meant remunerative work in almost every class of employment. It was realised that this prosperity was transitory, though it had not ended in 1947-48 when the estimated revenue of \$33,702,500 was higher than in any year excepting 1946-47, basic industries operating to capacity, while there was still full employment at the airports and the Amer. bases. In these circumstances a movement was started to urge the redemption of the pledge made by Britain in 1934 that, when the Is. was again self-supporting, the former constitution would be restored. To ascertain whether Newfoundland was restored to a self-supporting basis and what form of gov. the people desired, the Brit. Gov. in Oct. 1946 set up an elected National Convention of forty-five members to make recommendations on possible future forms of gov. which should be placed before the people in a referendum. The Convention was in session for fifteen months and cost over a million dollars. It was interested at first in two things only, the restoration of responsible gov. or the retention of commission gov. The deliberations were protracted by reason of the fact that in the meantime the question of union with Canada was under discussion be-

tween the Canadian Gov. and a delegation who went to Ottawa to ascertain 'what fair and equitable basis might exist for federal union with Canada.' Three months later the delegation returned with terms which seemed adequate and even generous; but there were fears in Newfoundland about income tax and Canadian competition in trade. The anti-Confederates suggested that the terms had not been negotiated (the members of the Convention were ordinary citizens and in most cases lacked the knowledge necessary to deal with involved financial and economic matters) and that in any case terms should only be discussed by a properly constituted Newfoundland Gov. In its final vote (Jan. 28, 1948) the Convention decided by twenty-nine votes to sixteen that union with Canada should not be recommended as a possible choice. Instead the Convention recommended two choices only for the ballot paper, the continuation of commission gov. and the return of responsible gov. But the Convention did not have the last word. It merely made recommendations to the Brit. Gov. and the latter decided that three choices should be placed before the people, including union with Canada, included because there was a substantial minority in the Convention in favour of considering it. There were manifest advantages in joining Canada, including substantial financial grants and social service benefits. The result of the first referendum showed over 60,000 votes each for confederation with Canada and a return to responsible gov. and only 22,000 for the retention of gov. by commission. As none of the three choices secured a vote greater than the combined total of the other two a second referendum was thought to be necessary. But on July 22 a referendum was held only as between a return to responsible gov. and union with Canada. At this referendum a clear vote was secured in favour of Canadian confederation, despite much bitter feeling among a large section of Newfoundlanders. It then only remained for Newfoundland representatives to negotiate with the Canadian Gov. for the final terms of union for submission to the Canadian Parliament, with whom the final decision rested.

The terms of the agreement for taking Newfoundland into the Canadian confederation were signed in Ottawa on Dec. 11, 1948, by representatives of the Canadian Gov. and the Newfoundland delegation, the operative date for union being March 31, 1949, subject to the approval of the terms by the Canadian Parliament and the Newfoundland Gov. The Canadian Commons having passed the necessary resolution, and the Newfoundland Gov. also assenting to the terms, the Brit. Gov., in accordance with the joint request of Canada and Newfoundland, gave its assent to union by an Act of Parliament confirming the agreement. Under the agreement the services taken over by the dominion gov., thereby relieving the new prov. (now the tenth prov. of Canada) of the public costs incurred in respect of them after they had

been taken over, were: the Newfoundland railway, including some shipping and other marine services; the Newfoundland Hotel; telegraphic services; civil aviation; customs and excise; defence; protection of fisheries; geological, topographical, geodetic, and hydrographic surveys; light-houses, buoys, and beacons; radio broadcasting system; and some other public services.

Newfoundland Dog. Few breeds of dog are associated with so many accounts of canine instinct, devotion, and sagacity as the N. D., which was introduced, probably in the late eighteenth century, from Brit. N. America, where it had been accustomed to a very hard life on rough

T. Fall

NEWFOUNDLAND DOG

fare, and had long been bred for intelligence and taught to take to water without hesitation. It is in fact unrivalled as a water dog, and is much assisted by the oily nature of its dense, straight coat and by its partly webbed feet. Newfoundlanders of the time when Sir Edwin Landseer immortalised the breed by his painting, 'A Distinguished Member of the Humane Society,' were of various colours. But there are now two established varieties, the black and the white and black. Other colours, such as bronze or red and white

are not favoured. In both varieties the head is broad and massive, with short and square muzzle, small ears, and small deep-set eyes without hairs. The back is broad, neck strong and short, legs very strong, and the feet large and round. The chest is deep and broad, and the tail thick and long enough to reach just below the hock. The general appearance is that of a dog of great strength and activity for its build and size. The movement is free, and the loose swinging of the body between the legs, giving a slight roll to the gait, is characteristic. According to the Newfoundland Club's standard, the weight should not be less than 110 lb. for a bitch and not more than 140 lb. for a dog, while the average height is put at 25 to 27 in. respectively, but considerably larger animals are not uncommon. Newfoundland puppies need plenty of lean meat, both raw and cooked, as soon as they are able to take it, and they must have regular and frequent exercise.

Newgate Prison, former prison in London, situated at the W. end of Newgate Street, opposite the Old Bailey. It was begun in the reign of Henry I., and is mentioned as a prison in 1207. In 1241 a sum of 20,000 marks was exacted from wealthy Jews of London to repair the structure. In the fifteenth century funds for its rebuilding were left by the will of Sir Richard Whittington. It was destroyed in the Great Fire of 1666, but rebuilt about 1770. It suffered much damage by fire during the No-Popery riots of 1780, when 300 prisoners were let loose (see Dickens's *Barnaby Rudge*). Mrs. Fry began her labours for the improvement of the condition of prisoners there in 1808, and it ceased to be used as a debtors' prison in 1815 and as a place of incarceration in 1877. Executions took place within it after 1868. In 1904 it was demolished, and the site is now occupied by the Central Criminal Court. The noted prisoners who have been confined in it include John Wilkes, Daniel Defoe, Jack Sheppard, Titus Oates, and Wm. Penn.

New Georgia Archipelago (Pacific Ocean), see SOLOMON ISLANDS.

New Glasgow, tn. of Pictou co., Nova Scotia, Canada, on East R., 10 m. S.E. of the seaport of Pictou. There is an important shipbuilding industry, rolling and steel plate works, car works, potteries, and saw mills. Coal-mines are worked in the neighbourhood, and agriculture is carried on. Pop. 9210.

New Granada, see COLOMBIA.

New Guinea, large island (the next in size to Australia) in the E. archipelago, lying N. of Australia and separated from it by the Arafura Sea and Torres Straits (80 m. wide). Length (E. to W.) about 1500 m.; breadth 30 to 430 m.; area about 300,000 sq. m. It is divided politically between Great Britain (the S.E. or Papua, and the N.E. mandated ter. of N. G.), and Holland (W.). The N.E. was held by Germany until it was taken by an Australian force for Great Britain in Sept. 1914. It is now held under a mandate by the Commonwealth of Australia (for the S.E. see PAPUA). The

is. is very irregular in shape, the coast being indented by numerous deep bays, such as Geelvink Bay. The coast is mountainous and rocky in the N. but low and marshy in the S.W., and large numbers of small is. lie off it. The interior is still little known, but is very mountainous, rising in the Charles Louis Mts. to over 16,700 ft. Mt. Trafalgar is an active volcano. The chief rvs. are the Baxter, Philip, Aird, Aivel, Kaiserin Augusta, and Ambrno, sev. of which are navigable. The climate is hot and humid in the lowlands, where fever is very prevalent, but comparatively healthy at an elevation of 3000 ft. The rainfall is very heavy, reaching 150 in. in parts. The vegetation is dense and luxurious, mainly resembling that of the Malay Archipelago, with some Australian types. Fruit and spices are also abundant. The animals are few, mainly marsupials, but birds are abundant. The natives, classed as Papuan Negroes, have a considerable admixture of Malayan and Polynesian blood, and belong to the Melanesian div. They are usually medium or small in stature, with a narrow head and slight chin. Some of the inland tribes are very savage and addicted to cannibalism. The is. was discovered by a Portuguese, De Abrea, in 1511, and named Papua by De Meneses in 1526 and N. G. by De Orterz in 1545. The Dutch annexed some parts of the W. coast in the eighteenth century; in 1793 the E. India Company formally annexed the is. In 1848 Holland annexed the country W. of 141° E.; in 1885 Germany estab. a protectorate in the N.E. In 1883 the E. was annexed by Queensland, and the action of Germany forced Great Britain to proclaim a protectorate over the S.E. This was made a crown colony in 1888. In 1893 a boundary treaty was concluded in accordance with which the Brit.-Dutch boundary runs from the mouth of the Bensbach, N. to the Fly, and along it to 141° E. The boundary between Papua and the mandated ter. runs from 5° S. in 141° E. to 6° S. in 144° E., thence to 80° S. in 147° E., thence along 80° S. Dutch N. G. has an area of 152,000 sq. m. and a pop. of over 200,000. Chief port, Doreh. The mandated ter. of N. G. (including the adjacent is.) has an area of 91,000 sq. m. This mandated section is the most developed part, but in 1938 there were only 547 white settlers, and these were cultivating some 250,000 ac. or only 0.4 per cent of the total area. In 1940 the area under cultivation was returned at 11,000 hectares. Pop. (white) 4000, (native) 669,000 (including 39,000 indentured labourers). Civilisation is practically confined to the coasts; the interior is mountainous, little explored, and left to the natives. Chief ports: Astrolabe Bay, Friedrich Wilhelm Hafen, and Finschhafen. The seat of gov. was at Rabaul, New Britain (q.v.), and is now at Kokopo. Much of the land is covered with dense forest and its development has but recently begun. Tobacco can be grown, experimental work in the cultivation of cotton and tea has been done, sisal-hemp was exported in

small quantities in Ger. times, and cocoa (since the losses due to the Second World War, the production declined by 60 per cent, only 150 tons per annum being produced against a pre-war potential of 1000 tons, which, however, was never reached), coffee, kapok, and potatoes (at a high-altitude experimental station) are grown. Coco-nut plantations are extensive. Copra is exported in increasing quantities (18,887 tons in 1948, valued at £625,662), and there are excellent timber resources in the forests of the larger is. off N. G. Fishing has been little developed, though pearl-shell is exported. Gold is being produced in varying quantities (the early Spaniards, finding traces of the metal in the is., named it the Is. of Gold), and silver and platinum are mined. Of the total value of products exported in the year ended June 30, 1948, £1,927,075, gold bullion and native gold accounted for £851,000, and other exports were trocus shell £21,000, and cocoa-beans £16,976. Oil has been found, and both the Australian and the Dutch Govs. have granted large concessions to oil interests. Brit., Dutch, Amer., and Australians operating singly or in combination. It is expected that N. G. will prove one of the world's great oil reservoirs, comparable with Borneo. Coal is known to exist, but it is of mixed quality. Osmidrium, copper, iron, and phosphates suitable for manure are found. Revenue (1947-48), £1,699,203; expenditure £1,658,929. There are sev. gov. schools but, except for them, educational work is left to the missions. Health problems are great. There are no reasonably adequate hospital and other facilities for treating serious diseases and injuries, but the Australian authorities estab. the practice of giving native youths a short course of training in the rudiments of medical work. In the Second World War N. G. soon became the prin. theatre of the struggle between the Jap. forces and the allied forces under Gen. MacArthur (q.v.). After bombing Kavieng and Rabaul by long-range aircraft the Jap. invaded N. G. with infantry, artillery, and tanks on Jan. 23, 1942. At one time they were within 30 m. of Port Moresby and were threatening Australia, the N. ramparts of whose defences were then dominated by Jap. bases at Rabaul, Lae, and Salamaua. But by early 1943 Buna, chief enemy base on the N. Papuan coast, had been taken by the Allies, and Jap. warships and transports had suffered two great defeats in Huon Bay and off Kallang. See further under PACIFIC CAMPAIGN, OR FAR EASTERN FRONT IN SECOND WORLD WAR; WORLD WAR, SECOND.

New Guinea, British, see PAPUA.

New Hamburg, vill. of Waterloo co., Ontario, Canada, on R. Nith, 75 m. W.S.W. of Toronto. Pop. 1500.

New Hampshire, one of the New England states (known as the 'Granite State'), and one of the original thirteen states of U.S.A., lying on the Canadian border between Vermont and Maine and N. of Massachusetts, with 18 m. of coast. Land area 9031 sq. m. The surface is largely mountainous, the chief range being the White Mts. in the N. (Mt. Washington 6293 ft., the highest in the N.E. states). There are numerous rivs., the chief being the Merrimack, Connecticut, and Androscoggin, which afford plentiful water-power, and about 600 small lakes. Hay, potatoes, corn, fruit, and vegetables are grown, and forest trees are abundant. The climate is temperate, with long winters. The manufs. are numerous and important, and include boots and shoes, cotton goods, woollens and worsteds, hosiery and leather goods. Minerals are little worked, but there are some good granite quarries. Dartmouth College at Hanover, founded in 1769, is non-sectarian and provides for higher education. The univ. of N. H. at Durham was founded in 1866. The Rom. Catholic Church is the leading one in the state, with 63 per cent of the church membership in 1936. Rom. Catholic schools are maintained in all the cities and some of the large tns. Cap., Concord (27,100). Prin. tns.: Manchester (77,600), Nashua (32,900), Berlin (19,000), Portsmouth (14,800), Keene (13,800), and Dover (14,900). N. H. was settled by Englishmen in 1623, and made part of Massachusetts Bay in 1641, and a royal prov. in 1679. Pop. 491,500. See H. H. Metcalfe, *History of New Hampshire*, 1926; Federal Writer's Project (pub.). *New Hampshire: a Guide to the Granite State*, 1938; and T. Kalljarvi and W. C. Chamberlin, *The Government of New Hampshire*, 1939.

New Harmony, tn. of Posey co., Indiana, U.S.A., on Wabash R. and Illinois Central Railway, 13 m. N. of Vernon, settled by one of the seceding Harmonist colonies of Robert Owen in 1826. There are flour mills and brick works. Pop. 1000. See G. Lockwood, *The New Harmony Communities*, 1907.

Newhaven: 1. Seaport tn. of Sussex, England, on the Eng. Channel at the mouth of the R. Ouse, 6½ m. S.E. of Lewes. It is a bonding port and has regular cross-Channel communication with Dieppe. There is a fort and a coastguard station, and the tn. contains a twelfth-century Norman church. Pop. 8000. 2. Fishing tn. of Midlothian, Scotland, on the firth of Forth, 2½ m. N. of Edinburgh, of which it is a part.

New Haven, co. seat of N. H. co., Connecticut, U.S.A., at the head of N. H.

Bay, 4 m. from Long Is. Sound, with an important foreign and coastwise commerce. It has many handsome buildings, public squares, parks, and gardens. It is the seat of Yale Univ., Hopkins Grammar School, the State Normal Schools, Connecticut College of Pharmacy, and other colleges. It is a commercial distributing centre, and has manufs. of electrical equipment, cutlery, packed meats, rifles, clocks, hardware, and corsets. Fishing and dairy farming are carried on in the dist. Pop. 160,000.

New Hebrides, archipelago of Polynesia in the Pacific Ocean, lying between 13° and 20° S., and 166° and 170° E., and extending over 500 m. The N. H. (the total area of which is about 5100 sq. m.) include the Banks and Torres groups, the former lying a few miles N. of the main group, and the latter 40 m. N.W. of the Banks Is. The largest is. of the group are Santo (75 m. by 40 m.) and Malekula (nearly as large). Other is. are Efata, Ambrym, Erromanga, Epi. Aoba, Pentecost, and Macovo, and Gaua and Vanua Lava of the Banks group. In addition there are at least sixty small is. and islets. There are four good harbours, Vila and Havannah on Efata, and Ports Sandwich and Stanley on Malekula. The headquarters of the administration are at Vila, which is the chief trade centre. The climate is very enervating but no worse than that of many tropical places. The is. are volcanic and free from coral reefs. The soil is rich and deep, and the surface is densely wooded, and produces breadfruit, sago-palm, bananas, sugar-cane, yam, taro, arrowroot, oranges, pineapples, and coffee, and particularly sandalwood. The chief exports are copra, coffee, cocoa, shell, and sandalwood. The natives are Melanesians and Polynesians. By a convention of Nov. 16, 1887, Britain and France set up a joint naval commission to protect the lives and property of the Brit. and Fr. subjects in the group. By 1902 resident commissioners were appointed by each gov. to deal with judicial cases. Finally, by a new convention of Oct. 20, 1906, Brit.-Fr. condominium gov. was estab. The executive consists of a Brit. and Fr. resident commissioner acting in concert, each assisted by a staff of officers. There is steamboat communication with Australia. The N. H. group was discovered by the Sp. explorer de Quiros (1606), who imagined he had at last found the long-sought S. continent and therefore named it Tierra Australia del Espiritu Santo. He estab. a settlement on a riv. and named it La Nuova Jerusalem and to the port which existed in those days he gave the name Vera Cruz. This is. is to-day known as Santo, but no trace of Vera Cruz can be found. Sailing between the is., known to-day as Santo and Malekula, Bougainville in 1768 thereby disproved de Quiros's claim to the discovery of the S. continent. On this same voyage Bougainville discovered the is. of Pentecost, Aoba, and Macovo, which he named the Cyclades. It remained, however, for Cook to discover and chart the greater part of the group in 1774. He is said to

have spent some fifteen days in the then snug little harbour of Port Resolution, on Tanna Is. Other early visitors were Laperouse (1788); d'Entra Casteaux, who went in search of Laperouse (1793); and Bligh who sighted Banks Is. on the occasion of his famous voyage in an open boat to Timor after the mutiny of the *Bounty*. Dumont d'Urville, Belcher, and Markham are among the early voyagers whose accounts of these is. are of interest. Pop. (natives) 40,000; non-natives 3000. See also *ESPIRITU SANTO*; *MALEKULA*. See II. Le Chartier, *La Nouvelle Calédonie et les Nouvelles-Ilebrides*, 1885; E. H. Imhaus, *Les Nouvelles-Ilebrides*, 1890; Dr. Robert Lamb, *Saints and Savages*, 1908; E. Jacob, *France and England in the New Hebrides*, 1914; W. H. R. Rivers, *History of Melanesian Society*, 1914; C. B. Humphreys, *The Southern New Hebrides: an Ethnological Record*, 1926; J. R. Newhills, tn. of W. Aberdeenshire, Scotland, 4½ m. N.W. of Aberdeen. Pop. 6245.

New Holland: 1. Small ferry port on the Lincolnshire shore of the Humber, England. 2. Former name for Australia (q.v.).

New Iberia, cap. of Iberia co., Louisiana. U.S.A., 125 m. N. of New Orleans. It has manufs. of jewellery, paper, lumber, and foundry and machine-shop products. Salt is mined in the dist., and fruits, cereals, and sugar produced. Pop. 8000.

New Ireland, is. of the Bismarck Archipelago (q.v.).

New Jersey, middle Atlantic state of U.S.A., in the N. Atlantic group, bounded on the N. by New York and Pennsylvania, on the E. by the Hudson R. and Atlantic Ocean, on the W. by Pennsylvania and Delaware Bay, and on the S. by the Atlantic and Delaware Bay. It was the third of the original thirteen states which ratified the Federal Constitution. Area 7836 sq. m. (311 sq. m. being inland water). The N. of the state is hilly, being intersected by the Blue Mt. and Highland Range, belonging to the Appalachian system, and sev. other ridges. The state is a gently undulating plain, sloping towards the E. and W. It is watered by the Hudson, Passaic, Hackensack, Raritan, Delaware, etc., Rrs., and has numerous small lakes. Off the coast is a line of sandbars, enclosing lagoons and marshes. The sea-coast is studded with well-known ocean resorts, the most famous being Atlantic city, Cape May, and Asbury Park. The land is well wooded and fertile. Cereals, especially maize, fruit, and vegetables are largely grown. Market gardening, to supply the needs of New York city, is a large industry. The pasture is good, and there are valuable fisheries. The mineral wealth includes iron, zinc, manganese, talc, soapstone, and graphite. Manufs. are the chief industry, among them being textiles of all kinds, leather, foundry and machine-shop products, petroleum and brewing products, chemicals, and pottery. Higher

education is provided at Princeton Univ founded in 1746, Rutgers College founded in 1786 at New Brunswick, and the Stevens Institute of Technology at Hoboken. Cap. Trenton (124,700) (chief tns Newark (429,800) Jersey city (301,200), Paterson (139,700) Camden (117,500), Elizabeth (110,000) Bayonne (79,200) E Orange (69,000), Atlantic city (61,100). New Jersey was discovered by John Cabot in 1497, it was claimed by the Dutch but passed into Eng hands in 1664. Pop 4,100,000. See E J Fisher, *New Jersey as a Royal Province* 1911 I S Kull (ed.), *New Jersey A History*, 1930, W J Lane, *From Indian Trail to Iron Horse*, 1939. 1) Kemmerer Path to Freedom Struggle for Self Government in Colonial New

which it forms a suburb, together with Claremont. Pop (with Cape) 15,000. 2. Vil of Cumberland England, 4 m S W. of Keswick in the Newlands valley.

New London, seaport city of N. L. co., Connecticut U S A., at mouth of Thames R. 50 m E of New Haven. The harbour is one of the deepest on the Atlantic. There are manufs of motor cars, silk, woollens, and cotton, as well as shipyards, foundries, and sawmills. It is a summer resort and submarine base. Seat of Connecticut State College for Women. Pop 30,100.

Newlyn, port of Cornwall England, 1½ m S W of Penzance, of which it forms a part. It has a good harbour and a fishing industry. Pop 4000.

New Jerusalem Church, see SWEDEN-BORGIAN.

New Kensington, tn of Westmoreland co., Pennsylvania U S A. on Allegheny R. 15 m. E of Pittsburgh. It has aluminium and tinplate works, glass factories, lead and oil factories, and machine shops. There are coal mines in the neighbourhood. Pop 17,000.

Newlands, John Alexander Reina (1838-1898), Eng chemist. After 1865 he practised as an analytical and consulting chemist. His name is associated with the conception of the theory of periodicity among the chemical elements—the law of octaves later developed by Mendeleeff and Lothar Meyer. His papers on the subject were collected in *The Discovery of the Periodic Law* (1884).

Newlands, 1 Vil of Cape of Good Hope, S Africa, 4 m. S E. of Cape Town, of

New Lynn, tn on the W boundary of Auckland, New Zealand on an isthmus separating the Waitemata and Manukau harbours. It owes its industrial origin to the estab of tinneries and brickworks in the early days when the dist was remote from the city area. The spread of pop eventually reached its borders and to day it appears physically as part of the city of Auckland. Many new industries were estab during the war years, and a pottery company branched out into ceramic manuf in 1942. This branch of its activities has a daily output now of over 20,000 pieces. Besides supplying a considerable proportion of the local market, it has developed a substantial export trade in Australia. Pop 5200.

Newmains, tn of Lanarkshire, Scotland. It is on a coalfield 2 m N. of Wishaw, and has ironworks and steel works, and a large factory for precast concrete. Pop 6000.

Newman, Ernest (b 1864) Eng music critic, b in Liverpool. Originally intended

for the Indian civil service, he took up business owing to ill health. He taught music in the Midland Institute, Birmingham, 1903-5, and was music critic for the *Manchester Guardian*, 1905-1906, the *Birmingham Post*, 1906-19, and the *Observer*, *Sunday Times*, and *Glasgow Herald* at various times. He ed. the monthly *Piano-Player Review*. His following is of the largest, and his intense admiration of the Ger. classical and romantic composers makes him a severe judge of contemporary music schools. His book on Hugo Wolf is one of the best studies of any composer. Other works include *Glick and the Opera* (1895); *Wagner* ('The Music of the Masters') (1904); *Musical Studies* (1905); *Elgar* (1906); *Hugo Wolf* (1907); *Richard Strauss* (1908); *Wagner as Man and Artist* (1914); *A Musical Motley* (1919); *The Piano-Player and its Music* (1920); *A Musical Critic's Holiday* (1925); *The Unconscious Beethoven* (1927); *Fact and Fiction about Wagner* (1931); *The Life of Richard Wagner* (1933-46); *The Man Liszt* (1934); *Opera Nights* (1943); trans. of most of Wagner's opera-texts; of Schwelltzer's *J. S. Bach* (1911); and Weingartner's *On Conducting* (1906), etc.

Newman, Francis William (1805-97), Eng. scholar and man of letters, younger brother of Cardinal N., b. in London. In 1826 he became a fellow of Balliol, but resigned in 1830 through conscientious scruples, and travelled in the E., joining a Baptist mission at Bagdad. He returned to England in 1833, and was classical tutor at Bristol College 1834-40, prof. of classics at Manchester New College 1840-46, and prof. of Lat. at Univ. College, London 1846-63. He then devoted himself entirely to literature. His divergence from the Church of England in the direction of theism and free thought forms a curious contrast to the religious development of his brother. His works include *Catholic Union* (1844); *History of the Hebrew Monarchy* (1847); *The Soul, her Sorrows and Aspirations* (1849); *Phases of Faith, or Passages from the History of my Creed* (1850); *The Odes of Horace translated into I'rhymed English Metres* (1853); *The Iliad*, etc. See M. Arnold *Last Words on Translating Homer*, 1862, and J. G. Sieveking, *Memoir and Letters of Francis W. Newman*, 1909.

Newman, Sir George (1870-1948), public health administrator, educated at Edinburgh Univ. and at King's College, London. At Edinburgh he won the Gunning scholarship in public health and took the diploma of D.P.H. At Cambridge in the same year (1895). He was senior demonstrator of bacteriology and lecturer on infective diseases at King's College, London, 1896-1900. For a short time he was medical officer of health to Finsbury and to Bedfordshire, was chief medical officer of the Board of Education 1907-35, and of the Ministry of Health from 1919 to 1935, in which latter year he retired. One of the chief architects of the modern system of public health administration, in addition to writing numerous official reports he was the author of books on

Bacteriology and the Public Health (1904); *Infant Mortality* (1906); *Bacteriology of Milk* (1908); *Hygiene and Public Health* (1917); *An Outline of the Practice of Preventive Medicine* (1919); and *Recent Advances in Medical Education in England* (1923). Late in his career he turned again to historical studies and wrote *Interpreters of Nature* (1927), a series of biographies of leading figures in medical hist. His Halley-Stewart lectures on 'Health and Social Evolution' were pub. in book form in 1930; *The Rise of Preventive Medicine* appeared in 1932, and *The Building of a Nation's Health* in 1939.

Newman, John Henry (1801-90), Eng. cardinal, was the eldest child of John N., a banker. In 1816 he entered Trinity College, Oxford; two years later he gained a scholarship, and in 1820 he took his B.A.

CARDINAL NEWMAN

degree, having failed to obtain any high academic distinction. In 1822 he was awarded a fellowship at Oriel, the acknowledged centre of Oxford intellectualism, and in the following year the same honour fell to Pusey. In 1826, when N. obtained a tutorship, Richard Froude became fellow. Having assisted Hawkins to the provostship of Oriel, N. was appointed to the vicarage of St. Mary's, Oxford, which Hawkins had just vacated. After resigning their fellowships because Hawkins failed to recognise the substantially religious nature of their office, N. and Froude went abroad to the Mediterranean and to Rome, where they composed many of the short poems afterwards collected in the *Lyra Apostolica* (1834). It was during this tour, whilst he lay bedridden in the straits of Bonifacio, that N. wrote the beautiful hymn, *Lead, Kindly Light*. The Oxford Movement dates from N.'s return home. In July 1833 he resolved with Froude and a few other friends and thinkers to uphold the integrity of the Prayer Book, and to defend the doctrine of apostolic succession. In Sept. of the same year he began his *Tracts for the Times*, and whilst publishing these, he was expounding from the pulpit of St. Mary's the doctrines therein expressed. A chief source, if not the main spring, of that torrent of religious feeling which passed

forth from Oxford to all parts of the kingdom must be looked for in the intense spiritual conviction, the magnetic and fascinating personality, the eager intellectuality and singular dialectical faculty of N., at that time a leading Tractarian. It was his study of the early fathers, of Athanasius, Origen, and Clement, and of the Monophysite controversy, that first filled his mind with doubts as to the justice of Anglicanism. In 1841 he raised a storm of indignation against himself by his *Tract 90*, in which he argued that the Articles do not disavow Catholicism. He retired to Littlemore near Oxford in 1842, renounced the living of St. Mary's in 1843, and at the same time recanted all his earlier adverse criticism of the Rom. Church. After three years of monastic seclusion at Littlemore he was received into the Rom. Catholic Church in 1845. He was ordained in Rome in 1846 and returned to England as a member of the Congregation of the Oratory (see ORATORY or ST. PHILIP NERI). He founded the oratories at Birmingham (1847) and London (1850). In 1852 he was fined £100 for libelling an apostate monk, Achilli, notwithstanding his ample demonstration of the truth of his accusations. His splendid and dignified *Apologia pro vita sua* was a reply to the 'grave and gratuitous slander' which Charles Kingsley set down against him in *Macmillan's Magazine* (1864). In it the author traces his mental development with a frankness which must have been repellent to so sensitive a nature, but which must for ever silence any who are inclined to question the transparent purity of his motives or the singleness of his aims. From this 'Apology' it is clear that N. was from the first actuated by his conception of an infallible church, and that a longing to attain, or at least approach to, this ideal alone induced him to transfer his allegiance to the Rom. Church, which seemed the one 'divine kingdom' on this earth. The three years of fasting, prayer, and meditation which he passed in comparative seclusion at Littlemore (1842-45) are a sufficient indication of the grave and earnest spirit in which he took this step. In 1878 he was elected honorary fellow of Trinity and in 1879 he was created cardinal by Leo XIII. One of the great masters of Eng. prose style, his works include *Sermons*, *Lectures*, *Grammar of Assent* (1870). See lives by W. Meynell, 1887; R. H. Hutton, 1891; W. P. Ward (2 vols.), 1912; G. G. Atkins, 1931; and H. Tristram, 1948. See also T. Mosley, *Reminiscences* (2 vols.), 1882; R. W. Church, *The Oxford Movement*, 1891; Anne Mosley (ed.), *Letters and Correspondences*, 1891; I. Reilly, *Newman as a Man of Letters*, 1925; J. M. Flood, *Cardinal Newman and Oxford*, 1933; F. R. Cronin, *Cardinal Newman, his Theory of Knowledge*, 1935; and R. D. Middleton, *Newman and Bloxham: An Oxford Friendship*, 1947.

Newmarket, mrkt. tn. 13 m. N.E. of Cambridge, England, partly in Cambridgeshire and partly in Suffolk. St. Mary's Church, in Suffolk, is not of great interest, while All Saints, in Cambridgeshire, has been rebuilt. The fame of the tn. rests on its races, racecourse, training and racing establs. The racecourse, adjoining the tn. on the N., is owned partly by the Jockey Club and partly by the duke of Rutland and is said to be the finest in the world. The Jockey Club was founded between 1727 and 1760 when extensive buildings were erected. The horses are trained on the downs where there is a great prehistoric earthwork known as the Devil's Dyke—100 ft. wide and sev. miles long. In the tn. is a house reputed to have been occupied by Nell Gwynne. Pop. 10,000. **Newmarket Stakes, see under HORSE-RACING.**

E.N.A.

A COMMUNAL CAVE DWELLING IN THE RIO DE LOS FRIJOLES, NEW MEXICO
This 'house' contains 200 rooms.

New Mexico, state in the W. of the U.S.A., bounded on the N. by Colorado, on the E. by Texas, on the S. by Texas and Mexico, and on the W. by Arizona, was organised in 1850 and admitted to statehood in 1912. It forms part of a rocky tableland, the Rocky Mts. and the Sierra Madre ranges running through it. In the E. is the Llano Estacado, a barren plain, which is being brought under cultivation by dry-farming and which rises to mt. ranges in the centre of the state, the W. being mainly plateaus. It is watered by the Rio Grande and its affluent the Rio Pecos, and the tribs. of the Colorado R. The average height

above sea level in N. M. is 5700 ft., the lowest height being 2876 ft. The climate is dry, the average rainfall being only 12 to 16 in. Much of the land is fertile under irrigation, and agriculture is rapidly becoming the leading industry of the state. The main crops produced by dry-farming are grains, whilst fruit, vegetables, and cotton are grown. Pasture is abundant, particularly on the tablelands where stock-raising and wool-growing are important occupations. Mohair production is a leading industry. There is much good forest land. The mineral wealth includes gold, silver, copper, lead, zinc, coal, granite, limestone, sandstone, marble, and petroleum. The main industries are car construction, lumber, and timber work, flour-milling, butter and cheese making, and the manuf. of evaporated and condensed milk. N. M. is a popular health and tourist resort. A great attraction is Carlsbad caverns, an enormous series of limestone chambers, now a national park. The lowest depth reached is 1350 ft., and the largest room (called the 'King's Palace') is 4000 ft. long with maximum width of 625 ft., and a ceiling of over 300 ft. Below this room are three vast chambers known as the 'Palace of Pluto,' discovered at the 900 ft. level (150 ft. below the 'King's Palace') in 1939. Many of the white people of N. M. are of Sp. or Mexican descent, and Sp. is still spoken. N. M. has over 4,600,000 ac. of Indian reservations, with over 28,000 Indians on them. There are eighteen Indian pueblos or vils., with 11,000 people. Cap., Santa Fé (20,300), which contains the State Univ. Chief tns.: Albuquerque (35,400) and Roswell (13,400). Area 121,511 sq. m. Pop. 531,800. See E. A. Powell, *The End of the Trail: the Far West from New Mexico to British Columbia*, 1915; G. P. de Villagrà, *History of New Mexico* (trans. by Espinosa), 1933; and L. Bloom and T. Donnelly, *New Mexico: History and Cities*, 1933.

New Milford, tn. and the co. seat of Litchfield co., Connecticut, U.S.A., 30 m. N.W. of New Haven. Pop. 5000.

New Mills, tn. of Derbyshire, England, on Its. Gort and Sett, 15 m. E. of Manchester; prin. industries are textile printing, bleaching, and dyeing. Pop. 8400.

Newmilns, burgh of Ayrshire, Scotland, on the Irvine, 7 m. E. of Kilmarnock. The burgh includes Greenholm on the other side of the riv. There are lace and Madras manufs. Pop. 4000.

New Model, name given to the army organised by Parliament on Feb. 15, 1645. It was formed on the plan of Cromwell's Ironsides, and was under the command of Sir Thomas Fairfax, Cromwell holding the position of lieutenant-general. Its first success was the battle of Naseby, and it was the chief military instrument of the parl. victory in the Civil war.

New Monkland, see **MONKLAND**.

Newnes, Sir George (1857-1910), Eng. magazine and newspaper publisher, b. at Matlock, Derbyshire. He ensured his first success in the publishing world by his

production of *Tit-Bits* in 1881, which eventually led to his opening the present offices in Buriolgh Street and Southampton Street, Strand. In 1895 he became a member of Parliament, sitting for Newmarket on the Liberal benches until 1895. In the latter year he was made a baronet, and five years later he became M.P. for Swansea. Among other magazines and papers which he founded or ed. are the *Strand Magazine*, the *Ladies' Field*, the *Wide World Magazine*, *Country Life*, and *C. B. Fry's Magazine*.

Newnham College, for the higher education of women, at Cambridge, was organised in 1873 and opened in 1875. Five women students came to study at Cambridge in 1871, twenty-five in 1874, 220 in 1912, and at the present time so many women seek admission that even those who have passed the college entrance examination are still dependent on the number of vacancies available in that year. The college was incorporated in 1880, and for thirty years the students enjoyed most of the scholastic privileges offered by the univ.; their names appeared in the tripos or honours lists, but they were not allowed to hold degrees. In 1917 a royal charter was obtained, and in 1923 women were admitted to degrees. In Dec. 1947 full membership of the body academic was granted. The buildings include North Hall (1880), Clough Hall (1888), Meffer Building (1893), Pelfe Hall (1920), Kennedy Buildings (1900), Old Hall, Sidgwick Hall, and the Library. There are about a dozen scholarships and exhibitions, all tenable for three years, available to new students when vacant, and about the same number to fourth-year students or to women who have especially distinguished themselves in some particular study. See Mary A. Hamilton, *Newnham*, 1936.

New Norfolk, tn. of Buckingham co., Tasmania, 21 m. N.W. of Hobart, on the R. Derwent. Pop. 2000.

New Order (or **Hitler's New European Order**), introduced by the National Socialist Gov. in the countries overrun by the Nazi armies (1939-41). The N. O. was defined by Dr. Funk, Ger. minister of economics, on July 25, 1941, as meaning that 'the peace-time economy must guarantee to the Greater Ger. Reich a maximum of security and to the Ger. people a maximum consumption of goods, in order to increase their welfare. European economies must be directed towards this end.' The ultimate objective of the N. O. was to turn Europe into a single economic unit, self-supporting in essentials, while trade with the outside world would be conducted by a single authority dealing directly with individual states; for the N.O. did not recognise the right of other continents to the benefits of cohesion which it claimed for itself. In brief, the N. O. involved a ruthless readjustment of European economy to suit Ger. ends and a monopoly of industrial production in Europe for the 'master people' (*Herrenvolk*). The frontiers of the Reich were so drawn as to take in the main industrial areas of Europe:

Luxembourg, Alsace-Lorraine, the Czech protectorate, Silesia, and W. Poland, including the large textile industrial area of Lodz. The Reich bought up control of industries outside this central block, e.g. in Hungary, Rumania, and Yugoslavia, and probably control was estab. in some form over the industries of N. Italy. Otherwise industrial development outside the Reich was to be suppressed, for the N. O. envisaged an agric. Europe feeding an industrial Germany. The contemplated new Greater Germany contained approximately 43 per cent of the industrial pop. of Europe (excluding Russia) against 19 per cent of its agric. pop., and provided 75 per cent of its total steel output or would do so when fully operative (these figures, however, omit Belgium and N. France, countries which Germany did not in 1941 apparently include within the area of Greater Germany). The N. O. offered certain evident attractions to the agric. or peasant states, since they would be certain of a market for their export surpluses of food and raw materials, without having to face the competition of the new world; but in fact, as Germany had manipulated the mark exchange since 1936, these satellite states would sell their exports cheaply and receive in return dear and inferior manufactured goods or nothing. Under the N. O. Britain was to be barred from European and African markets. Raw materials, but nothing else, would be accepted from Russia. The Lat.-Amer. states would lose the bulk of that 25 per cent of their exports which normally went to the conquered European countries. The spectacle of a future Germany exercising world hegemony through economic control was reflected in her dealings with occupied countries during the war. The N. O. in action was in fact one long record of systematic terrorism (see under the historical sections of the various European countries concerned). It should be noted that the N. O. was originally a Jap. phrase, adapted to Jap. ambitions in the Far E., and that it was only after the phrase had been appropriated by Hitler and had fallen into disrepute in Europe that it was transmuted into 'Co-Prosperity.' But whether it be called the N. O. or Co-Prosperity, the substance was the same. It involved the conquest of all Asia, and economically it meant the subjugation to Japan of all the other members supposed to be enjoying Co-Prosperity, the weak points in which sphere were Japan's inadequacy of shipping facilities, and lack of steel, cotton, and wool.

New Orleans, chief city and seaport of Louisiana, U.S.A., cap. of Orleans par. on the Mississippi R., chiefly on the l. b. The largest municipal limits are co-extensive with those of the par. of Orleans, and among the suburbs are Westwego, Gretna, McDonoghville, and Algiers, its W. dist., with a riv. frontage of 3 m. The site on which the city is built is almost perfectly level and lies so low that the difficulties of drainage are great. N. O.

lies below the levee of the riv. at high tide and is therefore protected by an extensive series of embankments called levees. The cemeteries are a peculiar feature of N. O.; owing to the water-saturated nature of the soil, bodies are buried in vaults often 12 ft. above the ground level, the coffins being ranged in tiers. In the past it has been regarded as an unhealthy city, but modern scientific methods have changed this reputation. The climate is not marked by extremes of either heat or cold. The Fr. or Lat. quarter of N. O. is separated from the Amer. quarter, or New City, by Canal Street, the centre of the retail trade, and just below this street are many of the most important buildings of the city. The Custom House, built of granite, is one of the largest and most important edifices in the U.S.A. There are also the cotton exchange, city hall, criminal courts, Howard Memorial Library, the post office, sev. handsome churches, and other buildings. Tulane Univ., founded in 1834, has state support in the shape of remission of certain taxes. It has over 400 profs. and over 4000 students. The N. O. Univ., founded in 1874, is for coloured students. The Fr. quarter of N. O. is that part closely connected with the hist., poetry, and romance of the city, and the influence of the Fr. and Sp. regimes still survives in the mode of life, customs, holidays, and social observances. A notable feature each year is the celebration of *mardi gras* with elaborate night pageants, balls, etc. It has one of the most dramatic histories of any U.S. city, being one of the settlements of Bienville in 1718 and was made cap. of the vast region known as Louisiana. It was ceded with Louisiana to Spain in 1763. In 1800 it fell to France, from whom it was purchased by the U.S.A. in 1803 as part of the great Louisiana purchase. In the eighteenth century N. O. rapidly grew as the outlet for riv.-borne cargoes down the Ohio and Mississippi, ever-increasing numbers of rafts and flatboats floating downward with grain, salt meat, and potash to what then was a Fr.-owned port. It was at N. O. in the war of 1812 that the Amers. defeated Batenham's veterans, one of their few successes in that war. Sugar-growing in N. O. was introduced in 1794-95 by an enterprising creole, Etienne Bore, who set up machinery and vats and inaugurated a boom. The first steamboat to run from Pittsburgh through N. O. and back was built in 1811 by Nicholas Roosevelt of a family which was later to become famous. In the civil war David Farragut, with a fleet of wooden sloops, forced the surrender of N. O., the Confederacy's largest and wealthiest city. The most important industries, apart from sugar-refining, are rice-cleaning and the manuf. of cotton-seed oil, iron ware, soap, cotton goods, cigars, clothing, etc. Tonnage of vessels entered and cleared in foreign trade is about 3,500,000 and 4,800,000 respectively. There is a navy yard and construction and repairing estab. Pop. 494,537 (including about 100,000 Negroes).

New Philadelphia, city and co. seat of Tuscarawas co., Ohio, U.S.A. Manufs. include iron, especially agric. implements, electric and vacuum cleaners, and sheet iron. Pop. 12,300.

New Pitsligo, tn. of Aberdeenshire, Scotland, 11 m. S.W. of Fraserburgh. In the vicinity are large granite quarries. Pop. 2000.

New Plymouth, cap. and a port of the dist. of Taranaki, North Is., New Zealand, 160 m. S.W. of Auckland. It has an extensive harbour, and is a holiday resort. There is an airport. Pop. 20,300.

New Pomerania, see NEU-POMMERN.

Newport: 1. Parl. and municipal bor., mkt. tn., and riv.-port of England, chief tn. of the Isle of Wight, and situated near the centre of that is., on the Medina, which is navigable up to this point. St. Thomas's Church, founded in 1854, on the site of an anct. structure built in the reign of Henry III., is a handsome edifice, and contains a monument erected by Queen Victoria in memory of the Princess Elizabeth, daughter of Charles I., who d. at Carisbrooke Castle, Sept. 8, 1650. The castle is about a mile N. of Newport and is where the king was confined under the guardianship of Col. Hammond for twelve months (1647-48). In the vicinity are the Albany barracks and Parkhurst prison. Lace manuf. and brewing are carried on to some extent. Vessels of considerable tonnage can ascend to the quay at high tides. Pop. 11,300. 2. Municipal and co. bor. in Monmouthshire, England, situated at the mouth of the Usk, a parl. constituency and a market and assize tn. The inhab. are engaged in shipbreaking and repairing, iron, steel, and aluminium undertakings, the manuf. of chemicals, clothing, confectionery, rubber goods and electrical equipment, and the shipping of coal and general merchandise. The dockage and wharfage are extensive. It was formerly a walled tn. defended by a castle, the ruins of which still stand. St. Woolos Church, the cathedral of the diocese of Monmouth, dates from Saxon times. One of the few transporter bridges in the world spans the Usk. Pop. 105,000. 3. Seaport of Fifehire, Scotland, on the frith of Tay, opposite Dundee. Pop. 3400. 4. City and co. seat of Newport co., Rhode Is., U.S.A. It is a very fashionable summer resort, and has a good harbour and a naval training station. Close by is situated the U.S. torpedo station. It has a fishery and manufs. of cigars, furniture, brass, and copper. Pop. 30,500. 5. City and co. seat of Campbell co., Kentucky, U.S.A., on the Ohio R., opposite Cincinnati. There are flour mills and iron foundries, and manufs. of machinery. Pop. 30,600.

Newport News, city and port of Warwick co., Virginia, U.S.A., on the James R. It has an excellent harbour, one of the world's largest shipbuilding yards, iron works, coal wharves, lumber mills, and dry docks. Pop. 37,000.

Newport Pagnell, mkt. tn. of Buckinghamshire, England, on the Great Ouse where it is joined by the Ousel. It is

14 m. from Buckingham and 50 m. from London on the Midland Region railway, and the Grand Union Canal passes 2 m. from the tn. It is in an agric. dist. and also has motor-car body works. Pop. 5000.

New Providence, see BAHAMAS and NASSAU.

Newquay, holiday resort on the N. coast of Cornwall, England, about 11 m. N. of Truro. Pop. 9600.

New Red Sandstone, see TRIASSIC SYSTEM.

New Richmond, port of Bonaventura co., Quebec, Canada, on the bay of Chaleur, 60 m. E. of Quebec. Pop. 2000.

New River, Eng. artificial cut or channel, now about 27 m. long, stretching S. from Chadwell and Amwell Springs, Hertfordshire, just S.W. of Ware, augmented from the Lee (Lea) at Broxbourne, and conveying these waters into reservoirs at Hornsey and Stoke Newington (N. London), the latter having a capacity for holding 92,000,000 gallons. It affords a great part of the London water supply. Begun in 1809 by Sir H. Myddleton, it was completed by a corporation in Hertfordshire and Middlesex (1820). The N. R. Head reservoir at Clerkenwell was opened in 1813. The property was originally divided into about seventy-two shares (of £100 each), thirty-six being 'adventurers' shares,' held by Myddleton and twenty-eight others, and the remainder granted to the king. Charles I. exchanged them (1631) for an annuity of £500. The adventurers' shares have in later years been valued at over £100,000 each (one sold for £125,500 in 1897). The Metropolitan Water Board took over this company and seven other London water companies in 1904, at a valuation of over £6,500,000. The N. R. area of service was extended to Chingford by the making of a new reservoir in 1913.

New River (U.S.A.), see GT. KANAWHA.

New Rochelle, tn. of Westchester co., New York, U.S.A., on Long Is. Sound, 18 m. N.N.E. of New York. The Knickerbocker Press is estab. there; druggists' scales and balances and speedometers are manufactured. Pop. 58,400.

New Romney, see ROMNEY, NEW.

New Ross: 1. Tn. of Wexford and Kilkenny cos., Eire, on the Barrow, 2 m. below the confluence of the Nore, 13 m. from Waterford. The Irish insurgents were defeated here by the Loyalists under Johnston and Mountjoy (1798). Pop. 4900. 2. Post vil., Lunenburg co., Nova Scotia, 45 m. W. of Halifax. Pop. 1300.

Newry, seaport of Down and Armagh cos., N. Ireland, one of the chief ports of Ulster, on Newry Water, near Carrington Lough, 33 m. S.S.W. of Belfast. There are corn, flour, and spinning mills, and potato processing, textile, wheelbarrow, clothing, knitting, and tobacco factories; also breweries, with granite quarries near by. Pop. 14,000.

News Agencies. Agencies for gathering news and supplying it to newspapers and for broadcasting, and also to private subscribers, though in the latter case not for press pub. To a certain extent the news agency reporter has supplanted the

newspaper reporter, the latter being now more often employed in 'descriptive' reports or on 'stories' which are of special interest to his particular newspaper. In practice the great London newspapers use foreign cables of the N. A. merely to supplement their own services, the news agency service (apart from Reuter's agency) being useful mainly for home news. In England the most important news agency is the Press Association, which was formed in 1868 when Parliament passed an Act empowering the state to take over the telegraphs. Its members are the prin. proprietors of the prov. newspapers (see PRESS ASSOCIATION). Another leading Brit. news agency is the Exchange Telegraph Company, notable for its 'tape' service. Reuter is the chief agency in Britain for foreign views, and has correspondents in all parts of the world. The Press Association has the sole right of circulating Reuter telegrams in the provs. Besides general news the N. A. also cover parl. reports, market news, and sport. The chief N. A. of the U.S.A. are the Associated Press of America and the United Press Association of America, both with London branches.

New Sarum, see SALISBURY.

'News Chronicle, The,' founded as the *Daily News* in 1846, under the editorship of Charles Dickens. From 1869 it was the recognised organ of the Liberal party in England. The *Daily News* was among the earliest papers to publish foreign telegrams. For a time it appears to have been the only 'daily' to admit engraved blocks or displayed advertisements. For years its only serious London rival in Liberal journalism was the *Morning Star*, which it bought up in 1870. Later it became identified with Liberal imperialism; but after it was taken over by George Cadbury it became more 'progressive,' and even struck a semi-Socialist note. In 1928 the *Daily News* absorbed the *Westminster Gazette* (q.v.)—which had changed from an evening to a morning paper some years previously—and in 1930 the *Daily Chronicle* was also amalgamated with the *Daily News* under the present title *News Chronicle*, which paper has thus remained the sole Liberal daily paper in London, long tenacious of Free Trade principles and other cardinal features of twentieth-century Liberalism (q.v.). The N. C., which devotes more space and consideration to political matters and foreign affairs than do most popular papers, includes among its readers a fairly large proportion who buy it on account of its political articles. Like other popular Brit. newspapers, the N. C. gives more space to its Amer. correspondents than before the Second World War, but even before the war the N. C. was consistently well served by able Washington correspondents. To-day, in conjunction with members of the Cadbury family, Lord Layton, while not actually editor of either the N. C. or the *Star* (the evening paper owned by the News Chronicle Ltd.), is the editorial and business chief.

New Shoreham, see SHOREHAM, NEW.
New Siberia Islands, Novaya Sibir, or

Liakov Islands, group of Russian is. in the Arctic Ocean, N.E. of the Lena Delta. Area 9650 sq. m. They include Kotelnoi, Fadievskoi, New Siberia, Liakhov (Lya-khov), Thaddens, and smaller is. They are mostly uninhabited, except temporarily by hunters. Fur-bearing animals abound. Bones of the mammoth and other extinct animals have been found. Liakhov discovered the is. in 1770.

'News of the World,' Eng. Sunday newspaper, founded in 1843, the fourth oldest of Eng. Sunday newspapers. It was acquired in 1891 by the syndicate which still controls it, and is the only Eng. newspaper to be independently owned. The editor from 1891 to 1941 was Sir Emsley Carr. The policy of the paper was admittedly sensational, giving more space than did any other to police court and divorce proceedings, and this has been maintained except for the restrictions in the latter subject enforced by the Judicial Proceedings (Regulation of Reports) Act of 1906. In addition a most comprehensive sports review is provided. Before the First World War Sunday newspapers met with much disfavour, but even in 1906 the sales of the *News of the World* exceeded 1,000,000; the average for July-Dec. 1947 showed a circulation of 7,391,275, the largest for any newspaper in the world. The company has a strong financial position, its liquid resources exceeding £2,500,000.

New South Shetlands, group of is. in the Antarctic Ocean, see SOUTH SHETLANDS.

New South Wales, oldest state of the commonwealth of Australia, in the S.E. portion of the is. continent, extending between lat. 28° 10' and 37° 28' S., and 141° and 154° E., with an area of 309,433 sq. m. and a coastline of over 700 m. There are 146 municipalities and 134 shires. Within the state of N. S. W. the mt. range which girdles nearly the whole is. is most continuous and elevated, and is known as the Dividing Range. The section of this mt. system on the S. boundary called the Australian Alps, rises in Mt. Kosciuszko to 6500 ft. From this the range extends northward, the watershed being from 50 to 150 m. distant from the E. coast, and thus divides the state into two slopes, with two distinct water-systems. The rvs. on the E. side descend with great rapidity, and in oblique tortuous courses, their channels often forming deep ravines. Many of them are navigable in their lower course for sea-going steamers. The prin. are the Richmond, Clarence, McLeay, Manning, Hunter, Hawkesbury, and Shoalhaven. The Hunter R., about 60 m. north of Sydney, opens up one of the most fertile and delightful dists. in the country. The Dividing Range, which, opposite to Sydney, is called the Blue Mts., being singularly abrupt and rugged, and full of awe-inspiring chasms, long presented an impenetrable barrier to the W., and kept the colonists shut in between it and the sea, and utterly ignorant of what lay beyond. At last, in 1813, when the cattle were likely to perish in one of those long droughts that appear to visit this country

at intervals of a dozen years, some adventurous individuals scaled the formidable barrier, and discovered those downs on the W. slope which now form the great sheep-ranges of Australia. A practicable line of road was immediately constructed by convict labour, and the tide of occupation entered on the new and limitless expanse. The numerous streams that rise on the W. side of the watershed within the state all converge and empty their waters into the sea through one channel

severe frost are sometimes experienced. At Sydney the mean temp. of the year is about 65°. The mean heat of summer, which lasts here from the beginning of Dec. to the 1st of Feb., is about 80°, but is much modified on the coast by the refreshing sea breeze. The ann. fall of rain is about 50 in. Rain sometimes descends in continuous torrents, and causes the rivs. to rise to an extraordinary height. N. S. W. is in the main an agrie. country, and much attention is devoted

Australian News and Information Bureau

NEW SOUTH WALES

BROKEN HILL, THE RICHEST SILVER, LEAD, AND ZINC MINE IN THE WORLD

Looking north along the line of lode, the Broken Hill South Ltd. mine is seen in the foreground; behind it is the mile-long vast Open Cut, now worked out. To the right is the central power station which supplies all the mines with electricity.

within the state of S. Australia. The S. and main branch of this great riv. system is the Murray. The other great trunks of the system are the Murrumbidgee, which is navigable; the Lachlan, at times reduced to a string of ponds, and the Darling. The Macquarie, passing through the rich dist. of Bathurst (*q.v.*), is a large trib. of the Darling, but it reaches it only in the rainy seasons. Numerous good harbours are formed by the estuaries of the rivs.

Owing to the great extent of the state, stretching as it does over eleven degrees of lat., the climate is very various. In the northern dists., which are the warmest, the climate is tropical, the summer heat occasionally rising in inland dists. to 120°, while on the high tablelands weeks of

to stockraising. The prin. crops are wheat, maize, barley, oats, potatoes, lucerne, and tobacco, and fruit culture has greatly developed in recent years—oranges, lemons, and mandarins predominating. In 1946-47, there were 6,511,493 ac. under crops. The area under wheat was 4,474,894 ac. (15,000,000 bushels); oats, 557,987 ac. (2,000,000 bushels); maize, 110,038 ac. (2,500,000 bushels); lucerne (hay), 79,666 ac.; rice, 31,995 ac. (2,978,000 bushels); barley, 26,698 ac.; potatoes, 21,309 ac.; and tobacco, 402 ac. The area under grapes was 16,338 ac.; citrus fruit (principally oranges), 29,917 ac. (33,000,000 bushels); other orchards 38,319 ac. Sugar-cane produced over 309,605 tons of sugar.

Bananas, pineapples, and passion fruit are also grown. The recognition of the fact that the cultivable area might be greatly extended by a system of water conservation and irrigation has induced the gov. to undertake various detached works and schemes, which are designed to constitute a portion of the system necessary to serve the whole state. The most striking of these is the Murrumbidgee scheme, with a storage dam across the Murrumbidgee at Burrinjuck. Enormous areas are utilised for grazing purposes, and the state is rich in mineral deposits. Silver, lead, and zinc are mined at Broken Hill (q.v.). Large iron and steel works, with subsidiary factories, are in operation near the coalfields at Newcastle and Port Kembla. The products include iron and steel of various grades, boilers, pipes, wire, brass cables, etc.

The staple exports are wool and wheat. The other prin. exports are butter, lead, coal, coke, skins and hides, tallow, frozen and preserved meat, sausage casings, biscuits, confectionery, fruit (fresh and preserved), wines, tobacco, pearl shell, leather, timber, copper ingots, tin, zinc, gold specie, and gold bars. The total value of the production of the primary industries in 1948-49 was £136,190,000. The value of exports overseas in Australian currency in the year ended June 30, 1947, was £116,579,972, and of imports from overseas £94,268,506. The manufs. of the state are varied and numerous. The chief industrial products are industrial metals, machines, etc.; clothing, food and drink, and tobacco; chemicals, paint, oil; wood-working, paper, printing, textiles and textile goods (not dress), skins, and leather (not footwear). The total value of manufactured products (1946-47) was £145,947,000; dairying and farmyard production, £27,048,000; mining, including the output of quarries, £20,808,754. Coal to the value of £9,582,985 was produced in 1946. Sydney (pop. 1,484,000) is the cap. Other important tns. are Greater Newcastle, 127,000; Greater Wollongong, 63,000; Broken Hill, 27,000; Blue Mts., 21,300; Maitland, 19,000; Goulburn, 16,000; Wagga-Wagga, 15,300; Lismore, 15,000; Lithgow, 14,500; Albury, 14,400; Orange, 14,000; Cessnock, 13,000; Liverpool, 12,600; Tamworth, 12,000; Grafton and S. Grafton, 12,000; Bathurst, 12,000; Dubbo, 9500; Armidale, 8000; Parkes, 7000; Casino, 6700; Inverell, 6500; Kempsey, 6300; Forbes, 6000. Sydney is the headquarters of the squadron in Australian waters, and is the seat of a univ. A bridge across Sydney harbour, the largest arch bridge in the world, was opened in March 1932. Education is compulsory between the ages of six and fifteen years. The railways and tramways are mostly state-owned. On June 30, 1947, 6128 m. of gov. railway were open. N. S. W. took its origin in a penal estab. formed by the Brit. Gov. in 1788 at Port Jackson, near Botany Bay (lat. 34°). The prisoners, after their period of servitude, or on being pardoned, became settlers, and obtained grants of land. Transportation to N. S. W. ceased

in 1840, and up to that date the total number of convicts sent thither amounted to 60,700, of whom only 8700 were women. They were assigned as bondservants to the free settlers, who were obliged to furnish them with a fixed allowance of clothing and food. In 1843 a practically elective legislative council was estab., and twelve years later responsible gov. was granted. The constitution is based on the Consolidating Act of 1902. Parliament consists of two Houses, the legislative council and the legislative assembly. The council, once a nominated body, was reconstituted after the referendum of May 1933, and now consists of 60 members, elected jointly by both Houses. Membership is for twelve years, fifteen members retiring in rotation triennially. Members are not entitled to remuneration. The assembly consists of 90 members and are paid a salary of £875 a year. The duration of a Parliament is limited to three years. The Women's Legal Status Act, 1918, gives women the same political rights as men. The executive is in the hands of a governor, appointed by the Imperial Gov., and an executive council consisting of members of the Cabinet. The pop. in 1947 was 2,985,464 (exclusive of full-blood aboriginals). See *Office Year Book of New South Wales* (ann.); *New South Wales Statesman's Year Book* (800 statisticians); also A. G. Foster, *Early Sydney*, 1920, and E. Mitchell, *Australia's Alps* (Sydney), 1942.

New South Wales Government Railway. Under this title in 1855 the gov. of N. S. W., Australia, took over the Sydney Tramway and Railway (1851, the first railway of the state) and the Hunter R. Railway (running from Newcastle to Maitland). A line was opened (1856) from Sydney to Parramatta. The present system includes the S. line and branches (from Sydney to Albury); the N. line and branches (from Sydney to Jennings); and the W. line and branches. The gauge is 4 ft. 8½ in. The Federal Cap. Ter. Railway (Queanbeyan-Canberra), after completion, was taken over by the chief commissioner of railways for N. S. W., who worked the line on behalf of the Commonwealth Gov. until 1928, when the management was taken over by the commonwealth railways commissioner. It connects with the N. S. W. railway system at Queanbeyan and is about 5 m. in length.

Newspapers. It is not easy to trace the origin of the newspaper press, but at least it is clear that analogies in the Rom. *Acta Diurna* or the Venetian *Gazzetta* are very remote, and hardly less so than the old Eng. news-letters of the sixteenth century. It was, however, essentially the invention of printing and the more or less accidental removal of restrictions on the liberty of the press that favoured the growth of modern N. According to Cicero, Petronius, and other writers, the *Acta Diurna* (called also *Acta Urbana* or *Publica*) pub. an account of anything worthy of note. But they are rather to be regarded as the official notification or registration of important public events than the voluntary presentation of news

as a commercial speculation. It is recorded that the republic of St. Mark had its *N.*, and it is very probable that we borrowed, if not the idea of a newspaper, many of the terms in familiar use to-day in connection with *N.* from the Venetians, e.g. the word 'gazette,' which word is apparently derived from the name of the coin charged for reading them. Like the *Acta Diurna* the Venetian gazettes were hung up in public places. The first man to print all the news of the day upon a single sheet, in a regular weekly pub., with a distinctive title, was Nathaniel Butter, who brought out the *Weekly News* in 1622. Up to that time the only means of circulating news was the news-letters, which were the MS. productions of professional London news-writers who collected the gossip and rumour of the city (see also JOURNALISM). There were, however, during the Civil war and the Commonwealth a great number of *N.*, but their pub. was only by leave of the Star Chamber. The press became temporarily free on the abolition of the Star Chamber, but the Long Parliament, becoming frightened by the mass of pamphlets which were soon broadcast over the country, again subjected books and other reading matter to licensing regulations. At the Restoration a most retrogressive step was taken in the passing of the Licensing Act, which vested in the gov. the entire control of printing. It was the non-renewal of this Act in 1695 on its automatic expiration that paved the way for the freedom of the press.

Among the earliest of Eng. *N.* after the Restoration were the *Protestant Intelligence*, the *Current Intelligence*, the *Domestic Intelligence*, the *True News*, and the *London Mercury*. But, none of them printed debates in Parliament, and none exceeded in size a single small leaf, or was pub. oftener than twice a week. The first daily newspaper, the *Daily Courant*, was not pub. till the accession of Queen Anne in 1702. Even after the abolition of the licencor of books (including *N.*), there was another obstacle to the free pub. of *N.* in the shape of the *N.* tax, the Bill for which was passed as the Stamp Act in 1712. It was the old bugbear of sedition which prompted this device for killing the *N.*, a device which was eminently successful, for not one penny paper survived, and even Addison's *Spectator* collapsed, while Steele incurred the wrath of the attorney-general for articles in the *Englishman* and the *Crisis*, which were held to be 'aspersions upon the character of Queen Anne, and assaults upon the conduct of the administration.' But the printers soon evolved means of evading the Stamp Act; and in this they were aided and abetted by the leaders of the opposition, to whose often scurrilous and venomous attacks on their political rivals we owe the beginning of the pub. of proceedings in Parliament. In 1738 Parliament seems to have taken steps to stop the practice of reporting, for the debates were thereafter pub. as if they had taken place in a fictitious assembly. But at the end of the eighteenth century

public sympathy for reporting became too strong for parl. privilege, with the result that reporting gradually became recognised as lawful. Parl. reporting laid the seeds of the future prosperity of the *Morning Chronicle*. Thereafter *N.* quickly developed into a form more or less similar to that of to-day.

A modern newspaper derives its news from two main sources: its own staff of reporters and correspondents and the news agencies (q.v.). Inasmuch as the material sent out by the news agencies is common to all their newspaper subscribers, *N.* would differ little from each other if they did not import individuality and colour through their own staffs. The staff of a newspaper consists of a body of full-time reporters at the head office, who receive their daily assignments from the news editor, and the political, diplomatic, dramatic, and other correspondents, who are really reporters in a special sphere and often enjoy the confidence of influential persons. The *Times* is to-day the only newspaper to maintain its own press gallery staff in the House of Commons; other *N.* depend on agency reports and sketch writers, while lobby correspondents keep close contact with ministers and other Members of Parliament and write on expected political and administrative developments. A staff of reporters is also kept at the law courts. The law reporters of *The Times* are required to be barristers and the pub. vols. of *The Times Law Reports* are accepted as authentic records of judgments. Under the news editor there are also correspondents in prov. tns. who send in their copy by telegraph or telephone. The foreign news editor deals with the messages sent by the newspaper's correspondents abroad, distant messages are sent in by cable- or radio-gram, but those from European caps. are normally sent over the telephone and taken down by dictaphone or in shorthand. A newspaper's correspondents, whether home or overseas, may be full-time staff men and required to work exclusively for the newspaper; others, in less important centres, may do other work and are paid a retaining fee and space rated. Distinctions such as 'our special correspondent,' 'a correspondent,' 'a special correspondent,' 'our correspondent,' 'our own correspondent,' are all well understood in Fleet Street; the first and last of these only are staff men as opposed to outside contributors and mostly their remuneration is much higher. The miscellaneous mass of news from whatever source received is prepared for the press by sub-editors, whose function is to select, compress, and correct and also to indicate the type and appropriate headings and sub-headings. The selection among the copy is done by a copy-taster, who 'spikes' (i.e. defers indefinitely) some and passes the remainder to his colleagues with a symbol indicative of its importance; the selection within the copy itself is done by the sub-editors, while the chief sub-editor approves and revises the sub-ed. copy.

A modern newspaper is not, however,

made up exclusively of news, and a large though very varying place is taken by 'features.' Thus the correspondence columns and the 'turnover' article are features of *The Times*, while birth, marriage, and obituary notices are a feature of both *The Times* and the *Manchester Guardian*. These are admitted in proof of pedigree at the College of Heralds. Social and political gossip is also a feature; others are political cartoons, and 'strip' cartoons and cross-word puzzles. Apart from news and features, a newspaper should have leading articles or editorials. These may be important and influential, such as those in *The Times*, *Manchester Guardian*, *Daily Telegraph*, and *Yorkshire Post*, which are always closely studied by the politicians, and in the Brit. press 'leaders' are unsigned because they are the views or policy of the paper and not of an individual.

It is often said that advertisers exert an undue influence over editorial matter; but although a great part of the revenue of a newspaper comes from advertising, most Brit. N. now carry news on the front page, though *The Times* and the *Manchester Guardian* are among the great national papers which still devote the whole front page to advertisements. Illustrations may be given to show that direct or indirect control by advertisers might tend to become dangerous, but the danger may, on the whole, be said to be hypothetical. Again, though a high circulation enables advertising rates to be increased, nothing so damages the tone of a newspaper as competition for big circulation, and, generally speaking, the N. which have the greatest influence on public opinion have comparatively low but steady circulations among sections of the public whose support is politically valuable. It has been well said that in Britain the power of the N. to influence opinion and policy is, in fact, almost in inverse proportion to circulation, though the rule is, of course, not mathematically exact (cf. Ivor Thomas, *The Newspaper*, Oxford Univ. Press pamphlets on Home Affairs, No. H.2., 1943). For the outstanding features of novelty in modern journalism, and some remarks on Fr. and Amer. N., see JOURNALISM; for the hist. of individual N. see under the name of the newspaper, and for the hist. and bearing of advertisements on N. see ADVERTISEMENTS.

The outstanding feature of newspaper finance in more recent years has been the growth of combines controlling chains of N. One of the prin. groups is Associated N. Ltd., which owns the *Daily Mail*, *Sunday Dispatch*, *Evening News*, and a chain of prov. N. This company has a large holding in Anglo-Newfoundland Development Company Ltd. (see under NEWFOUNDLAND). Another large group was the Berry group, but the brothers Wm. and Gomer Berry (Lords Camrose and Kemsley, q.v.) in 1937 divided their interests. Lord Camrose owns the *Daily Telegraph*; and Lord Kemsley the *Daily Graphic*, *Sunday Times*, *Sunday Graphic*, *Sunday Chronicle*, and sev. prov. news-

papers. The Westminster Press Prov. N. Ltd., formerly known as the Starmer group, controls four morning, nine evening, one Sunday, and nearly thirty co. weekly N., all these being mainly in the Midlands, Durham, and Yorkshire. But the Brit. press shows most conceivable types of ownership. Most London N. used to be family properties and many prov. N. still are. *The Times* since 1922 has been held by Lt.-Col. J. J. Astor and John Walter (see TIMES, THE), but to prevent the paper from falling into undesirable hands the owners entered into an arrangement whereby any transfer of shares in the Times Holding Company requires the consent of a body of trustees consisting of the lord chief justice, the president of the Royal Society, the governor of the Bank of England, and others. The controlling interest in the *Daily Express*, *Evening Standard*, and *Sunday Express* is held by Lord Beaverbrook (q.v.). The *Daily Herald* is owned as to 49 per cent of its shares by the general council of the Trades Union Congress and as to 51 per cent by Odhams Press Ltd., who own entirely the *Sunday People*. *The News of the World*, credited with the largest circulation in the world, is the sole N. pub. by its owners. The *Daily Mirror* and the *Sunday Pictorial* are owned by interlocked companies. The *News-Chronicle* and the *Star* are owned by the Cadbury family, the *Observer* by Viscount Astor, now under a trust formed in 1945; and *Reynolds News* by the Co-operative movement. The *Morning Advertiser* is the one example of a newspaper owned on behalf of a trade—the Licensed Victuallers. The *Daily Worker* is the organ of the Communist party.

Since the Franco-Ger. war the Amer. press has greatly influenced Brit. and European journalism. The use of the electric telegraph was without doubt first proved by Amer. correspondents in Europe at this time. A number of circumstances—the cheapening of paper, the development of setting and printing machinery, the reproduction of photographs to illustrate news items, and the estab. of powerful news agencies—tended to make N. in the U.S.A. of greater influence. It was also found convenient by wealthy men to be able to control a newspaper, or syndicate of N., for their own political or social advantage. The first Amer. newspaper was pub. in Boston, Massachusetts, under the title of *Public Occurrences*; two copies were issued, 1689 and 1690; both were suppressed by the gov. of Massachusetts. Next was the *Boston News Letter* (1709), followed by the *Boston Gazette* (1719). Further Massachusetts N. were the *New England Courant* (1721), *Massachusetts Spy* (1770), and the *Boston Sentinel* (1784). The *Liberator* of Wm. L. Garrison was pub. in Boston, 1831. Among modern Massachusetts N. may be mentioned the *Boston Record and American Post* (1831); *Herald* (1846); *Daily Globe* (1872); and the *Christian Science Monitor* (1908). The prin. N. in New York include *New York Journal and*

American (1788); *New York Post* (1801); *World-Telegram*, P.M., and *Sun* (1833); *New York Mirror*, *New York Herald-Tribune*, and *New York Times* (1851); and *Wall Street Journal* (1882). Chicago N. include *Chicago Tribune* (1847); *Herald American* (see HEARST), and *Chicago Daily News* (1875); and *Chicago Sun-Times* (1929). As an example of the growth of N. may be mentioned those in Pennsylvania, including *Pittsburgh Press* (1824); *Philadelphia Inquirer* (1829); *Philadelphia Bulletin* and *Bulletin* (1847); *Altoona Mirror* (1874); *Public Ledger* (1914); *Philadelphia Daily News* (1925); and *Pittsburgh Post-Gazette* (1927). Ohio N. include *Cincinnati Enquirer* and *Cleveland Plain Dealer* (1841); and *Cleveland Press* (1878). Other well-known N. include the *Kansas City Star-Times* and *Detroit Free Press* (1831); *Baltimore Sun* (1837); *Washington Post* (1877); and *Los Angeles Illustrated Daily News* (1895). In the U.S.A. there are 1769 Eng. language daily N., with a combined sale of 51,673,000; 511 Sunday N. with 45,950,000; and 8381 weekly N. with 13,245,000. Amer. N., with very few exceptions, do not have a nation-wide circulation, and indeed they are not designed for that purpose. The exceptions are the *New York Times* and the *New York Herald-Tribune*, which circulate into the Far W., even as far as California. The largest circulations (1948) are *New York Daily News* (2,402,300, Sunday 4,716,800); *New York Mirror* (1,054,265, Sunday 2,206,200); *Chicago Tribune* (1,031,900, Sunday 1,544,800); *Philadelphia Bulletin* (771,300, Sunday 630,500); and *Philadelphia Inquirer* (704,900, Sunday 1,056,400). Important Canadian N. include the *Halifax Herald and Mail* (1878); *Montreal Gazette* (1878); and the *Toronto Globe and Mail* (1844); *Evening Telegram* (1876); and *Star* (1892).

Radio-facsimile Newspapers.—Transmission of news by radio facsimile has made some progress in America since the Second World War. Before the war miniature N. were transmitted by nearby radio stations during the night and printed by a small unit fixed in place of a loud-speaker to an ordinary radio set which contained a device to shut off the machine automatically. By 1930 about a score of radio stations had estab. regular radio facsimile service. During the war these experiments had to yield to war work, though the armed services used the radio-facsimile process for transmitting orders. W. G. H. Finch is the pioneer of this process in America. The Finch transmitter consists of a scanning machine into which copy to be broadcast is inserted. The copy, printed or typewritten or drawn, is automatically wrapped round the surface of a spinning cylinder. Beside the cylinder is mounted a device called the scanning head, which consists of an electric bulb, lens system, and photo-electric cell. The lens focuses a spot of light which travels a closely spaced spiral line on the surface of the paper. This causes the lights and darks of the copy, made by letters or pictures, to reflect from the paper with the varying intensity of the

photo-electric cell. From this impact of reflected light issues a high-pitched soft note, known as the facsimile carrier, which is applied to an ordinary amplifier and delivered to the radio transmitter in the same way as if it issued from a studio microphone instead of from a photo-electric cell. The home receiver picks up these signals and passes them to the attached recorder instead of to a loud-speaker. The recording instrument prints the incoming news and pictures on a continuous sheet of electro-sensitised paper, which reacts to the facsimile signal and shuts itself off when the printing is completed. It is now possible to use paper five columns wide, the size of a small newspaper, and to transmit at the rate of 48 sq. in. a minute or more than 550 words of copy. An entire four-page small-size newspaper has been transmitted in 8 min. Departmental stores have used the radio facsimile to send illustrations and copy in their advertisements directly into the home. It is possible to equip ships at sea with the service. One present difficulty is that it is not yet possible to transmit the regular eight-point type size clearly. The twelve-point type, which is used, cuts down the number of words the paper can carry. Another difficulty is the high cost of the electrolytic paper required for radio-facsimile transmission. It is feared by some that even greater standardisation and monopolisation of news production may result from radio-facsimile N. But the fear that radio facsimile may make the regular newspaper obsolete is considered groundless.

Royal Commission on the Press, 1947.—In response to a persistent demand of its supporters, the gov., in 1946, allowed a private member of the Labour party to bring forward a motion asking for the appointment of a royal commission to inquire into the finance, control, management, and ownership of the press. The chairman of the commission, appointed in 1947, was Sir David Ross, provost of Oriel College, Oxford. The other members were M. E. Aubrey, general secretary of the Baptist Union; John Benstead, general secretary of the National Union of Railwaysmen; Neil Beaton, chairman of the Scottish Co-operative Wholesale Society; Lady Violet Bonham-Carter, president of the Liberal party organisation; R. C. K. Ensor, historian and journalist; Elwen Mary Owen, deputy regional commissioner for Welsh civil defence region during the Second World War; Hubert Hull, lawyer; J. B. Priestley, author; Wright Robinson, former lord mayor of Manchester; Gilbert Granville Sharp, recorder of King's Lynn; Lord Simon of Wythenshawe, chairman of the council of Manchester Univ.; Sir Geoffrey Vickers, legal adviser to the National Coal Board; Sir George Waters, formerly editor of the *Scotsman*; H. W. Wilson, chartered accountant; Barbara Wootton, reader in social studies, London Univ.; and G. M. Young, historian and author. The terms of reference were: 'With the object of furthering the expression of opinion through the press and the greater

practicable accuracy in the presentation of news, to inquire into the control, management, and ownership of the newspaper and periodical press and the news agencies, including the financial structure and monopolistic tendencies in control, and to make recommendations thereon.

The report of the commission was issued on June 29, 1949. The most important recommendation was for the estab. by the press itself of a general council of the press. It was proposed that this council should consist of at least twenty-five members representing proprietors and editors and other journalists and should have lay members amounting to about 20 per cent of the total. The lay members should be nominated by the lord chief justice and the lord president of the court of session, in consultation with the chairman, and should be entirely independent of the gov. of the day. The objects of the council should be 'to safeguard the freedom of the press; to encourage the growth of the sense of public responsibility and public service among all engaged in the profession of journalism—that is in the editorial production of newspapers—whether as directors, editors, or other journalists; and to further the efficiency of the profession and the well-being of those who practise it.'

Regarding chain N. the commission thought that such N. should carry a front-page formula indicating their common ownership; but concerning the allegations about monopoly, due to the growth in the series of chains, the assertion that the process had gone so far that a monopoly existed and that the chains were deliberately driving independent N. out of existence, was wholly disproved by the commission's findings. Of the five chains (Hov. N. Ltd., Harnsworth chain, Associated N. Ltd., Westminster Press Prov. N. Ltd., and Kemsley N. Ltd.), the Kemsley is the largest, its percentage of the total number of daily and Sunday papers being 17.18 in 1948. There were fewer daily and Sunday N. in the five chains in 1948 than in 1929. With the exception of two papers, whose lack of success could be attributed to other causes, no independent daily competing with a chain daily had ceased pub. since 1932. The commission found that the present degree of concentration of ownership in the press as a whole or in any important part of it 'is not so great as to prejudice the free expression of opinion or the accurate presentation of news, or to be contrary to the best interests of the public.' It was suggested in evidence that individual or joint stock ownership should be prohibited and papers be owned by gov.-licensed corporations. This the commission rejected as an 'unwarrantable interference with the liberty of the individual and the freedom of the press.' The commission saw no reason to believe that N. attached to the interests of political parties, trade unions, or other organisations would be better or have greater regard for truth and fairness

than those N. pub. by private undertakings. It is generally agreed, the report states, that the Brit. press is inferior to none in the world. 'It is free from corruption; both those who own the press and those who are employed on it would universally condemn the acceptance or soliciting of bribes.'

It has been claimed that the report of the commission was a complete vindication of the press generally. But the commission gave reasons why in their opinion N., with a few exceptions, failed to supply the electorate with adequate materials for sound political judgment. On this the report stated: 'In the popular papers consideration of news value acts as a distorting medium even apart from any political considerations: it attaches, as we have shown, supreme importance to the new, the exceptional, and the "human" and it emphasises these elements in the news to the detriment or even exclusion of the normal and the continuing. Consequently the picture is always out of focus. The combination, day after day, of distortion due to these factors with the distortion arising from political partisanship has a cumulative effect upon the reader. It results, where it is carried furthest, not only in a debasement in the standards of taste, but also in a further weakening of the foundations of intelligent judgment in public affairs. Political partisanship alone, as we have indicated, deprives the citizen of the evidence on which conclusions should be based. Political partisanship in conjunction with a high degree of distortion for news value may lead him to forget that conclusions are, or should be, grounded on evidence.' Discussing the standards by which the press should be judged, the commission sets down two requirements, firstly, that while the selection of news may be affected by a newspaper's political and other opinions the news it reports should be reported truthfully and without excessive bias; and, secondly, that the number and variety of N. should be such that the press gives an opportunity for all important points of view to be effectively presented. 'The first requirement is satisfied in very different measure by different papers. A number of quality papers do fully or almost fully meet its demands. But all the popular papers and certain of the quality fall short of the standard achieved by the best, either through excessive partisanship or through distortion for the sake of news value. The provincial newspapers generally fall short to a lesser extent than the popular national newspapers. As to the second requirement, the press provides for a sufficient variety of political opinion but not for a sufficient variety of intellectual levels. The gap between the best of the quality papers and the general run of the popular press is too wide, and the number of papers of an intermediate type is too small. The causes of these shortcomings do not lie in any external influences upon the press (other than those exerted by public demand). The policy of the press is

dictated neither by the advertisers, nor by the government, nor by any outside financial interests. . . . Nor do the causes of the shortcomings lie in any particular form of ownership. . . . We do not see a solution to the problems we have indicated in major changes in the ownership and control of the industry. Free enterprise is a prerequisite of a free press, and free enterprise in the case of newspapers of any considerable circulation will generally mean commercially profitable enterprise.* See also JOURNALISM; MAGAZINES; PRINTING.

New Stars, see NOVÆ.

'**New Statesman and Nation**,' independent Eng. weekly periodical formed in 1931 by the amalgamation of two papers, the *New Statesman* and the *Nation and Athenæum*. In 1934 the *Week End Review* was also taken over and its name now appears as a sub-title to the *N. S. and N.* The *New Statesman* was founded in 1913, through the inspiration of Sidney Webb (later Lord Passfield) and Bernard Shaw. The paper was ed. from 1913 to 1930 by Clifford Dyce Sharp and thereafter has been ed. by Kingsley Martin. Among many well-known contributors have been Arnold Bennett, Desmond MacCarthy, Sir J. C. Squire, Hilaire Belloc, G. D. H. Cole, and Robert Lynd ('Y. Y.'). The *Nation and Athenæum*, with which the *New Statesman* combined in 1931, was founded in 1907, superseding the *Speaker* (founded 1890), and was ed. until 1923 by H. W. Massingham (q.v.). In politics the *Nation* followed the *Speaker* in supporting the extreme radical wing of the Liberal party, in urging the need of social reform, and in criticising imperialism. In 1921 the paper amalgamated with the *Athenæum* (q.v.); J. M. (later Lord) Keynes frequently wrote in its columns, while its literary section was remarkable for the essays of Leonard Woolf, literary editor, and the contributions of Lytton Strachey and Virginia Woolf. The present combined paper, the *N. S. and N.*, is a political, critical, and literary organ, markedly to the Left in politics.

Newstead: 1. Vil. of Roxburghshire, Scotland, on the Tweed, 1 m. E. of Mel-

rose. Remains of a Rom. camp were excavated here in 1910. Armour and weapons were also found, and Rom. coins dating from the reign of Augustus to that of M. Aurelius. 2. Par. and vil. in Nottinghamshire, England, 9 m. N. of Nottingham, near the outskirts of Sherwood Forest. Its famous abbey was founded by Henry II. in the latter half of the twelfth century, and it was granted by Henry VIII. to the Byron family, who held it until 1818, when the sixth Lord Byron (the poet) sold it. It has since been restored at a cost of about £100,000. See W. Irving, *Abbotsford and Newstead*, 1835.

New Stone Age, see under STONE AGE. **Newt**, Eft, Asker (*Triton*), genus of tailed amphibians of the order Salamandrinae. Three species occur in Britain, viz. the common or spotted N. (*T. vulgaris*), the

NEWT

great or crested N. (*T. cristatus*), and the rare webbed N. (*T. palmatus*). Of them, the crested N. is the most aquatic. Its head is flat and the upper lip overhangs the lower one. The upper parts of the body are blackish-brown with darker brown spots. The under parts are reddish-orange, with black spots. The sides are dotted with white, and in spring the colours of the rough skin brighten and the notched crest comes into prominence. The male reaches a length of 5 or 6 in., while the common N. rarely exceeds half that length and the skin is smooth, though its colouring resembles the other.

New Testament, Introduction to, forms a considerable section of biblical criticism, and as such must be considered in regard to the whole (see BIBLE). The fixing of the canon of the N. T. (i.e. determining which of the sacred writings are to be taken as divinely inspired) was the work of some centuries, and before this took place there was much research of the kind that would now come under the head of N. T. Introduction. Certain books were held as canonical in some places; in other places they were ignored. In

the discussion which ensued as to the canonicity of such books, judgment was almost invariably based on historical grounds. Were those books for which apostolic authorship was really apostolic? Similar defence of the canonical books was also needed against the attacks of heretical sects. Thus we find many statements on points relating to N. T. introduction in such writers as Irenaeus, Tertullian, and especially Origen. A large number of the problems which confront the critics of to-day were not unknown to the fathers of the early Church. The canon, which had been accepted for centuries upon the authority of the Church, was disputed by the Protestant reformers, who rejected certain books. The old canon was confirmed by the Council of Trent. The early reformers, Erasmus, Luther, and Calvin, all expressed opinions on the authorship and value of certain of the N. T. books differing from the traditional views and calculated to support the new beliefs; but it is to a Catholic that we owe the true foundation of the study of biblical introduction. In 1689 Richard Simon, a Fr. theologian, pub. his *Histoire critique du texte du Nouveau Testament*, followed in the next year by an *Histoire critique des versions du Nouveau Testament*. He dealt with the N. T. with the object of vindicating the traditional view. Many critical introductions to the N. T. appeared in the years that followed—in England, France, and Germany: but the next epoch in the study of this subject is marked by the names of Michaelis and Semler. The former pub. in 1750 his *Einführung in die göttlichen Schriften des Neuen Bundes*, which was much improved in the fourth ed. (1788). He shows much breadth of view, dealing with the questions of inspiration and authenticity. Semler wrote no definite *Einführung*. His contribution to N. T. criticism lies in his insistence on the distinction between the temporal and universal elements in the N. T. From the time of Michaelis and Semler the study of N. T. introduction has been carried on by Ger. scholars. Only the most important can be named. J. G. Eichhorn in 1804–14 pub. the first three vols. of his *Einführung in das Neue Testament*, and the two remaining ones appeared in 1827. It is a brilliant work, but few of its results have been finally accepted. It is of less importance than the work of W. M. L. de Wette, whose *Lehrbuch der historisch-kritischen Einführung in die Kanonischen Bücher des Neuen Testaments* appeared in 1826. The first ed. of this work was characterised by a very anti-traditional attitude. This, however, is changed to some extent in later eds. A work equally famous for its full but concise exposition is K. A. Credner's *Einführung in das Neue Testament*, 1836. But like Eichhorn, Credner is too hasty in formulating his theories. In 1842 appeared Reuss's *Geschichte der heiligen Schriften des Neuen Testaments* (last ed., 1887), a work still of the greatest value in the investigation of the problems of biblical criticism. Most of these writers, especially de Wette, occupy

a position more or less opposed to that of the Tübingen school, whose head was F. C. von Baur. He pub. a number of works on the N. T. and early Church hist., in which he definitely assailed the historicity of the canonical books. These he considered were to be regarded as more or less polemical treatises embodying the tendencies of the opposition parties in the early Church. One of these was the Judaistic, headed by Peter; the other, headed by Paul and ultimately victorious, was the Catholic party. All the N. T. writings were to be estimated in their relation to this struggle. The main theses of the Tübingen school is now generally rejected, and its conclusions are discredited. One of the most convincing attacks on the Tübingen position came from a former disciple of Baur, A. Ritschl, in the second ed. (1857) of his *Entstehung der altkatholischen Kirche*. Reference must also be made in modern times to the introductions of H. J. Holtzmann, 1885; S. Lahn, 1897; A. Peake, 1909; J. A. Robinson, 1929; A. W. Blunt, 1936; A. Richardson, 1938; F. C. Syngé, 1941; and A. M. Hunter, 1945. On the Catholic side may be mentioned E. Jaquier, *Études de critique et de philologie du Nouveau Testament*, 1920, and *Histoire des livres du Nouveau Testament*, 1926; and introductions by A. S. Peake, 1909; J. Donovan, 1936; E. B. Redlich, 1939; and F. R. Hoare, 1944.

New Theatre, The, in St. Martin's Lane, London, was opened March 12, 1903, under the management of Charles Wyndham. The following are among the best-known plays produced at the N. T.: *The Constant Nymph*, 1920; *Richard of Bordeaux*, 1932; *Noah*, 1935; *The Gioconda Smile*, 1948. Between 1935 and 1947 the N. T. was the scene of sev. notable Shakespearian productions with Laurence Olivier and John Gielgud in the title roles.

Newton, Alfred (1829–1907), Eng. ornithologist, b. at Geneva. In 1854 he was elected travelling fellow of Magdalene College, Cambridge, and visited many parts of the world. He pub. *Zoology of Ancient Europe* (1862); *Ootheca Wolleyana* (1864–1902); *Zoology* (1872); and a *Dictionary of Birds* (1893–96).

Newton, Sir Charles Thomas (1816–91), Eng. archaeologist, b. at Bredwardine in Herefordshire. In 1852 he became vice-consul at Mytilene, and in 1853–54 consul at Rhodes. In 1854–55, aided by funds supplied by Lord Stratford de Redcliffe, he discovered an important series of inscriptions at the is. of Calymnos, and in 1856–57 he discovered the remains of the Mausoleum at Halicarnassus. In 1861 he was appointed keeper of Gk. and Rom. antiquities at the Brit. Museum.

Newton, Gilbert Stuart (1794–1836), Eng. painter, b. at Halifax, Nova Scotia. He first exhibited at the Royal Academy in 1818, becoming an associate in 1829, and an academicien in 1832. His pictures include 'Don Quixote in his study' (1823); 'Captain Macheath upbraided by Polly and Lucy' (1826); 'Yorick and the Grissets' (1830); and 'Portia and Bassanio' (1931).

Newton, Sir Isaac (1642-1727), Eng. mathematician and scientist, b. in the manor-house of Woolsthorpe-by-Colsterworth, near Grantham, Lincolnshire, on Dec. 25, posthumous son of a farmer, Isaac N., and Hannah Ayscough. Educated at the King's School, Grantham, and entered Trinity College, Cambridge, in June 1661, graduating in 1665. His great discoveries of the differential calculus, the discovery of the composition of light, and the law of universal gravitation were all made in his twenty-third and twenty-fourth years while he was spending an enforced vacation at home owing to an outbreak of the plague. Returning to Trinity College he was elected a fellow, took his M.A. degree, and in 1669 was appointed Lucasian

SIR ISAAC NEWTON

Engraving after the original picture by Vanderbank, in the possession of the Royal Society.

prof. of mathematics in succession to his teacher, Isaac Barrow. His election as a fellow of the Royal Society in Jan. 1672 led to controversies extremely unwelcome to N. Previous to this, from 1665 to 1667, he was engaged largely in mathematics, having studied Descartes's geometry, and invented the binomial theorem, the method of tangents, and the fluxional calculus (the discovery of fluxions, which he claimed, was contested by Leibniz, and led to a long and bitter controversy between the two philosophers), his paper *Analysis per Equales Numero Terminorum Infinitas* leading to his professorship. In 1666 his thoughts were directed by the falling of an apple, according to Voltaire, to universal gravitation. From Kepler's second law he deduced the law of inverse squares and applied it to the motions of the moon; but did not complete his verification till he had Picard's new value (69.1) for the length of a degree of lat., which was found in 1672. In 1681 he wrote *De Motu*, which was presented to the Royal Society. This was the germ of his great work, and with additions formed the first book of his

Philosophiæ Naturalis Principia Mathematica, written 1685-86, during which time he was in constant correspondence with the astronomer royal, Flamsteed, chiefly on the subject of measurements of planetary orbits. The whole work was pub. in 1687. In 1689 N. was elected to represent his univ. in the Convention Parliament. During 1692-93 he passed through a period of serious illness, with loss of appetite and marked insomnia. He was at last, in 1694, largely owing to the efforts of John Locke, appointed by Charles Montagu, warden of the Mint, and three years later master. The year 1701 saw him again in Parliament, but he was defeated at the polls in 1705. He became president of the Royal Society in 1703, and was annually re-elected for the remainder of his life. He was knighted by Queen Anne in 1705. His *Optics* was pub. in 1704. A very prolonged controversy took place between N. and Leibniz, as to priority of claim to the invention of the new calculus. In 1714 N. gave evidence before a committee of the House of Commons on the question of finding long. at sea. He was interested in theological studies and the anct. prophecies. After his death his *Observations upon the Prophecies of Daniel and the Apocalypse of St. John* and his *Chronology of the Ancient Kingdoms Amended* were pub., but nothing explicit concerning his views on the Trinity, which were believed to be Aryan and unorthodox, ever appeared. Amongst his great friends must be reckoned Halley, who persuaded and cajoled N. into writing his *Principia*; had not Halley exercised the greatest tact, the crowning part of the book would have been suppressed by N., for fear of controversy. Yet the work has been described as the supreme feat of the human intellect, for it contains not only the explanation of the planetary orbits, worked out in terms of universal gravitation and N.'s laws of motion, and of the behaviour of comets, but a host of other achievements of the first importance. It also gives the basis of mathematical physics, in particular of the science of fluid movements. It has been remarked that science was N.'s supreme interest only for short and separated periods, and in the intervals he displayed not only a lack of interest in physical science but sometimes even an actual distaste for it. It is certainly significant that he made no attempt to publish his great discoveries of the calculus, universal gravitation, and prismatic decomposition of light, and nothing on the calculus or on gravity appeared for some twenty years. N., far from being a man of remote academic interests, had a very practical mind. In his boyhood he made mechanical toys, clocks, and sundials. His interest in chem. began when he was boarding at the house of the apothecary, Clark, during his schooldays in Grantham, and this interest continued after he went to Cambridge. He took his chem. from Baptist van Helmont (q.v.), who discovered the materiality of gases, and from Boyle. The views in the *Principia* are akin to those of Boyle,

Hooke, and Mayow on the existence of a vital constituent in the atmosphere, isolated by Priestley long afterwards and named oxygen by Lavoisier. In 1692 he drew up a paper, entitled *De natura aëdiorum*, dealing with chemical affinity (pub. 1710), but it was in the queries appended to his *Optics* that he approached this problem more closely. Though he achieved the unique triumph of formulating the mathematical law of gravitational attraction, he was not able to extort from nature the laws of chemical attraction or to reach any corresponding simple numerical relationship. This problem is in fact one of far greater difficulty, because the attraction varies with the chemical nature of every reactant instead of with mere mass; and even today we cannot claim that progress in this problem reveals anything really satisfactory. Yet it seems that here was the great object of N.'s chemical speculations and researches and that 'here in the microcosm of chemistry he sought to parallel his discoveries in the macrocosm of mechanics' (Douglas McKie). N. was welcomed at the court of George I. and held in increasing reverence and honour—though his mind shrank from contact with the world. He *d.* at Kensington and was buried in Westminster Abbey near the entrance to the choir. Among Eng. scientists he stands foremost, and he left such a mark upon science that, until the beginning of the twentieth century, what was done in celestial mechanics and in general investigations of the properties of matter followed the lines he laid down (Andrade). See S. Horsley, *Isaac Newtoni Opera quae exstant Omnia*, 1779; Sir D. Brewster, *Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton*, 1855; G. J. Gray, *Bibliography of Sir Isaac Newton*, 1907; and L. T. More, *Isaac Newton*, 1934. In 1942 (tercentenary) the Royal Society (of which N. was president for twenty-five years), with the financial help of the Pilgrim Trust, acquired N.'s bp. at Woolsthorpe-by-Colsterworth for the nation. The room in which N. was *b.* has a simple marble tablet on the wall, inscribed with Pope's well-known couplet.

Newton, John (1725-1807), Eng. divine and friend of Cowper, *b.* in London. First a sailor and slave-trader from 1755 to 1760, he was tide surveyor at Liverpool. In 1758 the archbishop of York refused him ordination, but in 1764 he was ordained by the bishop of London; he was curate of Olney till 1780, when he became rector of St. Mary Woolnoth, Lombard Street, London. With Cowper, he pub. *Olney Hymns* in 1779. See J. Bull, *John Newton: an Autobiography and Narrative*, 1868; and *John Newton: Centenary Memorials*, ed. by J. Challis, 1908. There is also a contemporary life by R. Cecil, dated 1808, which was prefixed to a collected ed. of N.'s works, 1816.

Newton, Thomas (1704-82), bishop of Bristol, *b.* at Lichfield. He was ordained in 1730. After holding various minor appointments he became bishop of Bristol in 1761. He ed. Milton's *Paradise*

Lost (1749), and pub. *Dissertations on the Prophecies* (1754, 1758).

Newton: 1. Tn. of Scotland in Mid-Lanarkshire, 5 m. N.W. of Hamilton. Pop. 5000. 2. Suburb of Auckland, N. Is., New Zealand. Pop. 3500. 3. City of Massachusetts, U.S.A., in Middlesex co., on the Charles R., 10 m. W. of Boston, and a residential suburb of that city. There are foundries and machine factories, and manufs. of electrical apparatus. Pop. 70,000. 4. City of Kansas, U.S.A., and the cap. of Harvey co., 30 m. N. of Wichita. There is a Mennonite settlement here. The trade is chiefly agric. Pop. 12,000.

Newton Abbot, seaport and mrkt. tn. of Devonshire, England, on the estuary of the Teign, 20 m. S.W. of Exeter. There are large engine works here, and there is some trade in shipping. Pipeclay and fine china clay are obtained in the neighbourhood. William of Orange was proclaimed king of England here, at the market cross in 1688. Bindley Manor, W. of the tn. is an admirable specimen of fifteenth-century architecture on the shell scale. Pop. 15,000.

Newton Grange, vil. N.E. of Edinburgh, Scotland, 2 m. S. of Dalkeith, with coal mines, brick and tile works, paper mills, etc. Pop. 5000.

Newton Heath, tn. of Lancashire, England, 1½ m. N. of Manchester, on the Medlock. There are cotton mills, and dye, bleach, and chemical works. It is a suburb of Manchester.

Newton-in-Makerfield, or Newton-le-Willows, urban dist. and tn. of Lancashire, England, 15 m. E. of Liverpool. The Liverpool farm reformatory school is here, with a farm and market gardens. There are iron foundries, glass factories, sugar refineries, and printing and stationery works, paper mills, etc. Coal is mined in the neighbourhood. Pop. (1938) 20,460.

Newton's Rings. Set of concentric, circular interference fringes formed around the point of contact when the convex surface of a lens rests on a plane polished surface. Newton took two lenses of very slight curvature, so arranged as to enclose, when pressed together, a film of air, thinnest near the centre and thickening gradually outwards. On pressing a number of concentric coloured rings appeared, varying in number and arrangement, but all exhibiting colours of the spectrum; the centre of the rings when the glasses were in contact was black. With white light the number of rings is seven, and the colours are arranged from violet to red outwards. When the light is transmitted instead of reflected, the colours are complementary and the black spot becomes white. The convex surface being pressed on the plane surface of the lower lens encloses a film varying from .0001 to .001 in thickness outwards, the thickness varying as the square of the distance from the centre. The light is reflected from each surface and arrives at the eye, having traversed paths differing minutely in length. The rays, which are reflected from the upper and lower surfaces, are thus seen simultaneously

in the same phase or opposite phases, so producing interference, destruction, or reinforcement. The different colours produce their effects at different distances from the centre, and by measurement the actual wave-length may be determined.

Newton Stewart, mkt.-tn. of Scotland, in the cos. of Kirkcudbright and Wigtown, on the R. Cree, 6½ m. N.N.W. of Wigtown. Cattle markets and horse fairs are held. Pop. 2000.

Newton-upon-Ayr, suburb of Ayr, Scotland. Pop. 10,000.

Agent General for British Columbia

THE PATTULLA BRIDGE OVER THE FRASER RIVER AT NEW WESTMINSTER

Newtown: 1. Manufacturing tn. of N. Wales, in the co. of Montgomery, 8 m. S.W. of the tn. of that name on the r. b. of the Severn, and on the Montgomery Canal, which connects it with the inland navigation of the country. It is the centre of the flannel manufs. of the co. Pop., with Llanllwchaearn, 5,200. 2. Tn. of New S. Wales, Australia, in Cumberland, 3½ m. from Sydney, and principally a residential suburb of that city. The univ. buildings and colleges are here. 3. Suburb of Hobart, Tasmania.

Newtownards, tn. of co. Down, N. Ireland, near head of Strangford Lough. Embroidered muslin, ghoshams, and handkerchiefs are manufactured. In the neighbourhood are the ruins of Moville Abbey. Pop. 12,000.

Newtown Hamilton, par. and mkt.-tn. of co. Armagh, N. Ireland, 11 m. W. of Newry. Pop. 3000.

New Towns, see under **SATELLITE TOWNS**.

Newtown Stewart, mkt.-tn. in co. Tyrone, N. Ireland, on the Mourne, 24 m. S. of Londonderry. Linen weaving is carried on. Pop. 1000.

New Ulm, city of Minnesota, U.S.A., and the co. tn. of Brown co., on the r. b. of the Minnesota R., 75 m. S.W. by W. of Minneapolis. It was founded in 1854 and destroyed by Indians in 1862; it has been well rebuilt since then. A trade in livestock is carried on. Pop. 8700.

New Westminster, tn. of Brit. Columbia, Canada, former cap. of the prov. on the

r. b. of the Fraser R., here crossed by a fine bridge. It is served by the Canadian National and Canadian Pacific Railway, and by the Great N. from the U.S.A.; an electric railway connects it with Vancouver, 12 m. E.S.E. N. W. was founded by the Royal Engineers in 1859 and incorporated in the same year. A fire occurred in 1898, when a large part of the city was destroyed. The fresh-water harbour is third among Canada's seaports, the chief exports being lumber, lead bars, ores, and fruit. Manufs. include wood products, paper, fertilisers, cordage, meat-packing, and canneries. Pop. 33,500.

New Year's Day has been celebrated in all parts of the world, and from remote antiquity with special festivities. The date of the commencement of the new year has, however, varied considerably. That of the anc. Egyptians and Persians commenced with the autumnal equinox (Sept. 1). The Jews (eccles.) and the Babylonians made it begin with the spring equinox. The Gks. (until the fifth century B.C.) celebrated it at the winter solstice. During the Middle Ages Christian countries almost invariably began the new year on March 25. According to the Julian calendar, the new year began on Jan. 1, and the Romans observed this day as a general holiday. Visits were paid and presents exchanged, the custom of giving presents being popularly derived from the time of the legendary King Tutius. The gifts were known as *strenæ* (cf. the name for N. Y. D. in France, *le jour d'trennes*), and so great were the imperial *strenæ* that they ultimately became a subject of legislation. The early Christians were not expected to take part in either the new year's revels or the Saturnalia of Dec., and many of the fathers order N. Y. D. to be kept as a fast. But the need for this vanished, and even in England the custom of giving New Year's gifts continued down to the time of Charles II. It has now given way to the giving of Christmas presents.

New York Bay. The lower (outer) Bay is that part of the Atlantic which washes the converging shores of Staten Is. and Long Is. Between these is. runs a strait called the Narrows, through which the Upper (inner) Bay is reached. This is some 6 m. long and 4 m. wide, and at its inner end are the mouths of the Hudson and East R., with Manhattan Is. and New York City lying between them.

New York Central Railroad was started as a large railway combine in 1868. It is now one of the largest railways in America, and has a total mileage of 10,745; the main line runs from New York to Chicago, but it has important branch lines and connects with most of the E. states railway systems. In addition to its own lines, the company leases and operates 2632 m. of track. The total investment is over \$1,180,000,000, and the operating revenue (1948) over \$703,340,000.

New York, Chicago and St. Louis Railroad, important railway company operating 1687 m. of track in the busy N.E. areas of the U.S.A. It was incorporated in 1923 as an amalgamation

of sev. lines, including the New York, Chicago and St. Louis railroad; the Chicago and State line; the Toledo, St. Louis and Western; the Lake Erie and Western; and the Fort Wayne, Cincinnati and Louisville. It has an authorised capital of \$105,000,000 of which \$69,000,000 is issued and subscribed. At one time a large part of the line was operated by the New York Central Railway.

New York City originally was the is. of Manhattan; but greater New York includes the bors. of Bronx, Brooklyn, Queens, and Richmond, and part of

length and very narrow), skyscrapers have been erected. The Empire State soars up eighty-five storeys, attaining a height of 1250 ft. and is the tallest structure in the world. Other notable ones are the Chrysler building; the Chanin Tower; the Woolworth building, being 792 ft. high; the Singer Co.'s building is 612 ft. high; the New York Telephone building in W. Street is 498 ft. high. Skyscrapers of from thirty-five to fifty-one storeys have now become a commonplace in N. Y. C. The Waldorf-Astoria hotel with its twin towers reaching over forty storeys is

Aerial Exploration Inc.

NEW YORK: A VIEW LOOKING SOUTH-WEST, SHOWING SOUTH MANHATTAN

Upper Bay is on the left; behind the skyscrapers are the River Hudson and Jersey City. In the foreground (East Side) is Manhattan Bridge; beyond it Brooklyn Bridge and the main financial district of Manhattan.

Westchester. New York disputes with London the claim to be the largest city in the world. Taking a radius of 25 m. New York is the centre of a large pop. It has more Gers. living in it than many large cities in Germany, more Irish than Dublin, and more Its. (mostly labourers) than most big It. cities. Every fourth person in New York is a Jew. Of the pop., over one-third are foreigners, females slightly predominating. There is also the great transitory pop. which is always a feature of large ports. Many Chinamen are engaged in laundry work. The Negro pop. is the largest of any city. The Jews are chiefly Polish and Russian. Swedes and Norwegians have each a strong colony in N. Y. C., and are prosperous, quiet, working citizens. Owing to the size of Manhattan Is. (12 m. in

the biggest hotel in the world. The New Yorker is another notable skyscraper hotel, reaching forty-two storeys. N. Y. C., is the great mart and exchange of the U.S.A., and is the commercial and financial metropolis of the States. The Stock Exchange, the building designed by George B. Post, and completed in 1922, is in Wall Street, a narrow street leading E. out of Broadway, which forms the central thoroughfare right through Manhattan, and across which run the avenues. The Fourth and Fifth Avenues were mostly residential and here were the palatial homes of the business kings, but in recent years many of the old houses have given way to commercial buildings, and the magnates have removed to Park Avenue or an hotel. The prin. shopping dist. is from 32nd to 57th

Street, with bargain stores in 14th Street. Bowery, extending N. of Chatham Square, is a Jewish quarter, and the poorest part of the city. Two lines of railway have termini in Manhattan, the New York Central and the Pennsylvania. They have the two finest railway stations in the world. Many other lines have termini across the Hudson R., in New Jersey and convey their passengers to N. Y. C. by ferry. The elevated railway is a feature of the city, and there is a vast underground railway along the whole of Manhattan Is., and extending to the Bronx, the Brooklyn, and the Long Is. points. New York is the largest port in America, more than half the import and export trade of the U.S.A. coming by way of this city. New York harbour, formed by the North and the Hudson, consists of two bays, the Upper and Lower, divided by the Narrows, commonly called Hell's Mouth, and bounded on the S.E. by Raritan Bay, N.E. by Brooklyn and Long Is. Sound. The promontory of Sandy Hook with lighthouse is the first land sighted by European travellers. The enormous statue of 'Liberty enlightening the World,' by Bartholdi, stands on Bedloe's Is., and has a pedestal of 150 ft. The water communication of the Hudson R. and the Erie Canal is of the utmost importance, for much of the wheat sent from Chicago market is thus shipped through to Europe. Many of the piers are on the New Jersey side at Hoboken; others on the North R. The U.S. naval shipbuilding yards are on the Brooklyn side, where there are extensive docks and 36 m. of improved water-front. The ferries crossing the rivers are of immense size. The city is noted also for its daily papers, over one-seventh of which are printed in foreign languages; two are in Yiddish. There are two univs.; Columbia Univ. was founded as King's College on the result of a public lottery in 1754. Its present site is on Morningside Heights and it includes the Barnard College for Women. New York Univ., the undergraduate dept. of which is on Washington Heights, was founded in 1831. It is a huge organisation and is divided into three centres, the undergraduate dept., the school in Washington Square, and the school of commerce in Trinity Place. The N. Y. C. College, whose new buildings were completed in 1900, has a policy of free education. Fordham (St. Francis Xavier) College has developed from a theological seminary into a complete univ. The People's Institute is a primary and adult evening school. The New York Public Library, estab. by consolidation of the Astor, Lenox, and Tilden foundations, was opened in 1911. The Bellevue Hospital Medical School is the largest medical school in America. There are over 550 churches; Trinity, at the head of Wall Street, Grace Church, the Church of the Transfiguration (Episcopalian), the vast and costly cathedral of Saint John the Divine on Morningside Heights, St. Patrick's Cathedral (Rom. Catholic), Madison Square Church, Byzantine, with golden dome (Presbyterian),

and the fine Jewish synagogue, are all notable.

As most business from the nineteenth century centred in Manhattan Is., and as the whole area was very narrow, the only way of expansion was in the air. Hence, after skyscrapers were invented, New York developed them to their highest pitch. The early ones, like the Pulitzer and Flat Iron buildings, to-day look almost like pygmies compared with those erected subsequently. In order to provide for light and air, the new building laws require the step-back or terraced form of building, which gives to these enormous structures something of a Babylonian aspect. The time is probably rapidly approaching when most of Manhattan will consist of skyscrapers. Wall Street section—the financial dist.—is filled with them. Another great group was constructed between 30th and 60th Streets, and many avenues are lined with them. There is one group devoted to the clothing and needle trades, another to medical schools and hospitals. Skyscraper hotels are the fashion in New York. Most of the modern ones range from eighteen to forty storeys high, and have from 750 to 2300 bedrooms, each with private bath. The vast working pop., accumulated in the skyscrapers during the day, has made the traffic problem the most difficult in the world. In the morning and evening the streets are congested with motor vehicles, the sidewalks with pedestrians travelling to tramcars or underground, there known as the subways. The city has not been able to build its subways fast enough to accommodate the crowds.

New York possesses at least two thoroughfares which are world famous—Broadway and Fifth Avenue. The latter, from which tramcars are barred, is the great retail, shopping, hotel, and club avenue. Broadway, between 25th and 60th Streets, is the centre of the theatrical and night life. It is the section known as the Great White Way, because of the vast series of electric advertising signs which almost turn night into day. In some aspects it is the city that never goes to sleep. Buses, tram-lines, subways, elevated trains, run all night; there are countless drug stores and restaurants which never close their doors, and there are cinemas which have performances which start at midnight. Central Park is 840 ac. in extent, and has many magnificent drives and walks. At the main entrance is a fine monument of Columbus. The Metropolitan Art Museum faces the E. side of the park. It is one of the greatest in the world and was greatly enriched by the princely legacies of Benjamin Altman and Henry Frick, both of whom bequeathed to it their priceless collections of old masters. The city frontage on the Hudson R. from 72nd Street northwards has been made into a beautiful scenic driveway, Riverside Park. On the Brooklyn side the prin. park is Prospect Park, famous for its gardens. That part of the city known as the Bronx contains the huge Bronx Park, in which is located

the New York Zoo, the richest and one of the largest and best equipped in the world. Manhattan is connected with Brooklyn by four enormous bridges besides the great Hellgate railway bridge which connects Brooklyn with the Bronx just above Harlem R. The Williamsburg Bridge is one of the greatest suspension bridges of the world, as also is the bridge between Manhattan and Fort Lee, New Jersey, with its suspension span of 3,500 ft. But plans for a vehicular bridge to be constructed in New York Harbour over the narrows between Staten Is. and Brooklyn will necessitate a suspension bridge larger than any in existence. Its centre span of 4,620 ft. will be 420 ft. longer than that of the Golden Gate bridge at San Francisco, now the longest, and 1,120 ft. longer than the centre span of the George Washington bridge which crosses the Hudson R. from New York to New Jersey. At its highest point it will be 237 ft. above the narrows. The bridge is designed to carry a six-lane roadway with clover-leaf approaches to belt parkway in Brooklyn and main highways on Staten Is. It is expected that it will take four years, at least, to build the bridge, but some estimates run as high as ten years, while the cost is put at \$78,000,000. (c) *Manhattan Is.* The tendency is for private houses to become impossible except for people of wealth, and for the dense pop. to live in ever larger and more elaborate 'apartment houses.' There are fine municipal buildings. N. Y. C. has a large domestic commerce, 10 per cent of the nation's products being manufactured there. The manufs. include clothing, printing products, millinery and lace goods, bakery products, tobacco, cigars and cigarettes, fur and knitted goods, boots and shoes, furniture, foundry and machine-shop products, and musical instruments. Brooklyn has its own industrial trades; it is a large grain depot, imports, refines, and distributes sugar, imports and distributes coffee, and manufs. boots and shoes. Pop. (1940) Manhattan 1,889,900; Brooklyn 2,698,300; Bronx 1,394,700; Queens 1,297,600; Richmond 174,400; total 7,454,900. See TAMMANY HALL.

History.—In 1609 Henry Hudson discovered the riv. named after him and also the Is. of Manhattan. In 1624 Peter Minuit, appointed director of Dutch colonies in America, arrived at Manhattan and bought the entire Is. from the Indians for twenty-four dollars' worth of beads and ribbons. To-day that Is. is the most valuable piece of land in the world. Thus began what was to be the modern Babylon. It was governed by Minuit and a council of five appointed by the Dutch W. India Company in Holland. The people had no voice in their gov. At first growth was very slow, and at the end of five years there were but 300 people living in the tn., which was named New Amsterdam. The home company, desiring to attract settlers, in 1629 adopted the patron system. Under this any member of the company who would bring or send at least fifty settlers, fifteen years

old or over, would be granted an estate of 16 m. of frontage on the Hudson R., and as far back as his resources would permit him to develop. The patron was bound to provide a farm for each of his tenants, who in their turn were bound to remain on it for ten years. The more powerful of these patrons became immensely wealthy, and in after years formed what was known as the Knickerbocker aristocracy of N. Y. C. It included such well-known names as the Van Rensselaers, Schuylers, and Livingstons.

New Amsterdam now began to grow, and attracted people, not only from the Eng. colonies in America, but also from Europe, so that by 1643 some eighteen languages were being spoken there, and the future of N. Y. C. was thus already marked by a cosmopolitan character which was to make it unique. The famous Peter Stuyvesant, with his wooden leg, was the last Dutch governor of the settlement. Under him the restlessness of the people came to a head. They wanted a voice in their own gov., strengthened in this by what they saw going on in the neighbouring Eng. colonies. The home company finally decided that the governor should have a council of nine, chosen from a larger number selected by the people. But, nevertheless, he managed to keep things very largely in his own hands until fate eventually overtook him. In 1664, England claiming the colony on the ground of the Cabot discoveries, King Charles the Second presented the entire surrounding country to his brother, James, duke of York. Richard Nicolls of the R.N. set out with 500 veteran soldiers. On reaching New England, he was joined by Eng. colonial militia from Connecticut and sailed for the mouth of the Hudson. Stuyvesant wanted to fight but the people were not with him, and he was compelled to surrender the tn., which was at once named New York. Old Stuyvesant retired to his farm or 'bowery'—after which that famous dist. of N. Y. C. is named—and later became fast friends with Governor Nicolls. Nine years later a Dutch fleet reconquered New York, but the next year by peace treaty it was returned to the Eng. Under the Eng. N. Y. C. became a busy mart containing over 10,000 people by 1750.

In the late eighteenth century, before the revolution, New York had prospered and developed more than any other Amer. city, though both Philadelphia and Boston were equally important ports. New York owed its position to the fact that it was the natural outlet and cap. of the Middle Colonies (see on this J. Truslow Adams, *The Epic of America*, 1942). Already it had a more mixed and polished society than anywhere else in New England, though some historians claim that Boston far outstripped it as the literary cap. of the U.S.A. even as late as the first half of the nineteenth century, and that in the late eighteenth century it was rivalled by Philadelphia for commerce. John Adams, on his way to staid Philadelphia, was impressed by the

splendid houses, fine salons, and elaborate cuisines. At this period the city had its clubs, balls, concerts, pleasure-gardens, and coffee-houses. A funeral in New York sometimes cost sev. thousand dollars, and the wealthy people dressed in the latest London modes, with silks and velvets, powdered wigs, and small swords (see A. Nevins and H. S. Commager, *America*, 1943). There were grammar schools but no general system of instruction. King's College (now Columbia Univ.) trained Alexander Hamilton and Gouverneur Morris, but wealthy families sent their sons to the Brit. univs. At this time (1790) the pop. was 33,000, that of Philadelphia being 42,000, and of Boston 18,000. The year 1789 saw New York developing temporarily into a national cap., and President Washington at first occupied a residence just outside the city

estab. a type of pictorial joke, in which written explanation was reduced to a minimum and attention directed on the joke even at the cost of visual accuracy. This style has had great influence on comic art in America and Europe. The N. Y. has, from its first issue, maintained a frankly optimistic and bolsterous outlook. It is the nearest Amer. counterpart to *Punch*, but possibly has a less national appeal, being particularly styled to suit the inhab. of New York city. It also contains rather more technical articles than are found in *Punch*.

'New York Herald Tribune.' The *New York Herald* was founded May 6, 1835, by James Gordon Bennett, in New York City. It was the first Amer. newspaper to make a feature of shipping, religious, and financial news. It sent H. M. Stanley to Africa in 1869. Under Bennett's son and

NEW YORK IN 1746

on Franklin Square and then later took an imposing mansion (McComb) in Lower Broadway, while Vice-President Adams occupied a large house on Richmond Hill. Congress sat both at Wall and Broad Streets. In the 1830s the new Amer. classes converted the city from a federated to a democratic city. To-day New York stands unchallenged as the marine, commercial, financial, journalistic, and literary metropolis of the New World. See J. G. Wilson, *Memorial History of the City of New York*, 1891-93; M. J. Lamb and B. Harrison, *History of the City of New York: Origin, Rise, and Progress*, 1896; Mrs. S. Van Rensselaer, *History of the City of New York in the Seventeenth Century*, 1909; —, *Warshow, The Story of Wall Street*, 1930; E. W. Spaulding, *New York in the Critical Period 1783-89*, 1932; C. Beaton, *Portrait of New York*, 1948; and A. Nevins and J. A. Krout, *The Greater City—New York, 1898-1948*, 1948. 'New Yorker', literary and satirical U.S. weekly magazine, first issued in Feb. 1925. Its chief owner was Harold Ross, who also ed. it. It is pub. by the New Yorker Magazine Inc., whose offices are at 25 West 43rd Street, New York 18. It

heir it achieved wide circulation and fame. The paper was purchased by Frank A. Munsey in 1920, and merged with the *New York Sun*, the morning paper still being called the *New York Herald* and the afternoon paper the *Evening Sun*. In 1924 the *Herald* was purchased by the *New York Tribune* (q.v.) and merged with that paper under the title of *New York Herald Tribune*.

'New York Journal,' originally founded in New York City in 1733, became a daily in 1788. It had a chequered career until 1924 when it was bought by Wm. Randolph Hearst, who immediately deprived most of the other New York papers of their best brains by paying higher salaries. Hearst made of it a more or less sensational newspaper, which achieved a huge circulation and gave rise to the phrase 'yellow journalism.' It was largely due to the campaign of the *Journal* and other Hearst papers that the people of the U.S.A. were aroused to the point of forcing their gov. to make war on Spain in 1898.

New York, New Haven and Hartford Railroad Company was incorporated in 1872, and now operates 1819 m. of track (of which 127 m. is electrified) in one of the

most densely populated areas of the E. states of America. It has been part of the company's policy to operate all kinds of traffic, and in consequence it is proprietor of a large number of motor coaches and a fleet of steamboats, which not only act as feeders to the railway lines, but also enable the company to deal with the waterways and roads of the area.

New York State, most influential of the U.S.A., called the 'Empire State,' one of the original thirteen states, is three times the size of England. It is bounded on N.W. by Lake Ontario, N. by the prov. of Quebec, E. by Vermont, Massachusetts, Connecticut, S. by New Jersey, Pennsylvania, W. by Lake Erie. Land area 49,204 sq. m., 1550 being water. The beautifully wooded Adirondack Mts. are in the N., the Catskills in the E., Shawang-lak Range in the S. Lake Seneca and Lake Cayuga are the largest of the Finger Lakes, a belt of lakes in W. New York, and both are about 40 m. in length. Lake Geneva is one of the prettiest. The beautiful George and Champlain lakes lie E. of the state. The famous Hudson R., with Mohawk trib., flows eastward and southward through this state alone, whilst the Delaware and Susquehanna rvs. drain the central part. The Erie Canal, opened in 1825, connects the Hudson with the Great Lakes. The largest cities are New York, 7,454,900; Buffalo, 575,900; Rochester, 324,900; Syracuse, 205,900; Yonkers, 142,500; Albany (the cap.), 130,500; Utica, 100,500; Schenectady, 87,500; Binghamton, 77,000; Niagara Falls, 78,000; Troy, 70,300; Mount Vernon, 67,300; New Rochelle, 58,400. The state sends forty-three members to the lower house of Congress at Washington, and it is sometimes called the pivotal state, owing to its influence. Education is compulsory between seven and sixteen, and over 73,000 teachers are employed in the 6430 public schools. Univs. include Columbia, New York Univ., Cornell (Ithaca, New York, where state scholarships can be obtained), Syracuse (Syracuse), Rochester (Rochester), Buffalo (Buffalo), Colgate (Hamilton), Union (Schenectady), besides Fordham (New York City), Hamilton College (Clinton), College of City of New York (New York City), the Union Theological Seminary (New York City), the General Theological Seminary (New York City), Vassar (Poughkeepsie), Barnard College (New York City), for women, eight law schools, twelve medical schools. The chief religions are Rom. Catholic, Jewish, and Protestant Episcopal. The governor is chosen for four years. The Senate, which meets at Albany, is composed of fifty-six members, elected every two years, and the Assembly of 150 members, elected every two years, thirty-five being sent from New York City. There are sixty-two cos., five of which comprise the city of New York. Agriculture is good, and dairy-farming is extensive. Grapes, pears, peaches, and other fruits are widely cultivated; the apple crop is second only to that of Washington. The state comes second in maple sugar, potatoes, and buckwheat.

Her manufactured products are worth well over \$7,000,000,000 a year. The leading industry in value of output is clothing manufs.; printing, publishing, and textiles are also enormous interests; other industries are fur goods, corsets, hats, millinery, gloves, and shoes. A considerable portion of the huge figures is accountable by the fact that New York City is the greatest manufacturing city in the U.S.A. Mineral resources are various, and include gypsum, talc, aluminium, zinc, salt, and emery. Cement, petroleum, and coke are produced, and there are natural gas yields. Mineral output in 1945 was valued at over \$90,000,000. In the state, excluding New York City, are 7955 m. of railway, and 199 airports. The climate is subject to extremes of heat and cold; the air is dry and invigorating.

New York Bay was discovered by Verrazano in 1524, and in 1609 Samuel de Champlain entered from Canada at the same time as Henry Hudson, sailing under the Dutch flag, reached New Amsterdam, the name first given to New York City. After much desultory fighting, Peter Minuit, in 1626, bought Manhattan Is. from Indians on behalf of the W. India Co. In 1664 Col. Nicolls took possession in the duke of York's name. In 1770 one of the preliminary skirmishes of the Amer. revolution took place in the streets of New York City, but was followed by peace until 1773, when news of the Boston 'Tea Party' aroused the 'Sons of Liberty' again. In 1775 a Prov. Congress met at New York City to elect delegates to the Continental Congress. During the Civil war between N. and S., party politics ran high, there being a strong anti-slavery feeling. Since 1860 the economic development has continued with uninterrupted smoothness. In 1882 the Labour party secured the passing of a Bill limiting hours of work for women and children. The state is the most populous of the U.S.A. Pop. 13,479,100 (Negro about 600,000). See J. R. Brodhead, *History of the State of New York, to 1691, 1871-72*; C. Z. Lincoln, *The Constitutional History of New York, 1906*; A. C. Flick (ed.), *History of the State of New York, 1933-37*; and Federal Writers' Project, *New York: a Guide to the Empire State, 1940*.

New York State Barge Canal, see CANAL.

'New York Sun' was founded in New York City in 1833 by Benjamin Day, who wrote, ed., and printed the paper by himself. In 1868 it passed into the hands of Charles A. Dana, a brilliant, sarcastic, often sardonic editorial writer, who forced upon his staff a style of such high level that the *Sun* was for years the Amer. newspaper man's bible. Dana maintained his own domestic and foreign news service, desiring to have accounts that were different from the highly standardised ones then sent out by news-gathering associations. He was succeeded by Wm. Lathan, who kept up the paper's high standard until his death in 1909. Frank A. Munsey bought the paper in 1916, merging the morning ed. with the *New York Herald* in 1920, but retaining the

Evening Sun. The 'N. Y. S.' ceased pub. in Jan. 1950, and was amalgamated with the *World-Telegram*.

'*New York Times*' was founded in New York City by H. J. Raymond in 1851. It had a chequered existence, and was rather moribund when Adolph S. Ochs, who had made a success with the *Chattanooga Times*, bought it in 1896. Ochs had the ideal of a Conservative paper which would never indulge in yellow journalism, and has adhered strictly to that programme. To-day the *Times* has its own special correspondents in all the great cities of the world. When Ochs became firmly seated in the saddle, to distinguish his paper from the yellow journals, he adopted the motto which is still printed on the first page, 'All the news that's fit to print.' The *Times* not only prints it, but does so *in extenso*. Its Sunday issue is enormous, averaging about 160 pages. In politics it is Democratic, but independent. See E. Davies, *History of the New York Times*, 1921.

'*New York Tribune*,' founded in New York City in 1841 by Horace Greeley, who remained its chief proprietor until 1872, when it was taken over by Whitelaw Reid as editor-in-chief and owner. Reid had served the paper as its chief correspondent during the Civil war. Under Reid the paper became the most stalwart Republican jour. of the E. With the development of Amer. newspapers, the *Tribune* was in the van with its huge Sunday ed. It also estab. an ed. issued daily in Paris. Reid's son, Ogden Reid, succeeded him in control of the paper. In 1924 he purchased the *New York Herald* and issued the merged organs under the name *New York Herald Tribune*. This paper is the most widely-read Republican jour. in the country, and combines a progressive international, with a conservative domestic, outlook.

'*New York World*' was founded in New York City in 1860 and taken over by Manton Marble, who ed. it until 1883, when it was purchased by Joseph Pulitzer, who had made a success with a newspaper in St. Louis. Pulitzer 'shook up the journalistic dry bones' of the metropolis by the methods of the new journalism and 'stunts.' The paper soon achieved wide circulation. But there was a firmer foundation to its appeal to the public in that Pulitzer made of the jour. a great Liberal newspaper right in the heart of Conservative New York. In 1931 it was amalgamated with the *New York Telegram*, and became the *World-Telegram*.

New Zealand. The dominion of N. Z. consists of two large and sev. small is. in the South Pacific. The is. forming the dominion proper for general practical purposes are North Is., South Is., and Stewart Is., each with its adjacent islets, and Chatham Is. Outlying is. included within the boundaries as proclaimed in 1847 are: Three Kings Is., Auckland Is., Campbell Is., Antipodes Is., Snares Is., Bounty Is., and Solander Is. is. annexed to N. Z. are Kermadec Is. (annexed in 1887), Cook Is. and other Pacific Is. (both annexed in 1901). The Pacific Is. consist of Niue or

Savage Is., Palmerston Is., Penrhyn or Tongareva Is., Manahiki Is., Rakahanga Is., Pukapuka or Danger Is., Nassau and Suvarrow Is. The proclamation of Brit. sovereignty over N. Z., dated Jan. 30, 1840, gave the boundaries of what then constituted the colony, but these were changed by letters patent in 1847 and again by proclamation in 1901. The boundaries extend approximately from 33° to 53° of S. lat. and from 162° E. long. to 173° W. long. By a trusteeship agreement of the United Nations the N. Z. Gov. also now administers the pre-1920 Ger. possessions of W. Samoa; and, jointly with the United Kingdom Gov. and the gov. of Australia, holds the trusteeship over Nauru Is. In 1923, the coasts of the Ross Sea, with adjacent is. and ters., were declared a Brit. settlement under the British Settlements Act, 1887, and named the Ross Dependency. In 1925, the Union or Tokelau Is. were excluded from the Gilbert and Ellice Is. colony and put under the administration of the governor-general of N. Z., and later delegated to the administrator of W. Samoa. The total area of N. Z. (excluding mandated ter., Ross Dependency, and Tokelau Is.) is 103,723 sq. m.; North Is. and islets, 44,281 sq. m.; South Is. and islets 58,093 sq. m.; Stewart Is. and islets 670 sq. m.; Chatham Is. 372 sq. m. (total, dominion proper, 103,416 sq. m.); 'outlying' is. 307 sq. m.

Coast.—The coast-line of N. Z. is very long in proportion to its area. Since nearly the whole of the N. Z. land mass lies parallel to the direction of its mt. ranges it is not greatly indented and there are few natural harbours. Even where natural harbours do exist, like those on the E. coast of the North Auckland Peninsula, they are often of little economic consequence owing to their unfavourable situation. The only two safe natural harbours of the North Is. of which the fullest commercial use can be made are Auckland and Wellington. The prin. straits are Cook Strait, Foveaux Strait, Coromandel Channel, and French Pass. Kapiti Is. is in Cook Strait, and Ruapuke Is. in Foveaux Strait, whilst there are sev. is. and islets off the coasts of the main is.

Mountains.—The mountainous character of N. Z. is one of its most striking physical features. In the North Is. mts. occupy about one-tenth of the surface, but with the exception of the four volcanic peaks of Egmont (8260 ft.), Ruapuke (9175 ft.), Ngauruhoe (7515 ft.), and Tongariro (6458 ft.), they do not exceed 6000 ft. in altitude. Of those four the first-named is regarded as extinct, and other volcanoes include Mt. Tarawera and White Is., both of which have in recent times erupted, with disastrous consequences. Closely connected with the volcanic system are the multitudinous hot springs and geysers. The South Is. contains much more mountainous country than is to be found in the N. Along almost the entire length runs the great chain known as the S. Alps, rising to its culmination in Mt. Cook (12,340 ft.), and no fewer than seventeen peaks of this range are over 10,000 ft. high. Owing

to the snowline being low in N. Z., many large and beautiful glaciers exist, the Tasman Glacier (S. Alps), over 18 m. long and 1½ m. wide, being the largest. In the North Is. the two prin. ranges are the Ruahine Range and the Taranaki Mts. To the W. and N. of the Ruahine Range are the Kaimanawa and other ranges. The volcanoes of Tongariro and Ruapehu are to the S. of Lake Taupo; the most noteworthy peak in North Is., Mt. Egmont, stands in the centre of a promontory on the S.W. coast and is conical in shape. The S. Alps are crossed at intervals by low passes, and their

(9510), Bristol Top (9508), Walter (9507), Grey (9490), Green (9307), Hutton (9297), D'Archiac (9279), Bell (9276), Hochstetter Dome (9258), Earnslaw (9250), Nathan (9200), Barnicoat (9183), Sibbald (9181), Arrowsmith (9171), Spencer (9167), The Footstool (9073), Itudolf (9039), and The Dwarf (9025). There are also at least ninety other named peaks all over 8000 ft., and fifty over 7500 ft. Although N. Z. is mountainous it has extensive plains, lying mostly on the W. side of North Is. and on the E. side of South Is. The general character of the N. Z. scenery is similar to that of the Brit.

New Zealand Government

PEMBROKE ROAD, WAKATIPU, SOUTH ISLAND

highest summits are covered with perpetual snow, and have immense glaciers in their higher valleys. Between Mt. Franklin and the W. coast are the Paparoa Mts., and between these and the E. coast are the Kaimanawa Mts. (highest peaks, Tapuaeunuku, 9465 ft., and Aorangi, 9400 ft., with nine others over 7700 ft.). The chief peaks of the S. Alps besides Mt. Cook are: Tasman (11,475), Dampier (11,287), Silberhorn (10,757), Lendenfeldt (10,450), David's Dome (10,443), Malte Brun (10,421), Torres (10,376), Teichelmann (10,370), Sefton (10,354), Haast (10,294), Elle de Beaumont (10,200), Douglas Peak (10,107), La Pérouse (10,101), Haidinger (10,059), De la Beche (10,058), The Minarets (10,053), Aspiring (9975), Hamilton (9915), Glacier Peak (9865), Aiguilles Rouges (9731), Nazomi (9716), Darwin (9715), Chudleigh (9686), Annan (9667), Lowe (9653), Haackel (9649), Le Receveur (9562), Goldsmith (9532), Big Mao (9511), Conway Peak

Isles, although the latter have nothing like its mts. or its lakes, hot springs, geysers, etc.

Rivers.—N. Z. abounds in rivs., most of which are, however, shallow and rapid, and none are navigable for more than a short portion of their length. Owing to the steep grades of their channels, few of the rivs. are suitable for navigation, except near their mouths, but to compensate for this drawback, they furnish ideal sites for power plants; and no country S. of the equator, except Chile and Patagonia, possesses greater stores of energy conveniently placed. The only part of the dominion which has rivs. capable of being used for navigation is the North Is. The relief is not so marked as in the S., and many streams flow in deep beds, with a somewhat sluggish current. The rivs. flowing into the Tasman Sea are the Waikato, Wairoa, Mokau, and Wanganui, and they are useful for modern transport, especially the Waikato. This riv. rises

in the snows of Ruapehu, and flows in a northerly course for 20 m. as a mt. torrent till it reaches Lake Taupo, on leaving which it plunges over the Huka Falls, formed by a hard ledge of volcanic rock; and then runs first N.E. and then N.W. till it reaches the sea. On the other coast of the North Is., the only streams capable of being used for navigation except just at their mouths are those flowing into the firth of Thames, i.e. the Piako and the Waihou. The remaining rivs. of the North Is. of any importance rise in the mt. axis stretching from near Wellington to the Bay of Plenty. The central and S. parts of the Tararua and Rimutaka ranges are drained by the Manawatu, Otaki, and other streams running into Cook Strait, by the Hutt R. which flows into Wellington harbour, and by the Ruamahanga and its tribs. sev. large rivs. rise in the Ruahine Mts. and their northerly extensions. In the S. Alpine system, the streams flowing to the W. coast of South Is. cross the narrow strip of coastal plain and cut their channels through old glacial drifts which at one time furnished rich leads of alluvial gold. Chief rivs. flowing from the central portion of the S. Alps to the Tasman Sea are the Taramakau, Ararua, Hokitika, Wanganui, Wataroa, Waiho, Karangarua, Haast, and Arawata. All these rise in glaciers and their valleys are noted for their magnificently diversified bush and mt. scenery. The general features of the rivs. which flow into the W.-coast sounds are somewhat similar except that few rise in glaciers, and the rivs. on the E. slope of the Alps present features similar to those on the W. coast in their upper courses, but their valleys are broader and flatter. The larger of these rivs. is the Clutha, its volume of discharge being greatest of any riv. in the dominion. Portions of the course of the Clutha are navigable, but only to a very limited extent; but it is important commercially because it has yielded, by means of dredging operations, large quantities of gold. The Jacobs, Oreti, Mataura, and Taieri rivs. belong to the Southland and Otago dist.; forming the N. boundary of the Otago prov. dist. is the Waitaki, which drains a large area of Alpine country, and includes in its basin Lakes Tekapo, Pukaki, and Ohau; its main affluents are the Tasman and the Godley. The chief rivs. rising in glaciers in the S. Alps are the Rangitata, Ashburton, Rakata, and Waimakariri, and further N. are the Hurunui and Waiau.

Lakes.—The N. Z. lakes are usually attributable to the filling-up of hollows formed by faulting or warping, or by volcanic explosions, or by the irregular accumulation of material round volcanic vents, or to the interference with riv. valleys by glaciers; and, since all these agencies have operated on an extensive scale in N. Z. in comparatively recent geological times, it is not surprising that its lake systems are well developed. The striking lakes of the middle of North Is. are due to volcanic action; those in South Is. to glacial action. Hence there are two distinct types of lake scenery. In the

South Is., the lakes lie amidst splendid mt. scenery, their waters rendered milky-white at times with the finest of sediment worn from solid rocks by powerful glaciers, and swept down to the quiet waters of the lake by turbulent glacial torrents. In the North Is., the relief of the land near the volcanic lakes being by no means marked, the shores of the lakes are rarely precipitous, and their scenic interest depends on their surrounding sub-tropical bush and partly on their desolate and forbidding environment. The largest sheet of fresh water in N. Z. is Lake Taupo, in the heart of North Is., at an elevation of 1211 ft. above the sea (area 238 sq. m., greatest length 25 m., greatest breadth 17 m., maximum depth 534 ft.). Near the middle of the lake lies the is. of Motutaiko, probably the summit of a volcanic cone. The lake forms an enormous reservoir of power conveniently located for exploitation. An interesting group of lakes lies in the midst of the thermal region to the N.E. of Lake Taupo. These comprise Rotorua, Rotoiti, Rotoehu, and Rotomua. The largest lake of the S.E. group is Tarawera, N. and W. of Mt. Tarawera; others are Rotokakahi, Okarokui, and Okataina, all owing their interest to the thermal action which occurs near them, and to their fishing, for they are especially well stocked with trout. Some 40 m. from the E. coast, in Hawke's Bay dist., is Lake Waikare Moana (21 sq. m. in area), lying 2015 ft. above sea level, and having a maximum depth of 846 ft. Along the coast-line are many small lakes, such as Rotokawa and Horowhenua; and a large shallow expanse of water occurs near the mouth of the Wairarapa valley, called Lake Wairarapa.

In the South Is., in the Grey R. valley, are two fair-sized lakes, Brunner, 15 sq. m., and Poerua—the former bounded on two sides by high wooded granite peaks. A beautiful sheet of water is Lake Kanieri (8 sq. m.) in the basin of Hokitika R., near Mt. Tuhua. On the E. side of the main divide lie the great valley lakes belonging to the riv. basins. These include Lakes Sumner, Coleridge, Heron, Tekapo, Pukaki, Ohau, Wanaka, Hawea, Wakatipu, Te Anau, Manapouri, Monowai, Hauroko, and Potoriteri.

Before the eruption of Mt. Tarawera in 1886, the Rotomahana Lake was widely celebrated for its pink and white terraces and boiling springs, which were then destroyed. The hot springs of the North Is. form one of the most remarkable features of N. Z. They are found over a large area, stretching from Tongariro, S. of Lake Taupo, to Ohacawai (a distance of 300 m.); but the prin. seat of hydro-thermal action appears to be in the vicinity of Lake Rotorua, 40 m. N.N.E. from Lake Taupo. In spite of the destruction wrought in 1886, however, the natural features of the country, lakes, geysers, and hot springs (which last-named possess remarkable curative properties in certain complaints) are still very attractive to tourists and invalids. The importance of conserving the famous

region as a sanatorium for all time has been recognised by the gov. and it is dedicated by a statute to that purpose.

Geological Formation.—The geological hist. of N. Z. is as complex and as ancient as that of a continent. Lava probably persisted in the N. Z. area from the oldest Palaeozoic age, or even earlier. The two important geological periods for N. Z. are those that followed the two latest mt.-building movements, the Kaikoura deformation of the late Tertiary time, and the Hokonui deformation of the early Cretaceous. The deposits of the intervening period of relative crustal stability cover a large part of the land, and contain all the coal and most of the limestone of the country. The soils on which grow the forests, pastures, and crops are of post-Tertiary age, and the great bulk of the gold has been won from deposits formed during the same period.

Seismology.—Earthquakes are, unfortunately, somewhat frequent in N. Z., that of 1931 being especially severe. The earthquakes of the Auckland Peninsula, a seismically sensitive dist., may be locally severe, but are not usually felt far from their point of origin. The tectonic earthquakes along the main earth-fold, however, shake large areas; but, fortunately for N. Z., the most severe earthquakes originate along the great shears that cut the submerged flank of the main fold 200 m. E. of the North Is. Many great faults and fault-zones have been traced by seismologists for long distances, but a few only have been active since European occupation. Recent levellings indicate that the earth-block towards the E. is sinking somewhat irregularly, a movement causing some of the innumerable local aftershocks still being felt in that area. Other sensible earth-movements occurred in connection with the Taupo earthquake of 1922, the Amuri earthquake of 1888, the Wellington earthquake of 1855, and probably the Awatere earthquake of 1848. In 1929, the N.W. part of South Is. was visited by a severe earthquake which was felt over the whole dominion, but only seventeen lives were lost, as against over 200 in the much more severe earthquake which occurred in Feb. 1931 in North Is. with disastrous results to the tns. of Napier and Hastings in the prov. dist. of Hawke's Bay (in Napier about 145 persons lost their lives).

Climate.—The climate of N. Z. is temperate and healthy, and similar to that of Great Britain, save that it is warmer and more equable. More rain falls on the W. than on the E. coast, and the climate is more equable on the former. Naturally, considerable variations are met with in different parts of a country which extends for over 1000 m. from N. to S.; the extreme N. of North Is. is sub-tropical in character, whilst severe frost and deep snow on the uplands are common in winter in the South Is.

Flora and Fauna.—The only pre-European mammals were the Maori rat and dog, but there were also native bats. The native plants are numerous and include many peculiar species. There are

about 120 indigenous forest trees, all of them evergreen; the kauri pine, sev. kinds of cedar, red and white birches, and the iron-wood tree may be mentioned. A great variety of ferns is found, and large tracts are covered with nutritious indigenous grasses which support over 32,000,000 sheep. The N. Z. flax (*Phormium tenax*) is a vegetable produce of considerable importance, being much used in rope-making. With few exceptions, the most beautiful flowers of N. Z. belong to the high-mt. flora. There are giant buttercups, white and yellow (but nearly all the flowers are of these colours) and they are to be seen by the acre; there are also lovely ourisias, with the flowers in whorls round the stem, as in some of the Asiatic primulas; forget-me-nots, yellow, bronze, purple or white; the snow-groundsel, with marguerite-like flowers; and edelweiss, far surpassing the Swiss. But the chief plant of the mts. is the *Celmisia*, whose leaves cover sub-alpine slopes with a mantle of white. Birds are numerous, and also include many species peculiar to the country, such as sev. flightless and weak-winged types. These include the kiwi (see *ARREYX*), kakapo or ground parrot (*Strigops*), takahe (*Nobornis Mantelli*), and the extinct moa and *Aptornis*. There are also the parrots kea and kaka. Fresh-water fish are not numerous, with the exception of eels; but many varieties of edible fish are found on the shores, and excellent oysters. Sharks are common, but rarely attack man, and penguins are found on the islets of the far S. Amongst sea mammals whales are the most important, and at one time extensive whaling was carried on, but the industry has declined greatly since 1840. There are no reptiles beyond various species of lizards and frogs.

With the advent of Europeans the whole face of the fauna of N. Z. was changed. Capt. Cook introduced the first pig in Queen Charlotte Sound in 1773. With settlement, sheep, cattle, and horses, and other domestic animals were brought; also song-birds, and animals, birds, and fish for sport, such as deer, trout, pheasants and quail. But the introduction of rabbits, stoats, and weasels was an irretrievable blunder, owing to the damage wrought by these animals to vegetation and bird life.

Railways.—Construction on the first railway in N. Z. was begun in 1860 and the first part opened in 1863. The line ran from Christchurch to Lyttelton. All railways in N. Z. are now state-owned save some 180 m. and private lines to factories, etc. They are, after various experiments, managed by a general manager responsible to the minister of railways. The use of electric power is extending and there are now thirty-six sub-stations with a total capacity of 30,525 kVA. In 1915 there were 3504 m. of railway, 1684 being on the North Is. and 1820 on the South Is. The railways are constructed by the public works dept. and when completed transferred to the railways dept. In 1948 the total revenue received amounted to £17,070,872, and the expenditure was

\$17,710,897. The prin. lines are from Auckland to Mokau and Rotorua, from Wellington to Napier, New Plymouth, and Manawatu, in the North Is., and from Culverdon to Lyttelton, from Invercargill to Bluff Harbour and Kingston, from Picton to Christchurch, Nelson to Glenhope, and Seddonville to Ross. There are electric tramway systems in Auckland, Napier, New Plymouth, Wanganui, Wellington, Christchurch, Dunedin, and Invercargill.

English Electric Company

HYDRO-ELECTRIC POWER

Pihapua power station of the Waikaremoana scheme, containing two 28,000-h.p. water turbines. The operation of this station is completely automatic.

Shipping.—Regular and frequent steam traffic exists between all the prin. ports of North and South Is., and communication is maintained with Australia, England, and America. The prin. lines are the N. Z. Shipping Company; the Union Steamship Company; the Oceanic Steamship Company; Shaw Savill, and Albion Company. The prin. ports of the country are Auckland and Wellington in the North Is., and Port Lyttelton and Port Chalmers in the South. The tonnage of all shipping arriving at or departing from N. Z. ports is recorded by the customs authorities. Overseas shipping showed a marked decrease after 1941 owing to the war. The yearly average entry for 1935–39 was 635 vessels, a total tonnage of 2,894,668, whereas for 1941–45 it averaged only 473 vessels, a tonnage of 2,059,783. Entrance from Brit. countries fell by 60 per cent, but from foreign countries only by 20 per cent, on account of increased

trade with the U.S.A. under the lend-lease agreement. The figures for entry in 1947 were 392 Brit. (1,043,256 tons) and 74 foreign (414,735 tons); totals, 466 ships of 2,057,991 tons.

Airways.—Complete control of air transport as a national service was estab. by an Act of 1945. All internal airways are operated by the N. Z. Airways Corporation which was set up by the Act.

Fisheries.—With its great length of coastline N. Z. has always been famed for the productivity of its fisheries. Off its more northerly coasts a variety of sub-tropical fish are found and off the S. coasts are found cold-water fish and the fur-bearing seal. The most important edible fish are the snapper, the tarakihi, mainly taken by trawlers in the waters of the Hauraki Gulf, Bay of Plenty, Hawke's Bay, etc., and a variety of flounders, blue cod, and the groper. The fishing industry is controlled by the marine dept. and all engaged therein commercially must hold a licence. The most important fishing ports are Auckland, Wellington, Thames, Timaru, Napier, Port Chalmers, Lyttelton, and Bluff. The industry was disorganised by the Second World War but began to improve in 1945. There are extensive oyster beds in Foveaux Strait and on the E. and W. coasts of Auckland. Crayfish occur in abundance and also N. Z. whitebait. There is a small whaling industry, and seals are taken under strict gov. supervision.

Minerals and Mining.—The gold-mining industry has declined in importance since the early stages, when it contributed so largely to the progress and settlement of N. Z. The chief minerals are gold and silver, platinum, osmiridium, tungsten ore, iron, silica sand, stone, pumice, sulphur, and coal. The value of gold and silver mined in 1945 was £1,353,207 (128,000 oz.) and £36,752 (245,000 oz.), of coal £1,250,361, and of stone £710,448. Other minerals include copper, manganese ore, cinnabar, tin (cassiterite in the form of 'stream-tin' occurs near Port Pegasus), petroleum (drilling has been carried out in recent years in Taranaki, Hawke's Bay, and Canterbury), kauri gum, phosphate rock, greenstone. N. Z. has a great variety of handsome and durable building stones. Valuable non-brickmaking clays are produced.

Agriculture.—N. Z. is primarily an agric. country: the soil is rich, varied, and fertile, the climate mild and equable, and the countryside well watered. While it is mainly a grazing country noted for its dairy cattle and sheep, crops of wheat, oats, and roots are extensively grown. The total area under field crops is about 1,839,500 ac. Two-thirds of the surface of N. Z. is suitable for agriculture and grazing and the total area under cultivation in 1946 was nearly 20,000,000 ac. The chief crops grown are wheat (260,603 ac. in 1942, 123,751 ac. in 1948), oats (282,408 ac. in 1942, 63,158 ac. in 1948), and barley (41,431 ac. in 1942, 63,398 ac. in 1948). In various parts of the North Is. fruit-growing, especially apples, pears, and

peaches, is carried on extensively. Citrus fruits can be produced, and lemons in particular are cultivated on a considerable scale. There is an export trade in apples and pears.

Forestry.—All state forests and related afforestation activities are controlled by the State Forest Service headed by the director of forestry. In March 1946 the area of state forests was 9,139,763 ac., representing 13.8 per cent of the total area. The policy is one of conservation and expansion, particularly with a view to combating soil erosion. Over £565,000 was spent on afforestation in 1940-41. The prin. softwoods include white pine, mt. cedar, kauri (the largest and most celebrated tree of N. Z.), black pine, miro (used in house-building), silver pine, tanekaha, and totara; hardwoods, black, hard, red, and silver beech, black-maire, hinau, kamahi, kokohoe (sometimes called cedar), manuka, or red tea-tree, pukatea, N. and S. rata, reweroa, and tawa. The prin. timbers milled in N. Z. are rimu and kahikatea.

Commerce.—The chief industries of N. Z. are the meat freezing and preserving industry and the butter, cheese, processed milk, and allied industries. Next to these come the sawmilling, paper and printing, engineering, and textile industries. The prin. exports are wool, butter, cheese, frozen meat, hides, skins, and gold. About 80 per cent of exports go to Brit. countries, and the United Kingdom supplies about 50 per cent of imports. The prin. exports in the calendar year 1947 were, in £N. Z., wool, 31,933,000; butter, 28,836,000; lamb (frozen carcasses), 18,469,000; cheese, 19,621,000; hides and skins, 10,383,000; mutton (frozen), 4,085,000; seeds (grass and clover), 1,663,000; other meats (dehydrated, meat extract, canned, etc.), 1,385,000; beef (frozen), 3,930,000; other frozen meats, 2,869,000; sausage casings, 1,526,000; milk (dried and condensed), 1,651,000; gold, 1,035,000; tallow, 2,337,000; peas, 894,000. The chief imports (1947) were textiles (woollen, cotton, silk, artificial silk, and linen goods); electrical and other machinery; sugar, wheat, tea, fruits (canned, fresh, etc.), etc.; tobacco, bags and sacks, paper, books and stationery, manures, hardware and cutlery, vegetable oils, drugs and chemicals, ironware, floor coverings, and alcohol; very largely from the United Kingdom and Australia. In 1941 the value (in £N. Z.) of the imports was 49,167,010, and in 1947 128,724,841; of exports (1941), 67,179,413; (1947), 127,713,184.

In 1936 the gov. introduced a guaranteed price system for dairy produce, to ensure stability of income for producers, and undertook the marketing of the purchased produce. During the Second World War this system was extended to all farm produce in effect, by the system of bulk purchase agreement entered into with Britain, and except for wool is still (1949) in existence. There has been little expansion in farm production during recent years, though wool output has been

kept at levels higher than those of pre-war years. The shortage of labour in agric. dists. is a prevalent difficulty. The volume of production of secondary industries, that is, those not connected with processing primary products, increased by 47 per cent between 1938-39 and 1946-47, and the numbers employed increased by 30 per cent. In the main, expansion has been in the development in new branches of existing industries such as engineering, textiles, and clothing. N. Z., however, lacks supplies of some vital industrial raw materials, e.g. iron, and there is a shortage of power supply, which latter may be overcome by hydro-electric schemes now being developed.

State participation in economic activities has long been a familiar feature in N. Z., and has increased since the coming to power of a Labour Gov. in 1935. It takes the form of direct state action, as in railways, tourist services, and broadcasting, and also of controls designed to ensure state direction of the country's economy, whilst leaving its administration to private enterprise.

Population.—The pop. of N. Z. is divided into the Maori and European pop., the Maoris (*q.v.*) being the native inhab. The Maoris are the finest in physique and the highest in intelligence of all the Polynesian peoples, being superior in every respect to the aborigines of Australia. Their language is a Polynesian dialect differing but slightly from the Hawaiian and other similar languages. The European pop. has shown an unbroken increase over the past 100 years and the early preponderance of men over women has now been eliminated, the proportions being about equal. Immigration, which supplied the greatest source of pop. increase in the past, has gradually slowed down; in 1931-35 there was a net exodus; but in 1948 arrivals were 33,141, and departures 27,388.

The last census was taken on Sept. 25, 1945, and figures relate to Europeans unless otherwise stated. The pop. of N. Z. according to this census was 1,702,298 inclusive of 98,744 Maoris. Including Is. ters. (Cook Is., Tokelau Is., and W. Samoa), the total pop. in 1945 was 1,790,256. At present the North Is. holds the greater part of the total pop. (65 per cent) and since 1881, when 60 per cent lived in the South Is., the trend has been towards an increase in this Is. The pop. in 1948, exclusive of members of the armed forces overseas, was 1,840,182, including 109,811 Maoris. The chief tns. (pops. including Maoris) are Wellington, pop. 186,100; Auckland, 289,800; Christchurch, 164,000; Dunedin, 88,800; Invercargill, 30,000; Palmerston North, 30,100; Hamilton, 29,400; Wanganui, 28,200; New Plymouth, 25,600; Hastings, 22,600; Napier, 22,200; Timaru, 21,100; Gisborne, 18,500; Nelson, 18,200.

The revenue for 1948 was £117,116,115 (excluding social security taxes), and the expenditure £115,330,403. Taxation receipts in 1947-48 for all purposes amounted to £122,275,911 giving an average of £87.92 per head of mean pop. War

expenditure up to March 1948 totalled £872,742,989, including a gift to the United Kingdom of £12,500,000.

Religion and Education.—There is no state Church, and no state aid is given to any form of religion. The main religious denominations in order of strength (1948) are as follows: Church of England, 625,000; Presbyterian, 376,000; Rom. Catholic, 226,000; and Methodist, 136,000. There are small numbers of representatives of other Christian denominations and a few Hindus, Confucians, and Jews. Education is free, secular, and compulsory. The central administration of education is vested in a minister of education, and the local control is in the

ditions of work and basic wages in all sections of industry and agriculture. An eight-hour day is in force and disputes are settled under an Arbitration Act. A Social Security Act, passed in 1938, became operative on April 1, 1939. The prin. objects of this legislation are (1.) to substitute for the system of non-contributory civil pensions, e.g. old age, widows' and other pensions, a system of monetary benefits on a contributory basis; (2.) the inauguration of a system of medical and hospital benefits, and of other related benefits. Mention may here be made of the work of Sir Frederick Truby King (1858-1938), a N. Z. physician b. at Wellington. He founded, in 1907, the Plunket Society for the health of women and children, and from 1921 to 1927 was director of child welfare in N. Z., achieving most beneficial results in the lowering of the child mortality rate.

Defence.—A council of defence, consisting of five Cabinet ministers, the chiefs of staff of the services, and the secretary of the Treasury, deals with defence policy and organisation; it acts only in an advisory capacity and responsibility for decisions rests with the Cabinet. The minister of defence is the president of each of the three service boards which are concerned with training and administration. The N. Z. Army is a small regular force supplemented by the territorials. The decision to adopt compulsory military service entails a considerable increase in the army forces, both regular and territorial. The navy includes the cruisers *Bellona* and *Black Prince* (lent from the R.N.), six frigates, two corvettes, ten trawlers, a survey vessel, and four coastal craft. The gross intake of men into the armed forces between 1939 and 1945 is estimated at 224,000, of whom 160,000 joined the army, 12,000 the navy, and 52,000 the air force. In addition, 10,000 women served in the forces. Total deaths in the services and mercantile marine were 11,625.

Constitution and Government.—The country was at first a dependency of New S. Wales, but was separated by letters patent in 1842. Its settlement was effected largely by the N. Z. Company, with a royal charter, which was surrendered in 1850. By an Imperial statute of 1847 N. Z. was divided into six provs., later nine, Auckland, Taranaki, Wellington, Nelson, Canterbury, Otago, Hawke's Bay, Westland, and Marlborough, each governed by a superintendent and elected prov. council. In 1878 the prov. system of gov. was abolished, the powers previously exercised by superintendents and prov. officers passing to the governor or local boards, and the country was divided into cos. and *hōrs.* An Act granting representative institutions to N. Z. was passed by the Imperial Parliament on June 30, 1852. Under that Act the constitution of a General Assembly was provided for, to consist of a Legislative Council and a House of Representatives. The first session of the General Assembly was opened in May 1854, but the members of the executive were not responsible to

High Commissioner for New Zealand
DUNEDIN UNIVERSITY

hands of nine education boards, and of school committees. There are nearly 2000 public primary schools (226,578 scholars on the rolls in 1947). Secondary education is provided at forty-seven secondary schools, 100 dist. high schools, twenty-eight technical high schools, and technical day schools. There are nine secondary schools for Maoris besides many native schools and Maori mission schools. For higher education, there are four endowed colleges affiliated to the univ. of N. Z., and each specialises in one or more directions. At Dunedin, the special subjects are mining, medicine, dentistry, etc.; at Christchurch, engineering, technical science, and forestry; at Wellington, law and science; and at Auckland, commerce, engineering, architecture, and forestry. There are agric. colleges at Canterbury and at Palmerston North (Massey College), and there are seven schools of mines besides the Otago Univ. School of Mines.

Social Conditions.—There is extensive legislation governing hours and con-

Parliament. The first ministers under a system of responsible gov. were appointed in 1856. In 1907, the style and designation of the colony of N. Z. was altered to 'The Dominion of New Zealand.' By letters patent, May 11, 1917, the designation of governor was altered to 'Governor-General.' Payment of members of the legislative council is at the rate of £375 a year; and those of the House of Representatives £750 a year. The thirty-four members of the legislative council are appointed by the governor-general, and hold office for seven years. The members of the House of Representatives are chosen by electors possessing a liberal franchise: registration of electors on the roll is compulsory. Every elector, male or female, is qualified to become a member (women being given the right to be elected to either House in 1919). Every adult Maori in any of the four Maori electoral dists. can vote, provided he or she be not registered on any European roll. The House of Representatives now consists of eighty, including four Maori members, elected by the natives. The control of native affairs, and the entire responsibility of dealing with questions of native gov., were transferred in 1863 from the Brit. to the N. Z. Gov. In 1865 the seat of gov. was removed from Auckland to Wellington on account of the central position of the latter city. Justice is administered by ten supreme court judges besides three judges in special courts. The police force is a national body maintained wholly by the general gov. The death penalty, except for treason, was abolished by the Crime Amendment Act, 1941.

History.—The hist. of the is. of N. Z. can be traced back some centuries through the traditions and genealogies of the Maori tribes whom Cook found in occupation, but Britain's influence on the country's destiny began only with the voyages of the great navigator in quest of the S. Continent (see under TERRA AUSTRALIS INCOGNITA). Tasman sighted the S. Alps in 1642 but he made no landing. Cook's first voyage off the coast was in 1769-70. Within a brief space of his return in 1771 a plan for the colonisation of the country was put before the Brit. public by Benjamin Franklin and the hydrographer Alexander Dalrymple (q.v.), but colonisation began only after the loss of the Amer. States had brought the penal settlement of New S. Wales in contact with N. Z. Maori visitors to New S. Wales prompted the sympathetic interest of the colonial chaplain, Samuel Marsden, whose first missionary party (1807) were massacred by the Maoris, and the second party did not go out until seven years later and then only to rouse the hostility of Hongi, the Bay of Islands chief, who exploited the missionaries in order to acquire arms for his wars against other tribes. Marsden's intervention, supported by the energy of the Rev. Henry Williams, however, thwarted Hongi's efforts to win a dominating position, and with his death (1828) the bane of intertribal wars was ended. But with no source of tribal authority or

guidance, contact with European civilisation threatened the Maoris with political and economic collapse, and in 1830 Marsden suggested to the governor of New S. Wales the desirability of appointing a Brit. representative in N. Z., backed by naval visits in order to control a growing community which was incapable of adjusting itself to change without such control. The immediate result of this suggestion was that the Brit. Gov. sent a resident, James Busby, to the Bay of Islands, to be subordinate to the gov. of New S. Wales, but Busby's attempt in 1835 to form a confederation of the united tribes of N. Z. proved abortive. The one man whose influence in N. Z. was most profound and enduring was the celebrated Edward Gibbon Wakefield, whose efforts,

High Commissioner for New Zealand

THE TREATY HOUSE AT WAITANGI, BAY OF ISLANDS

The treaty of 1840 was signed here.

despite official and missionary antagonism, to inaugurate systematic colonisation marked, in effect, the dawn of a new era in overseas settlement. Enlisting the support of politicians, religious leaders, business men, and others, he eventually succeeded in his purpose of making N. Z. a Brit. colony in the full sense of the term. It is said that the home gov.'s hand was forced by indications of Fr. missionary infiltration and whaling expeditions in the seas off N. Z., factors which had indeed intensified Wakefield's efforts, for without even troubling himself over official sanction, his N. Z. Company sent out its prin. agent, Col. Wm. Wakefield in May 1939 in anticipation of the arrival of settlers. In that year the gov. sent out Capt. Hobson, a naval officer, to negotiate with the Maori chiefs for the recognition of Brit. sovereignty, and the result was the treaty of Waitangi (Feb. 6, 1840), the charter of Maori rights and a treaty which has had the greatest influence in winning that confidence in the Brit. Crown which has so greatly conduced to the harmonious relations subsisting between 'Pakeha' (white man) and Maori to-day, though in

the intervening period there were wars and occasional violations of the treaty.

Hobson was, in effect, the first Brit. governor of N. Z., and under him Brit. law and gov. were estab. in the N., where the Maoris were most numerous and where the headquarters of the N. settlement were moved from the Bay of Islands into Auckland, which in 1841 became the seat of gov. It was, none the less, the organised colonization of the N. Z. Company which ultimately had the most influence on the character and the plan of the new colony. Under the company's aegis was founded Wellington, while new colonies were estab., all round the coast by bodies of settlers who gave to them the names of their places of origin, e.g. Dunedin in Otago harbour, founded by the Bay Association of the Free Church of Scotland in 1848 and Christchurch, founded by the Canterbury Association in 1850. The later settlements, profiting by their predecessors' errors, devoted themselves to pastoral activities from the outset and thereby founded N. Z.'s first staple industry. Land settlement, generally, did not expand as the company had hoped, and for many years settlers preferred to work in the tus. for wages. A still greater error of the company was to ignore the validity or otherwise of the title to land sold to them over the heads of their Maori occupiers. Over this and other matters, such as the imposition of customs duties, discontent flared up into actual warfare in the N. in 1845, but the Brit. Gov. recalled Hobson's vacillating successor, Fitzroy, and sent out the famous Sir George Grey, governor of S. Australia, who soon compelled the Bay of Islands tribes to sue for peace. This was the period of Lord Durham's celebrated report on Canada, recommending the management of internal Canadian affairs by a Cabinet responsible to the Canadian electorate (see DURHAM REPORT), and in relation to N. Z. the Brit. Gov. agreed to the view of the N. Z. Company that N. Z. should have representative institutions. An Act to that effect was passed in 1846, though Grey was opposed to its proposed div. of the country into European and Maori dists., it being evident to him that the Maoris would never agree to a gov. in which they had no share. His arguments prevailed with the gov. and the Act was suspended pending a new Act of 1852. Though Grey had thus delayed self-government in N. Z. for six years it is still open to question whether the colony was really ready for it in 1852. The New Zealand Constitution Act of 1852 was a liberal measure for its time and, subject to subsequent amendments, it is still the basis of the constitution of N. Z. The Act, however, did not go so far as to provide for responsible gov. A motion seeking ministerial responsibility was moved in the local Assembly by Gibbon Wakefield, himself now a colonist, and this being almost unanimously passed, the Brit. Gov. acquiesced at once (1856). Thus in less than two decades of the setting up of Brit. authority in N. Z. (1840) that authority, with but a single

important reservation, had been transferred to the colonists so far as their domestic affairs were concerned.

There were two Maori wars; the first lasted from 1845 until 1848; the second from 1860 with little intermission until 1870. But fully one-half of the tribes have always been friendly to the King, and many of them fought on the side of the colonial gov. against their own countrymen. Permanent tranquillity was estab. in 1871 throughout the country. The real cause of the outbreak of 1860 was that the tribes and their chiefs felt that their traditions and whole way of life were jeopardised by the colonists, who had now so firmly estab. themselves that, in the South Is., most of the land had been transferred to the Crown for nominal sums while, even in the N. where Maori settlements were much larger, the Crown owned 4,000,000 ac. Moreover, the Maoris realised that they had no share or voice in the constitution, whence the Maori King movement or attempt to create a Maori state within the state, but mutual suspicion between Maori and European settler was incompatible with any hope of success for this movement. The operations in Taranaki (q.v.) lasted about a year, ending in March 1861. Colonial volunteers and militia, in addition to imperial troops, had taken part in the campaign. At this juncture Sir George Grey returned to N. Z., having volunteered his good offices; but his efforts to win back the confidence of the tribes were in vain and the hopes of peace receded. The tribes of the Waikato, the heart of the Maori King movement, were preparing to renew the fighting. Brit. troops from Taranaki invaded the Waikato in July 1863. Meanwhile there was a protracted dispute with the Brit. Gov. as to whether the wars were justified and whether the use of imperial troops could be defended and as to how far the colonial gov. was empowered to make war on its own responsibility. In the result the colony, recalling Wakefield's advice to do so, relied on its own financial and military resources and the war at length seemed to die away. But in 1868 there was a fresh outbreak in Taranaki under a clever guerrilla leader, Te Kooti. At this moment of danger the home gov., anxious to rid itself of the colony's wars, withdrew the one imperial regiment then in N. Z. (1870), so that this later campaign was fought and won by colonial levies aided by friendly tribesmen. Maori losses were considerably heavier than those of the colonists, which were only a few hundreds, and the Maoris had lost much of their belief in their own destiny as a race. Fortunately, however, there have always been tribesmen, such as Te Waharoa the 'king-maker,' who have been shrewd enough to grasp European conceptions of statesmanship and thereby foster the hope, gradually realised, that the long struggle would eventually lead the way to partnership. This process was hastened by a Colonial Act providing for the election of four Maori members to the House of Representatives and

by the passing of the Native Schools Act.

Meanwhile gold had been discovered in Otago, in the valleys of the W. coast of South Is. (1861-65) and the inevitable gold rushes spelt much, if irregular, development largely enhanced by the ambitious plans of Julius Vogel, a gold-seeking immigrant who had become colonial treasurer and, in that capacity, introduced - his famous public works budget of 1870. Under his schemes 100,000 immigrants were brought into the country; railways were built to open up new lands; new industries including woolen mills, foundries, and paper mills were introduced. There was a severe reaction later from this 'Vogel boom' but under Vogel's successor, Atkinson, financial equilibrium was gradually restored. In the early nineties the public debt of N. Z. was no less than £40,000,000, which in itself afforded some indication of confidence in the destiny of the country. For the total amount invested in land and mortgage companies operating in N. Z. was £30,000,000, so that the total Brit. investment in the colony was about £70,000,000. Overmuch reliance on the London money market might, however, have seriously depreciated the country's credit and there was a crisis in 1894, when the N. Z. Gov. came to the aid of the Bank of N. Z. by guaranteeing an issue of new shares up to £2,000,000. It was significant, however, that the credit of the country was sound enough to save its leading bank from failure. The ensuing years saw considerable legislative activity in the sphere of fiscal and social reform; thus, the Land and Income Tax Act enabled large estates to be compulsorily acquired for settlement, and during 1894-98 were passed a Factory Act, a Shops and Offices Act, an Act for compulsory arbitration in industrial disputes, and an Old Age Pensions Act, all Liberal measures which represented an important change in the progress of N. Z. towards political maturity, besides revealing what later became emphasised as a characteristic N. Z. outlook, an outlook which has in recent years seen striking manifestation in an advanced social security scheme (1938). This Liberal programme was indeed the fruit of the distribution of power between the gov., as representing the people, and the strong capitalist class, resulting in the development of the country's resources to the general advantage, and it owed its success partly to the work of John Ballance and still more to the notable premiership of Seddon (*q.v.*). Seddon was in power to the end of his life and by his state coal mines, state accident and fire insurance, and the like maintained the attitude characteristic of the earlier Liberal reforms; but he was not prepared to accede to more extreme Socialistic demands from the small farmers. The influence of the small farmers increased with each election, and though Seddon's successor, Ward, had no success with them, Massey (*q.v.*), leader of the new Reform Gov., who had been a working

farmer all his life, enjoyed the confidence of the farming community. The development of N. Z. farming had gathered momentum and the N. Z. farmers believed themselves to be the real masters of the country. In view of the great exports of wool and of dairy products there was some justification for their attitude. Feeling themselves the political masters they demanded the right to purchase their freeholds on reasonable terms, and Massey conceded this right.

Always loyal to the Imperial connection, N. Z. freely supported Great Britain in the Boer war of 1899-1902. At the outset Seddon, with the practically unanimous support of the representatives, offered a N. Z. contingent and some 7000 officers and men were sent to S. Africa. Throughout his thirteen years of office Seddon, of all dominion statesmen, was the strongest supporter of Joseph Chamberlain's dreams of closer union, and at the Colonial Conference (1902) he suggested that each of the self-governing colonies (as they then were styled) should maintain a body of troops especially for Imperial service. At the Imperial Conference of 1911 Ward, who shared Seddon's imperial sentiment, put forward a plan for an imperial council to which the sev. dominions (as they now were styled) should elect members on the basis of their pop. But the proposal came to nothing. Asquith, the Brit. Premier, making it evident that the shaping of foreign policy was the exclusive prov. of the mother country. Ward's purpose, however, was to remedy the position that the dominions could be committed to war by the sole decision of the United Kingdom Gov. However, in 1909, when Brit. naval supremacy was threatened by Germany's programme of construction, N. Z. offered Britain a battleship. In the same year the N. Z. Gov. adopted the principle of compulsory military training. In the First World War conscription was introduced in N. Z. in 1916 and an expeditionary force of 10,000 men sailed for the Middle E. and formed part of the famous Anzac Army. In all 117,000 men volunteered or were called up for foreign service, and 7000 for home service; and of these 92,000 were volunteers. During the later stages of the war there was labour unrest, and the N. Z. Labour party of to-day had its origin in those years. Taxation was greatly increased, but the war was financed by loans. N. Z. began the war with a national debt of £100,000,000; by the end of the financial year 1919 it was £178,000,000, much of the increase being, however, met by borrowing on the local market. The most important effect of the war in N. Z. was a ripening of national self-consciousness, coupled with a fuller appreciation of the difficulties and responsibilities of Britain. Massey, however, did not favour the Canadian and S. African demands for separate representation at the Peace Conference and separate membership of the League of Nations, and indeed he viewed these manifestations of nationalism with apprehension, yet he was not prepared to

give Britain an unqualified support at every turn. Both Massey and Ward took part in the Peace Conference and duly signed the treaties. N. Z. became a member of the League and accepted W. Samoa as mandatory, giving up her previous desire for outright annexation.

After the war the interdependence of Britain's and N. Z.'s economies remained. N. Z.'s major preoccupation, for her previous prosperity had declined and the efforts to restore that prosperity form the content of economic and political history throughout the next two decades. This was, in part, effected in the early twenties by the passing of export control legislation

but the dairy industry was still at a low ebb and in 1934 a Royal Commission, appointed to report on the industry, recommended control coupled with more efficiency. N. Z. economic anxieties were further increased in 1935 when the Brit. Gov. decided to tax imported mutton and lamb for the benefit of the home producer. In this crisis the country, under its first Labour Gov., in which Mr. Savage secured fifty-five members in a House of eighty, followed the path of economic nationalism. The Labour Gov.'s first important measure of credit policy was to change the Reserve Bank, estab. in 1934, into a Central Bank to carry out the monetary

High Commissioner for New Zealand

AUCKLAND FROM MOUNT EDEN

aimed largely at Brit. shipping companies and middlemen. But although the net result of this legislation was the expansion of the farming industries, the restoration of pre-1914 prosperity seemed as remote as ever. The Coates (*q.v.*) Gov., formed after Massey's death (1925), was not in favour of further borrowing on London, but in 1928 Ward's Gov. was returned to office on a platform of land settlement and railroad development to be financed by loans, and £30,000,000 was borrowed in the next few years. When, however, in the economic crisis of 1930-32, it appeared that the Brit. market for N. Z. farm produce had shrunk, N. Z.'s economy was seriously threatened, though after the Ottawa Economic Conference (*q.v.*) hopes were entertained that the country's dairy produce exports would recover as the result of the institution of preferential tariffs against foreign produce. By the end of 1933 N. Z. was on the road to recovery, mainly through the expansion of the wool market, but in a world in which guns were of greater importance than

policy of the gov. By 1938 N. Z. felt that its prosperity had been restored, for in 1937 her exports yielded nearly £67,000,000, almost as high a total as had ever been achieved. This was accomplished during an era of Socialist administration, when high wages were paid and an ambitious programme of public works set afoot as a system of relief for unemployment, pensions were increased, a big housing programme was begun, and the 44-hr. week had been introduced; all this had been accomplished without having solved the problem of dairy produce exports, though agreement with Britain had been reached on the question of marketing of meat. But this newly won prosperity rested on a insecure foundation inasmuch as the country was importing more than it could pay for. The gov. found that it could only discharge its liabilities for interest on loans by a policy of restricted trade and in the result a new loan was arranged. Brit. Gov. credits of £5,000,000 for defence and an export credit of £4,000,000 to finance

imports were granted as a result of the mission of Walter Nash, the N. Z. finance minister. Throughout this period of repeated economic and financial difficulty, however, the will to co-operate with Britain politically was never wanting in N. Z. Common interests strengthened the community of sentiment and political tradition. Conscious of her interests in the Pacific, N. Z. actively supported the construction of the Singapore base (*q.v.*) and Massey protested when construction was suspended by the Brit. Labour Gov. of 1924. The N. Z. Gov. contributed £1,000,000 when work was resumed. With the return to office of a Labour Gov. in N. Z. in 1935 there was, for the first time, a pronounced difference of views on foreign policy between Britain and N. Z. This difference concerned 'collective security,' belief in which N. Z. shared with the Labour Opposition in Britain as the best policy for the empire in general. For the N. Z. Gov. had a strong faith in the League of Nations and had little sympathy with the Brit. Gov.'s efforts to compromise between the moral ideals of appeasement and power politics. None the less, at the Imperial Conference of 1937 N. Z. agreed to co-ordinate her defence policy with that of Britain, and the nearer the clouds of the Second World War approached, the less did the N. Z. Gov. insist on its independent point of view, and the clearer became its sturdy resolve to stand by Britain. The Brit. declaration of war on Germany was regarded as binding on N. Z. and when war came New Zealanders stood loyally where their fathers had stood, side by side with Britain. The risk that Japan might strike together with her Axis partner enhanced N. Z.'s anxieties and it seemed doubtful whether she could afford to dispatch an expeditionary force to Europe; but this risk was lessened by Germany's pact with Russia, and in the result the N. Z. Gov. agreed to send and maintain a force of one div. The achievements of this div., known as 2nd Div., under the command of Sir Bernard Freyberg, V.C. (*q.v.*) (who became governor-general in 1946), in Greece, Crete, at El Alamein and in the advance to Tunis and in Italy, culminating in the final advance to Trieste, no less than the exploits of N. Z. members of the R.A.F. and of the R.N. and an infantry div. which fought in the Pacific with U.S. forces, have added fresh lustre to the hist. of the country, besides emphasising her position as a loyal member of the Brit. Commonwealth of Nations (see W. P. Morrell, *Britain and New Zealand*, 1944; and the articles AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN; ITALIAN FRONT, SECOND WORLD WAR, CAMPAIGNS ON, and LONG RANGE DESERT GROUP).

It was not until the end of 1947 that at long last N. Z. adopted the prin. sections (2-6) of the Statute of Westminster and passed a further Act asking the United Kingdom Gov. to legislate to relieve N. Z. of restrictions remaining, under an amending Act of 1857, on N. Z.'s powers to amend its own constitution, a

request which was promptly acted upon by the passage of the New Zealand Constitution (Amendment) Act 1949 repealing the New Zealand Constitution (Amendment) Act 1857 and making it lawful for the Parliament of N. Z. 'to alter, suspend, or repeal, at any time, all or any of the provisions of the New Zealand Constitution Act, 1852.'

A national referendum held on August 3 (1949) resulted in an overwhelming majority in favour of the Fraser Gov.'s proposals to institute compulsory military training in N. Z. The returns were: in favour 533,016; against, 152,443. Sixty per cent of the electorate, including the Maoris, went to the poll. After fourteen years in office the Labour Gov. was defeated by the National party, whose leader, S. G. Holland, became Prime Minister (Dec. 1949).

Literature and Art.—As might be expected, the literary roots of N. Z. are Eng. In the early days of the colony the time and energies of the settlers were almost entirely taken up with the hard task of developing the country and winning a meagre existence from the soil. Contact with the Maori culture provided them with little else but material for the natural historian. The earliest writing to come out of N. Z. consisted of scientific accounts of the natural hist. and natives of N. Z. Among these early writers may be mentioned Edward Jerningham Wakefield, *Adventure in New Zealand* (1845); Ernst Dieffenbach, *Travels in New Zealand* (1843); Sir George Grey, *Mythology and Traditions of the New Zealanders* (1854). Poetry was even less in evidence in these early years, although a certain amount of rough verse in ballad form was written and disseminated in broadsheets by such men as Wm. Golder (*c.* 1850).

The overriding preoccupation with economics and commerce persisted into the latter half of the nineteenth century, and Samuel Butler, who went to N. Z. in 1860, wrote scathingly of the prevailing concern with sheep. At this time a number of minor novelists appeared who wrote long and serious novels of a high moral tone with involved plots and a strong Puritan bias. Lady Barker wrote *Station Life in New Zealand* (1870) and *Station Amusements in New Zealand* (1873) and other works of a domestic and semi-fictional character; Mrs. C. Evans and Dugald Ferguson were authors of a similar school. At this time also a hist. of the Maori wars was written by J. E. Gorst (later Sir J. E. Gorst, *q.v.*), entitled *The Maori King* (1864), an important and absorbing account from first-hand observation, and by F. E. Manning's *History of the War in the North* (1862) and *Old New Zealand* (1863). Among poets of the period may be mentioned F. N. Broome, Alfred Donnett (Browning's 'Waring'), and Tom Bracken. Their work, however, was largely derivative and influenced by contemporary Eng. minor verse.

At the turn of the century the level of writing was improving and perhaps the most noted author was Wm. Pember

Reeves, a well-known lawyer, politician, and journalist, author of *State Experiments in Australia and New Zealand* (1902), *The Long White Cloud* (1898), and writer of the national song *New Zealand* (1898). Jessie Mackay, the poetess belongs to this period, and Edith Grossman the novelist, a strong supporter of the feminist movement.

At this time the cultured New Zealander was always strongly tempted to leave the somewhat prov. atmosphere at home and to migrate to London. Of such the most famous was Katharine Mansfield (*q.v.*). Born in Wellington in 1888, she was sent to school in London and returned to Wellington only to leave again for England in 1909. Her stories and sketches have placed her among the foremost contemporary women writers. Another novelist, Wm. Satchell, wrote between 1900 and 1914, and H. Guthrie Smith wrote *Tutira*, a noted account of a N. Z. sheep station, in 1921. Guthrie Smith has been called the Gilbert White of N. Z. and his work has something of the imaginative qualities of both the poet and novelist. He gives a detailed account of the natural hist. of the locality and also deals with man's influence on his natural environment, the habits and customs of the Maori, and the acclimatisation of European man and the effects of the various foreign flora and fauna which he introduced.

After the First World War the quality of N. Z. literature improved considerably and writers became emancipated from their Victorian models. From this time onward literary talent appears more frequently, though the domination of London is still apparent. The most promising poet in the 1920s was Eileen Duggan. Among novelists may be particularly mentioned Miss Robin Hyde, authoress of *Passport to Hell* (1932), *Check to your King* (1936), and many other novels, who was one of the most outstanding of the contemporary novelists. She has sensitive imagination and a great power of evocation. Other contemporaries are Ngalo Marsh, John A. Lee, John Mulgan, and Frank Sargeson. Among poets may be mentioned Walter D'Arcy Cresswell, Evelyn Hayes, James K. Baxter, Ruth Dallas, A. R. D. Fairburn, and Mary Stanley. With the new contact and widened horizons brought about by the war and modern communications the outlook for modern N. Z. writing is encouraging.

As with literature, so also the origins of N. Z. (European) art date back to about 1800 (for Maori art see under MAORI) and the first efforts are far and few between, owing to the hard life led by the early colonists. Some of the early painters were draughtsmen in the employ of the N. Z. Company and their task was to record various phases of the company's operations and activities. Among these may be mentioned Charles Heaphy, W. Swainson, and J. A. Gilliland, who portrayed N. Z. life and scenery in the 1840s and 1850s. Their style is perhaps conventional and lacking in any great distinction, but faithful to detail. Those of the

generation which followed were rather idealists who were greatly under the influence of contemporary Eng. traditions. John Gully, for example, employed hazy blues and greens more appropriate to the atmosphere of the Brit. Isles. Mention may be made of J. C. Richmond and W. M. Hodgkins, but the most important artist of the period was John Buchanan, a water-colourist, who dispensed with the prevailing naturalism and placed the chief stress on form and contour. By about 1870 a number of art schools had been estab. in N. Z. and art societies founded and galleries opened; the N. Z. Academy of Fine Arts was founded in 1889 and thenceforth art flourished in its own right. At the same time a Dutch professional artist, Van der Velden, settled in N. Z., and it was he who provided a stimulus to N. Z. students. James Naife emigrated from Scotland and introduced impressionism to N. Z. at this time. By 1900 it had, however, become customary for N. Z. artists to study in London and Paris, with the result that the level of technical competence was raised considerably, though inevitably some talent was permanently lost to the country, e.g. David Low, the famous cartoonist, and Frances Hodgkins. However, with the general improvement in communications after the First World War and the consequent spread of ideas, N. Z. artists responded to outside influences to a much greater extent. The influence of the Fr. post-impressionists has been great and, while it is difficult to single out any name in particular among contemporaries, the following deserve mention: T. A. McCormack, Stewart MacLennan, Russell Clark, A. J. C. Fisher, Cedric Savage, Vida Steinert, and George Woods.

Bibliography: GENERAL.—J. S. Polack, *Manners and Customs of the New Zealanders*, 1840; E. Shortland, *Traditions and Superstitions of the New Zealanders*, 1856; Wm. New Zealand, Bank of, estab. in 1861 by an Act of the N. Z. Parliament, and has now more than 250 branches in Australasia. It acts as banker to the N. Z. Gov., which holds practically all the capital stock.

Next Friend, in law, a phrase used to denote the person who in any transaction acts on behalf of another, where that other, either from youth, mental infirmity, coverture (q.v.) or from some other cause entailing legal incapacity, cannot act for himself (see also CAPACITY; INFANCY; MAJORITY). The N. F. of an infant or minor is not necessarily his parent or legal guardian, for the court will in its discretion allow any one to represent an infant in an action.

Next-of-Kin, see KIN. **NEXT OF**, and **DISTRIBUTION**, STATUTES OF.

MARSHAL NEY

Ney, Michel (1769-1815), marshal of the first Fr. Empire, b. at Saarlouis. He was a non-commissioned officer in a Hussar regiment when the revolution began. For the capture of Mannheim he was made a general of div. in 1799. He was interim commander of the army of the Rhine for a short time, during which he frustrated

an important movement of the Archduke Charles against Masséna and the army of Switzerland. After the peace of Lunéville, Bonaparte, anxious to win N. to his party, brought about his marriage with a young friend of Hortense Beauharnais, and appointed him inspector-general of cavalry. On the estab. of the empire he was made a marshal. In 1805 he stormed the entrenchments of Elchingen, and was created duke of Elchingen. He afterwards rendered important services in the Tyrol; contributed much to the Fr. successes of 1806 and 1807; and served in Spain with great ability in 1808 and 1809, but quarrelled violently with Masséna, his superior officer in the invasion of Portugal of 1810-11. In 1812 he received the command of the third *corps d'armée*, and greatly distinguished himself at Smolensk and the Moskwa, in consequence of which he was created prince of the Moskwa. It was due to his devotion in command of the rearguard that some remnants were saved in the 1812 retreat. He had a prin. part in the campaigns of 1813 and 1814. On Napoleon's return from Elba, N. was sent against Napoleon at the head of 4000 men; but N. went over to his side. He commanded at Quatre-Bras, and in the battle of Waterloo commanded the centre, and had five horses shot under him. After the capitulation of Paris he retired to Switzerland; but a costly Egyptian sabre, the gift of Napoleon, led to his being suspected by an official, and arrested. He was condemned to death for high treason, and was shot in the garden of the Luxembourg. His sons pub. his *Mémoires*, 1833. See lives by H. Welschinger, 1893; L. Blythe, 1937, and P. Compton, 1937; also H. Bonnal, *La Vie militaire du maréchal Ney*, 1910-14.

Nez Percés (so called from their custom of wearing nose rings), tribe of N. Amer. Indians, settled in Idaho and E. Washington and Oregon. After the N. P. war in 1877 the survivors were sent to Indian ter., but have now been transferred to Lapwai reservation, Idaho.

Ngami Lake, former lake of W. Rhodesia, Brit. S. Africa. It was discovered by David Livingstone in 1849. It was 70 m. in length, with a breadth of 20 m., but now it is only a swamp.

Nganwhel, or **Anhwei**, prov. of China, bounded on the E. by the provs. of Kiangsu and Chekiang, on the W. by Hupe and Honan, and on the S. by Kiangsi. It is watered by Yangtse-kiang, which flows through the fertile tea-growing dists. of the prov. Other products are wheat, cotton, rice, and indigo. The prov. is mountainous in the W., reaching an elevation of over 7000 ft. The north section is drained by the Huai R. Iron and coal are found, but they are not mined to any great extent. Its cap. is Hwaining, and its treaty port is Wuhu, which has railway communication with Wenchow in Chekiang. Area 54,305 sq. m. Pop. 21,705,000.

Ngatoro, see under MAORIS.

Ngolo-Setas, people of N.E. Tibet. The N.-S. ter. includes the drainage area of

the Upper Tong R., and also probably extends to the N. as far as the dists. watered by the great bend of the Hwang-ho. The ter. lies between two mt. systems, the extreme of the E. end of the Bayen-Khara Mts. on the N.W., and the complex formed by the chain which extends from the Tao Fu Mts. to Myria Gonka, and by the Sseutshauan Alps on the E. and S.E. It is a plateau whose highest level is 16,000 ft. In addition there are wide, deep valleys; the herds-men of the former and the settlers of the latter communicate by means of the secondary valleys of the trib. streams, each being the economic supplement of the other, trade being controlled by the monasteries. The collection of nomads in N.E. Tibet is a loosely organised confederation of tribes, the Ngolos and Setas being the most important. Their independence of the Chinese authority in Sinkiang prov., and of the temporal power of Lhasa, explains the superficial cohesion of the ensemble, and the slight knowledge which the outside world has of them. It would appear that the Setas are but a tribe of the Ngolos and the relationship of the two is close enough to justify the hyphenated name. The nomads of the plateau, the N.-S. proper, have the social conditions of all pastoral peoples, in which most of the work is done by the women. The duty of the adult males is to protect the camp, which leaves them enough time and energy for raiding. Sometimes expeditions are directed against the valley peoples, but the usual target is the caravans of strangers; the salt caravans from the Koko-nor are seemingly immune. The strong influence of the magical superstition of Lamaism tends to provoke battle and bloodshed on the plateau. The N.-S. warriors have long hair falling to the shoulders, wear ear-rings of silver, and dress in sheepskins with the wool inside. Apart from their different modes of life, it is probable that anthropological research would reveal important morphological differences between the inhab. of the plateaux and those of the valleys. The N.-S. were first mentioned by Père Huc, and descriptions may be found in his *Souvenirs d'un voyage dans le Tartarie, le Thibet, et la Chine pendant les années 1844-46, 1850*. See also A. Guibaut, *Tibetan Venture*, 1947.

Ngornu, tn. of Bornu, W. Africa, on the S.W. shore of Lake Chad. Pop. 20,000.

Niagara (formerly Newark), tn. and summer resort of Ontario, Canada, in Lincoln co., on Lake Ontario, at the mouth of the N. R., 15 m. from the falls.

Niagara Falls: 1. On lower Niagara R., which is 20 m. in length, and connects Lake Erie with Lake Ontario. The falls are the greatest in the world in volume of water. At Goat Is. the riv. divides. There are two distinct falls, side by side; the Amer. Fall, a sheer descent of 167 ft., and 1080 ft. wide; and the Horse-shoe Fall, on the Canadian side. The volume of water of this fall is terrific, and a depth of 158 ft. is taken in a leap; the spray is like heavy rain. It has been estimated that the water is at least 20 ft.

in thickness. The fall is over a grand curve of rock measuring 3010 ft. The whirlpool is just below the falls, a raging mass of turbulent water. The riv., now a quiet, gently flowing stream, enters the lake of Ontario at Lewiston. The drop between Lakos Erie and Ontario is 326 ft. The edge of the Horse-shoe Fall is receding to the extent of 5 ft. each year. It is believed that the original falls were at Lewiston. The Gov. Reservations, on both sides of the falls, have been turned into fine parks. One of the best points of view of the fine Horse-shoe Falls is from the railway track, and observation cars are run, and the trains are

NIAGARA FALLS

E.N.J.

stopped for some minutes for the benefit of tourists. The falls were discovered in 1678 by a Fr. priest, but his description was laughed at as a traveller's tale. For over half a century the water has been used for industrial purposes, many manufacturing plants being worked by its power. The largest of the plants constructed is the Queenston-Chippawa development on the Niagara R. Construction was begun in 1917 and the first unit was in commercial operation in 1922. The total capacity of the diversions for power purposes is 1,010,000 h.p. (Canadian 450,000 h.p.; Amer. 560,000 h.p.). Many thousands of tourists visit the falls every summer. The sight is even more wonderful in winter, when the gigantic falls are in the grip of frost and snow, and huge icicles hang glistening in the sunshine. Three bridges span the riv. The view from the suspension bridge is magnificent, whilst the fine culvert bridge is a triumph of modern engineering. The Rainbow Bridge (replacing a former

bridge destroyed by ice-jams) was opened to traffic in 1941. This new bridge is 950 ft. long and cost about £1,000,000. It is the longest fixed-end steel arch span in the world, was dedicated by the king and queen in June 1939, and has a 10-ft. footway which gives wonderful views of the cataracts. See H. Hulbert, *The Niagara Falls*, 1908. 2. City of Ontario (formerly Clifton), Canada, in Welland, on the W. bank of the Niagara R., opposite the N. F. It is connected with N. F., New York, by three bridges. There are sev. factories which utilise the water-power from the falls (the total h.p. from the Niagara R. is 830,000. There is a beautiful park along the riv. bank. Pop. 20,589. 3. City of New York state, U.S.A., in Niagara co., on the E. bank of the Niagara R., at the falls, 18 m. N.N.W. of Buffalo. The bridge which here crosses the riv. is 1210 ft. long, and there are also two railway bridges. The falls supply water-power for the city, which is a shipping centre, with important manufs. N. F. is the site of the largest electric power plant in the world, and is a summer and winter resort. Pop. 78,000.

Niamoy, cap. of the Niger colony, Fr. W. Africa, on the E. bank of the Niger R. The trans-Saharan motor route ends at N., which trades in ivory. Pop. 5000.

Niam-Niam, or Azandeh, race of negroid stock who formerly inhabited the region lying between the Congo and the Upper Nile, now known as the Welle and Ubangi distrs. in the N. of the Belgian Congo, Equatorial Africa. They are allied to the Nubas, and have a dark reddish skin, oblique eyes, and generally round features. They are fond of music and show an aptitude for wood-carving and the fashioning of pottery. The kingdom of the N.-N., which flourished for over two centuries, was destroyed by an Arab invasion, since when the inhab. were dispersed. See G. Schweinfurth, *Heart of Africa*, 1873; W. Junker, *Travels in Africa*, 1890-92; D. Westermann, *Die Sudafrikaner*, 1911; and J. Czernichowski, *Forschungen in Nil-Kongo-Zwischengebiet* (vol. vi.), 1924.

Nias, Dutch Is., off the W. coast of Sumatra, with an area of 2100 sq. m. Its surface is mountainous. Rice, coco-nuts, bananas, pepper, tobacco, and sugar are grown. Pop. about 187,200. See E. W. Schröder, *Nias: Ethnographische, geographische en historische*, 1917.

Nibelungenlied, or Der Nibelunge Nôt, old Ger. epic poem embodying stories and traditions which were current in Germany before its writing, and which dates from some time near the beginning of the twelfth century. The N. really derives from the *Völsungasaga*, the Scandinavian prose version of a lost poem or great poetic saga which is believed to have been the earliest coherent form of the story so universal among the Teutonic peoples. Fragments of this great saga are to be found in the poet-*Edda*, dealing with the chain of stories of the two heroic families of the Völsungs and the Niblungs. The romantic epic, *Der Nibelunge Nôt*, is a further extension and corruption of the

Scandinavian myth; but neither in this nor in any modernised or Teutonised form does the auct. legend touch such a consummate height of heroic poetry as in these earliest fragments of Icelandic song. The author of the N. is not known, but he drew his materials not only from various well-known lays and poems, but probably from a more or less connected account of the twelfth century, and, according to some authorities, from Lat. poems also. The story relates how Siegfried, son of the king of the Netherlands, and the possessor of the treasure of the Nibelungs, wins as his wife Kriemhild, the sister of Gunther, king of the Burgundians. For the latter he obtains the hand of Brünhild, queen of Iceland, by causing him to be successful in three trials of strength. This he accomplishes by wearing a magic cloak, and thus being invisible beside Gunther. Some years after Brünhild, Gunther's wife, brings about the murder of Siegfried by means of Hagen, who by treachery finds out the hero's vulnerable spot and slays him. He afterwards secures the treasure which has become the property of Kriemhild, and buries it in the Rhine. The widow finally accepts the hand of Attila (Etzel), king of the Huns. She then induces Gunther and Hagen to visit her court, and they with members of their train are slain at the instigation of Kriemhild, who had always vowed vengeance on Hagen. She herself, however, is also slain at the end of the conflict, which is a scene of awful slaughter. The *Klage*, a poem written about the same time as the N., deals with the lament of those who survived the destruction. The chief eds. of the N. are those of K. K. F. W. Lachmann, 1826, and K. Bartsch, 1870, the latter ed. by H. de Boor (1940); there are Eng. trans. by A. G. Foster-Barham, 1887, and Margaret Armour, 1897; see also Margaret Armour (trans.), *Gudrun*, 1928 (Everyman's Library); D. von Kralik, *Von deutschen Art in Sprache und Dichtung* (vol. II.), 1941; and N. Dürrenmatt, *Das Nibelungenlied im Kreis der höfischen Dichtung*, 1945.

Nicæa (modern İznik), city of auct. Bithynia, in Asia Minor, on the E. shore of Lake Ascania. It was built by Antigonus, the son of Philip, in 316 B.C., and named Antigonea, but the name was changed by Lysimachus to N. in honour of his wife. N. was of great importance under the Rom. and Byzantine emperors, having fine streets and monuments. The sultan Solymán had his cap. here in 1078, and after the Lat. conquered Constantinople in 1204, N. was the cap. of an E. empire. It was besieged and taken by the crusaders during the First Crusade (1096.)

In eccl. hist. it is noted as the scene of two councils; the First Œcumenical Council, consisting of 300 bishops and the Emperor Constantine, was held here in A.D. 325 to discuss, among other things, the Arian question and the Meletian schism, and to fix the date of Easter; the Nicene Creed (q.v.) had its first formulation. The Seventh Œcumenical Council, held here in 787, discussed mainly the

question of image worship. See also NIOX (for which a former name was N.).

Nioander, Karl August (1799-1839), Swedish poet, b. at Ströngnäs, was educated at the univ. of Upsala. In 1820 he pub. his first vol. of poems, and by his powerful tragedy *Runesvarden* (The Runic Sword) he won a foremost place among his literary contemporaries. He also wrote *Rimor* (The Rimes), *Enzio*, 1825, and *The Death of Tasso*, for which he was awarded a medal by the Swedish Academy. After a tour in Italy in 1827 he pub. *Memories of the South*.

Nicaragua, republic of Central America, between the Caribbean Sea and the Pacific Ocean. Area 57,145 sq. m.; pop. 1,148,700. Along the Caribbean coast there are lagoons, estuaries, and swamp lands, but the Pacific coast is rocky. The prin. ports are Corinto, Brito, and San Juan del Sur on the Pacific side, and Bluefields and Greytown (San Juan del Norte) on the Caribbean. The Cordillera de los Andes, a volcanic range, crosses the northern half, Cosequina (3835 ft.) and El Viejo (6267 ft.) being the highest summits. The cap. of the republic is Managua, with a pop. of about 141,900. Among other ins. Matagalpa has a pop. of 52,000; León, 51,700; Jinotega, 39,900; Granada, 38,900; Masaya, 37,600; Chinandega, 25,500; and Bluefields, 20,300. Two large lakes, the Managua and the N., are situated in Central N. The latter is 100 m. long and has an area of 2900 sq. m. There are five rapids on the San Juan R., which greatly impede navigation. The climate is tropical except on the highlands. Coffee, bananas, rubber, and hides are the chief products; coffee formed 25 per cent of the 1947 exports. Sugar, timber, maize, rice, and cocoa are also produced. There are rich undeveloped resources. Gold is mined on the Caribbean coast. The forests yield mahogany and cedars, and form a valuable part of the exports. There are also other excellent timber trees, rosewoods, guaiacum (or lignum vitæ), gums, and dyewoods. Rubber is also produced. In 1947 the imports were valued at \$21,085,850 Amer. dollars, and exports at \$20,979,627. Exports to the United Kingdom totalled £45,124 and imports from the United Kingdom, £113,440. There are 411 km. of railway.

The roads for the most part are mere tracks, and the want of an adequate network has hindered the exploitation of large areas of agric. and forest land. The one important all-weather road is the Inter-Amor. (or Pan-Amor.) highway, which runs for 240 m. from the Costa Rican frontier, through Managua, and north to the Honduran frontier. A concrete highway, 19 m. long, from Las Conchitas, is open to Masachapa, on the Pacific. A branch road of the Inter-Amor. highway is being built from San Benito on the highway, to Rama, 60 m. from Bluefields, on the Atlantic. There are air services to the U.S.A. and the Central and S. Amer. republics. There is a powerful wireless station at Managua, with branches at Bluefields and Cabo Gracias a Dios. Most of the people are mixed Indian and

European blood. Primary education is free and compulsory, but the masses are ignorant; illiteracy amounts to about 60 per cent. There are 984 state elementary schools and some secondary, but the latter are carried on by private individuals. There are univs. at Managua, León, and Granada. Rubén Darío (*q.v.*), the greatest of all Sp. Amer. poets, was a native of N. The prevailing religion is Rom. Catholic, and N. constitutes one archbishopric and eccles. prov., the seat of the archbishop being Managua, with bishoprics at León, Bluefields, Granada, and Matagalpa. The gov. consists of a president elected for six years, and a Congress composed of two houses, the Chamber of Deputies having forty-four members, and the Senate fifteen, all elected for six years by popular vote. The judicial power is vested in the supreme court at Managua, five chambers of second instance (León, Granada, Bluefields, Mesaya, and Matagalpa), and about 150 judges of inferior tribunals. Until recently the gov. of the country was largely controlled by the U.S.A. The National Guard was trained by U.S. marine officers, who with a strong force of marines occupied the country in 1928 to keep order. Banditry has by no means disappeared, and traders, notably in the Matagalpa area, are protected by bodies of the Guardia Nacional, who in this part replaced the U.S. marines. The U.S.A. acquired naval bases, and the option for a canal route, survey for which began in 1939. There are also plans to canalise the R. San Juan, and thus provide a Caribbean-Pacific link for N. and Costa Rica. See J. Ganez, *History of Nicaragua*, 1889; S. J. Bernardo Portas, *Compendio de la historia de Nicaragua*, 1918; C. R. Knock, *The Republics of South and Central America*, 1922; H. L. Stimson, *American Policy in Nicaragua*, 1927; T. Gann, *Discoveries and Adventures in Central America*, 1928; and R. de Nogaes, *The Looking of Nicaragua*, 1932.

Nicaragua Canal. In 1884 a treaty was made between the gov. of U.S.A. and Nicaragua with the object of cutting a ship canal to link up the Atlantic and Pacific oceans. The canal was begun at Greytown in 1889, and its total length would have been about 170 m., including Lake Nicaragua and the San Juan R. Less than 30 m. would have had to be excavated. Operations were, however, suspended in 1893, and attention was directed to the Panama Canal, whose last barrier was blown away by dynamite in Oct. 1913, and the waters of the Pacific mingled with those of the Atlantic. The N. C., though it would have been a longer route, presented fewer difficulties in the way of natural barriers and fewer gigantic rocks to engineer and blast. The scheme was abandoned owing principally to the political unrest of the country. By a treaty in 1916 the U.S. Gov. for 3,000,000 dollars acquired the option for a canal route through Nicaragua and also for naval bases in the bay of Fonseca on the Pacific coast, and Corn Is. on the Atlantic coast. The treaty was ratified by

Nicaragua in 1916 and by the U.S.A. in 1926. In 1931 Amer. military engineers reported to Congress that a Nicaraguan canal would cost fivefold that of a third set of locks on the Panama Canal, but a later estimate was much lower. Surveys of the route began in 1939.

Nicastro, com. of Italy in the prov. of Catanzaro, 16 m. W.N.W. therefrom. It is a bishop's see. There is a ruined castle in which Frederick II. was confined. Pop. 30,900.

Niccola Pisano, see **PISANO**.

Niccolini, Giovanni Battista (1782-1861), It. poet and dramatist, b. at Bagni di San Giuliano, Tuscany. N.'s first poem, *Peste de Livorno*, appeared in 1804. From 1807 to 1808 he was secretary and prof. of hist. and mythology at the Florentine Academy of Fine Arts. His first dramatic work was the tragedy of *Polissena* (1810), followed by *Ino e Temisto* (1825), *Edipo*, and *Medea* (1825). The first of his political dramas, *Nabucco*, appeared in 1815; another invective against absolute power is *Antonio Foscari* (1827), the most popular of all his dramas, although *Arnoldo da Brescia* is his literary masterpiece (1843) (Eng. trans. by T. Garrow, 1846). His pub. and unpublished works were ed. by Garzanti, 1863-80. See monographs by Barelli, 1888; Ostermann, 1900; Leoni, 1901; and R. Gastalla, 1917.

Niccolò Alunno (c. 1430-1502), see **ALUNNO, NICCOLÒ**.

Nice (anc. **Nicea**; It. **Nizza**), seaport and episcopal see of France, cap. of the dept. of Alpes-Maritimes, 8 m. S.W. of Monaco, at the mouth of the Païenne. The city is sheltered on the N., but is exposed to the *Libeccio*, a moist S.W. wind, and is occasionally visited by the mistral, the sirocco, and the tramontane. It has, nevertheless, a delightful climate, supposed to be particularly beneficial to gout and chest complaints. The tourist traffic is the basis of the city's economy. In the centre of the tn. is a high hill (318 ft.) on which the castle, destroyed by the duke of Berwick (1706), formerly stood. The fashionable and residential quarters lie to the W. Along the shore and round the base of the hill stretch fine promenades. The chief public buildings are the Rom. Catholic cathedral (1650), the Gothic church of Notre-Dame du Vœu (1435), the municipal casino, art gallery, and observatory. To the E. of the hill are the harbour and port. There is a large coasting trade, and the chief exports are flowers, olives, oranges, lemons, perfumes, wines, liqueurs, chocolate, soap, and tobacco. The inhab. execute fine inlay work in olive wood, and also manuf. art pottery.

The anc. tn. of **Nicea** was founded by the Phœceans from Massalia (Marseilles) and so called in commemoration of a victory (Gk. νίκη) over the Ligurians. In the second century B.C. it fell into the hands of the Romans. In the ninth and tenth centuries A.D. it was more than once sacked by Saracen invaders, and was plundered by the Turks (1543). From 1388 until 1706 (save between 1600 and 1691) it belonged to Savoy, from 1706 to

1713 to France, then it was in the possession of Savoy until 1744, reverting to France and Spain in that year. From 1792 to 1814 it was in the co. of Nice, France; it then belonged to Sardinia until 1860, in which year France finally resumed authority over it. It is the hp. of Garibaldi, Massena, and Vanloo, the painter. Pop. 211,100. See Nash, *Guide to Nice*, 1844; G. Home, *Along the Riviera of France and Italy*, 1908; E. Berl, *Le Port franc de Nice*, 1924; and M. Malingue, *Les Primitifs niçois*, 1941.

Nicene Creed, the only creed of the Church which has received oecumenical sanction, was originally drawn up at the Council of Nicæa in A.D. 325 (see **ARICUS**). It was in the form familiar to Westerns in the Rom. Mass and the Anglican Communion service, but terminated at the words 'And I believe in the Holy Ghost.' It was reaffirmed at the Council of Constantinople (381), and the rest of the creed, as we have it, was then added, with the exception of the word *filioque* ('and the Son'). See also **CREED**. See A. d'Ales, *Le Dogme de Nicæum*, 1926; J. S. MacArthur, *Chalcedon*, 1931; and F. J. Badcock, *History of the Creeds*, 1938.

Nicephorus (c. 758-828), patriarch of Constantinople (806), defended the worship of images against the Iconoclasts, and was consequently banished to a convent in Asia by Leo the Armenian (A.D. 816). He wrote *Chronographia Brevis* and *Breviarium Historicum*, also sev. other historical works. He is numbered among the saints of both the Gk. and the Rom. Church.

Nicephorus, names of three emperors of the E.:

Nicephorus I., was emperor from 802 to 811. He made a treaty with Charlemagne, but in a war with the Saracens and Bulgarians was surprised and slain.

Nicephorus II., was emperor from 963 to 969. In a series of campaigns against the Saracens (960-963) he captured Candia and Aleppo. He was assassinated by his wife and nephew.

Nicephorus III. (Botaniates), last of the Armenian dynasty, was emperor from 1078 to 1081. With the help of Alexius Comnenus, he defeated his rival, Bryennius, but revolt broke out and he abdicated, retiring into a convent.

Nicol, John (1833-94). Brit. author, b. at Montrose. He became prof. of Eng. literature at Glasgow. He wrote a historical review of Amer. literature for the *Encyclopædia Britannica* (1882). Among his other works are the drama *Hannibal* (1873); *The Death of Themistocles and other Poems* (1881); *Byron* (1881) and *Carlyle* (1892) in the English Men of Letters series; and *Burns* (1882).

Nicholas, Saint (d. c. 350), patron saint of Russia and a native of Patara in Lycia. He is specially honoured as the guardian and patron of children and of scholars, as also of travellers by sea and land, and merchants. He is a prominent saint of the Gk. Church, and there are many legends illustrating his benevolence and good nature. His festival still survives in the Santa Claus of Christmas rejoicings.

See E. Crozier, *The Life and Legends of St. Nicolas*, 1949.

Nicholas, name of five popes and one anti-pope.

Nicholas I., sometimes called the Great, succeeded Benedict III. in 858. His pontificate was marked by three great contests: those in connection with the degraded patriarch, Ignatius of Constantinople, the divorce of Lothair, king of Lorraine, and with the right of bishops to appeal to Rome against the verdict of their metropolitan. He d. in 867. See E. Amann, *L'Epoque carolingienne*, 1937.

Nicholas II. (Gerard, a Burgundian) was pope from 1058 to 1061; he owed his importance to the counsel and influence of Hildebrand whose policy of reform he pursued. See A. Fliche, *La Réforme grégorienne*, 1924 37.

Nicholas III. (Giovanni Gaetano), b. at Soriano, was pope from 1277 to 1280; he strengthened the papal power in Italy and made the Vatican the official residence.

Nicholas IV. (Girolamo Masci), b. at Ascoli, was pope from 1288 to 1292; a member of the Franciscan order, his main object was the recovery of the Holy Land by crusades. The college of cardinals acquired independence by his financial reforms. See O. Schiff, *Studien zur Geschichte Nikolaus IV.*, 1897.

Nicholas V. (Tommaso Parentucelli), b. at Sarzana, was pope from 1447 to 1455. During his pontificate, in 1449, the resignation of the antipope, Felix V., put an end to the papal schism. The fall of Constantinople in 1453 was a great blow to him. He inspired many architectural projects in Rome, and founded the Vatican library.

Nicholas I. (Pietro Rainalducci) was antipope in Italy from 1328 to 1330 during the pontificate of John XXII. at Avignon. He resigned in 1330, having been excommunicated by John in 1329, received pardon for his sins, and was kept in honourable imprisonment in the papal palace until his death in 1333.

Nicholas I. (1796-1855), Russian emperor from 1825 till 1855, the third son of Paul I., was b. at Tsarskoe Selo. He visited England and Europe in 1816, and in the following year married the eldest daughter of Frederick William III. of Prussia. On the death of Alexander I., he succeeded to the throne, as Constantine, the real heir, had abdicated in his favour. During the early part of his reign some reforms were carried out, but N. soon reverted to the autocracy of the old tsars, supported by the force of arms. The wars with Persia and Turkey ended in victory for Russia (1828), and the crushing of the Poles was accomplished, but were accompanied by a terrible loss of men, as was the Crimean war later. See life by N. de Grunwald, 1946.

Nicholas II. (1868-1918), last Russian emperor; b. in St. Petersburg; eldest son of Alexander III. (whom he succeeded in 1894), and nephew of King Edward VII. of Great Britain. In 1896 he visited France and followed up the understanding between that country and Russia by

signing definite military agreements with President Faure. In 1898, inspired by traditions of the Holy Alliance, he brought about the convention at The Hague of the first International Peace Congress. In reply to the deputation of 1895 on his accession, he repudiated the claims of the people to share in matters of internal administration. In 1902 N. issued a manifesto proclaiming the inviolability of property and the land tenure system as against the growing claims of social democracy, especially in the direction of extending the principle of 'zemstvo' or local elective assemblies to the provs. A policy of E. expansion led to the Jap. war of 1904-5. Liberal inclinations were shown, however, in his estab. of the Duma the same year. But he came more and more under the reactionary influence of the empress, who was under Rasputin's domination, and this, combined with the

NICHOLAS II.

terrible mismanagement of Russia's part in the First World War, annihilated all respect for his crown. In March 1917, at headquarters, he abdicated, as required by the provisional gov., nominating the Grand Duke Michael to succeed him, but this Michael refused to do. N. was confined at Tsarskoe Selo, Tobolsk, and Ekaterinburg (Sverdlovsk) in the Urals. Yourkovsky, commissar of the last-named place, presumably acting on instructions, shot him dead in a cellar there and his wife and family perished with him, on July 16. See the Eng. trans. of the correspondence with his wife, 1929; Sir J. H. Williams, *The Emperor Nicholas II.*, 1922; and life by C. Radziwill, 1931.

Nicholas I. of Montenegro (1811-1921), king of Montenegro, b. at Njegos. He was proclaimed prince in 1860, and in 1900 took the title of royal highness. Ten years later he styled himself king, in accordance with a petition from the Skupstina. The Balkan League of 1912 brought the union of Montenegro, Serbia, and Bulgaria with Greece, but the 'Germanisation' of Bulgaria brought the league to naught in the First World War, with the result that the entry of Turkey involved Montenegro, and King N. soon afterwards placed one div. of 2500 men in

the field. By Jan. 20, 1916, however, he had capitulated, proclaiming that unconditional surrender was necessary to avert the ruin of his country. The Montenegrin Grand Assembly in April 1919 affirmed his dethronement and that of his dynasty, and proclaimed the union of Montenegro with the kingdom of the Serbs, Croats, and Slovenes. He wrote sev. dramas (*Balkanska Tzaritza* and *Knjaz Arsaniti*), a book of poems (*Ilaidana Potini Abenseraçe*), and one of ballads (*Skuplene Pesme* and *Nova Kola*). **Nicholas** (1856-1929), Russian grand duke and soldier, see under RUSSIA, History.

Nicholas of Damascus (fl. 16-8 B.C.), see DAMASCENUS, NICOLAUS.

Nicholas of Hereford (fl. 1390), Lollard preacher and author, was b. probably in Hereford. A close friend and supporter of Wycliffe, he was condemned and excommunicated by the church council in 1382 for his support of the Lollard doctrines. An appeal to the pope against his sentence led to his imprisonment in Rome. He escaped, but was captured in England. In 1391 he recanted, and after holding sev. offices under the crown retired to a monastery. He aided Wycliffe in his trans. of the Bible.

Nichols, John (1745-1826), Eng. historian and biographer, b. at Islington. When thirteen he was placed with Wm. Bowyer, the printer, to whose business he succeeded in 1777. He pub. in 1778 *Anecdotes, Biographical and Literary of William Bowyer, Printer* (enlarged, 1782); and many other works of which he was either editor or author including *The Progresses and Public Processions of Queen Elizabeth* (1788); and *Illustrations of the Manners and Expenses of Ancient Times in England* (1797). The *Gentleman's Magazine* passed into his hands in 1778, and continued until his death. He was succeeded by his son, *John Bowyer Nichols* (1779-1863), who also pub. sev. hist., and was a fellow of the Society of Antiquarians, and of the Linnean Society. See J. Nichols, *Brief Memoirs of John Nichols*, 1804.

Nichols, Robert Malise Bowyer (1893-1944), Eng. poet and writer, educated at Winchester, and Trinity College, Oxford; at the beginning of the First World War he obtained a commission in the Royal Field Artillery, and while serving in France pub. *Invocation*, a book of war poems. In 1917 his second book, *Ardours and Endurances*, was very successful. *Aurelia* (1920) contains the finest of his poems; later, however, he snatched at greatness, though only narrowly missing it. His later works, such as the drama *Guilty Souls* (written while he held the Lafcadio Hearn chair of Eng. literature in the Imperial Univ. of Tokyo), tend to be over-long and grandiose. His only publicly performed drama, *Wings over Europe* (in co-operation with Maurice Browne), produced in London and New York, foresaw the problems of the Atomic Age. In 1934, *Fisbo*, a long satire, was the last of his poetry, save for a few pieces in 1942. In *Such was my Singing*.

Nicholson, John (1821-57), Brit. general,

b. in Ireland. In 1841 he assisted in the defence of Ghazni, and greatly distinguished himself, but was ultimately captured and imprisoned at Kabul. He was rescued by Gen. Pollock after some months' incarceration. He saw active service during the second Sikh war. After the annexation of the Punjab he served in the Punjab Commission. At the outbreak of the mutiny N. was brigadier-general. His services during that troublous period were invaluable. On Sept. 14, 1857, he commanded the main storming party in the assault on Delhi, but was mortally wounded. See life by J. L. Trotter, 1904.

Nicholson, William (1753-1815), Eng. scientist, b. in London. He turned to scientific research after a commercial career with the E. India Company, and made the historic discovery that water could be decomposed by passing an electric current through it. This is an example of electrolysis which is the foundation of many important industrial and scientific operations. Working in company with another Eng. chemist, Carlisle, in 1800, N. constructed an electric battery (known at that time as a 'voltaic pile') from thirty-six half-crowns, and a number of zinc disks and pieces of pasteboard. Though the current produced by this crude apparatus was so minute that only a few thimblefuls of gas were collected over a period of 13 hrs., N. showed not only that water could be electrolysed, but that the two gases of which it is composed appear at different places, the oxygen being evolved where the electric current enters the water and hydrogen where it leaves. N. made many other scientific discoveries after his return from India in 1786. He invented a hydrometer, took out patents for textile printing machinery, planned and carried out a scheme for the water supply to Portsmouth. He was a scientific writer of great contemporary eminence and founded and, until his death, ed. the *Journal of Natural Philosophy*. But the electrolysis of water, a fundamental discovery of very great importance, remains this Englishman's real contribution to the world's total of scientific knowledge.

Nicholson, William (c. 1782-1849), the 'bard of Galloway,' was b. in Kirkcubrightshire. He became a pedlar and wrote verses on his wanderings. The preface to his *Tales in Verse and Miscellaneous Poems, descriptive of Rural Life and Manners* (1814), acknowledges his indebtedness to Hogg. His best poem is *The Brownie of Blednoch*, a folk-lore ballad.

Nicholson, Sir William Newzam Prior (1872-1949). Brit. painter and designer, b. at Newark-on-Trent, was educated at the Magnus School there, and trained under Wm. Cubley of Newark, a pupil of Sir Wm. Beechey, R.A. and in Paris. He collaborated with his brother-in-law, James Pryde (q.v.) in producing the 'Beggars' posters, which owed their inspiration to Whistler and Toulouse-Lautrec and were noted for their theatrical character. N. next produced woodcuts

in colour, which were pub. in collections under the titles *London Types*, *Characters of Romance*, *Twelve Portraits*, etc. Unlike many western woodcutters, N.'s work is completely free from the influence of Jap. colour-prints. His first appearance as a painter in oil was in exhibitions of the International Society (of which Whistler was president). He never exhibited in the Royal Academy, but one-man shows of his work were held at the Leicester and the Beaux Arts Galleries, London. In 1933 an exhibition of his work was held in Nottingham in recognition of his birth in that co. The Tate Gallery has two of his best portraits: 'Portrait of W. E. Henley,' bequeathed by Mrs. W. E. Henley (1925), and 'Portrait of Miss Jekyll,' presented by Lutyens (1922); also 'Lady in Furs' and a still-life study 'The Lowestoft Bowl.' He is well represented in Brit. city municipal galleries, e.g. 'The Landlord' in the Manchester City Art Gallery, and other works in the galleries of Liverpool and Nottingham. In the Fitzwilliam Museum are his portraits of Gen. Smuts and of A. C. Benson, and also 'The Girl with the Tattered Glove,' 'Armistice Night,' and 'The Gate of Honour under Snow.' He also designed costumes and settings for the stage: e.g. the costumes in *Peter Pan* and the settings and costumes for Massine's ballet *The Rake*. See life by Marguerite Stein, 1943.

Nicias, Gk. painter, son of Nicomedes, b. at Athens, and flourished probably between 350 and 300 B.C. According to Pliny, he was employed by Praxiteles to colour marble statues. Among his chief works were 'Necromantia Homeri,' 'Calypso,' 'Diana,' and 'Ilyacinthus.'

Nicias (c. 470-414 B.C.), Athenian statesman and general, belonging to the aristocratic party. He was sev. times a colleague of Pericles in the strategia, and on the death of the latter became leader of the aristocrats, and opposed Cleon. Prior to the Sicilian expedition he achieved a number of minor successes, and in 421 took a prominent part in the peace of N., which terminated the first part of the Peloponnesian war. In 418 he was one of the commanders in the naval expedition against Sicily; after the flight of Alcibiades, was practically the sole commander. In 414 B.C. he led the great expedition to Syracuse; but the enterprise terminated in disaster, and he was put to death by the Syracusans. See Plutarch's *Nicias*.

Nickel, one of the transitional elements of the first long period of the periodic table. The primary physical constants are: electron configuration, 2, 8, 16, 2, i.e. atomic number 28; atomic weight 58.69; density 8.9; melting point 1452°C.; electrical conductivity 12.0 (silver=100); thermal conductivity 0.14 cal./cm.²/cm./°C./sec.; crystal structure: a-nickel, hexagonal close-packed; β -nickel, face-centred cubic; symbol Ni.

The name N. is derived from the term 'kupfer-nickel' applied derisively by the old Westphalian miners to an ore resembling copper, actually N. arsenide, from

which no copper could be extracted and was therefore believed to be 'bedevilled.' In 1751 Cronstedt obtained impure malleable N. from this ore. The two most important sources are New Caledonia in the S. Pacific, and near Sudbury in Ontario. The New Caledonian ore is garnierite, $(\text{MgNi})\text{OSiO}_3 \cdot \text{H}_2\text{O}$, containing up to 35 per cent of N. but averaging about 6 to 7 per cent; 6000 short tons were produced in 1937. The Sudbury ore is pentlandite, $(\text{FeNi})\text{S}$ to $\text{NiS} \cdot 2\text{FeS}$, averaging 2 to 3 per cent; 102,000 short tons were produced in 1937. The method of extracting the N. from the ore depends upon the type of ore. The Sudbury ore, being associated with copper, is smelted to a copper-N. matte from which the N. is extracted by the Orford 'tops and bottoms' process of the International Nickel Company and may be refined by the Mond carbonyl process or by electro-deposition. The New Caledonian ore is simpler to deal with since no separation from copper is necessary, but iron has to be removed by conversion before the matte is roasted to oxide which is reduced to metal by coal.

Details of the processes are as follows: The Canadian ore analyses at copper, 1-2 per cent; nickel, 2-4 per cent; iron, 40 per cent; silicon, 25 per cent; sulphur, 20 per cent; alumina, etc., 10 per cent. The stages of extraction are: (i) By differential froth flotation it is possible to obtain two concentrates. The first to rise to the surface is mainly copper and is treated for extraction of this. After adjustment of the conditions most of the N. plus the remaining copper comes up. (ii) The copper-N. concentrate is roasted in a multi-hearth MacDougall furnace, the reaction being self-supporting, which reduces the sulphur content from 28 per cent to 16 per cent. (iii.) Smelting in a reverberatory furnace follows; the product is copper-N.-iron matte, containing 25 per cent N., on which the gangue floats and can be tapped off. (iv.) The matte is converted to oxide the iron and flux it off as a ferro-silicate slag. The blow is not continued any longer than is required to remove the iron, because over-conversion would oxidise the N. sulphide to oxide which would be lost in the slag. The resulting matte, containing 80 per cent N., together with copper, is the raw material of the Orford process, which is based on the fact that if mixed copper and N. sulphides are fused with sodium sulphide the mass separates, on solidification, into two layers, the 'bottoms' being mainly N. sulphide and the 'tops' a mixture of sodium and copper sulphides. The reaction takes place in a blast furnace in the presence of coke, the product being allowed to separate in 6-ton pots. The 'bottoms' are ground, washed, and sintered to oxide: $2\text{NiS} + 3\text{O}_2 \rightarrow 2\text{NiO} + 2\text{SO}_2$. The oxide is reduced to metallic N. by coal in a reverberatory furnace: $2\text{NiO} + \text{C} \rightarrow 2\text{Ni} + \text{CO}_2$. In the Mond refining process, originated by Mond, Lager, and Herz, and used by the International Nickel Company near Swansea, the Orford 'bottoms' are crushed, ground, washed,

and roasted at 700° C. to produce N. oxide. This is reduced to metal by heating it at 350-400° C. in an atmosphere of water-gas; 97 per cent of the reduction is done by the hydrogen and only 3 per cent by the carbon monoxide: $\text{NiO} + \text{H}_2 \rightarrow \text{Ni} + \text{H}_2\text{O}$. Next carbon monoxide is passed over the N. and forms volatile N. carbonyl: $\text{Ni} + 4\text{CO} \rightarrow \text{Ni}(\text{CO})_4$. The temp. is 60° C., maintained by the exothermic nature of the reaction. Finally the carbonyl is decomposed by passing it over N. pellets at 180° C., the newly formed N. deposits on the pellets releasing carbon monoxide for further use. The product of the Orford process may also be purified by electrolysis a N. sulphate solution containing also sodium sulphate and boric acid. The copper which goes into solution from the impure N. anodes is kept from the cathodes by placing the latter in a canvas compartment and maintaining a head of copper-free solution round them. The copper-contaminated solution is pumped into a separate tank where copper and iron are precipitated and removed before the solution is recirculated to the cathode compartment.

The New Caledonian garnierite is first smelted with gypsum and coke in a blast furnace, the product being a N.-iron matte containing 30-45 per cent of N. as sulphide. This is treated in a Bessemer converter in which the iron is removed as a silicate slag and the sulphur partially oxidised away. The N. sulphide is roasted to oxide, which in turn is reduced to metal by mixing it with coal and heating in either retorts or reverberatory furnaces.

Pure N. is used as a catalyst, for plating, and for some laboratory apparatus such as crucibles, spatulas, etc., where its resistance to oxidation is useful. N. is ferro-magnetic at room temp. but becomes non-magnetic when heated above 365° C. When N. is alloyed with iron the magnetic change temp. of the resulting solid solution decreases as the percentage of N. increases until at about 30 per cent N. the alloy is non-magnetic at room temp. With further addition of N. the magnetic permeability increases again and reaches a peak at about 78 per cent of N. The alloy of this composition is called permalloy. A similar alloy is mu-metal: 74 per cent nickel, 20 per cent iron, 5.3 per cent copper, 0.7 per cent manganese. Both are used where high permeability at low field strength is required. The addition of N. to iron also gives rise to a reduction of thermal expansion until at 36 per cent N. the alloy Invar is produced which has zero coefficient of expansion. The alloy of 80 per cent N. with 20 per cent chromium is widely used as electrical resistance heating elements in furnaces because of its resistance to scaling at temps. up to 1000° C. A development of this basic composition is nimonic, a standard alloy for the blades and other high temp. parts of the gas turbine where creep resistance at high temps. is required.

All alloys of N. with copper are of the solid solution type, hence they are all

particularly amenable to cold-rolling, drawing, forging, etc. Examples include Monel metal, 70 per cent N., 30 per cent copper, with small amounts of iron and manganese, noted for its high resistance to many corrosive agencies; 80/20 cupro-N. is extensively used for marine condensers because of its freedom from corrosion and season cracking. The term 'N. silver' applies to a wide range of alloys which contain no silver whatever; they are essentially 70/30 brass with the addition of up to 30 per cent of N. The higher the N. content the whiter the colour. The N. silvers also have good corrosion resistance and are used for spoons, forks, tureens, etc., generally in the electro-plated condition (E.P.N.S.). Alnico is an aluminium-cobalt-N. alloy developed to give the high B-H values required for permanent magnets. N. is also present in small percentages in many other alloys, e.g. up to 2 per cent in bronzes and aluminium alloys, and is a valuable constituent of many alloy steels.

Nickel Steels.—N., when added to a plain carbon steel in small percentages, dissolves in the ferrite which it stiffens and so increases the tensile strength of the steel at the rate of about 2 tons/in.² for every 1 per cent added, but there is hardly any loss of ductility, e.g. 3½ per cent N. in an annealed 0.30 per cent carbon steel increased the tensile strength from 30 tons/in.² to 40 tons/in.², with a slight improvement in ductility. Further additions of N., however, render the gamma-alpha change so sluggish that, depending upon the carbon content, some of the brittle constituent, martensite, begins to appear in the structure of even the annealed steel at about 8 per cent N. and the ductility falls off markedly. At about 15 per cent N. the ductility begins to improve again, accompanied by a fall in tensile strength, because the softer gamma constituent, austenite, begins to appear. At 30 per cent N. the transformation has become depressed to below room temp. and the alloy is wholly austenitic and non-magnetic. For ordinary structural purposes the N. content seldom exceeds 5 per cent because (a) N. is an expensive metal and the improvement in properties is more rapid for the first 5 per cent than for subsequent additions, and (b) steels containing much more than 5 per cent N. are more difficult to forge. The effect of N. on the properties is illustrated by the following figures:

measured by the Izod impact value, is also improved as shown in the above table. In another example a 3½ per cent N. steel and a carbon steel were both heat-treated to 50 tons/in.² tensile strength; the impact values were 58 and 45 foot-pounds respectively.

N. steels permit a much slower rate of cooling from hardening temp. without loss of hardness, and the depth to which the steel hardens is much greater than in carbon steels. For this reason oil may be used as the quenching medium and the risk of distortion of complicated structures is minimised. At the same time, large bars 6 in. in diameter or more will attain almost the same hardness at the centre as at the outside, a condition impossible with a carbon steel. On account of the slow rate of grain growth of N. steels excessive grain size does not result from high forging and hardening temps. These properties are the result of the slow rate of diffusion of N. in the solid state and the consequent sluggishness of the steel transformations. The austenitic 30 per cent N. steels find application, with the addition of other alloys, where hot strength and resistance to high temp. scaling are important, e.g. gas and steam turbine blading and engine valves.

Nickel-chrome Steels.—The combination of N. and chromium together in structural steels offers advantages which cannot be obtained with equivalent amounts of either of these elements alone. A few of these advantages are higher elastic ratio, greater hardness and higher impact and fatigue resistance, and resistance to abrasion. Chromium inhibits the tendency of N. to graphitise the iron carbide, a function performed by manganese in N. steels, and therefore less manganese is used in N.-chrome steels. Chromium, like N., also suppresses the transformation temp. of the steel and therefore increases the deep-hardening and air-hardening properties. The latter is influenced by the N. content, e.g. a steel containing 1 per cent chromium and 3 per cent N. air-hardens markedly, while with the same amount of chromium and only 1.2 per cent of N. present air-hardening is not appreciable. A 4½ per cent N., 14-15 per cent chromium steel is fully air-hardening. A popular range of N.-chrome steels contains 0.25-0.4 per cent carbon, 1 per cent chromium, and 2.5-3.5 per cent N. By oil quenching

	Carbon per cent	Nickel per cent	Tensile strength tons/in. ²	Yield Point tons/in. ²	Elongation per cent	Reduction of area per cent	Izod Impact ft.-lb.
Carbon steel	0.31	nil	39	29	28	66	55
Nickel steel	0.31	3.25	53	43	22	66	61

(Both steels had been quenched and then tempered at 600° C.)

In addition to the enhanced combination of strength and ductility which up to 5 per cent of N. confers upon steel, another property, resistance to shock as

and tempering at appropriate temps. a wide range of properties is possible. Despite the high tensile strength range of 50-65 tons/in.² the steels machine well

in the fully heat-treated condition and can therefore be put into service as connecting-rods, axles, gears, crankshafts, etc., without further heat-treatment. Stainless steel is an 18 per cent N., 8 per cent chromium steel which has very high resistance to corrosion. Being austenitic it cannot be hardened and tempered.

Nickel-chrome-molybdenum Steels.—N.-chrome steels suffer from temper brittleness if air-cooled from tempering. To avoid this oil-cooling is necessary. Alternatively the incorporation of small amounts of molybdenum achieves the same object; 0.25–0.30 per cent is usual.

Nickel Silver, see GERMAN SILVER.

Nicobar Islands, group of nineteen is. in the bay of Bengal, between 6° 45' and 9° 15' N. and 93° and 94° E., between Sumatra and the Andaman Is. and under the same prov. administration as the latter, as a prov. of India. The Dutch ceded the group to the Brit. in 1869. The is., of which only twelve are inhabited, have an aggregate area of about 635 sq. m. There are two groups, Great and Little Nicobar, and sev. others to the S., and Car Nicobar, Camorta, and the remainder to the N., separated by Sombrero Channel, 36 m. broad. Great Nicobar is the largest is., with an area of 333 sq. m., and Car Nicobar (49 sq. m.) is the most densely populated (4000). The best harbour is Nankauri, formed by Camorta and Nankauri. The coco-nut is the prin. tree grown, 3,000,000 nuts being produced annually; betel nuts are also found. The fauna of the is. includes monkeys, bats, flying-foxes, tree-shrews, many varieties of birds and reptiles, and also of butterflies and insects. The inhab. are a Far E. race and speak varieties of the Mon-Aunum group of languages; their appearance is somewhat repulsive, but the mental capacity of the best of them (natives of Car Nicobar) is considerable. The religion is a form of animism; there is a Church of England missionary station under the supervision of native Indians. The is. were occupied by Jap. forces from March 1942 until 1945. Pop. 11,000.

Nicodemus, Pharisee and member of the Sanhedrin, described as a 'man of authority among the Jews' (John iii.). Jesus, early in his teaching won his secret allegiance and held with him the memorable discourse on the new birth. Jesus styles him 'the teacher of Israel,' probably implying such a function as interpretation of the law. Cautious, even timid, N. sought Jesus by night to avoid critical eyes. Yet in the Sanhedrin, when his colleagues proposed to condemn Jesus unheard, N. had the courage to risk suspicion by contending for a fair and legal procedure. In the end he freely associated himself with Joseph of Arimathea in providing honourable burial for the Crucified in the rock-hewn garden-grave of Joseph.

Nicodemus, The Gospel of, Apocryphal writing which had much influence on the religious thought of medieval times, consisted of two distinct works. The first

contains an account of the trial of Christ before Pilate, a work which seems to have been extant separately under the title of *Acta Pilati*. It is for the most part a compilation of excerpts from the accounts of Christ's trial in the canonical gospels. This work exists in sev. forms, both in Gk. and Lat., in some of which Nicodemus writes the work in Heb.; in others he is represented as translating it into Gk. In style it appears to be the work of a Jew. The two Gk. forms seem to have emanated from a common source composed early in the second century. The second part, *Descensus ad Inferos*, is a much more rhetorical production. It purports to be by Simeon and his two sons, who had risen from the dead at Christ's resurrection. They describe what took place in Hades when Christ descended there. It was written, possibly, in the third century. The old legend according to which Joseph of Arimathea brought Christianity to Britain in the time of Vespasian, and on which Robert de Boron based his poem on the grail or cup of Christ's passion and the table of the Last Supper, is in some way connected with the anct. popular G. of N.

Nicol, Erskine (1825–1904), Scottish painter, was b. at Leith. He lived in Ireland from 1845 to 1849, and returning to Edinburgh was elected a member of the Scottish Academy. In 1862 he settled in London. His paintings, the best of which are scenes of Irish life and customs, include 'Among the Old Masters,' 'Both Puzzled,' 'Paying the Rent,' 'The Trio,' and 'Interviewing the Member.'

Nicolai, Carl Otto Ehrenfried (1810–49), Ger. musician and operatic composer, was b. at Königsberg. From 1841 to 1847 he was first kapellmeister of the Court Opera at Vienna, and was the founder of the Philharmonic concerts there. He produced sev. operas, all successful, the best known of which are *Il Templario* (1840) and *The Merry Wives of Windsor* (1849). See life by G. R. Kruser, 1911.

Nicolai, Christoph Friedrich (1733–1811), Ger. author and publisher, b. in Berlin. In his youth he was a friend of Lessing and Moses Mendelssohn, and in conjunction with the former he estab. the famous *Briefe, die neueste Literatur betreffend* (1759–65). Gradually he began to attack the romantic movement and critical school, and foolishly misrepresented the new movement of ideas represented by such great thinkers as Goethe, Schiller, Kant, and Herder. His works include *Description of a Trip through Germany and Switzerland* (1783); *Anecdotes of Frederick II.* (1788–92); and a rationalistic novel, entitled *Sebalus Nothander* (1773–76). See lives by R. Amer, 1912, and F. C. A. Phillips, 1926.

Nicolaitans, heretical sect of the Christian Church, fl. in the second century. Their cult of libertinism was probably evolved from pagan rites and a rejection of the rules of Deuteronomy xlii. There are links with the doctrines of Balaam (Rev. ii. 14; Jude: 2 Peter, i.).

Nicolas, Saint, see NICOLAS.

Nicolas, Sir Nicholas Harris (1799–

1848), Eng. antiquary and biographical writer, b. at Dartmouth, Devon (though his family, originally Breton, had been settled in Looe, Cornwall, since 1685). In 1823 he pub. his *Index to the Herald's Visitations in the British Museum*. Among the most important of his works are *Notitia Historica* (1824); *Despatches and Letters of Lord Nelson* (1884-88); *Life of Chaucer: History of the Battle of Agincourt* (1827); and an unfinished *History of the Royal Navy* (1847).

Nicole, Pierre (1825-95), Fr. theologian and philosopher, was b. at Chartres. His most important work is a collection of treatises called *Moral Essays and Theological Instructions* (1671-78). He also wrote a *Treatise on Human Faith*, and *The Perpetuity of Faith in the Catholic Church concerning the Eucharist* (1669-74), the last in conjunction with Arnauld. Together with Arnauld, Le Maistre, Lancelot, and others of the most distinguished scholars of the age, N. was a permanent inmate of the community of Port Royal, best known for its adhesion to the Jansenist movement.

Nicolet, tn. of Quebec, Canada, in the co. of N., 20 m. N.E. of Montreal. Pop. about 4000.

Nicoll, Aliardye (b. 1894), Eng. literary historian and biographer, b. at Glasgow and educated at Glasgow Univ. Before the Second World War, N. was prof. of drama and head of the dept. of drama at Yale Univ., U.S.A., and later became prof. of Eng. at Birmingham Univ. His most detailed work has been done on drama and the theatre, and he has spent sev. years in compiling a study, in seven vols., of Eng. drama from 1660 to 1900. He has also pub. *Masks, Mimes, and Miracles* (1931), on popular drama, *The Development of the Theatre* (1948); and *World Drama* (1949); as well as biographies of Wm. Blake (1922), John Dryden (1923), and other poets.

Nicoll, Robert (1814-37), Scottish poet, b. at Auchtermargan, Perthshire. His first poems were printed in 1835. He ed. the *Leeds Times*, from 1836, successfully, but is chiefly remembered as a Scottish minstrel. Had his life not been cut short, N. would probably have attained great distinction. See life by F. R. Drummond, 1884.

Nicoll, Sir William Robertson (1851-1923), Scottish author and critic, was b. at Lumsden, Aberdeenshire. He was Free Church minister of Dufftown, 1874-77, and later of Kelso. He then came to London and ed. the *Expositor* and *British Weekly*, together with the *Bookman*, estab. by him in 1891. He was editor of the *British Weekly* for the rest of his life. His pubs. include *Songs of Rest* (1879); *Life of James Macdonnell* (1890); *Anecdotes of the Nineteenth Century* (1895-96); *The Expositor's Dictionary of Texts* (1897); *Letters on Life* (1901); *The Church's One Foundation* (1901); a life of 'Ian Maclaren' (1908); and *Professor Elmalie* (1911). He also ed. the complete works of Emily Brontë (1910).

Nicoll, Charles Louis Henry (1866-1936), bacteriologist, b. at Rouen. App-

ointed director of the Pasteur Institute at Tunis, he studied N. African infectious diseases, discovering the transmission of the typhus bacillus by lice. In 1928 he received the Nobel prize for medicine. In 1932 he became prof. at the Collège de France in Paris.

Nicolson, Harold (b. 1886), Eng. diplomat, historian, and biographer, b. at Teberan, where his father, who later became Baron Carnock, permanent under-secretary at the Foreign Office, was minister. Educated at Wellington and Balliol College, Oxford, N. entered the Foreign Office in 1909 and served in the embassies at Madrid and Constantinople. He married in 1913 Victoria Sackville-West (q.v.). He was a member of the Brit. delegation to Versailles in 1919, and was lent to the League of Nations staff from 1919 to 1920. He accompanied Lord Curzon to Lausanne, and subsequently became conseller to the legation at Toheran until his transfer to Berlin in 1927. In 1929 he retired from the diplomatic service to devote himself to politics. He was one of the early members of Sir O. Mosley's New party (q.v.) in 1931, but left the party when its Fascist tendencies became more overt. At the general election of 1935 he was returned as National Labour member for W. Leicester, and became a junior minister in the Churchill Gov. of 1940. He joined the Labour party in 1947 and stood unsuccessfully for N. Croydon in the by-election in that year. He was entrusted with the official biography of George V. N.'s political career is of much less importance than his writings, and it is by these that he will be remembered. His wide culture and sympathy has enabled him to present a diverse selection of subjects, enlightened by a capacity for sharp impressions and built by strong powers of construction. His pubs. include (novels) *Some People* (1927); *Sweet Waters* (1932); *Public Faces* (1932); *The Desire to Please* (1933); (biographies) *Paul Verlaine* (1921); *Tennyson* (1923); *Byron: the Last Journey, 1823-24* (1924); *Swinburne* (1926); *Lord Carnock* (1930); *Curzon: the Last Phase* (1934); *Dwight Morrow* (1935); *Benjamin Constant* (1949); (hist.) *Peacemaking* (1933); *The Congress of Vienna* (1946); (essays) *Small Talk* (1937); *Marginal Comment* (1939); *Comments 1944-48* (1948). The last three are collected contributions to the *Spectator*.

Nicolson, William (1685-1727), Eng. prelate and antiquary, was b. in Cumberland. He occupied the sees of Carlisle and Derry, and finally rose to be archbishop of Cashel in Ireland. His prin. work was the 'Historical Library', consisting of Eng., Scottish,* and Irish sections. He also contributed a *Glossarium Northern-hymbricum* to Ray's *Collection of English Words*.

Nicol's Prism, see POLARISATION OF LIGHT.

Nicomachus (fl. c. 400 B.C.), Gk. physician of Macedonia, was the father of Aristotle. He was patronised by Amyntas II., king of Macedonia.

Nicomachus of Thebes (fl. c. 400 B.C.), celebrated Gk. painter, son of Aristodemus (q.v.), whose pupil he became. He is one of the most remarkable of the painters of antiquity. His skill is praised by Cicero, and he was renowned for his rapidity of execution. Among his prin. works were 'Apollo and Diana,' 'The Rape of Proserpine,' and 'The Tyndaridae.'

Nicomedes, name of three kings of Bithynia: **Nicomedes I.** began to reign in 278 B.C., and founded the great city of Nicomedia. He d. c. 250 B.C. **Nicomedes II.** was sent by his father, Prusias II., as a hostage to Rome, where he found favour with the Rom. senate, and later dethroned and killed his father, and

an altitude of nearly 3000 ft., and possesses a fine Norman cathedral and sev. churches. The tn. is full of crusaders' tombs, many of them with Eng. names upon them. In the Second World War sev. churches were damaged, including the Carmine, S. Michele, S. Salvatore, and S. Vincenzo, but repairs were soon effected. Salt is mined and near by are sulphur springs. Pop. 15,960.

Nicosia (or **Lefkosia**), cap. of the is. of Cyprus and a Gk. Orthodox archbishopric, lies near the centre of the great plain of the Mesaoria, on the r. b. of the R. Pedias, 25 m. from its port, Larnaca. The tn. presents a quaint, old-world aspect and has interesting memorials of

A.A.A.

NICOSIA AND THE MESAORIA PLAIN

became an ally of the Roms. He d. about 90 B.C. **Nicomedes III.**, son of the preceding, succeeded his father. He also was an ally of Rome, but was defeated and driven from his kingdom, which was, however, subsequently restored to him. He d. in 74 B.C., leaving no issue, and Bithynia passed to the Roms.

Nicomedia (modern Ismid), anct. city of Bithynia, Asia Minor, at the N.E. corner of the gulf of that name, an arm of the sea of Marmora. It was the seat of the Bithynian kings, and the abode of Hannibal, Diocletian, Constantine, and Arrian the historian. See further under ISMID.

Nicopolis (Bulgaria), see NIKOPOLI.

Nicopolis (Gk., city of victory), anct. city of Epirus, Greece. It was situated on the gulf of Arta, and was founded by Octavian to commemorate his victory at Actium in 31 B.C. Many Rom. antiquities are to be seen on the site.

Nicosia, tn. of Sicily, in the prov. of Catania, 14 m. N.E. of Castrogiovanni. The surrounding dist. is fertile. N. has

its former Venetian rule in the shape of its anct. cathedral and bastion walls. Textile goods and leather are the prin. manufs. It is the seat of the Brit. governor. Pop. 35,000 (mostly Turks).

N. does not appear as the cap. until the Lusignan dynasty but the great number of anct. tombs going back to 3,000 B.C. indicates that this was the site of a city from remote times. It is suggested that the site of the present tn. may have been the city of Ledra, founded by Lefcon, son of Ptolemy Soter (280 B.C.). The earliest mention of N. (as Cossia) is that made by Willbrand, count of Oldenburg, in 1211 (see Cobham, *Excerpta Cypria*, 1908). Dante, in *Paradiso*, refers to its luxurious life under its king, Henry II., and it was here that St. Louis of France estab. himself with that monarch when on his way to the fourth crusade. The period of luxury ended in the early fifteenth century when the Mamelukes landed in the is. and marched on N., which they pillaged in 1426. At the end of the fifteenth century N. had 250 churches and 50,000

inhab., chiefly Its., Fr., Gks., and various peoples of the middle E. countries and Ethiopia, and the circuit of the city extended for 7 m. The Venetians, who were then in military occupation, began to fortify the is. against an expected Turkish assault (1567). In fortifying the city they destroyed everything outside their new circumvallation, including the monastery and royal castle of St. Domenico. In 1570 the long-expected siege of N. was launched by Mustapha Pasha, whose army spent two months in reducing the place. It is said that 20,000 Christians were slain in the street fighting which followed the fall. The 300 years of Turkish occupation were, generally, uneventful.

In 1741 N. was damaged by an earthquake and a minaret of S. Sofia Cathedral fell to the ground. In 1878 the Brit. Admiralty ordered Vice-Adm. Lord John Hay, then off Crete, to take over Cyprus and to raise the Eng. flag over N. These instructions were carried out. The Paphos Gate, known in the Middle Ages as the Porta Domenico, was closed by the Eng., when they made a new entrance through the city walls. The ant. Franciscan church was destroyed in the great siege, but a new church, the Rom. Catholic church of St. Cross, took its place. The Armenian church of the Blessed Virgin Mary was formerly the Benedictine abbey of our Lady of Tyre. During the siege of 1570 the Armenians, out of hatred for the Lats., helped the Turks and received this church as a reward. Near the law courts and in the centre of the Konak Square is the Venetian column, the symbol of Venetian domination erected in the various colonies held by the republic, and which was once crowned by the Lion of St. Mark. It was taken down by the Turks but restored to its present position in 1917. It is a monolith of grey granite and probably came from a temple of Salamis. The Kyrenia Gate, also erected by the Venetians, has in recent years been isolated and new entrances cut in the walls on each side of it. St. Sofia, once the cathedral and now the prin. mosque of N., stands in the centre of N. and its twin minarets are a prominent landmark. It is built after the plan of a Fr. cathedral of the thirteenth century and its chief feature is the parvis, with its three splendidly decorated doorways comparable with any in Europe. Opposite the E. door of the cathedral is the Turkish library founded by Sultan Mahmud last century. Another notable building is the Bedestan, which has been erroneously supposed to be the church of St. Nicholas founded in memory of Thomas a Becket, and which was, prior to 1570, the Orthodox metropolis of the Venetian period in N. St. Catherine, now known as Hajdar Pasha, after the cathedral, the most important Gothic building remaining in N., was erected towards the end of the fourteenth century. The Augustus Gate was the chief gate of the city, and is the prin. monument of the Venetian era in N. It

is built as a copy of the Lazaretto Gate at Candia. Its central dome is reminiscent of the Pantheon in Rome. The Orthodox bishopric, or church of St. John, is probably built on the same site as the old abbey of St. John the Evangelist, which belonged to the Benedictines. For other monuments see Sir R. Storrs and B. J. O'Brien, *Handbook of Cyprus*, 1930; R. Gunnis, *Historic Cyprus*, 1936. During the riots of 1931, which were fomented by agitators for union with Greece (*enosis*), Gov. House was burned down (see under CYPRUS).

Nicot, Jean, Sieur de Villemain (1530-1600), Fr. diplomatist and philologist, was b. at Nîmes. In 1560, during the reign of Henry II., he was sent as ambas. to Lisbon. On his return from Portugal he introduced the tobacco plant into France (hence the name nicotine). N. was the author of *Historia Francorum* and *Le Trésor de la langue française*.

Nicotera, Giovanni, Baron (1828-94), It. statesman, was b. at San Biagio, Calabria. For his part in revolutionary movements he was condemned to the gallows. He was, however, set free in 1860 by the revolutionists and joined Garibaldi. Seven years later he commanded an expedition against Rome. In the Parliament of the new kingdom of Italy he took a foremost part, and was a consistent supporter of Victor Emmanuel. He was minister of the interior in the first Crispi cabinet, under Depretis (1876-77), and again in 1891-92, under Rudini.

Nicotiana, genus of plants (family Solanaceae), a number of which are grown in the garden as half-hardy anns. *N. alba*, the sweet-scented tobacco plant, bears panicles of white funnel and star-shaped flowers. *N. Tobacum* is the tobacco plant of commerce.

Nicotianin, volatile oil to which tobacco owes its flavour. It contains four alkaloids: nicotine, nicotimine, nicotine, and nicotelline.

Nicotine ($C_{10}H_{14}N_2$), alkaloid found in the leaves of the tobacco plant in the form of the malate and citrate. It may be prepared by extracting the oil from the leaves with boiling water, mixing it with milk of lime, and distilling; the distillate is treated with oxalic acid, concentrated, treated with potash, and the N. extracted with ether. N. is a colourless oil, but rapidly turns brown on exposure to air. It boils at 246-273° C. and readily dissolves in water and alcohol. It has a pungent odour, similar to that of a foul tobacco pipe. N. is exceedingly poisonous, a few drops in the stomach being sufficient to cause death, while a grain has been known to cause symptoms of poisoning. N. is used as an insecticide in greenhouses, etc. It was synthesised in 1904.

Nicotinamide. See NICOTINIC ACID. **Nicotinic Acid and Nicotinamide**. N. A., oxidation product of nicotine, is the β monocarboxylic acid of pyridine (C_6H_4N) and has the formula NC_6H_4COOH . It is one of the vitamins of the B₃ complex. It occurs in liver, yeast, wheat, rice, etc.,

and is said to be so stable that it has been detected in barley taken from the tomb of Tutankh-Amen (1350 B.C.). Shortage of N. A. in the diet is responsible for the skin disease of pellagra (*q.v.*), which is common in peoples living chiefly on maize. Nicotinamide ($\text{NC}_5\text{H}_4\text{CO}\cdot\text{NH}_2$) is the acid amide of N. A. and has similar physiological properties to the acid itself. Diethylnicotinamide ($\text{NC}_5\text{H}_4\text{CO}\cdot\text{N}(\text{C}_2\text{H}_5)_2$) is used in medicine (under the trade name of 'Coramine') for its action on the medulla of the brain, where by stimulating the respiratory centre it accelerates breathing and by its action on the vaso-motor centre it raises the blood pressure; hence it is useful in reviving people who have collapsed, *e.g.* on the operating table.

Nichteroy, or **Niteroi**, residential quarter of Buenos Aires, standing on the opposite shore of the harbour, with which it is connected by ferries. It has fine, prov. gov. buildings and handsome private houses. Many Brit. and Amer. families live here. When the port installations are completed N. will become a port of call for transatlantic shipping. Pop. 162,600.

Nidaros, see **TRONDHEIM**.

Nidderdale, picturesque vale of Yorkshire, situated in the W. fidding, traversed by the Nidd, which issues from the base of Wharfedale, and after a generally S.E. course empties into the Ouse near York. Water is supplied to Bradford from a dam above Pateley Bridge.

Nidwalden, see **UNTERWALDEN**.

Niebuhr, Bartold Georg (1776-1831), Ger. statesman and historian, was b. at Copenhagen, son of the traveller, Carsten N. (*q.v.*). In 1810 he became royal historiographer and prof. at Berlin, and by a course of lectures on Rom. hist. estab. his position as one of the most original and philosophical of modern historians. In 1816 he went to Rome as Prussian ambas., and during his residence there discovered and pub. fragments of Cicero and Livy, and contributed to the great work on the topography of auct. Rome by C. C. von Bunsen and E. Platner (1773-1855). He resigned the embassy in 1823 and settled at Bonn, where he spent practically the whole of the remainder of his life. Here he re-wrote and pub. the first two vols. of his *Roman History* (first pub. 1811-12) and delivered lectures on the Fr. revolution, geography, ethnography, and auct. hist. The first two vols. were trans. (1828) by J. C. Hare and C. Thirwall, and the third (bringing the narrative down to the end of the first Punic war) by Smith and L. Schmitz.

See D. Hensler, *Lebensnachrichten*, 1838-1839; and lives by J. Chasen, 1876; Eisenhart, 1886; and F. Schnabel, 1931.

Niebuhr, Carsten (1733-1815), Ger. traveller and author, was b. at Luddingworth, Hanover. In 1761 he joined an expedition sent out by the king of Denmark for the scientific exploration of Egypt, Arabia, and Syria. He returned in 1767 as the sole survivor. In 1778 he accepted a position in the civil service of Holstein and went to live at Meldorf.

The result of his travels appeared in his *Beschreibung von Arabien* (1772), followed by *Reisebeschreibung von Arabien und andern umliegenden Ländern* (1774-78), and *Reisen durch Syrien und Palästina* (1837). See life by his son, B. G. Niebuhr, 1817 (Eng. trans., 1828, by Mrs. Austin, in the *Lives of Eminent Men* series).

Niebuhr, Reinhold (b. 1892), Amer. protestant theologian, b. at Wright city, Missouri. Prof. for applied Christianity (Christian ethics) at the Union Theological Seminary, New York. He expounds a biblical theology, orientated to the present day, which has found some acceptance outside the U.S.A. See E. L. Allen, *Christianity and Society: an Introduction to the Thought of Reinhold Niebuhr*, 1949.

Nieder Hermsdorf, see **HERMSDORF**.

Niedersachsen, see **SAXONY, LOWER**.

Niederwald, int. ridge in Wiesbaden, Hesse, Germany, crowned by the Ger. national monument erected in 1883 in commemoration of the estab. of the empire in 1871. It is on the r. b. of the Rhine, opposite Bingen, between Rudesheim and Assmannshausen, and has an elevation of about 1150 ft. above sea level, 900 ft. above the Rhine. The summit is approached by a cog-wheel railway.

Niegos, Petrovic, see **DANILO I.**

Niel, Adolphe (1802-69), Fr. marshal, was b. at Muret, Haute-Garonne, France. He served in Africa, and distinguished himself at the capture of Constantine in 1837. In 1849 he was engaged in the siege of Rome, and took the Malakoff redoubt near Sebastopol in 1855; three years later he pub. *Le Siège de Sébastopol*. He again distinguished himself in the battle of Solferino, 1859, when Napoleon III. made him marshal. N. was appointed minister of war in 1867.

Niel, Belgian tn. on the R. Rupel, 9 m. S.W. by S. of Antwerp. There are brick-kilns and manufs. of pantiles, floor-tiles, cement and pottery. There are also small shipyards. Pop. 10,800.

Niello (It. form of Lat. *nigellum*, diminutive of *niger*, black), name of the method of ornamenting a polished metal surface by filling in incised lines with a black metallic amalgam, which has been practised from very early times up to the present day. The amalgam is made up of silver, copper, and lead, heated and then poured into flowers of sulphur. The earliest specimens of N. date from Rom. times. The use of N. has also been revived by a few Eng. craftsmen. The invention of printing from engravings on metal plates was undoubtedly suggested in great measure by N. See A. M. Hind, *Niello, chiefly Italian of the fifteenth century*, in the *British Museum*, 1936.

Nielsen, Carl August (1865-1931), Dan conductor, composer, and musicologist, b. Nørre-Lyndelse. Being poor as a youth, he joined a military band at the age of fourteen, but at eighteen succeeded in entering the Copenhagen conservatory as a pupil of Gade. In 1891 he entered

the royal orchestra and was its conductor in 1908-14. He also became conductor of the Musical Society and director of the conservatory. With an independent style and a strong sense of counterpoint and melody, N. is one of the most important of Scandinavian composers. Works include (operas) *Saul og David* (1903); *Maskarade* (after Holberg) (1907); and others; incidental music for Oehlenschläger's *Aladdin*; six symphonies (II. *The Four Temperaments*, III. *Esplanade*, VI. *Sinfonia semplice*), *Saga-Dream* for orchestra; violin and piano-forte sonata, etc.

Niernbsch (or Niernsch), Nikolaus von Strehlenau, see LENAU, NIKOLAUS.

Niemcewicz, Julian Ursin (1757-1841), Polish scholar and statesman, was b. in Lithuania. He served for a short time in the army and became acquainted with Kosciuszko, with whom he was taken prisoner at the battle of Maciejowice in 1794, and was secretary of state and president of the Constitutional Committee in Poland after the Congress of Vienna. Of his works the *Historical Ballads* (1816) are the most popular, but he also wrote *The Return of the Deputy*, a comedy; *John of Tenczyn*, a novel in the style of Scott; and a *History of the Reign of Sigismund III.* (3 vols.) (1819). See life by A. Czartoryski 1860.

Niemen River (Russia), see MEMEL.

Niemöller, Martin (b. 1892), Ger. pastor of the Protestant Evangelical Church and theologian, b. at Lippstadt, Westphalia. Served in the First World War as a naval lieutenant and U-boat commander. Ordained in 1924, N. became pastor of the wealthy Berlin-Dahlem par. (1931-37). A strong supporter of nationalism and opponent of communism, he welcomed National Socialism (q.v.) and joined the Nazi party, but in 1933 he led a campaign against the state totalitarian control of the Lutheran Church and became thereafter an opponent of the Nazi regime. When the Nazis caused a schism in the Church, setting up the 'Ger. Christians' with a Nazi-inspired programme, thereby virtually establishing the supremacy of the State and its teaching over the Church and its fundamental principles. (Including the adoption of the Aryan paragraph (see ARYAN), N. assumed the leadership of the Confessional Church Bekenntniskirche), which remained true to Evangelical principles. He also founded the Pastor's Emergency League (Pfarrernotbund) to defend the Lutheran faith, and helped to draw up the 'six principles' of the Confessional Church at the synod of Barmen (1934). At the beginning the League had 7000 members, but Nazi persecution reduced its numbers, and in 1938 only 1000 persons were left to reject the oath of allegiance to Hitler. N. preached courageously against Nazi domination of the Church and other policies, and his services had crowded congregations. On July 1, 1937, he was put into the Sachsenhausen concentration camp, but refused to recant or accept release on the condition that he would undertake not to preach any more. In a

secret trial in 1938 before a 'people's court' he was sentenced to seven months' 'fortress' imprisonment (a sort of honourable prison for officers), but after eight months he was released, only to be re-arrested by the Gestapo and kept in further 'protective custody.' There he remained throughout the Second World War. In 1946 he proclaimed Germany's war-guilt at the International Missionary Council in Geneva and in 1947 was elected the first bishop of the reformed Evangelical Church of Hesse-Nassau. His works include *Vom U-Boot zur Kanzel* (1934); and *Dass wir an ihm bleiben* (1935). See H. M. Stükelburger, *Der Kampf der Bekenntniskirche*, 1945.

Niernsch von Strehlenau, Nikolaus, see LENAU.

Niepsce, Joseph Nicéphore (1765-1833). Fr. physicist and an inventor of photography, was b. at Châlon-sur-Saône. From 1795 to 1801 he was administrator of Nice, when he returned to his native place and directed his energies to chemical research with his brother Claude (1763-1828). In 1811 he turned his attention to lithography, in 1827 produced a photograph on a metal plate; in 1829 he joined Daguerre in his work, and after years of experimenting together they discovered the process of chemically amplifying the photographic image.

Nierembergia (named after J. E. Nieremberg), genus of the family Solanaceae, allied to *Petunia*. There are twenty species native to tropical America, perennial herbs and shrubs, frequently cultivated. They are propagated from cuttings, or by sowing seed in a hotbed during spring and transplanting in May.

Nierstein, vil. of Hesse, Germany, on the Rhine, 8 m. S. of Mainz. Is specially noted for the Niersteiner wines and near by is a sulphur spring. Pop. 4800.

Nietzsche, Friedrich Wilhelm (1844-1900), Ger. philosopher of aristocratic Polish extraction, was b. at Röcken, near Lützen, his father being a clergyman. After a brilliant univ. career at Bonn and Leipzig he was appointed, at the age of twenty-four, prof. of Gk. at Basle. This post he resigned in 1879 owing to ill-health, retiring on a pension of £120. In 1889 he went mad, and, after remaining so for eleven years, he d. at his sister's house in Weimar. To these few biographical details must be added (for it is the key to much in his philosophy) the fact that his life was one long struggle against sickness, neuralgia and insomnia being its prin. manifestations.

N.'s philosophy can be expressed in a few words. He regarded humanity as being composed of two types fundamentally different from each other; the weak and the strong, the slavish and the masterful, the mob and the aristocratic few. In the struggle between these two types each would naturally seek to impose its morality on the other and to depreciate those qualities in its opponent that are dangerous to it. Thus the weak commend the qualities of meekness and compassion, extol poverty and renunciation. Because Christianity (which, as N. significantly

points out, arose among the slave pop. of Rome) extolled this slave morality, he was opposed to it and proclaimed himself Antichrist. He would revalue all values in the light of the morality of the strong. And for mankind he held up the ideal of surpassing itself, the need for creating a higher, stronger, and more dominant race, the Superman. These ideals are set forth with much powerful eloquence in his many books, but chiefly in the lyrical and epigrammatic *Thus Spake Zarathustra*.

F.N.A.

F. W. NIETZSCHE

A complete ed. of N.'s works in Eng. (18 vols.) has been ed. by Dr. Oscar Levy (1909-12). See lives by his sister, E. Förster-Nietzsche, 1895; H. Albert, 1903; D. Halévy, 1909, and 1911; R. Richter, 1922, and G. B. Foster, 1931; also studies by F. C. Schiller, 1913; H. L. Mencken, 1913; G. Brandes, 1914; G. Abraham, 1930; J. Lavrin, 1948; H. A. Reyburn, 1948; and H. Mann (now ed.), 1948. See also O. Levy (ed.), *Thoughts out of Season*, 1909; A. R. Orage, *Nietzsche in Outline and Aphorism*; E. Bentley, *The Cull of the Superman*, 1947.

Nieburg: 1. Tn. of Lower Saxony, Germany, on the Weser, 30 m. N.W. of Hanover. Pop. 11,100. 2. Tn. in Saxony-Anhalt, Germany, on the Saale, 20 m. from Magdeburg. Pop. 6000.

Nieuwland, Pieter (1764-94), Dutch poet and mathematician, b. near Amsterdam. He became prof. of mathematical and physical science at Leyden. His *Poésies hollandaises* (1788) contain some fine pieces, among which may be mentioned the poem *Orion* and the elegy on

the death of his wife. His scientific works include *Almanach nautique*, with Van Swinden; *Dissertations sur la construction des océants de Hadley* (1789); *Discours sur les moyens d'accélérer l'art nautique* (1789); and *L'Art de la navigation* (1793).

Nieuwpoort (Fr. *Nieuport*), city in the prov. of W. Flanders, Belgium, 21 m. W.S.W. of Bruges. It stands on the R. Yser (q.v.) about 2 m. S. of its mouth and is the junction of sev. canals. It is one of the less important Belgian seaports, but has a fishing fleet. By opening the sea-locks in Oct. 1914, thus inundating the lower polders as far as Dixmude, the Ger. advance could be stopped at the Yser. During the war the city was completely destroyed and its interesting buildings, the cloth hall, the belfry, and the Gothic church, were lost. Rebuilt, the city suffered again very much in the Second World War. It is engaged in fishing, and there are oyster parks, salt works, and manufs. of ropes, sail, and nets. It has sev. war memorials. Pop. 5100. See C. Wybo, *Nieuport ancien et moderne*, 1904, and C. Loppens, *Nieuport, notices historiques*, 1935.

Névis, see **NEVIS**.

Nièvre, dept. of Central France, formed mainly out of the old prov. of Nivernais with a part of Orléanais. It is divided into four arrons., Nevers, Châteauneuf, Clamecy, and Cosne. It belongs to the basins of the Loire and Seine, and has an area of 2658 sq. m. The surface is rugged in the E., comprising part of the granitic mts. of the Morvan, of which the highest point within the dept. is Préneley (2790 ft.), but in the W., where the calcareous formations predominate, the highest point is 1400 ft. Forests cover large areas, but much land is given over to pasture and the cultivation of forage, the fattening of cattle and the rearing of sheep and horses being important agric. industries. The chief cereals are oats and wheat, but potatoes are largely cultivated. Vines are grown in the valley of the Loire and in the neighbourhood of Clamecy, the white wines of Pouilly being famous. The prin. mineral is coal, which is found in the neighbourhood of Decize, and the chief manufs. are iron and steel at Guérigny, Fourchambault, and Imphy. The cap. is Nevers. Pop. 248,500.

Nieuwe Diep Harbour, see **HELDER**.

Niffer, see **NIRPUR**.

Nigdeh, or **Nigde**, tn. of Asiatic Turkey in Konla, 68 m. N.N.W. of Adana. Pop. 59,200. There is a villayet of the same name, pop. 251,800.

Niger, **Gaius Pescennius**, governor of Syria, was a Rom. of equestrian rank. He was chosen emperor by the troops in A.D. 193 on the death of Commodus; but, failing to march on Rome at once, was intercepted by Severus, a rival claimant. Three battles were fought, resulting in the defeat of Pescennius, who died towards the Euphrates. He was captured and put to death, A.D. 194.

Niger, or **Quorra** (Kwara, Kowara, etc.) (the name is not derived from the Lat. adjective for 'black,' but from a Libyan

and Sudanese root, meaning 'water' or 'river.' The word was used by Ptolemy in the Gk. form of *Nyep* and is used today by Lake Chad tribes in the form *njer*. See also NIGERIA, important river system of W. Equatorial Africa, ranking next in size to the Congo and the Nile. It rises in the country of the Mandingos, about 150 m. from the coast, and flows N. and N.E. towards the Sahara, then S.E. and S., finally entering the gulf of Benin in the gulf of Guinea by an enormous delta (14,000 sq. m. in area), which extends nearly 150 m. inland. Its chief stream, the Tembi, is joined by the Tamincono and the Falico, all rising in the mountainous region of N.E. Sierra Leone. Lower down, at its confluence with the Tankisso, it is called the Babaa or Joliba. At Bammaku in Bambarra it becomes navigable for steamers, and after passing Sansanding it divides into sev. arms, enclosing extensive ls. From Kabara (port of Timbuctoo) it passes along the desert towards the frontiers of Hausa Land and is called the Kwari, Kiokra, or Mayo, and further S. the sea or lake of Nupe (Nyfe). The Niger's chief l. b. trib., the Benue or Chadda (*q.v.*), joins it opposite Lokofa, and being navigable from Adamawa affords communication with the interior. The Bussa rapids, in which the explorer Mungo Park was drowned (1805), are below the junction of the Sokoto and the Niger, and are more dangerous than those between Ansongo and Say. The chief deltaic branch of the Niger is the Nun (now little used); others are the Forcados, Brass, Bonny, Sombbrero, Opofo, etc. Total length about 2600 m.; area of basin 600,000 sq. m.

Mangrove forests form the chief vegetation of the remarkable delta region. The Upper Niger was explored by Mungo Park (1795-97 and 1805), the Middle by Barth (1851-54), and the Lower by Clapperton (1826-27) and Lander (1830). Among other explorers are Houst (1896), Lefant (1903), and Talbot (1904). The riv. is Brit. from its mouth to the end of navigation, above that part it is Fr. See R. and J. Lander, *Journal*, 1833; H. Barth, *Travels and Discoveries in North and Central Africa*, iv-v., 1857-58; J. Johnston, *The Niger Delta in Proceedings, Royal Geographical Society*, Dec. 1888; J. Thompson, *Mungo Park and the Niger*, 1890; A. Mockler-Ferryman, *Up the Niger*, 1893; J. K. Trotter, *The Niger Sources*, 1898; J. Lefant, *The Niger* . . . 1903; A. G. Leonard, *The Lower Niger and its Tribes*, 1906; B. Alexander, *From the Niger to the Nile*, i., 1907; M. Delafosse, *Haut Sénégal-Niger*, 1912; P. Germann, *Mungo Park*, 1924; M. Abadie, *Le Colombie du Niger*, 1927; E. P. Stebbing, *The Forests of West Africa and the Sahara*, 1937; and C. Hanin, *Occident noir*, 1947.

Niger Colony, see KENYA WEST AFRICA. **Nigeria** (from very early times the land of the Niger, of the derivation of which name see NIGER, was called Nigritia, possibly following Pliny's form *Nigrit*). The modern name Nigeria was suggested by Miss Flora Shaw, later Lady Lugard, wife of the master builder of the protec-

torate and adopted by the Imperial Gov. in 1900), a Brit. colony and protectorate of Brit. W. Equatorial Africa, extending between the Lower Niger and Lake Chad. It is situated on the N.E. shore of the gulf of Guinea, and enclosed roughly by parallels of lat. 4° and 14° N. and by meridians of long. 3° and 14° E. It is bounded on the N. and N.W. by the military ters. of the Fr. Sudan, on the E. and S.E. by the Cameroons, on the S. and S.W. by the gulf of Guinea and on the W. by Dahomey. Greatest length from E. to W. is 700 m. and greatest breadth from N. to S., 650 m. The area of Nigeria, including the mandated ter. of the Cameroons (*q.v.*), is approximately 372,674 sq. m. (S. Provs. and colony, 90,971 sq. m.; N. Provs., 281,703 sq. m.). The coloured pop. is estimated at 20,477,000 (N. Provs., 11,886,000, S. Provs., 8,266,000; colony, 325,000), and the number of Europeans on an average is 5900. The territorial divs. of Nigeria are the 'colony of Nigeria,' the 'N. Provs.,' and the 'S. Provs.' The N. and S. Provs. were amalgamated in 1914, the colony and protectorate of S. Nigeria and the protectorate of N. Nigeria being formed into the colony and protectorate of Nigeria. The country is usually divided into the delta region (swampy and unhealthy and abounding in mangroves), the forest region (very hilly in parts) and the plateau region in the centre, where the climate is much drier. Tornadoes and cyclones are met with in the N. and N.E. and the harmattan blows from the Sahara. Malaria, leprosy, and ophthalmia are common diseases. The former protectorate of N. Nigeria was constituted (Jan. 1900) over ters. which belonged before to the Royal Niger Company Ltd. (incorporated 1886). It included the old Fulah empire, with its Hausa states, and the ters. of Bornu, Kano, and Sokoto were acquired 1900-3. The N. Provs. are Adamawa, Bauchi, Benue, Bornu, Ilorin, Kappa, Kano, Niger Plateau, Sokoto, Zaria, and Nassarawa. The Middle and Lower Niger and most of its large trib. the Benue, lie in this region. Among the chief ters. of the N. Provs. are Gando, Sokoto, Kano, Hida, Bauchi, Zaria, Ilorin, Yola, and Mafoni. The administrative headquarters of the N. Provs. are at Kaduna. The former protectorate of S. Nigeria contained three provs.—W. or Lagos (including the colony), Central Prov., and E. Prov., and occupied the whole of the delta region. In 1906 the old colony and protectorate of Lagos were united to the protectorate of S. Nigeria, with Lagos as the seat of government. Later, as seen above, the N. Provs. were amalgamated with the S. These later are Abeokuta, Benin, Calabar, Cameroons, Ichea, Oyo, Ogoja, Onitsha, Owerri, and Warri. The chief ters. are Lagos, Barutu, Forcados, Degema, Bonny, Opofo, Ibadan (*q.v.*) (largest native city in Africa), Calabar, Badagry, Jebu Ode, Ondo, Shaki, Benin City, Onitsha, Port Harcourt, Abeokuta, and Brass.

Administration.—In 1944 the governor, Sir Arthur (later Lord) Richards sub-

mitted proposals for the revision of the constitution to the secretary of state (see Cmd. 6599), the prin. features of which were a legislative council for the whole of Nigeria; regional councils for each of the provs., consisting of houses of assembly with the addition in the N. Provs. of a house of chiefs; direct representation of the people via the native authorities and houses of assembly on the legislative council; and an African majority both in the houses of assembly and the legislative council. These proposals which may be regarded as the logical outcome of the development of 'indirect rule,' were accepted by the imperial gov. and were brought into effect in 1946. There is an executive council, whose official members are also members of the legislative council. The legislative council consists of the governor as president, twelve ex-officio members, three nominated unofficial members, eighteen unofficial members nominated by the unofficial members of the regional houses of assembly and the N. house of chiefs, six unofficial members nominated by the governor, and four elected members. Conformably with the Richards proposals there are houses of assembly for the N., W., and E. Provs., each of which has an unofficial majority, and a house of chiefs for the N. Provs.

The Provs. are each administered by a chief commissioner, with headquarters at Kaduna, Enugu, and Ibadan; the colony is administered by a commissioner. The protectorate is divided into twenty-three provs., each under a resident. Nigeria is usually considered to offer the most typical illustration of the characteristic features of 'indirect rule' (*q.v.*) or, in other words, the system by which the trustee power recognises African societies and assists them to adapt themselves to the functions of local government. Historically, it was after the conquest of the Bida emirate that Sir George Goldie, regarded as the founder of Nigeria, laid down the principle that the Royal Niger Company should as far as possible 'rule indirectly through feudatory princes' on the model adopted in India in dealing with the Indian states. Lord Lugard, a famous colonial governor, had experience of the Indian system and as governor in N. Nigeria he encountered circumstances unusually favourable to the adoption of the principles of ruling through the chiefs, for in the N. emirates the Fulani conquerors had estab. organisations which had many of the features characteristic of the Moslem kingdoms in N. Africa and Asia. Lord Hailey, a distinguished critic of colonial administration, has indicated that the study of the early stage of native administration in Nigeria is of outstanding interest since it 'reflects the application of a deliberate policy, put into operation from the first and steadily developed to meet the expanding needs of civilised government' (*An African Survey*). There were, in the N. Provs. in 1938 approximately 80 chiefs and 130 councils, including chiefs in council, as native authorities, with 41 and 451 native authorities subordinate to them respec-

tively. In S. Nigeria there were recognised as native authorities 29 chiefs, 139 chiefs in council, 360 clan and group councils, some with numerous subordinate native authorities, 150 vil. councils and 29 native courts. The native treasury in Nigeria is regarded as an essential feature of the system of native administration; for it not only preserves the tradition under which the native authorities held the proceeds of tribute or services in trust for the community, but provides a training in responsibility, and also establishes a close contact between the native authority and those on whose behalf expenditure is incurred. Equally essential to native administration as practised in Nigeria is the native court. These are true native tribunals and only in exceptional cases do Brit. administrative officers take part in their proceedings; and they are manned by one or more chiefs or other persons or a combination of these. There is a whole hierarchy of courts up to native courts of appeal which hear appeals from courts of first instance.

The emirs of N. Nigeria mostly stem from the cattle-owning, nomadic Fulani invaders. The degree of personal autocracy exercised by each varies according to custom and temperament. Some are progressive, a few openly reactionary. As a class they possess political instinct, and the development of a big international air junction round Kano put them in touch during the Second World War with world affairs. They are fully conscious of the need for the N. to overcome S. opposition to their rule if their traditional way of life is to survive at all. In domestic life they are frugal. Inhabiting rambling, castellated mud palaces, they maintain large retinues but do not go in for luxuries in the western sense. A defect of the administration is over-centralisation, but this is being remedied. The headquarters secretariat of an emirate is the prin. repository of power. The secretariat is run entirely by natives, with Brit. advisers holding a watching brief. It deals with almost every branch of administration, including revenue and police. The chief *alkali* still presides over his court sitting cross-legged on a high divan in a towering white turban. In the technical depts. there is a sprinkling of Christians from the S. wearing striped shirts and grey flannel trousers. A feature in the administration is the growing power of the young *malams*, the educated few who approximate to the Middle-E. *effendi*. Still mostly of chiefs' families, their ranks are now open through the schools to the peasantry. On them the future must depend. The part of the Brit. administrative officers in this organisation is concentrated on advising, watching, and hearing complaints. Their greatest power is probably the granting or withholding of approval in important appointments to office. They exist in a proportion of not more than one to 300,000 of pop. A higher proportion is unnecessary in view of the fact that the native administration is reasonably efficient. In

technical services direct intervention is more common. Downwards the chain of command extends through the hierarchy of dist. and vil. headmen, now being strengthened by the addition of councils where these do not already exist.

Production.—There are great agric. resources in the N. Provs. Crops for home consumption include maize, yams, cassava, sweet potatoes, sugar-cane, Guinea corn (or sorghum), ground-nuts, rice, millet, tobacco, plantains, bananas, and beans of various kinds. The outstanding agric. products for export are palm oil, palm kernels, ground-nuts, and cocoa. Ground-nuts and palm products are used for cattle-cake, soap, margarine, and a number of other important commodities. Other products for export are cotton lint (but cotton is grown mainly for the local industry of hand spinning and weaving) and mahogany. Wheat is grown to a small extent, large herds of cattle, sheep, and goats are raised in the N. Provs., and in the extreme N. ostriches and camels are bred. Horses and donkeys are bred and in common use in the N. part of the portecorate. Tin is the chief mineral produced. Tin ore has been worked and smelted by natives during the last hundred years, the present Seriki (Chief) Lirueh-Delma being the grandson of the native who, historically, first discovered and worked it. There is, however, strong evidence to show that some former race knew of its existence. Beads that could only have been made by man may be seen that have been found in the deep detrital deposits, and they bear no resemblance to any modern ornaments made by tin workers, and, further, the depth at which they have been found precludes a modern origin. The prin. tin-fields are situated on the W. boundary in the Bauchi Prov. and in the provs. of Nassarawa, Zaria, and Kano adjoining the boundary. Tin is also known to exist in the provs. of Ilorin, Calabar, and Yola, but as yet has not been found in payable quantities. The peak output of 15,335 tons in 1929 made Nigeria the fourth tin-producing area of the world; but in 1933 the international restriction scheme reduced production to 4956 tons; in 1936, at 13,432 tons it represented the second largest output in the Brit. Empire, with a value of £2,011,000. 14,090 tons were exported in 1947. The second important mineral of Nigeria is gold, but development is still confined to the alluvial stage. Deposits of lignite and coal have been discovered near Asaba and Udi in the S. Provs. A colliery was opened by the gov. in 1915 at Enugu, the coal won being used by gov. depts. or sold to the public. This colliery is capable of producing 400,000 tons a year, which exceeds the local demand, and further prospecting for coal is therefore prohibited (1939). Coal output in 1947 was 581,528 tons. There are salt and soda deposits in Bornu Prov. Iron ore and silver are also found. In 1936 Nigeria exported over 500 tons of columbite and is said to be the world's chief source of supply. Other products are cotton, ivory,

drugs, capsicum, gums, balsams, indigo, and hides. Citrons, limes, oranges, date-palms, pomegranates, mangoes, and other fruits flourish. The Niger Company Ltd. carry on much of the trading, banking, and mining operations of the N. Provs. Mining rights are vested in the gov., but under an agreement with the Royal Niger Company at the date of the revocation of the charter, the company receives half the gross profits from royalties on minerals for a period of ninety-nine years as from 1900. Three new marketing boards for ground-nuts, palm oil, and cotton, on the model of the Cocoa Marketing Board (which has been functioning successfully for some years) were set up in April, 1949. Their main object is to buy from local producers at controlled prices and sell abroad at world prices, thereby creating funds for the benefit of the industry and the producer.

Education.—See below under *Religion and Education*.

Exports and Industries.—The chief native industries are cloth and mat-weaving, bead work, brick-making, and canoe-binding. The prin. exports (*see also above*) are palm kernels, palm oil, tin, hides and skins, ground-nuts, cotton lint, cocoa, mahogany, and shea produce. Amongst minor products exported from the colony are ivory, ebony, copra, coffee, gutta-percha, beeswax, silk, gums, benniseed, piasava fibre, capiscums, ginger, and ostrich feathers. Exports in 1947 were £38,369,076 (over £36,000,000 to the United Kingdom) and imports were £39,421,512 (over £15,000,000 from the United Kingdom). The revenue for 1947-48 was £18,404,132; expenditure, £17,185,940. The ports served by ocean steamers are Lagos, Forcados, Burutu, Warri, Sapele, Koko Tn., Skassa, Bonny, Port Harcourt, Degema, Opobo, Calabar, Victoria, and Tiko.

Fauna and Flora.—The fauna and flora of Nigeria are interesting. Lions, leopards, elephants, giraffes, a kind of buffalo, hyenas, antelope and gazelles, camels, monkeys, and snakes are found. The rivs. contain numerous varieties of fish, while the crocodile, the rhinoceros, and the hippopotamus are also common. The tsetse-fly and mosquitoes infest the coast dists. and all the delta region. The birds include ostriches, bustards, birds of prey (such as vultures, kites, and hawks), anipes, qualla, partridges, ducks, widgeon, and teal, and many varieties of paroquets, pigeons, geese, etc. Among the chief trees are different kinds of palm (notably the oil-palm, *Elæis guineensis*; the date-palm, *Phoenix dactylifera*; and the doum-palm, *Hyphæne thebaica*), the gambler, the baobab, shea-butter and locust trees, and the tamarind. *In the drier regions mimosa and acacia bloom freely. Mangroves are confined to the swampy coast dist. and form its peculiar vegetation.

Tribes.—The vast number of tribes in Nigeria precludes any detailed account, but a few of them may be mentioned. Among the coast tribes are the Jekri, Ijos, Ibos, and Aros; to the S.E. round Calabar dwell the Efiks, Ibibios, and Kwes. The

Hausas and Fulani of the N. are much higher races than these coast-dwellers. Other tribes are the Yoraghumas, Munshi, Okpotos, Berberi or Kanuri, and Yorubas.

Communications.—The W. div. of the Nigerian Railway (3 ft. 6 in. gauge) runs from Lagos through Abeokuta, Ibadan, Kaduna, and Zaria to Kano (705 m.). The main line from Kano has been extended to N'Guru (Borku). There are also four branch lines, one from Minna to Baro on the Niger (111 m.), Ife junction to Idogo (27 m.), Zaria to Kaura Namoda (137 m.), and Zaria to Jos (133 m. of 2 ft. 6 in. gauge track). Port Harcourt is linked with Enugu by a 3 ft. 6 in. gauge line, this line being generally known as the Eastern Railway. It runs through a rice oil-palm belt, and taps the coalfield at Enugu. The line is 593 m. in length and is an alternative outlet for the tin ore and agric. produce of the N. The gov. has constructed a very large number of roads, many of which are suitable for motor traffic. The rvs. Niger and Benue are in themselves great natural highways, and in the S. there are numerous other navigable waterways which provide means of communication and transport. There is a wireless station at Lagos under the control of the Eastern Telegraph Company for ship to shore communication and a number of Post Office wireless stations for internal communications. Direction finders have been installed at Lagos and Kano. There are sixteen aerodromes.

Religion and Education.—Mohammedanism is widely diffused in the N. Provs., notably among the Fulani and Hausa tribes who are of very long-standing historical antecedents. Paganism prevails in some parts. Protestant and Catholic missions have industrial schools at many stations. Of the 20,000,000 inhab. 8,500,000 are Muslims, 10,500,000 pagans, and 1,000,000 Christians. The fewness of the Christians is surprising in view of the fact that the W. coast of Africa has been in close contact with Europe for three centuries. But Christian missionary effort did not make any great headway until the beginning of the present century. It has met with conspicuous success in S. Nigeria where, unopposed by Mohammedanism, it has gone hand in hand with European education. Elsewhere Christianity suffers from a number of disabilities, compared with Islam. It is spread by Europeans, whose culture is poles apart from that of the African; Islam is spread among blacks by blacks. Christianity is presented in multitudinous forms; Islam is practically free from sectarianism and indeed constitutes one huge brotherhood. The prin. schools are at Kano, which is a Mohammedan centre, and the natives are educated on the lines of the system prevailing in the Egyptian Sudan. Until recent years education was mainly primary, but proposals made in 1929 led to the reorganization of the system into primary and middle schools, the latter giving a training of various types, which includes workshop practice and agric. instruction, closely

connected with the teaching of biology. In the N. Provs. education in the Mohammedan emirates is chiefly in the hands of the gov., while the missions concentrate on the pagans. There are in the N. about 37,000 Koran schools with over 220,000 pupils, 530 primary and middle schools with 25,000 pupils, 4 training centres, and 1 college. The Katsina College gives preliminary instruction in medicine and agriculture. In the S. Provs. the great majority of the people are pagan, but both Christianity and Islam are rapidly gaining ground. The lower stages of education are given in mission schools conducted by the African Churches. More advanced education is given in some

E.N.A.

KANO: HOUSES OF PROSPEROUS HAUSAS
IN THE NATIVE QUARTER

mission and gov. institutions. In 1942 there were 3500 primary and middle schools with 270,000 pupils, and over a score of training institutions. At Yaba, near Lagos, there is a higher college, one of the chief institutions for post-secondary education in Brit. African dependencies. The college gives courses in medicine, agriculture, engineering, and surveying. In 1947 an autonomous Univ. College was set up at Ibadan, and it is proposed to raise its status to that of a univ. of W. Africa, which will confer its own degrees.

Labour Services.—The first labour code was enacted in 1929, a section of the secretariat dealing with affairs under the ordinance. In 1942 the Labour Dept. was formed as a separate gov. dept. Its present activities cover industrial relations, wages inspectorate, inquiries into the cost of living, and advice to trade unions. There are also advisory boards for various trades who inquire into

conditions and wages. Adult and juvenile employment exchanges were opened in Lagos in 1943. Regional headquarters were estab. in the N., W., and E. Provs. and in the colony of Lagos, in order that the chief commissioner and the commissioner of the colony may get the advice of labour officers and experts on labour problems. The ordinance of 1929 was replaced by a more comprehensive ordinance embodying those conventions of the International Labour Office which the Brit. Gov. has agreed to observe in relation to the colonies. This new code came into existence in April 1946. Ninety-six African trade unions had been registered under the Trade Unions Ordinance by the end of 1945. A Nigerian Trades Union Congress came into being in 1943.

Ten-year Plan of Development and Welfare.—Under the 1946 ten-year development scheme extensive plans were elaborated for improvement in agriculture, education, and health, communications, water supplies, etc. It was proposed to spend £55,000,000, and towards this a contribution of £23,000,000 was made by the Brit. Gov. under the Colonial Development and Welfare Act (q.v.). The remaining sum of approximately £32,000,000 was to be found in about equal proportions from Nigerian revenue and from loans to be raised by the Nigerian Gov. The provision of adequate water supplies was of such importance that most of the cost of the rural supplies was to be met by development funds. The urb. scheme provided for all tns. with a pop. of over 5,000 to have a piped and treated supply. As regards health services, the aim was to provide one hospital bed for every 2000 of pop., the existing ration being only one in 5000 (the rate in England is one in 350). Rural health centres, mobile clinics, and epidemic units were to be estab. For lepers, hospitals and segregation vils. were built as the centres of out-station work.

In the sphere of education it was recognised that all existing facilities should be much expanded at all levels, but it was not possible to expand elementary education until teachers were available, and these could only be forthcoming from extended secondary education. Meanwhile, in the N. Prov. a women teacher's training centre was estab. at Kano and a secondary school at Zaria. Technical education is backward and trades centres were set up for each of the four administrative regions, where in addition to general education a five-year course provide for instruction in the building and mechanical trades. Near Lagos, a technical institute capable of taking 250 students is being estab. The extension of roads and communications generally applied chiefly to the S. parts of the country and the mileage of feeder as against main roads was to be almost doubled. In this connection most large tns. issued tn.-planning ordinances in an attempt to prevent ribbon development and the ruin of country small holders consequent on the disturbance of balance

between urb. and rural pop. From a long-term point of view the development of Nigeria's natural resources is the most far-reaching aspect of the ten-year plan, and the maintenance cost alone for the new services to be provided will impose a heavy charge on the ann. budget of the colony. Experimental farms were estab. in all parts to improve the quality and strain of indigenous crops. In the N. Provs. experiments in rice-growing under methods of controlled irrigation and of the mechanised production of groundnuts were pursued. Organised research was being carried out on the problem of tsetse (q.v.) infection. World shortages, political unrest, and rising prices had a considerable retarding effect on the schedule prepared when the whole plan was first inaugurated, and delays and 'bottle-necks' in the import of essential materials were an added complication. These delays particularly affected the supply of heavy machinery for the provision of water supplies and the construction of roads. It is a valid criticism of the development plan that to a large number of the people living in the remote regions it appeared to be a mere administrative action which would leave them unaffected. The Nigerian Local Development Board, however, has powers to allocate loans to native administrations, whether for development of townships, improvement of farms, building of dispensaries, etc.

History.—The N. part of Nigeria, although vaguely known to Arab geographers of the fourteenth century who were acquainted with the Negro kingdoms of the W. Sudan, remained unknown to Europe until, towards the end of the eighteenth century and in the first half of the nineteenth century, explorations by Mungo Park, Clapperton, the Landers, Barth, and others revealed the true course of the Niger and the existence of organised states of the interior. These discoveries led to attempts to open the country to overseas commerce, and, despite very heavy mortality in the early years, trading posts were estab. on the banks of the Niger and the Benue. When the interior of Nigeria first became known to Europeans, the open country had been for some time the home of the Negroid and Herber peoples, who had adopted the Muslim religion and formed powerful and comparatively civilised states. In the forest and mt. country, on the other hand, there dwelt many Negro tribes, the people of which were rude savages, addicted to cannibalism and human sacrifice. Of the origin of the Yorubas, numerically the most important tribe, who now occupy the country between the Lagos lagoon on the S. and the Niger on the N. and are the predominant race throughout the provs. of Abokuta, Ilesha, Ondo, and Oyo, there is no definite knowledge. A tradition that they came from Egypt is suggested by certain carved stones found at Ife and the manner in which the dead are bound for burial. The cause, however, of their estab. in the W. of Africa was, it is generally stated, in consequence of their

being driven by Yaa-rooba, son of Kahtan, out of Arabia to the W. coast between Ethiopia and Egypt whence they advanced into the interior of Africa until they reached Yarbba. On account of the mutual distrust of the Yoruba chiefs, and the consequent weakness of the central authority, the Fulani were able to subdue a Yoruba pop. and to set up a kingdom in one of the best Yoruba provs. When, through these mutual jealousies, the Alafin, ruler of Oyo, was left with little but his cap., the Fulani from Ilorin came in and sacked the tn. Soon afterwards, the emir of Ilorin summoned the Alafin to Ilorin and compelled him to accept the doctrines of Islam, whereupon the Yoruba people resolved to drive out the Fulani and thereby avenge the insult to their titular head. The Fulani, however, inflicted on their forces a crushing defeat; Oyo was deserted, and the people fled before the victorious Fulani, who overran the country as far S. as Abeokuta.

The estab. of the early Hausa states must have taken place at a very remote era but, owing to the systematic destruction of written records by their Fulani conquerors, we have little documentary evidence of the early hist. of the Hausas, who to-day are spread over a large area of N. Nigeria, especially in the provs. of Sokoto, Kano, Zaria, and Bauchi. Before the spread of the Muslim creed the Hausas were pagans, but the new religion penetrated the country in the course of the thirteenth century and profoundly affected both the religious and social life of the Hausas. A form of government grew up based on Islamism, with a well-organised fiscal system and judiciary, and each state was ruled by a king in a walled cap. to which people could flee from invaders. Though each Hausa state was independent, they seem to have been joined together at times in a loose confederation for purposes of defence. From time to time Bornu armies overran Hausaland, while about the year 1513 Askia the great king of Songhay (people of the Middle Niger) conquered Katsina, Zaria, and Kano, and made them provs. of his empire, but later the Hausa states regained their power. Hausaland was often distracted by civil wars for the next century and a half but, by the middle of the eighteenth century, Gobir became the paramount power in Hausaland, which was now under pagan rulers again.

Islamism was at its lowest ebb when the movement commenced which was only to end with the definitive estab. of a Fulani empire over the whole of the land. Nothing definite is known of the Fulani (also called Fulas, Fulahs, Peulhs, and Pulo), and they have been derived by various ethnologists from Phœnician, Indian, Jewish, and Malayan stock, but the most widely accepted theory is that they originated from Upper Egypt and migrated via the Atlantic coast into Nigeria, their superior intelligence soon giving them a permanent footing in the country. For centuries, however, the Fulani remained in Hausaland as a more or less subject race, but in 1802 Othman

dan Fodlo, a Fulani sheikh whose reputation for sanctity gave him great influence over even the pagan king of Gobir, quarrelled with the king, on behalf of a party of Moslems who were being driven into captivity. When a general massacre of the Fulani was threatened, Othman raised the banner of revolt and defeated the king in a decisive battle. The heads of the various Fulani clans now flocked to Othman's banner, recognising him as the Sarkin Musulmi (commander of the faithful). The jihad or holy war had now commenced, nominally only against pagans, but actually also against all tepid followers of Allah and His Prophet. Thus, although Bornu was a Muslim country, it was attacked and conquered (1808) and only regained its independence by the military skill of a famous sheikh named El Kanemi. The jihad was not at first entirely successful but it was sufficiently so for Othman to entrust the administration to his brother Abdullahi and his son Bello, he himself resuming study and preaching until his death in 1817. Bello's reign was troubled one, there being continual wars against tribes which refused to submit to Fulani hegemony, but, despite these wars, Bello found time to study and, like his father, wrote sev. works on hist., theology, and geography. He was visited by Clapperton at Wurno (1824) and sent a cordial message by Clapperton to William IV. The Fulani rulers certainly administered the Hausaland with ability and justice, and the fact that they were able to maintain their rule for a hundred years, a comparatively small number of aliens governing a numerous subject people, is evidence of their marked superiority among the W. African tribes. But as Othman's original famous 'flag-bearers' in the jihad passed away, corruption crept in, the emirs slackened in their administration and lapsed into the habits of the pagans. Thus it was a diminished kingdom, from which the glory had departed, when the Brit. arrived at the end of the nineteenth century.

Lagos was bought in 1861 from a native king, in 1866 placed by letters patent under the gov. of Sierra Leone and, later, administered as part of the Gold Coast colony until 1886, when a separate colony and protectorate of Lagos was founded. It is true that other European nationals had set up trading posts on the Niger as early as the seventeenth century, but they were not interested in political development and were concerned exclusively with the slave-trade, and indeed it was only after the abolition of this trade in the early years of last century that there was any appreciable advance in the commerce in commodities. Even so, Lagos had been bought chiefly to prevent its continued use as a slave market. Prior to the period commonly known as the 'scramble for Africa,' Brit. merchants came together in mutual defence against Fr. competition, under the leadership of Sir George Goldie (the 'founder of Nigeria') as the United African Company, being granted a Royal Charter (1873). In

1885 the Brit. claim to a protectorate over Nigeria was recognised by the Berlin Conference, and that part of the country which was not included within the Lagos terra, or the sphere of the chartered company was placed under Foreign Office administration as the 'Oil Riva. Protectorate,' later named the 'Niger Coast Protectorate.' By 1900 the chartered company had passed its period of usefulness and its charter was revoked. The N. part of its terra, became the N. Nigeria Protectorate and the S. was combined with the Niger Coast Protectorate as the protectorate of S. Nigeria, and both were placed under the Colonial Office. In 1906 the colony of Lagos and its protected terra, were combined with the protectorate of S. Nigeria and designated the colony and protectorate of S. Nigeria, with Lagos as the seat of government, and finally, in 1914, the N. and S. protectorates were amalgamated to form the present colony and protectorate of Nigeria. Until 1900 the chartered company had been responsible for both the civil administration and commercial development, but it never succeeded in extending its administration over the whole of Nigeria though its influence was felt along the main trade routes on the rivers. Even after the transfer of government to the Crown much remained to be done in the pacification of the country, a work which owed much to Lord Lugard and the late Sir Hugh Clifford; and it was not until after 1900 that the phase of internal economic development could begin. Yet, as Lord Hailey justly observes, 'the fact remains that for a capital outlay of about £1,000,000 the largest British Colony in Africa was added to the Crown.' Niger Territory (Fr.), see NIGER; SENEGAL, UPPER.

Night-blindness, see NYCTALOPIA.

Night-blooming or Noctiflorous Plants, are plants which have adapted themselves so as to gain the fertilising services of moths and a few other nocturnal insects. All of them are strongly scented and most very fragrant, and on that account are valued in the garden. Most of these plants bear showy white flowers, and those that are tinted yellow, pink, or blue have their texture such that they are conspicuous in the lighter hours of the summer night. The commonest instance amongst wild plants is the white bladder campion, a member of a genus that exhibits a variety of devices for securing fertilisation by insects. Most of the tobacco plants (*Nicotiana*) close their flowers and allow them to droop in the daytime, raising them in the evening, opening out and emitting a penetrating but very sweet odour. In some plants the flowers last for a number of nights, but others open and fall in one night. Other familiar garden noctiflora are the jasmynes, the tree of sadness, the marvel of Peru, the night-blooming cactus, the night-scented stock, dame's violet, and the evening primrose, none of which are natives of Britain.

Nighthawk, another name for the Brit. nightjar. Also the best-known species (*Chordeiles virginianus* or *C. popetue*) of Chordiles, a genus *Caprimulgus* (goat-sucker). It is the nighthawk of N. America and has a wide range from Canada to Brazil. See GOAT-SUCKER.

Night Heron, or *Nycticorax*, genus of birds of the family Ardeidae of very wide distribution. They are most active at night. Of about nine species, *N. griseus* alone visits Britain. The bird is 23 in. long, and its plumage is beautifully coloured, the back being greenish-olive

and the breast wine colour; long white plumes are borne on the head.

Nightingale, Florence (1820-1910), the reformer of hospital nursing, b. at Florence. While quite young, she did much philanthropic and social work in England, and in 1844 visited many hospitals and reformatories in Europe. In 1851 she trained as a nurse at an institution of the Protestant Deaconesses at Kaiserswerth, on the Rhine, and on her return to England devoted herself to the Governesses' Sanatorium in connection with the London Institute. At the beginning of the Crimean war the wounded soldiers suffered so terribly from the inefficiency of the nursing dept. that Florence N. volunteered her services and sailed with thirty-four nurses in 1854. Her self-sacrificing services to the wounded made her name famous throughout Europe. She wrote sev. pamphlets on nursing and hospitals, and a fund, the interest on which amounts to about £1600 per annum, was raised in 1857 for the purpose of training nurses, now carried out at St. Thomas's and King's College Hospitals. The newly available Verney-Nightingale papers afford interesting details of her relationships with Benjamin Jowett (who wanted to marry her), Richard Monckton Milnes (also a great admirer), Sidney Herbert, and the poet Arthur Hugh Clough, both also intimate friends. See lives by Miss Tooley, 1904; Sir E. T. Cook, 1913; R. Nash and A. Short, 1925; G. C. Willis, 1931; and C. Woodham-Smith, 1949; also L. Strachey, *Eminent Victorians*, 1918.

Nightingale (*Luscinia megarhynchos*), most famous of the warblers, or indeed of any song-birds. The male bird arrives from N. Africa, in the middle of April, a few days before the female, going almost invariably to the woods and oopes which have always been the haunts of its species; but the distribution is very local, being confined to the S. and Midland co., though sometimes found in the W. The N.'s song on a calm night in May or June has a perfect setting; but it is impossible to exaggerate the beauty of its song, which is unique in its variety and sustained melody. Contrary to the popular idea, the song can be heard by day as well as at night-time. The nest is made often on the ground, of dry grass and leaves, and in it are laid four to six olive-green eggs. The male's song continues until the young are hatched. The female is slightly smaller than the male, but exhibits no definite distinction of plumage. The upper parts are chestnut-brown; the long rounded tail is reddish-brown, and the breast is dull greyish-white, tinting to brown. The food is mainly composed of caterpillars, other insects, and small worms; but fruit is sometimes eaten. The winter migration is begun as early as July, and is completed before the end of Aug. Ns. are sometimes kept in captivity, but need much careful management. *L. philomela*, the thrush N. of E. Europe, is a louder but not such a sweet songster. The Persian N. (*L. hakisi*), is said to be the bulbul of the poets.

Nightjar, see GOATSUCKER.

Nightmare, see under DREAMS; FREUD, SIGMUND.

Nightshade, name given especially to a number of plants of the family Solanaceae. The deadly N. (*Atropa belladonna*) is the most dangerous of Brit. poisonous plants. Every part of the plant has the poisonous principle, atropin (q.v.). The berries are large and black, and except for the persistent calyx, resemble cherries; they are often mistaken for an edible fruit by children, with fatal results. It is a stout, erect plant, 3 or 4 ft. tall, with large ovate leaves and solitary drooping bell-shaped flowers, purple in colour; happily it is not common. Frequently

DEADLY NIGHTSHADE

mistaken for it are the woody N., or bittersweet (*Solanum dulcamara*), a common twining plant in hedges with drooping clusters of purple flowers with yellow anthers, and the black N. (*S. nigrum*), a small upright plant with drooping white flowers with yellow anthers. These also are poisonous, and frequently cause loss of livestock. Enchanter's N. is *Circaea lutetiana* (family Onagraceae).

Nigra, Constantino, Count (1827-1907), It. diplomatist, who carried on the traditions of Cavour for more than forty years, was b. at Castelnovo, Turin, Italy, and studied law at the Turin Univ. In 1851 he entered the diplomatic service and became secretary to Cavour. He was for many years minister plenipotentiary in Paris, then ambas. in St. Petersburg (1876), London (1882), and Vienna (1885). He ed. popular It. songs, and the correspondence of Cavour and comtesse de Circourt.

Nigri Sembilan, see NEGRI SEMBILAN.

Nigritia, see NIGERIA; SUDAN.

Nihilism (Lat. *nihil*, nothing) as a philosophic term dates from the twelfth century, and may be said to signify that sceptical attitude of mind which denies everything, even existence. In more modern times, however, N. came to stand for an amorphous body of social and political discontent which manifested itself

among the Russian educated classes. Its currency in Russian intellectual circles owed much to Turgenev's famous novel, *Fathers and Sons*, when the chief protagonist of the creed recognises no authority, doubts every general principle and value, and asserts the freedom of the sovereign individual. It was essentially a philosophical and literary school without any political action of its own. However, from the fact that in so far as N. was given a political direction it aimed at a reconstruction of society on a communistic basis, and as, in order to attain that end, Nihilists did not scruple to use the most violent means (their most prominent victim was the Tsar Alexander II., who was assassinated by bombs on March 13, 1881). N., in the popular mind, became a synonym for anarchism (q.v.). But the great bulk of Nihilists in Russia took no part whatever in the political struggle, and were content to devote their energies to such matters as education, the raising of the status of women, etc., and to making known their ideals through the channels of literature and art. During the last decade or two prior to the First World War, the term N. became more and more obsolescent, for the politically minded reformers had become identified with definite political creeds and parties. See also *RUSSIA. History*. See J. B. Hopkins, *Nihilism*, 1881; K. Oldenburg, *Der russischer Nihilismus von seinen Anfängen bis zur Gegenwart*, 1888; Prince P. Kropotkin, *Memoirs of a Revolutionist*, 1899, and *The Terror in Russia*, 1911; H. E. Read, *The Philosophy of Anarchism*, 1940; E. von Schenck, *Europa vor der Deutschen Frage*, 1946; and A. Weber (trans. by R. F. C. Hull), *Farewell to European History; or, the Conquest of Nihilism*, 1947.

Niigata, open port of Hondo, Japan, 180 m. N.W. of Tokio. Tea is grown throughout the dist., and there is trade with Siberian ports. The production of petroleum has been developed, and there is a large manuf. of lacquer-ware. Pop. 150,900.

Nijar, tn. of Spain in the prov. of Almería, on the R. Artal, about 6 m. from its mouth. Wheat, esparto, fruit, and olives are grown, and lead, iron, and manganese are obtained in the dist. Pop. 13,000.

Nijinsky, Vaslav (b. 1890), Russian ballet dancer and choreographer. His family, of Polish origin, had been dancers for many generations. He was b. at Kiev and at the age of ten entered the Imperial School of Ballet as a student under Nicolai Legat. His extraordinary talent soon became evident, and in May 1908 he graduated as a member of the Imperial Ballet, making his début at the Mariinsky Theatre in the ballet of Mozart's *Don Giovanni*. Two years later he resigned because, it is believed, the propriety of his costume in *Giselle* was questioned. By this time, however, he had won a European reputation with his creation of the parts, among others, of the Egyptian slave in Bakst's *Scheherazade* and of Harlequin in Fokine's *Carnaval* during

the seasons of Russian ballet organised in Paris by Diaghilev in 1909 and 1910. Early in 1911 he left Russia with the independent company which Diaghilev formed with headquarters in Monte Carlo. During the seasons held there and at Paris, Rome, Berlin, and London over the next two years N. added to his triumphs—particularly in Fokine's ballets, *Le Spectre de la Rose* and *Petrouchka*, in which there was scope not only for N.'s genius as a dancer but also his great dramatic ability. In 1913 N. succeeded Fokine as *maitre de ballet*, and in *L'après-midi d'un faune*, *Les Jours*, and *Le Sacre du printemps* he created a new non-classical style of dancing, violently controversial at the time. In Aug. of that year he went to S. America with the Ballets-Russes and on arrival at Buenos Aires he married Romola de Pulszky, a member of the company, the daughter of an aristocratic Hungarian family. The marriage caused a break with Diaghilev, and N. endeavoured to maintain a London season with his own company. He was entirely unsuited to the administrative work involved and his health broke down. On the outbreak of the First World War he, his wife, and daughter Kira were interned in Hungary, but in 1915 he was allowed to go to the U.S.A. where he again joined the Ballets-Russes. His new ballet *Tyl Eulenspiegel* to music by Strauss was produced in New York in 1916 but was ineffectual. The Amer. tour was followed by a short season in Madrid and Barcelona at the invitation of Diaghilev. A S. Amer. tour undertaken by N. in the summer of 1917 proved a failure and was the end of his association with the Ballets-Russes. He retired to St. Moritz. His mental instability, noticeable even in the earlier years devoted to his art almost to the exclusion of normal adult responsibility, now became more evident. In 1918 he was pronounced insane and his career ended. He was the greatest of male dancers, the role of which he revolutionised. His technique, interpretation, and characterisation amounted to genius, combined with a wonderful lightness of movement. It is said of him that he defied the law of gravity, appearing to descend through the air more slowly than he rose. See also *BALLET*. See C. W. Beaumont, *Nijinsky*, 1932, and Romola Nijinsky, *Nijinsky*, 1933.

Nijmegen, Nimeguen, or Nymwegen, tn. in the prov. of Gelderland, Holland, on the R. Waal. It was formerly the residence of the Carolingian emperors, and the beautiful park called the Valkhof is built on the site of the old palace. Another interesting feature of the tn. is the Groot Kerk of St. Stephen, which was originally built in 1272, and contains a monument of Catherine of Bourbon (d. 1469). There are extensive manufs. of beer, Prussian blue, and leather, as well as of pottery, cigars, and gold and silver work.

Nijmegen figured prominently in the Anglo-Amer. operations on the W. front in Sept. 1944, being involved in the plan to acquire flanking bridgeheads across the lower Rhine beyond the main fortifications

of the Siegfried line (*q.v.*) in the hope of quickly turning the Ger. N. flank and so ending the war earlier than might have been expected. This operation to seize the lower Rhine bridges comprised an airborne operation to capture the vital bridges over the Maas, Waal, and lower Rhine at Grave, Nijmegen, and Arnhem and a land operation, on a very narrow front with a one-road communication most of the way, to advance through Eindhoven and Nijmegen. The Brit. 1st Airborne Div. was dropped furthest N. in the Arnhem area, the U.S. 101st Airborne Div. N. of Eindhoven, and the U.S. 82nd Airborne Div. in the Nijmegen area (Sept. 17). This latter div. soon captured the area between Grave and

THE TEMPLE OF NIKE-APATERON, ATHENS

Nijmegen so that the armoured advance on the tn. of Nijmegen itself was rapid. But Nijmegen was strongly held by the Gers., as also was the very important five-span road bridge of steel and concrete crossing the Waal. An attempt to get through to the bridge on Sept. 19 failed against the Ger. anti-tank guns sited in houses near the approaches. On the next day a regiment of the 82nd Div. surprised the Gers. holding the N. approaches. The Brit. troops, meanwhile, had seized the S. end, and the allied armour then crossed the bridge and advanced 2 m. to the N. In the next few days there was much confused and heavy fighting between Nijmegen and Arnhem. Repeated Ger. attacks against the thin allied line of communications necessitated the temporary withdrawal of armour from Nijmegen to keep the single road open; but gradually, as the line was strengthened, a firm front was estab. along the Waal and Maas (for further details *see under WESTERN FRONT IN SECOND WORLD WAR*).

Nearly the whole shopping area of Nijmegen was destroyed by bombing and shelling; but soon after the war temporary shops of good design were erected as an emergency measure in order to obviate the risk of the tn. losing its trade to the rival

tn. of Arnhem before it could rebuild its devastated commercial centre. A new double-track road has been constructed between Nijmegen and Arnhem. Pop. 95,000.

Nijni-Novgorod, *see GORKY*.

Nijni-Tagil, tn. in the Sverdlovsk Region of the R.S.F.S.R., 140 m. E. of Perm. There are chemical plants, machine-tool, armament, and steel works, and railway workshops. Pop. 159,900.

Niké (Gk. *vén*), in Gk. mythology, the goddess of victory, and, according to Hesiod, the daughter of Pallas and Styx, by whom she was sent to fight on the side of Zeus against the Titans. She is generally represented as winged, and with a wreath and a palm branch. As herald of victory she also has the wand of Hermes. In the fifth century B.C. a temple was built in her honour at Athens.

Nikko, or **Hatsiisi**, tn. of Hondo, Japan, 80 m. from Niigata. It is one of the chief religious centres of the country, and is much visited on account of its famous temples and the sepulchres and sanctuaries of the first and third shoguns of the Tokugawa dynasty. Pop. 5000.

Nikolas of Cusa, *see CUSA*.

Nikolayev (Nikolaev), tn. and naval station of Russia, on the Black Sea, 41 m. N.W. of Kherson. There are immense shipbuilding yards, and a floating dock for armoured ships. N. has also steam flour-mills (at the riv. port are the largest grain elevators in Europe), iron and machinery works, railway wagon works, and saw-mills; it manufs. soap, tobacco, vinegar, carriages, and agric. implements. N. is the chief port for the export of cereals from the most fertile areas of S.W. Russia. Iron from Krivoi Rog and manganese from Nikopol are also exported. Like Kherson, it has developed at the expense of Odessa, both being more conveniently situated for the grain exports of the Ukraine. N. is cap. of a region of the same name, having a pop. of 629,000. Pop. of tn. 167,100.

Nikolayevsk (Nikolaiev): 1. Tn. in the Khabarovsk, ter. of the R.S.F.S.R., on the R. Amur, 23 m. from its entrance into the Pacific. Timber from the coniferous forests to the north of Khabarovsk is carried down the Amur to the port of N. N. is the centre for the Amur fisheries. Millions of tins of preserved fish are produced at its mechanised canneries. Pop. 16,500. 2. Tn. in the Saratov Region, *see PUGACHEV*. 3. Tn. of Poland, *see SOSNOWIEC*.

Nikolsburg, or **Mikulov**, tn. of Moravia, Czechoslovakia, 26 m. S. of Brünn. It has a château of Prince Dietrichstein-Mensdorff. The preliminary treaty of peace between the Prussians and Austrians was signed here in 1866. Pop. 6000.

Nikopol, tn. in the Zaporozhe Region of the Ukrainian S.S.R., on the R. Dnieper, 160 m. from its mouth. There are rich manganese mines in the dist., 957,000 tons being produced before 1939. Pop. 57,800.

Nikopoli, or **Nicopolis**, fort. tn. of Bulgaria, on the Danube, 24 m. N.N.E. of Plevena. The tn. was the scene of the defeat of Sigismund and his hosts in 1396 by Bayezid I., and was captured and

burnt by the Russians under Krüdener in 1877. Pop. 6000.

Nikosia, *see* Nicosia.

Nile (from the Semitic *nihal*, a riv.), longest and most important riv. of Africa, and only surpassed in length by the

Mississippi-Missouri among the riva. of the world. It rises in the vast lake of Victoria Nyanza, which stands at an altitude of 3900 ft. above sea level. None of the riva. which flow into this lake is sufficiently large, in relation to the size of the lake, to be a source riv. The chief trib. is the Kagera, the length of which, from the source to Victoria Nyanza, is 530 m. The Nile leaves the Victoria Nyanza at its N. extremity, and flows in a N.W. direction, passing through the Ibrahim and Koga Lakes. The riv. leaves the central African highlands at Fawera and turns westward, being known now as the Somerset Nile. Between Fawera and the Albert Nyanza the riv. falls at least 1000 ft., with many cataracts, such as the Murchison Falls (118 ft.). After leaving this lake, and receiving as a trib. the Semlike Nile from Lake Albert Edward, the riv. begins its northerly course and soon flows through the plains of the E. Sudan. It is now navigable, and is in character like a riv. of the lowlands, having a sinuous course. The main riv. is split up into sev. channels; at 7°-30' N. the two main arms are the Bahr-el-Jebel and the Bahr-el-Seraf, which join again about 9° 30'. The Bahr-el-Ghazal here flows into the main stream, and deflects it for a short distance to the E., but when the Sobat joins it the course once more turns northwards. From Fashoda to Khartoum the riv. is known as the White Nile (Bahr-el-Abiad), and the name 'Nile' simply is given to it only after the junction with the Blue Nile (Bahr-el-Azrek), which joins it at Khartoum, flowing from the Abyssinian tablelands. The Atbara is the last trib. which joins the Nile at a point 200 m. below Khartoum, and is a large riv. in the rainy season, though greatly reduced in the dry. The Libyan and the Red Sea plateaus, which approach the riv. in succession, are the cause of its sinuous course in Nubia. Between 16° and 24° N. lat. there are six groups of cataracts, the largest being at Wadi Halfa. From the junction of the Atbara to the sea the Nile does not receive a single trib., the lower basin being hence very small in area, varying in width from 1 to 12 m., that is to say, the region over which the ann. inundations of the riv. extend. This region increases from less than 1 m. in Nubia to as much as 12 m. in upper Egypt, and it is the extent of the inundation which determines the pros-

perity of the country during the ensuing season. N. of Cairo the delta of the Nile, which has a width of 120 m. and an area of 8500 sq. m., commences, with many canals, lakes, etc. The most important branches are the Damietta and the

THE RIVER NILE

perity of the country during the ensuing season. N. of Cairo the delta of the Nile, which has a width of 120 m. and an area of 8500 sq. m., commences, with many canals, lakes, etc. The most important branches are the Damietta and the

Rosetta, each having a length of 146 m. Irrigation was begun by Mohammed Ali; in 1842 he called in Mungel Bey, a Frenchman, who built the Cairo barrage. Water was conducted to the land by irrigation canals, but the control of the water robbed the land of silt, and its productivity decreased. Bey's barrage was used until 1883, when Brit. engineers

rebuilt it, increasing the depth of water so that it travelled down the irrigation canals with increased velocity and carried the silt with it. The Aswân (Assuan) dam, which was begun in 1895 and finished in 1902, was heightened in 1912. From Dec. to March the sluices are closed and the waters held until the maximum capacity of $2\frac{1}{2}$ milliards of cubic metres is reached. Before March and July the water is drawn off into the irrigation canals. S. of Aswân for 200 m. the riv. is one large reservoir. Above the Aswân dam is a barrage at Eana, made by placing suitable booms at an angle of 45° to the stream and there is another barrage at Assiut. Assiut dam gave new life to an irrigation system which was 3000 years old. A dam at Sennar, 170 m. S. of Khartoum, has been constructed to hold up the waters of the Blue Nile. It was finished in 1925, and is nearly 2 m. long. The Aswân reservoir holds 5,500,000,000 cubic metres of water, and the (Gebel Aulia reservoir (completed in 1937) 2000,000,000 cubic metres. New barrages have been constructed at the bifurcation of the Nile below Cairo to replace the existing structures which, having been built in 1861, were unable to meet the conditions following the increase in summer supplies, the reclamation of considerable waste lands, and the earlier watering of food crops. The Mahmudick Canal, which connects the Rosetta with the Alexandria Nile, is of great commercial importance. At high water there is continuous communication between Fort Berkeley and the sea, a distance of 2900 m., but in periods of low water the cataracts impede the navigation. All the year round navigation is possible between Khartoum and Fort Berkeley (1890 m.), and also from the sea as far as Mansura (60 m.) on the Damietta, and as far as Kafr-el-Zayab (70 m.) on the Rosetta branch. The ann. rise of the middle and lower Nile is due to the periodical rains of Abyssinia and equatorial Africa. The White Nile constitutes a more uniform source of supply, whilst the Blue Nile and the Atbara, when swollen by three months' rain, cause the inundating floods. A series of new projects has been formulated to bring the Nile under control so that every possible cubic foot of its water will be utilisable. The principle of the projects is 'century' or continuous storage, enabling the maximum supply in abundant years to be conserved for lean years. The first of the new projects is the Owen Falls dam on Lake Victoria, the object being not only to utilise to the greatest possible degree the waters of the White and Blue Niles and their tribs., but also to safeguard against flooding and its concomitant famine. At present much water goes to waste, for excess supply from years of plenty cannot be stored. Yet in low years all the water that can be stored from the flood still falls short of normal crop requirements. Even if its size permitted, excess water could not be stored in a reservoir like Aswân because of evaporation losses. Adequate storage is possible

only in the great lakes of central Africa—Victoria, Albert, Kioga, and Tana. On these lakes evaporation and rainfall are nearly equal and, in fact, rainfall may exceed evaporation. In the great lakes a far greater volume of water could be stored without much increase in surface area, and therefore in evaporation, an important consideration when a reservoir may be held at high levels for many years. The White Nile's capacity is, however, limited by the swamps of the Sudd, N. of Mongalla. In these swamps a high proportion of the flow is lost through evaporation and plant transpiration, so that out of 100 cub. ft. leaving Mongalla, only 62 reaches Aswân. It is therefore planned to cut a by-pass canal, the Jonglei diversion, round the swamps. Its size will depend on the discharge, and the velocity of the water must be sufficient to prevent the growth of weeds and papyrus. Lakes Victoria and Tana are to be the main reservoirs. Lakes Albert and Kioga being used as regulators. At the outlet from Tana there would be a hydro-electric station, as at Owen Falls. At present about 6,000,000 foddans (or ac.) is irrigated in Egypt, and less than 500,000 in the Sudan. The new projects would supply enough water for 7,000,000 foddans in Egypt and 2,000,000 in the Sudan. The whole scheme may take twenty to twenty-five years, and it may be as long as twenty years more if there were a succession of bad years before the Victoria reservoir fills. The Owen Falls dam, a concrete and masonry structure over 400 yds. long and 30 yds. high, should take about four years to build (*The Times*, Aug. 11, 1949). The Nile has the longest basin of any riv., although the area of that basin (1,107,227 sq. m.) is surpassed by those of the Amazon and Mississippi; the length from the outlet at the Victoria Nyanza is 3473 m. Considering the great importance of the Nile to Egypt, it is not surprising that in auct. times it was deified, and has always been regarded with the utmost reverence; the height of the flood has been recorded annually since at least 3600 B.C. It was not until the latter half of the nineteenth century that the question of the source of the Nile was finally settled, Sir J. H. Speke discovering the Victoria Nyanza in 1858; Bruce had in 1770 discovered the source of the Blue Nile.

See Sir S. W. Baker, *Nile Tributaries of Abyssinia*, 1880; Sir H. Johnston, *The Nile Quest*, 1903; W. E. Garstin, *Report upon the Basin of the Upper Nile*, 1904; H. G. Lyons, *Physiography of the Nile and its Basin*, 1906; J. H. Speke, *Discovery of the Source of the Nile*, 1908; Sir W. Willcocks and J. I. Craig, *Egyptian Irrigation*, 1913; A. Moret, *Le Nil et la civilisation égyptienne*, 1923; E. Ludwig, *The Nile* (Eng. trans., 1940); and H. E. Hurst and R. P. Black, *The Nile Basin*, 1945.

Nile and Red Sea Railway was opened in Jan. 1904. As its name indicates, it establishes communication between the Nile and the Red Sea. The line runs from Berber on the Nile to Port Sudan, situated 45 m. N. of Suakin, on the Red Sea.

Nile, Battle of the (1798), see ABOUKIR.

Nile, Blue, see BAHR-EL-AZREK.
Nile Province (now Northern Province), prov. of Uganda, Central Africa, Brit. protectorate comprising the dists. of Karamoja, Lango, Acholi, and W. Nile. The soil is fertile, and coffee, cotton, and indigo are grown; there are rubber and ebony trees.

Niles: 1. Tn. of Trumbull co., Ohio, U.S.A., on the Mahoning R., 54 m. E.S.E. of Cleveland. The chief industries are the manuf. of sheet iron and steel boilers, railway cars, chemicals, etc. Pop. 17,000. 2. Tn. in Berrien co., Michigan, U.S.A., on both banks of the St. Joseph R. It is a railway centre, ships fruit and livestock, and manufs. flour, furniture, etc. Pop. 11,000.

Nile, White, see BAHR-EL-ABIAD.

Nilgai, see NYLGHAU.

Nilgiri, or Neilgherry Hills (Blue Mts.), plateau in India, S. of Mysore, with a general elevation of 6500 ft., the highest peak being Doddabetta (8760 ft.). The hills were first explored by Brit. officers in 1814. The climate is healthy and invigorating. The area is a dist. of Madras prov., totalling 989 sq. m. with a pop. of 209,700.

Nilometer is, as its name indicates, an arrangement for measuring the height of the Nile in Egypt. There were sev. such arrangements in anct. times, as the height of the riv. was then, as now, the factor which determined the country's measure of prosperity for the year. On the is. of Elephantine, near Aswân, there is a N. which dates back to Egyptian times. It was extended by the Romans, and repaired by the Khedive Ismail in 1870. On the is. of Rhoda, opposite Cairo, there is another famous N., which was constructed during the reign of Caliph Al-Mutawakkul (847). It consists of a square well, which is connected with the Nile by a canal; in the centre is an octagonal marble pillar, graduated in cubits (41 386 in.). If the rise reached 19 cubits it was fairly good, 22 excellent, but 24 ruinous; the average rise at Cairo is from 24 to 26 ft. Other Ns. in anct. times were situated at Philæ, Edfu, Esna, Memphis, Ekhnin, etc.; modern gauges are now situated at Cairo, Aswân, Berber, and Khartoum in the main riv. and some on the tribs.

Nilotes, one of two large groups of hamitised Negroes of the Anglo-Egyptian Sudan, the other being known as the Nilo-Hamites. The latter belong to the Bari section of the Bari-Masai linguistic group for which it is difficult to find an appropriate name, though linguistically the term is permissible. Physically both groups are distinguished by dolichocephalic skulls and are of very tall stature. These characteristics, most marked in the N., leave little doubt that stature greater than either parent stock is one of the results of the mixing of Negro and Hamites. The N., numerically the strongest of the sub-racial units of the Sudan, occupy a vast area from 12° north lat. well into Uganda, including in the W. by far the greater part of the basin of the Bahr-el-Ghazal, and extending E. of the

Nile between that riv. and the Flibor-Sobat in the Upper Nile prov. The N. include the Dinka (or Denka, *q.v.*), the Nuer (*q.v.*), and Shilluk (*q.v.*) tribes, together with one or two smaller tribes such as the Anuak. All these tribes, besides being tall and long-headed, are very dark-skinned and woolly-haired, their skin having no sign of the coppery tinge noticeable in the shorter, rounder-headed folk dwelling in the S. part of the Bahr-el-Ghazal prov. Although their features are usually coarse and their noses broad ('platyrrhine') there may, among the Shilluk, be found men with long, well-shaped faces, thin lips, well-modelled foreheads, and noses the reverse of coarse. The Denka and Nuer have broader noses than have the Shilluk. Temperamentally the N. offer a strong contrast to all other Sudanese peoples. They are aloof, proud, tenacious of their traditional beliefs, and very religious, asking nothing of the white man except to be left alone, and only yielding slowly to the unremitting pressure brought to bear by the gov. and missionary. These characteristics are common to the N., but are more marked in the Denka and Nuer than in the Shilluk. The Sudanese representatives of the Nilo-Hamites are less markedly characterised physically than the N. Linguistically the majority of the tribes included in the group are related to such strongly hamitised peoples of Kenya colony as the Masai and Nandi (tribes termed by some anthropologists as half-Hamites). The main distribution of the Nilo-Hamites is in the Kenya highlands and are not further treated in this article, which is more concerned with the tribes of the Nilotic or Anglo-Egyptian Sudan.

The N. are mostly herdsmen, cattle being of the highest importance to them, for there is barely enough grain to feed the people and make beer. They carry spear and shield and wooden clubs. They dislike clothing; men go naked or wear a cloth over the shoulders. The hair of the head is often worked into an elaborate headdress. Women wear leather petticoats reaching to the knee. Ivory bracelets are worn above the biceps, smaller ones at wrists. They have a clan organisation, as indeed have all great sub-racial units of the Sudan. The rain-maker is a well-established institution among all the racial units. With the N., however, the rain-maker is more than an expert. With the Shilluk and Denka he is a divine king in whom is immanent an ancestral spirit and who, by prayer, moves a god in the firmament to send rain. These divine rulers are, or were, killed ceremonially for the benefit of their people. It is a belief of the Denka that the ruler takes the food of the land with him to the grave; but if the underlying idea of this belief is the spiritual unity of rain-maker, rain, and vegetable food (an idea which is not limited to the Denka or even to the N. as a whole), it is curious that the belief is not recorded of other tribes. Like other African peoples, the N. have a

profound belief in magic, this everywhere being the greatest obstacle facing the administration in attempting to impose European conceptions of justice, for magic is woven into the whole structure of African society and is an essential feature of the African's social heritage. Everyday life with the N. (as of the Nuba (q.r.) and other races) is based on the kinship system. The family, in its narrowest sense, is associated with a wider circle of relatives, all of whom are constrained by more formal regulations than in W. society. Kinship terms are used among the group of persons linked together by the system, and an understanding of the position in which each individual stands to his relatives and of his obligations and privileges, and the forms of etiquette by which he is bound. Polygamy, as with so many African tribes, is a social institution of the N. Each wife owns her own hut and is individually responsible for the care and feeding of her own children. Contact with the white man has, for two decades or more, produced two great changes among the N., and peoples of the Sudan generally: the abolition of tribal warfare and the diminution of the public status of the medicine-man (see WITCH-DOCTOR), the individual who throughout the Anglo-Egyptian Sudan is known as *kajur* (a word of unknown etymology), though the private personal prestige of the successful medicine-man is probably almost as high as ever. See C. G. Seligman and Brenda Z. Seligman, *Pagan Tribes of the Nilotic Sudan*, 1932.

Nilotic Languages, see under NEGRO-AFRICAN LANGUAGES.

Nilsson, Martin Persson (b. 1871), Swedish archaeologist, was educated at Lund, Basle, and Berlin Univs. Lecturer in Gk. (1900) and prof. of classical archaeology and anc. hist. from 1910 at Lund Univ., he became Sather prof. of classical literature at California Univ. in 1939. N. has written many works on archaeology and anc. Greece, including *Griechische Feste* (1906); *Primitive Time Reckoning* (1920); *A History of Greek Religion* (1925); *The Minoan-Mycenaean Religion and its Survival in Greek Religion* (1927); *Mycenaean Origin of Greek Mythology* (1931); and *Homer and Mycenae* (1933).

Nimar: 1. Dist. in the Nerbudda div. of the Central Provs. of India, having an area of 3357 sq. m. Cotton, millet, and hemp are the chief crops and there are factories for ginning and pressing cotton at Khauwa, which is also the administrative headquarters. Pop. 251,000. 2. Dist. in the state of Indore, on both banks of the Nerbudda, with an area of 3872 sq. m. Pop. 251,700.

Nimburg, tn. of Bohemia. Czechoslovakia, on the Elbe. 26 m. N.E. of Prague. Pop. 8000.

Nimbus, see under CLOUD. For the meaning of the word in art see AUREOLE.

Nimeguen, see NIMEUGEN.

Nimes, city of France, cap. of the dept. of Gard, 80 m. from Marseilles and 31 m.

from Montpellier. It is famous for its Rom. remains, among which may be mentioned the amphitheatre, which dates from about the second century A.D., and is one of the best preserved in France. Besides this there are the Maison Carrée, a beautiful temple in the style of the Parthenon; the temple of Diana; the Porte d'Auguste and the Porte de France, two Rom. gates; and the Tour Magne, the oldest monument of the tn., which is still 92 ft. high. Other buildings are the cathedral (St. Castor); the old citadel dating from 1687, and now used as a central prison; and the former lycée, which contains the public library and the museums. The city is the seat of a bishop. It is also one of the great S. markets for wine and brandy, and has a good trade in grain, groceries, and colonial wares. The chief manu. are silk goods, upholstery, shawls, carpets, cotton goods, candles, machinery, boots and shoes, and brandy. Jean Nicot, who introduced tobacco into France, was from N., also François Gaultier, the historian, and Alphonse Daudet, the novelist. Pop. 89,200. See E. Espérandieu, *Le Pont du Gard et l'Aqueduc de Nîmes*, 1926, and *La Maison Carrée à Nîmes*, 1929.

Nimitz, Chester William (b. 1885). Amer. Adm., b. in Fredericksburg, Texas, U.S.A., son of Chester Bernhard N. Graduating from the U.S. Naval Academy, 1905, he became ensign in the U.S. Navy in 1907. Having sev. years' experience as a submarine officer before the First World War, N. was lieutenant-commander of the Atlantic submarine flotilla, 1916, and, in 1918, chief of staff to the commander of the Atlantic fleet's submarine force. From 1933 to 1935 he was commanding officer of the U.S.S., *Augusta*. Promoted to rear-admiral in June 1935, he was chief of the bureau of navigation in the Navy Dept. 1939-41. On Dec. 17, 1941, following the Jap. attack on Pearl Harbour, the naval high command was overhauled and N. became commander-in-chief of the Pacific fleet, with the rank of admiral. N. then reorganised his fighting groups and strategy, selecting as leaders Halsey, Mitscher, Kincaid, Spruance, and Turner. He was responsible for the reconquest of the Solomon Is. in 1942-43, of the Gilbert Is. in 1943, and of the Marianas and Marshalls in 1944. With the withdrawal of the Jap. fleet to the inner seas there was a regrouping of the Amer. naval forces in the Pacific. Gen. MacArthur was given the Seventh Fleet as part of his command, Adm. Halsey was assigned to the Central Pacific as commander of the Third Fleet, which, with the Fifth Fleet under Adm. Spruance, was put under the supreme direction of Adm. N. MacArthur invaded Leyte, aided by immense naval forces sent to his support by N. N. directed the initial stages of the invasion of Okinawa (1945). (See PACIFIC CAMPAIGNS, OF FAR EASTERN FRONT IN SECOND WORLD WAR.) In Dec. 1945 he was promoted to the five-star rank of fleet admiral of the U.S. Navy. In common with most distinguished naval officers N. is opposed to the

merger of the armed services. In March 1949 he was appointed by the United Nations as administrator for the plebiscite in Jammu and Kashmir (q.v.) in conformity with the terms of the last interim report of the United Nations Commission for India and Pakistan.

Nimonic, see under **NICKEL**.

Nimrod. According to Genesis a son of Cush and grandson of Ham, famous for his exploits as a hunter. He was at first ruler of Shinar, and afterwards founder of the Assyrian Tetrapolis (Resen, Nineveh, Rehoboth-ir, and Calah). He is sometimes identified with the princely hero of the Babylonian Izdubar legends, or 'N. Epic.'

Nimrod, see **APPERLEY**. **CHARLES JAMES**.

'Nine Days Queen,' see **GREY, LADY**.

Nine-power Agreement, treaty made in 1923 between Great Britain, the U.S.A., France, Belgium, Italy, Holland, Portugal, China, and Japan, to guarantee the sovereign independence and territorial and administrative integrity of China. The signatories pledged themselves to help China to maintain a stable gov./ while other clauses estab. the principle of the 'open door' in Chinese trade and forbade the powers to seek special privileges in China. Japan violated the treaty in 1936 by occupying Manchuria and by starting a large-scale war in China in 1937. In that year the treaty was invoked and a conference of the signatories was held at Brussels (Nov.) but to no purpose.

Nineteen Thirty-nine-Forty-five Star, see under **STAR** (decoration).

Nineveh, a cap. of anc. Assyria. According to all account it was a city of size, strength, and magnificence. The anc. city is represented by two large mounds known as Kuyunjik and Nebi Yunus ('Prophet Jonah': the site of the reputed tomb of the prophet Jonah), situated on the E. bank of the Tigris, opposite the modern city of Mosul. In the Neolithic period, there existed a small vil. During the first three centuries of the Assyrian Empire, N. was a poor place. Sharrukin (or Sargon) II. (721-705) had made his cap. successively at Ashur, Calah, and N., and then finally at Dur-Sharrukin or Khorsabad. The real founder of the great N. was Sargon II.'s son and successor, Sennacherib (704-681 B.C.). He planned the fortifications of this city, restored its temples, built its most magnificent palaces, and gave it a system of waterworks: he conducted water from the hills by eighteen canals, and distributed it round the moats into the ponds and tanks within the city. It is computed that his great palace contained not less than 10,000 ft. of walls lined with sculptured slabs. Ashurbanipal's reign (669-633 B.C.) was the 'golden age' of Assyria and of N. His important work was the estab. of the great royal library at N. In the temple of Nabu at N. one library had already been in existence at least since Sargon II., but Ashurbanipal's library was to surpass all others in size and importance. He sent to all the old temples of Babylonia and had copies made of their mythological epics,

hymns, and incantations. Tens of thousands of clay tablets were collected, containing chronicles, medical and other scientific literature, dictionaries, religious literature, official dispatches, and archives, business documents, and letters. They form the basis of our knowledge of the Assyrian and Babylonian language, literature, and hist. With the death of Ashurbanipal, the Assyrian period and that of N., had really closed. The kingdom and N. continued for twenty years more, but they were the years of a lingering death.

The story of N.'s fall is told by a Babylonian clay tablet preserved in the Brit. Museum: N. fell in 612 B.C., the fourteenth year of the Babylonian king Nabopolassar (625-605 B.C.), who was joined in the destruction of this city by Cyaxares the Mede and the Scythians. The destruction of N. was predicted by the prophet Zephaniah (II., 13-15), and in the book of Nahum (III., 1-3) we have an ecstatic expression of delight at the prospect of ruin overtaking the hated city ('bloody throughout'). N. in its prime was, no doubt, a city of great magnificence. It was constructed of brick and enameled tile, or of stone brought from the distant mts. It was surrounded by brick walls sixteen m. in length. Winged bulls and lions with human heads, and sculptured sphinxes with wings, guarded the gates of the royal palace, while its numerous rooms were decorated with bas-reliefs, mouldings, and carvings, giving evidence of no little artistic skill. A vast number of reliefs and inscriptions are preserved in the Brit. Museum.

Research.—Early in the nineteenth century, Claude James Rich, resident of the East India Company at Baghdad, visited the mound Kuyunjik (and others), where he made slight excavations. In Dec. 1842, Paul Émile Botta (of It. parentage), a Fr. vice-consul at Mosul, began digging on the site of N., but he worked there only for three months. He was followed by Victor Place. The excavations, begun by a young Englishman of Huguenot descent, Austen Henry Layard, in 1845, at Nimrod (the Biblical Calah) and Kuyunjik, constitute the next great landmark in the hist. of modern archaeology. In 1847 Layard discovered at N. the palace of Sennacherib, which was largely unearthed from 1849 to 1851. In 1852, Hormuzd Rassam (who had been one of Layard's helpers) continued the excavation of N. under the direction of Sir Henry C. Rawlinson, the Brit. consul-general at Baghdad. Rassam, who worked until 1854, had the good fortune to find Ashurbanipal's palace and his great library. In Dec. 1872, George Smith, of the Brit. Museum, announced that among the tablets from N. he had found an account of the flood which closely resembled that in the Bible. This aroused so much interest that the *Daily Telegraph* commissioned Smith to undertake further explorations. George Smith worked at N. in 1873 and 1874. In 1876 and 1877, Rassam again excavated, on behalf of the Brit. Museum. Finally, also on behalf of

the Brit. Museum, in 1931-32, M. E. L. Mallowan (now prof. at the Institute of Archaeology, Univ. of London) excavated the first prehistoric settlement at N., underlying the Assyrian levels. See A. H. Layard, *Discoveries in the Ruins of Nineveh and Babylon*, 1853; C. J. Gadd, *The Fall of Nineveh*, 1923; S. Smith, *Early History of Assyria*, 1927; R. C. Thompson and R. W. Hutchinson, *A Century of Exploration at Nineveh*, 1929; B. Meissner and D. Opitz, *Studien zum Bitt Hildni im Nordpalast Assurbanaplis zu Ninive*, 1940.

Ningpo (Ning-po-fu, city of the calm waves), formerly **Liampo**, a treaty port and important trading city of Chekiang prov., China, on Takia or Ningpo R., 16 m. from its mouth opposite Chusan, and 95 m. from Hangchow. Manufs. include silks and other fabrics, gold, silver, and lacquered wares, carved wood, furniture, carpets, and confections. Tea, raw cotton, drugs, and straw goods are among the exports. Bamboos and rice are grown. There are salt works and fisheries near by. The ruined Pagoda or Obelisk (T'ien-feng-t'a) and the old Drum Tower are interesting buildings. N. contains numerous temples (e.g. that of 'the Queen of Heaven'), monasteries, schools, and clubs, and a fine library. It is noted as an important missionary centre. There was a Portuguese settlement from 1522 to 1545. A Brit. occupation took place in 1841-42, and in the latter year the port was opened to foreign trade by the treaty of Nanking. It serves as a distributing station for Shanghai. Pop. estimated at (1949) 218,800.

Ningsia, prov. of Inner Mongolia, China, inhabited by Mongol-speaking Khalaks and Buriats. Through the centre of the prov. run the Alaskan mts. Wheat, wool, and livestock are produced. The city of N. is the cap., and has canals for irrigation. Area 106,115 sq. m. Pop. 773,000.

Ningyuan, see KUTJA.

Ninian, Saint (d. 432?), missionary preacher, probably from Strathclyde. He went to Rome and was ordained bishop of the S. Picts by Pope Siricius in 394. He founded the church of Candida Casa, or Whithorn, in Wigtownshire, and dedicated it to St. Martin of Tours. According to Bede, he preached Christianity to the Picts of all S. Scotland as far N. as the Grampians. See Bede, *Historia Ecclesiastica* and Alfred of Rievaulx, *Life of St. Ninian*.

Ninon de Pénelos (1618-1708?, see L'ENCLOS).

Ninove, city in E. Flanders, Belgium, 20 m. S.E. of Ghent, on the R. Dender. There is a fortified city gate of the eighteenth century. It has manufs. of safety matches, cotton goods, linen, lace, silk, gloves, and shoes. Pop. 11,100.

Niobium (or Columbium, Cb), symbol Nb; atomic number 41; atomic weight 92.91. Discovered by Hatchett, 1801. A metallic chemical element, it is usually associated with tantalum, and occurs in the minerals tantalite, columbite, and fergusonite. The metal is obtained by reducing the chloride with hydrogen in a red-hot iron tube, or by reducing the oxide

with carbon in the electric furnace. It is a steel-grey metal of sp. gr. 7.06, burns on heating in air, and is soluble in warm concentrated sulphuric acid. Its resistance to corrosion makes it suitable for the manuf. of chemical apparatus.

Niort, city of France and cap. of the dept. of Deux-Sèvres, on the R. Sèvre-Niortaise, 42 m. E.N.E. of La Rochelle. It possesses a noted church of the fifteenth century, and an old castle in which Mire de Maintenon was born. The manufs. are boots and shoes, gloves, and brushes. Pop. 24,000.

Nipigon, Lake, sixth largest of Ontario's immense number of lakes, has an area of 1750 sq. m. and 800 m. of shore line, and lies 35 m. N. of Lake Superior, in a forest reserve of over 7000 sq. m. It is 70 m. long and 50 m. wide, is exceedingly deep, and contains over 1000 is. The R. Nipigon drains the lake, and is the largest which flows into Lake Superior. The lake is notable for the grandeur of its scenery and its wild primitive surroundings.

Nipissing, Lake, lake of Ontario, Canada, about half-way between Huron Lake and the Ottawa R. It is 50 m. long, 20 m. broad, and contains numerous is. The Sturgeon R. enters it on the N., and the outflow to Georgian Bay, Lake Huron, is by the Fr. R.

Nippon, **Nippon**, or **Dai Nippon**, native name for the whole of the Jap. Empire. It is used particularly of the prin. is. of Japan, Honshu.

Nippon Yusen Kaisha (Japanese Mail Steamship Company Ltd.), most important steamship company of Japan, estab. in 1885. The Mitsubishi Kaisha and the Yubin Kisen Kaisha lines were formed as early as 1871, the two amalgamating (1876) as the Three Diamonds Company. In 1899 the Jap. Diet granted subsidies to the company's European and Amer. lines, which carried the mails. During the First World War further lines were added to the routes covered, including Java, Calcutta, New York, and the S. Pacific is. The near sea services were incorporated in 1923 under **Kuikoku Yusen Kaisha** and in 1926 the Joyo-Kisen was absorbed.

Nippur, or **Niffer**, was an ant. city of Babylonia, 100 m. S.E. of Bagdad. It was the seat of the worship of the Babylonian god, En-til. Its hist. was continuous from Neolithic times to the Parthian rulers. The temple of En-til finally became a Seleucid fortress. See C. S. Fisher, *Excavations at Nippur*, 1905.

Niquiran. Some scholars still use this term (while others prefer the term **Nicarao**, an abbreviation from **Nicaragua**) for the important language, now extinct, which was spoken, at the time of the Sp. conquest in the sixteenth century by the native pop. of the ter. lying between the Pacific Ocean and the Lake Nicaragua, and the neighbouring is. of this lake. Unlike Mangue or Chorotega (which is a Chiapanecan dialect), the other prin. language of Nicaragua, N. or Nahuat of Nicaragua belongs to Nahuatlun linguistic family, being thus closely related to Aztec of Mexico and Pipil of Salvador, Guatemala, and Honduras. The origins

of the N.-speaking people is uncertain. According to some scholars (C. Thomas) they were a relatively recent colony, immigrated from the Pipil group of Salvador and Guatemala. According to W. Lehmann they immigrated in about the tenth century A.D. from Cholula in Mexico, and were connected with the Toltec. However, all scholars agree that N. (together with Aztec, Pipil, and other dialects) was a branch of Nahuatl, this being a subdivision of the Uto-Aztecan group of languages. The other two subdivisions were Piman or Sonoran, and Shoshonean. According to Sp. sources, the N. possessed codices written in pictographic script, but none has been preserved.

Nirvana, highest state of spiritual attainment for the Buddhist. Existence is a continual passage from one state into the next, man's earthly life being but one episode. This 'round' of existence is but a veil over reality. If ignorance, desires, and all other 'poisons' can be removed, the individual is delivered from his fictitious individuality, and from the 'round.' This is the state of N., and is completely discontinuous from the 'round.' N. cannot be defined, since the terms used by man bear no relation to it. **Nisan**, see ABIB.

Nish, or **Nis**, fortified garrison tn. of Yugoslavia, and cap. of the dept. of N., on the l. b. of the Nishava. Its position is important from a strategic point of view, for it lies at the convergence of sev. of the important Balkan high roads, and also at a railway junction. It was captured by the Bulgarians in 1915. It is also a centre of commercial activity. There is a railway repairing factory and an iron foundry. N. is the see of a bishop and a royal residence. Constantine the Great was b. there. Pop. 50,700.

Nishapur, tn. of Khorasan, Persia, 44 m. S.W. of Meshed. Omar Khayyam was b. and buried here. There is trade in almonds and other fruits, and textile goods. Pop. 15,000.

Nisi, Decrees, see under DIVORCE.

Nisibis (called **Antiocha Mygdoniae** during the Macedonian rule), cap. of anct. Mygdonia, N.E. Mesopotamia. It was taken by the Parthians in 149 B.C., and sev. times fell into the hands of Rome, being captured by Lucullus (68 B.C.), by Trajan (A.D. 116), and by Lucius Verus (A.D. 165). It was finally ceded by Julian to the Persians in A.D. 363. The Armenian vil. of Nisibin, 85 m. S.E. of Diabekr, occupies the site.

Nisi Prius (literally 'unless before'). When the judges sit at the assizes to try civil actions they are still said to be 'sitting at N. P.' though the words N. P. have lost their original significance. N. P. denotes no more at the present day than the commission by virtue of which judges are empowered to try civil causes at assizes. The words N. P. originated in the writ of *venire facias* (a writ addressed to the sheriff of a co. where a particular action was to be tried calling upon him to secure a jury) as altered in form by the Statute of Westminster II. to square

with a prevalent practice by which inconvenience to jurors was avoided. Prior to this alteration, if jurors were summoned from any part of England whatsoever, they were bound at least in theory to come up to Westminster (where the king's courts then were) and wait about until the case in which they were summoned came on. The result was that the inconvenience was partially mitigated by the practice of attorneys allowing the action to be pending in Westminster from term to term until such time as the justices were about to go on circuit to the particular co. whence the jurors had been drawn, and then transferring the case to those justices as soon as it was certain they were coming. The Statute of Westminster II. provided that the writ of *venire* should contain words to the effect that the sheriff should command the jurors to come to Westminster on such a day in such or such a term, N. P. (unless before) that day the justices appointed to take assizes should come into the co. in which the cause of action lay. See also ASSIZES.

Nith, Scottish riv., rising about 8 m. S. of Cumnock, Ayrshire, which flows S.E. about 60 m. through Nithsdale to enter the Solway Firth 10 m. S. of Dumfries.

Nithard (A.D. 790-844). Fr. historian, grandson of Charles I. He met his death fighting for Charles the Bald. His *De dissensionibus filiorum Ludovici pi* is a useful hist. of the Carolingian Empire.

Nithsdale, William Maxwell, fifth Earl of (1676-1714), supported the Jacobites in their rising of 1715. He was captured after the battle of Preston, imprisoned in the Tower and condemned to death. His wife devised a plot and secured his escape; he fled to Rome and joined the Elder Pretender. The story of his flight was written by the countess of N., and pub. in the *Transactions of the Society of Antiquaries of Scotland*.

Niton, see RADON.

Nitrates, see NITROGEN.

Nitre, or **Saltpetre**, potassium nitrate (KNO_3); Chile saltpetre is sodium nitrate (NaNO_3). It is found on the ground and impregnating the upper soil in India and Persia; sodium nitrate is found in Chile and Peru. The soil is leached and the pure salt obtained by crystallisation. Potassium nitrate is used in the manuf. of gunpowder, sulphuric acid, and nitric acid, and in medicine as a diuretic and diaphoretic. Sodium nitrate was used for the manuf. of potassium nitrate and sulphuric and nitric acids, and is an important fertilizer. It is now largely made synthetically. N. when heated evolves oxygen and is converted into potassium nitrite.

Nitrian Desert, see NATRON LAKES.

Nitric Acid and Oxide, see NITROGEN.

Nitriding (Nitrogen Case Hardening). method of producing a very hard surface skin on steels by heating in ammonia at 500° C. for periods up to 96 hrs. A surface skin of nitride is formed on all steels by this treatment, but in most cases the skin is brittle. But with special 'nitralloy' steels, containing 1.4-1.7 per cent of chromium and 0.9-1.2 per cent of alu-

minum, the skin becomes intensely hard and firmly adherent. It resists wear and corrosion, and is used for surface hardening of gauges, spanners, gears, etc.; but it is not suitable for resisting severe localized pressure. The nitralloy steels possess mechanical properties comparable with those of a high tensile steel.

Nitrification, process by which organic nitrogenous compounds in the soil are oxidised, the whole or greater part of the nitrogen being converted into nitrates, chiefly of calcium or potassium. It was believed to be a purely chemical process until 1877, when it was discovered to be due to the agency of minute bacteria. The process occurs in two stages, following the action of putrefactive bacteria which produce ammonium compounds; one type of bacteria oxidises these partly into nitrites, and another type completes the oxidation into nitrates. An adequate supply of oxygen and water, darkness, a suitable temp., and the presence of alkaline salts are essential to the process, which is the means by which plant foods are made available for the plants. Leguminous plants are noted for the colonies of bacteria on their roots, which fix atmospheric nitrogen. Hence the agr. practice of ploughing-in a crop of clover, etc.

Nitriles, esters of hydrogen cyanide or prussic acid. They form a series which may be prepared by heating the alkyl halogen compounds with potassium cyanide. The lower members, as methyl cyanide, or acetonitrile (CH_3CN), and ethyl cyanide, or propionitrile ($\text{C}_2\text{H}_5\text{CN}$), are colourless liquids with a somewhat pleasant odour, and are miscible with water. The higher members are insoluble. The N. have corresponding isomers known as isonitriles, carbylamines, or isocyanides. They are poisonous colourless liquids of disagreeable odour. The aromatic N., e.g. $\text{C}_6\text{H}_5\text{CN}$, are also of importance. All N. on hydrolysis with caustic potash yield the potassium salt of the corresponding acid, e.g. $\text{CH}_3\text{CN} + \text{KOH} + \text{H}_2\text{O} = \text{CH}_3\text{COOK} + \text{NH}_3$.

Nitrates, see **NITROGEN Compounds**.

Nitrobenzene ($\text{C}_6\text{H}_5\text{NO}_2$), nitrated derivative of benzene. It is usually prepared by slowly adding to ten parts of benzene a mixture of twelve parts of nitric acid of sp. gr. 1.45 and sixteen parts of concentrated sulphuric acid at a temp. under 40°C . The vessel should be kept moving so as to keep the various constituents in contact, and when all the acid has been added, the mixture is heated to about 80° for half an hour, and then cooled. The N. collects at the top of the vessel, and after separation and washing with water, when it forms the lower layer, it is dried over calcium chloride and distilled. N. is a pale yellow oil with a strong smell of bitter almonds. It has a sp. gr. of 1.2 at 20° , and boils at 205° ; it is very slightly soluble in water. It is used for the manuf. of aniline and benzidine, and for flavouring and perfuming purposes under the name of 'oil of mirbane,' in spite of its poisonous nature. (1:3) metadinitrobenzene is a solid, obtained by using a higher temp. for the nitration. Other Ns. are ortho-dinitro

(1:2), para-dinitro (1:4), and trinitro (1:3:5), which is an explosive.

Nitro-cellulose, or **Gun-cotton**, compound formed by the action of nitric acid on cellulose. The word N. is a misnomer, and should be 'cellulose nitrates.' The chemical constitution of cellulose is itself a matter of doubt, and ordinary gun-cotton probably contains a mixture of nitrates, though $\text{C}_6\text{H}_7\text{O}_2(\text{NO}_2)_3$ is usually given as the formula. N. was prepared by Schönbein of Basle in 1846 by the action of strong nitric acid on cotton. In the modern method a mixture of concentrated sulphuric and nitric acid is employed, the idea being that the nitric acid is maintained in an anhydrous state in solution in the sulphuric acid, and that there is always sufficient excess of sulphuric acid to take up any water which may be produced during the reaction. Attempts were made to utilise gun-cotton as an explosive, but without success until it was produced in the form of a colloid by the action of certain solvents, as acetone (see **CORDITE**). The lower nitrates of cellulose are used in the preparation of artificial silk and of celluloid. The danger arising from the inflammable nature of nitrated cellulose in films for cinematograph purposes has led to the employment of other cellulose compounds, with some measure of success. Collodion is a mixture of the lower nitrates with alcohol and ether. See **CELLULOSE**; **COTTON**; **PYROXYLIN**.

Nitro-compounds, or **Nitro-derivatives**, those compounds which contain the

compound radicle $\text{N} \begin{smallmatrix} \nearrow \text{O} \\ \searrow \text{O} \end{smallmatrix}$ (as opposed

to the grouping $\text{O} \begin{smallmatrix} \nearrow \text{N} \\ \searrow \text{O} \end{smallmatrix} = \text{O}$ in the nitrites) directly attached to a carbon atom. When an aromatic compound such as benzene is treated with nitric acid of sp. gr. 1.3 to 1.5 at ordinary temps., a mononitro-compound is usually produced; and, generally speaking, the more concentrated the acid and the higher the temp. employed, the larger will be the number of NO_2 groups introduced into the molecule. The product is in such cases a mixture of dinitro and trinitro derivatives. The concentration of the acid is usually effected by mixing the nitric with a larger proportion of concentrated sulphuric acid, which effectively absorbs the water produced in the reaction, and maintains the nitric acid in a concentrated condition. The N. are for the most part yellow, stable, crystalline substances, only slightly soluble in water, but readily soluble in alcohol, ether, etc. The higher N. such as nitric acid and T.N.T. can be detonated and form widely used high explosives. With various reducing agents, as tin, with hydrochloric acid, N. are converted to amino-compounds, thus nitrobenzene ($\text{C}_6\text{H}_5\text{NO}_2$) is converted into aminobenzene or aniline ($\text{C}_6\text{H}_5\text{NH}_2$). The N. of the aliphatic bodies are obtained by the action of silver nitrite on an alkyl halide, and only very rarely (e.g. with octane) by the action of nitric acid on the hydrocarbon.

Nitrogen, non-metallic chemical element, symbol N, atomic number 7, atomic weight 14.008 (Fr. *azote*, without life). At ordinary temps. it is a gas, and occurs in an uncombined state in the atmosphere, forming approximately 78.1 per cent of air by volume. It also occurs combined with other elements in animal and vegetable substances; in various minerals as ammonium salts; in the form of nitrates in Chile saltpetre and other deposits found in the soil. The gas is colourless, tasteless, and odourless; it is slightly soluble in water, to a less degree than oxygen; it is slightly lighter than air. Liquid N. boils at -194°C . and solidifies to a white body at -214°C . N. was discovered as a constituent of the atmosphere by Rutherford in 1772. It was recognised as an extremely inert gas, and all attempts to bring about direct combination with other substances for a time failed. In 1785 Cavendish showed that N. combined with oxygen in the neighbourhood of an electric spark discharge. This method was used by later investigators, and in 1894 Lord Rayleigh demonstrated the presence of argon in the atmosphere by causing all the N. in a sample to be combined in this way. In 1892 Sir Wm. Crookes showed that the electric arc caused the formation of a N. and oxygen compound. This has been put to commercial use.

The artificial production of N. compounds derives its importance from the part played by N. in vegetable life. N. does not constitute a large proportion of the elements contained in vegetable matter; but it is a very essential constituent, and, as far as is known, most plants are unable to utilise the N. of the atmosphere directly. The N. used in building up the tissues of plants is contained in the soil in the form of nitrates, ammonium compounds, etc. These nitrates may owe their existence, in part, to the activities of certain micro-organisms which have the power of causing the combination of atmospheric N. Under ordinary circumstances cultivated land uses up the nitrates thus formed more rapidly than they can be replaced, so that the N. supply has been a problem to the agric. world. Experiments have been successfully made in the direction of cultivating bacteria of peculiar effectiveness as regards production of nitrogenous compounds, but the usual method is to dress the soil with manures consisting largely of nitrogenous material. The main source of nitrogenous manure was for long the natural deposits found in vast quantity in parts of N. and S. America, particularly Chile and Peru. The continued exportation of these nitrates gave rise to the apprehension that they would quickly become exhausted, and Sir Wm. Crookes predicted that this would happen in about 100 years. It therefore became of supreme importance that some technical method should be worked out for the solution of the problem. In wartime it is of obvious significance that a country must be capable of producing sufficient supplies of N. compounds such as nitric acid, if it is to be inde-

pendent of outside help. Indeed it is often said that the Gers. did not declare war in 1914 until they had perfected their method of making N. compounds from the air (see NITROGEN, FIXATION OF). Whatever the truth of the matter, Germany was in a position to be independent of outside supplies of nitrates when that war commenced.

N. is usually obtained from the atmosphere by removing the oxygen. This may be done by passing a current of air over copper heated to redness, by burning phosphorus in a confined volume of air, or by the action of an alkaline solution of pyrogallol on air. It may also be prepared by passing a current of chlorine through excess of ammonium hydroxide, or by heating ammonium nitrite or a mixture of ammonium chloride and sodium nitrite. But perhaps one of the soundest methods is by the fractional distillation of liquid air. The gas obtained by removing the oxygen from atmospheric air contains argon and small quantities of other gases besides N. All of these gases are so inert chemically that they can only be separated with difficulty. Chemically N. is inert, on the whole, but it will combine with magnesium to form a nitride, and with calcium. In 1910 Strutt demonstrated that an electric discharge from Leyden jars acted upon a low pressure current of N. in such a way as to produce a continuance of the glow after the gas had passed the region of the discharge. The 'active nitrogen' produced in the change is capable of bringing about various changes which ordinary N. cannot do. It combines with nitric oxide to form N. peroxide, with mercury to give a nitride, and it possibly consists of single atoms. All attempts to liquefy it have failed. This luminous gas also converts ordinary phosphorus into red phosphorus, while sodium and mercury combine with the gas when heated within it.

Compounds.—N. forms with oxygen five oxides: nitrous oxide (N_2O), nitric oxide (NO), N. trioxide (N_2O_3), N. dioxide (N_2O_4), and N. pentoxide (N_2O_5). Nitrous oxide (N_2O), or 'laughing gas', is prepared by heating ammonium nitrate. The oxide is a colourless gas with a pleasant odour and taste. It condenses at 15°C . under a pressure of 40 atmospheres. It is soluble in water, is easily decomposed by heat, and resembles oxygen in supporting combustion, but it can be distinguished from the latter gas by mixing it with nitric oxide, when no brown N. dioxide is formed. It has marked anæsthetic properties, and is used in dental practice to a great extent. There is a corresponding oxyacid, hyponitrous acid ($\text{H}_2\text{N}_2\text{O}_2$), forming salts called hyponitrites, of which the silver salt is most usually prepared. Nitric oxide (NO) is prepared by the action of dilute nitric acid on copper, or by the action of sulphuric acid on a mixture of potassium nitrate and ferrous sulphate. It is a colourless gas which readily combines on admixture with oxygen, forming reddish-brown fumes of N. dioxide. It is only sparingly soluble in water. It can be

converted into a liquid boiling at -153.6°C . and into a solid which melts at -187°C . The gas combines with ferrous sulphate to form an addition product which is easily decomposed by heat. This is the basis of a common test for a nitrate. Thus if a nitrate is dissolved in water and a crystal of ferrous sulphate is added and shaken up until dissolution takes place, then on tilting the tube and gradually pouring in strong sulphuric acid, a brown ring appears at the junction of the two liquids. N. trioxide (N_2O_3) is prepared by decomposing a nitrite with sulphuric acid. It is a very unstable compound, and the gaseous form is probably a mixture of nitric oxide and N. tetroxide. At low temps. it condenses to a blue liquid. It is the anhydride of nitrous acid, which is also an unstable body, readily decomposing into nitric acid and nitric oxide. Nitrous acid forms salts called nitrites, which are all soluble in water, and give off reddish fumes when heated with a warm mineral acid. N. dioxide, or tetroxide (N_2O_4), is formed by the direct combination of nitric oxide with oxygen, and the condensation of the reddish-brown fumes. The liquid is colourless at low temps., but darkens in colour as the temp. rises. The behaviour of this body furnishes a good example of dissociation, a reversible thermal change. Bodies which burn with sufficiently high temps. to decompose the gas will continue to burn in it. Water decomposes N. peroxide with the production of nitrous and nitric acids at low temps., and of nitric acid and nitric oxide at high temps. N. pentoxide (N_2O_5) is a white crystalline solid obtained by the action of phosphorus pentoxide on nitric acid at a low temp. At 30°C . the crystals melt to form a yellowish liquid which tends to decompose at higher temps. N. pentoxide is very readily soluble in water, forming nitric acid, which forms salts called nitrates. Nitric acid is a colourless, fuming liquid with a powerful oxidising action. It readily chars dry organic matter and attacks metals, forming the nitrates or the oxides. The nitrates are all soluble in water and decompose at high temps. N. forms with hydrogen the compound ammonia (NH_3) (q.v.), which was at one time supposed to be the oxide of a metal ammonium. No such metal exists, however, and the ammonium salts are derived from a radicle (NH_4), which behaves chemically in much the same way as the alkaline metals: sodium potassium, etc. Hydrazine N_2H_4 is another compound, as is N_2H hydrazoic acid. N. trichloride (NCl_3) is obtained by the action of chlorine on ammonium chloride. It is a volatile yellow oil, irritating to the mucous membrane, and is very explosive. Nitrosyl chloride (NOCl) is obtained by the combination of nitric acid and chlorine. It is an orange-coloured gas which is readily liquefied. N. sulphide (N_2S_4) is obtained by the action of ammonia on sulphur chloride. It is an orange-coloured crystalline solid, melting at 178°C . See also CYANAMIDE.

Nitrogen Case Hardening, see NITRIDING.
Nitrogen, Fixation of. Any process

whereby elementary N. is converted into useful N.-containing compounds, particularly those connected with artificial manures, explosives, nitric acid, and ammonia.

(1) Under the action of an electric discharge, N. and oxygen in air combine to a small extent.

$\text{N}_2 + \text{O}_2 = 2\text{NO} - 43,000 \text{ gm.-calories.}$
 Technical methods utilise this reaction.

In the Birkeland-Eyde process (formerly used in countries where electricity is cheap, e.g. Norway), an electric arc passing between water-cooled copper electrodes (alternating current at 5000 volts pressure)

I.C.I.

FIXATION OF NITROGEN: COMPRESSION PLANT OF THE BILLINGHAM AMMONIA SYNTHESIS PROCESS

The compressors shown are of the reciprocating type: those at the right raise the pressure of the gases used for ammonia production to fifty atmospheres, and those on the left complete the compression stage by further raising the gas to 250 atmospheres.

is spread out into a circular sheet of flame by the action of a strong magnetic field. Air is forced into the furnace containing the electrodes and leaves at a temp. of about 1000°C ., after which it is cooled quickly, passes into chambers where the oxidation $2\text{NO} + \text{O}_2 = 2\text{NO}_2$ (about 1-1.5 per cent of air converted) goes on, and thence to granite towers packed with quartz, down which water trickles,

The nitric acid produced is either kept as such, or converted into calcium nitrate. The remaining nitric oxide is largely absorbed in towers containing alkali, but some is lost. In the Pauling process

(Italy and Austria) the hollow, water-cooled electrodes are inclined at right angles, and the sheet of flame spreads up between them, whilst the Schönherr process utilises a long arc along which the air streams with a whirling motion. All these methods are now obsolete, having been replaced by (2).

(2) *Ammonia Production.* In the Badische process steam and air are passed over hot coke, and the resulting gases subjected to a catalytic process, whereby carbon monoxide is converted into carbon dioxide. The mixture is compressed in stages to 200 atmospheres (the Claude process uses 1000 atmospheres), and carbon dioxide removed by water, traces of carbon monoxide and poisons being removed later. The pure gas (a mixture of N. and hydrogen 1 : 3 by volume) is led into steel converters containing catalysts (e.g. iron) and promoters (e.g. molybdenum) at a temp. of nearly 600° C., when the change goes on

$N_2 + 3H_2 \rightleftharpoons 2NH_3 + 24,000 \text{ gm.-calories}$ to about 8 per cent. The ammonia in the issuing gas is washed and removed, or converted into ammonium sulphate by the action of carbon dioxide and anhydrite suspension. Many details are kept secret. Sometimes electrolytic hydrogen is used.

(3) *Formation of Nitrides, etc.* Serpek's process utilised the action between alumina and coal heated in a current of N. 1800–1900° C.

with catalysts like copper. Rotating cylinders are employed for the mixing. With water the nitride forms ammonia. Calcium cyanamide ($CaCN_2$). Calcium carbide (q.v.) made on the spot is finely pulverised, mixed with lime and heated in steel cylinders electrically to 1000° C., when pure N., made by the distillation of liquid air is introduced. One ton of N. is fixed by the expenditure of 115 kilowatt-hours. The product is cooled, sprayed with a little water to remove carbide, and is known variously as lime N., calcium cyanamide, nitrolim, kalkstickstoff. It yields ammonia, especially when heated with water in an autoclave. Some plants (leguminous) can fix N. directly.

See J. Knox, *Fixation of Atmospheric Nitrogen*, 1921; J. R. Partington and P. H. Parker, *Nitrogen Industry*, 1922; F. Ernst, *Fixation of Atmospheric Nitrogen*, 1928; T. P. Hilditch, *Catalytic Processes in Industry*, 1929; and T. P. Hilditch and C. C. Hall, *Catalytic Processes in Applied Chemistry*, 1937.

Nitrogen Peroxide, see NITROGEN, Compounds.

Nitro-glycerine ($C_3H_5(ONO_2)_3$) or more correctly 'glyceryl trinitrate,' was produced first by Sobrero in 1846 by the action of nitric acid on glycerol. Nobel introduced it into the manuf. of explosives. It is prepared by mixing twelve parts of fuming nitric acid with twenty parts of sulphuric acid and forcing a spray of four parts of glycerol through the mixture, which is kept cool by a current of air. The mixture is allowed to stand, when the

N. forms a layer on the surface. This layer is run off into water, from which it separates as a heavy oil. It is then treated with sodium carbonate to free it from acid, and then dried by filtering through felt covered with a layer of salt. It is a heavy, colourless liquid, which solidifies at 8° C., sp. gr. 1.6. It is very poisonous, and has a sweetish, burning taste. Sometimes it is used in medicine. If touched by a flame it simply burns, but if heated in a confined space it explodes violently. In the form of a liquid there are many dangers associated with the use of N. To obviate these, as well as to increase its explosive force, Nobel invented *dynamite*, in which N. is absorbed in *kieselguhr*, a fine, siliceous earth. The mixture is pressed into cartridges and fired by a detonator. Many other explosives (e.g. blasting gelatine, cordite) are simply made by mixing N. with various absorbent materials. On saponification by means of alkalis it gives rise to glycerol, a fact which indicates its real structure.

Nitrolim, see KALKSTICKSTOFF.

Nitro-sulphuric Acid ($H(NO)SO_4$) is obtained as an intermediate product in the commercial manuf. of sulphuric acid. It is produced by the interaction of sulphur dioxide, nitrogen peroxide, and water. It is a white crystalline compound which is decomposed by excess of water, forming sulphuric acid and a mixture of nitric oxide and nitrogen peroxide.

Nitrosyl Chloride, see CHLORO-NITROUS GAS.

Nitrotoluenes. The nitration of toluene (q.v.) leads to the formation of a mixture of ortho (1.2) and para (1.4) Ns., $CH_3 \cdot C_6H_4 \cdot NO_2$, which can be separated by fractional distillation. The ortho-compound is a liquid which solidifies at -10.5° C. and boils at 218° C., while the para-compound is a solid melting at 54° C. and boiling at 234° C. They are both employed in the colour industry. Meta-N. is obtained from paratoluidine by converting it first into its acetyl derivative and then nitrating the latter. The resulting meta-nitro-para-aceto-toluidine on hydrolysis and diazotisation in alcohol yields meta-N., a solid which melts at 16° C. and boils at 230° C. There are a number of dinitrotoluenes, $CH_3 \cdot C_6H_3(NO_2)_2$, the most important being the (1.2.4) compound obtained by the further nitration of toluene. Trinitrotoluene, or T.N.T., is used as a powerful explosive (q.v.), and is obtained by the nitration of toluene. The formulae of the bodies mentioned are

Nitrous Acid, *see* NITROGEN.

Nitrous Ether, or Ethyl Nitrite ($C_2H_5NO_2$), is a colourless liquid (sp. gr. 0.947 at 15°; boiling-point 17° C.) with a pleasant fruity odour like apples. It is usually prepared by distilling a mixture of alcohol and sulphuric acid with copper and nitric acid. It is insoluble in water, is hydrolysed by boiling water and dilute alkalis, and is a component of the 'sweet spirit of nitre' used in medicine.

Nitrous Oxide, *see* LAUGHING GAS; NITROGEN, *Compounds*.

Nits, *see under* LICE.

Nitti, Francesco Saverio (b. 1868). It. politician and economist, was b. at Melfi in Potenza. Formerly prof. of science of finance at Naples Univ., he was Liberal deputy from 1904 to 1922, and minister of commerce and agriculture in the Cabinet of Giovanni Giolitti, the Piedmontese bureaucrat, from 1911 to 1914. As a friend of Giolitti he has always shared the latter's unpopularity with the parties of the left, but after the disaster of Caporetto in Oct. 1917, he formed a new gov., with Orlando as Premier, the latter also being a friend of Giolitti, whose governmental machinery, rightly or wrongly, was condemned in 1915. N. was minister of finance in Orlando's gov., 1917-19. Following the victories of Diaz in the First World War, N. became Prime Minister and minister of the interior, 1919-20. After the war he was succeeded by Giolitti, whose return to power has been regarded as a major cause of the national catastrophe of Fascism. N. lived in France throughout the dictatorship of Mussolini, but after the Second World War he returned as a leader of the National Democratic Union. His political sympathies seem to lie between Liberalism and neo-Fascism, hence the almost pathological reaction of the parties of the left when the right, after the war, urged the employment of the ripe experience of such men as N., Orlando, or Bonomi in resolving the country's political confusion, since in the eyes of the left wing parties these ageing statesmen will always bargain some form of Fascism back into authority. In the days immediately preceding the meeting of the Constituent Assembly in 1945-46 the working classes were opposed to N. and other pre-Fascist ministers, and they criticised N.'s financial *modus vivendi* with America, but N. received strong support from Giannini's notorious *L'Uomo Qualunque* ('The Ordinary Man'), which attributed Italy's post-war political difficulties to the Comitato di Liberazione Nazionale political parties and called for an administrative state instead of a political state, by which Giannini meant a state without parties and governed by technical experts like Orlando and N. (*See further under* ITALY, *History*.) Pubs. by N. include: *Europa senza pace* (1921); *The Decadence of Europe* (1922); and *L'Inquietude du monde* (1934).

Niue, coral is. in the S. Pacific Ocean, in lat. 19° 10' S. and long. 169° 47' W. It is 14 m. long and 10 m. wide. It was annexed, together with the Cook and other

S. Pacific Is., to New Zealand in 1901. There is a resident commissioner, and laws, etc., are the same as for Cook Is. Straw-plaiting is one of the chief occupations, and hats, bananas, copra, baskets, and kumaras are exported. At Alofi, the seat of the administration and the port of the is., is a wireless station. Area 100 sq. in. Pop. 4300.

Nivelle, Robert George (1856-1924). Fr. general, studied at the École Polytechnique. He commanded the Eleventh Army, later becoming commander-in-chief of the armies of the N., and N.E. A former member of the Conseil Supérieur de la Guerre, in the First World War he first came to the fore at Verdun in 1916. In May 1916 he resisted the efforts of the Gers. to overwhelm Fort Vaux, but ultimately both that fort and Douaumont (q.v.) fell. In Oct.-Nov., however, he launched a successful counter-attack on the E. bank of the Meuse, recovering both places, together with Dambloup, though it is commonly stated that the actual operations were conducted by Gen. Mangin (q.v.). Later in the same year Joffre was made a marshal of France, and N. was made commander-in-chief in his stead. During the general Ger. withdrawal in March 1917 to the Hindenburg line (q.v.) N. conceived the bold plan of a 'decisive blow' and, abjuring the method of attrition, made preparations for a combined assault of all his armies from the Aisne heights from W., S., and S.E., the most ambitious effort since the battle of the Marne of 1914. But he failed utterly, and a strong reaction set in against him, his methods being unfavourably contrasted with the more cautious Fabian strategy of Pétain and Foch (q.v.). The result was that the post of chief of the general staff in Paris was revived, and Pétain was appointed to fill it, the step being a mere formality to Pétain's eventual appointment to succeed N. as commander-in-chief of the Fr. armies, while Foch took Pétain's place at the Ministry of War. *See* F. E. A. Hellot, *Le Commandement des généraux Nivelle et Pétain* 1917.

Nivelles (Flem. Nijvel), city of Belgium, in the prov. of Brabant, 18 m. S. of Brussels. It has important railway works, and munifs. of paper and iron furniture. There are also steel works, copper foundries and mills. The fine Romanesque church of St. Gertrude, dating from the eleventh century, was heavily damaged in May 1940 when the centre of the city, with about 470 houses, was totally destroyed. Pop. 11,900.

Niven, Frederick John (1878-1944), Scottish writer of poems and songs, novels, and books on Canada, was b. at Valparaiso. Educated at Hutchesson's grammar school and Glasgow School of Art. He served in the Ministry of Information during the First World War. His works include *Hands Up* (1915); *Sage-Brush Stories* (1917); *Justice of the Peace* (1923); *Canada West* (1930); *The Paisley Shawl* (1931); *Mrs. Barry* (1933); *Triumph* (1934); *The Maillands* (1939); *Mine Inheritance* (1940); *Prelude to Victory* (1941). One of

his best novels of Canada is *The Flying Years*, a slow-moving story which tells of the development of the W. on the threshold of the twentieth century.

Nivernais, former prov. in the centre of France, nearly coinciding with the modern dept. of Nièvre. It was ruled by the counts of Nevers in the Middle Ages, and was created a duchy by Francis I. Its cap. was Nevers, which was included in it to the Merovingian period. The N. canal joins the Yonne and Loire rivers, and was constructed in 1784-1842.

Nix and **Nixie**, in Teutonic mythology, male and female water sprites, for the most part malignant. They were represented as of human form, and frequently mixing with mortals, particularly in music and dancing. See also **DEMONOLOGY**; **NICKER**. See K. Heckscher, *Die Volkskunde des germanischen Kulturkreises*, 1925.

Nizam, title of the sovereign of Hyderabad.

Nizhni-Tagilsk, see **NIJNI-TAGIL**.

Nizhniy-Novgorod, see **GORKY**.

Nizza, see **NICE**.

N.K.V.D., **Narodni Komissariat Vnutrenniih Del** (People's Commissariat for Internal Affairs), name of the Russian secret police from 1938 to 1945. After the 1917 revolution the tsarist Ochrana was restored by Lenin as the Cheka, which in its turn, in 1923, was reorganised and renamed G.P.U. (Ogpu). This was developed into an elaborate organisation with great influence in many branches of Russian life and society, and its work was continued when, after the 1936-38 purges, it was renamed the N.K.V.D. and put under the control of Lavrenti Beria. After the Second World War the People's Commissariats were renamed ministries, and the N.K.V.D. was divided into the M.V.D. and the M.G.B., both under the ultimate control of Beria, and sharing between them, in proportions impossible to define, the work of the N.K.V.D. See further under **M.V.D.**

No, or **No-Amon** (Egyptian *nu-aa*, the large city, or *nu-Amen*, Amon's city), city in Egypt known to the Gks. as Thebes, and surviving to modern times in the ruins at Karnak and Luxor. Founded in remote antiquity, N. became prominent when from it sprang the eleventh dynasty; it was less prominent again till the time of the eighteenth dynasty, and thereafter to the twentieth. It was the prin. centre of the worship of Amen, regarded as the equivalent of the Gk. Zeus; hence its name Net-Amen, of which the later Gk. 'Diospolis' was a trans. The more anct. Gk. 'Thebes' seems to have been an adaptation of *Tape*, the 'head' or 'capital.' See further under **THEBES**.

Noah, son of Lamech, is described in the Book of Genesis as the head of the family that survived the Deluge, and hence as the patriarch of mankind after his time. In Gen. vi.-ix. he is credited with the invention of wine. For the story of the Deluge, see **DELUGE**.

Noah, the Book of, lost Heb. work which has, however, been largely incorporated into the Ethiopic Book of Enoch and the Book of Jubilees. From these we learn

that it dealt with the birth and life of N. It must not be confused with the late Heb. work of the same name and partly based on it, given in Jellinek's *Bet ha-Midrash*.

Noah's Dove, see **COLUMBA NOACHI**.

Noailles, name of a noble Fr. family which dates from the eleventh century, the chief members of which are: **Antoine de** (1504-62), appointed admiral of France in 1547, and ambas. to England from 1553 to 1556. **François de** (1519-85), a diplomatist, a brother of Antoine; was ambas. to Venice, Constantinople, and London. **Anne Jules** (1650-1708), took part in the siege of Maestricht in 1673, persecuted the Protestants in Languedoc, and became marshal of France in 1693. **Louis Antoine** (1651-1729), became archbishop of Paris in 1695, and cardinal in 1700. He opposed the bull 'Unigenitus' in 1713, for which he was expelled from the court, but he accepted it in 1728. **Adrien Maurice** (1678-1766), served in the Sp. war, 1705-1711, in the wars in Germany, and in those in Italy. He was defeated at the battle of Dettingen in 1743, but distinguished himself at Fontenoy in 1745. **Philippe** (1715-1794), became marshal of France, and served in Germany and Flanders. He and his wife, who was nicknamed 'Madame l'Étiquette' by Marie Antoinette, were guillotined. **Louis Marie** (1756-1804), a general and politician. He served under La Fayette in America, and when he was appointed a member of the Military Committee he drew up a plan for the reorganisation of the army. He also proposed that titles should be abolished. He was made brigadier-general in San Domingo, but was killed in an attempt to capture an Eng. ship off Cuba. **Paul** (1802-85), a politician and author, became a member of the Acad. in 1849, and pub. *Histoire de la maison royale de Saint-Louis établie à Saint-Cyr* (1843), and *Histoire de Madame Maintenon et des principaux événements de son règne de Louis XIV* (1848). **Jules Charles Victorien** (1826-95), an author, wrote works on economics, and contributed to the *Revue des Deux Mondes*.

Noailles, Anna, Comtesse de (1876-1933), Fr. poetess, b. in Paris, on her father's side a Rumanian, a Bibesco, of one of the ruling families of Wallachia; on her mother's side descended from Gk. aristocrats; by her marriage a member of Fr. aristocracy. Her poems are musical, personal, and often exotic and mystical. In 1901, after her marriage, she pub. her first vol. of verses, many of which had been written when she was only sixteen. It was called *Le Cœur innombrable*, had an immediate success, and was crowned by the Fr. Academy. Other well-known books of poems are *L'Ombre des jours* (1903), and *Les Vivants et les morts* (1913). *L'Honneur de souffrir* was pub. four years after the death, in 1923, of Maurice Barrès, one of her greatest friends. Her autobiography appeared in 1931. See lives by G. A. Masson, 1924; J. Larnac, 1931; and M. Bordy, 1939.

Noakhali, dist. of E. Bengal, Pakistan, in the Chittagong div. The cap. is Sud-

haram. The chief exports are rice, betelnuts, linseed, and hides. Area 1644 sq. m. Pop. 1,150,000.

Nobel, Alfred Bernhard (1833-96), Swedish engineer and chemist, was b. at Stockholm. In 1842 he went to St. Petersburg with his family, and studied the construction of torpedoes and marine mines with his father. In 1859 he returned to Sweden and devoted himself to the study of explosives, especially the utilisation of nitro-glycerine. In 1867 he discovered and patented the explosive mixture known as dynamite. A few years later he produced ballistite or smokeless powder. From his various other inventions and discoveries and the exploitation of the Baku oil-fields, he amassed a large fortune. At his death he left the bulk of it in trust for five ann. prizes, to be awarded without distinction of nationality or sex, for eminence in physics, chem., physiology or medicine, literature, and to one who rendered the greatest service to promote international peace. *See* lives by H. Schuck and R. Sohlman, 1933, and Herta M. Pauli, 1948.

Nobel A. M. Prizes, prizes awarded, by the Swedish Academy of Science for physics and chem.; by the Stockholm Faculty of Medicine, for medicine or physiology; by the Swedish Academy of Literature, for literature; and by a committee elected by the Norwegian Legislative Assembly, for peace. The prizes, which amount to about £8000 each, are awarded from the income of a capital sum of £1,750,000 left on trust by the Swedish scientist, Alfred N. (*q.v.*). This fund is administered by a board of directors chosen by the prize-awarding bodies above noticed, the president of the board being appointed by the Swedish Gov. Undistributed prize money reverts to the main fund or is reserved for each section. Mme Curie is the only case of an award of two prizes to one individual. The following lists show the winners of the various prizes, from 1901 to 1919.

Nobile, Umberto (b. 1885), It. aviator and aeronautical engineer, was b. at Avellino. He became director of the dept. for aeronautical design and designed the dirigible *Norge* which made the successful Rome-Alaska trans-Polar flight in the Amundsen-Ellsworth-N. expedition of 1926. N. led the *Italia* airship expedition which flew to the North Pole but was wrecked off North East Land, and rescued by a Russian ice-breaker (1928). Appointed deputy chief of Soviet airship construction, by permission of the It. Gov., he was recalled in 1931. He was appointed prof. of aeronautical construction at Naples Univ., and became a member of the Pontifical Academy of Sciences. He wrote *L'Italia al Polo Nord* (1930). See F. Behounek, *Sieben Wochen auf der Eisscholle*, 1929.

Nobile Officium, term in Scots law which is practically equivalent to the Eng. equity. The Inner House alone exercises the jurisdiction except in cases where petitions are required by statute to be presented to the junior Lord Ordinary. Instances of its exercise are: (1) Petitions for the custody of children; (2) applications to settle schemes for the administration of charitable trusts; (3) applications to supply omissions in deeds. See Erskine, *Principles of the Law of Scotland*, 1895, and J. Bell, *Dictionary and Digest of the Law of Scotland*.

Nobility. It is difficult to define N., because the term connotes different qualities and privileges with different nations, and even with the same nation at different periods. N. does not necessarily imply titles, though at the present day it would be a violation of conventional ideas to speak of any one as a noble who had no title, e.g. Article I. of the U.S.A. Constitution contains a provision against the grant of any title of N. The Eng. baronial N. differed in important essentials from the N. of the Continent, whether of France, Germany, or the medieval republic of Venice. Stubbs points out (*Constitutional History*) that 'the great peculiarity of the baronial estate in England, as compared with the Continent, is the absence of caste,' because in the Eng. system 'the theory of nobility of blood as conveying political privilege has no legal recognition.' This dictum, however, must be understood with the important reservation that Eng. peerages may become extinct or fall into abeyance, but so long as there is an heir to the title that heir is *ipso facto* an hereditary counsellor of the Crown or member of the House of Lords. The only difference, therefore, between the Eng. and the continental theory is that, whereas in the former one member only (the eldest son or next heir) of a family is noble in the sense of being a member of the peerage and an hereditary counsellor, in the latter the whole kin of certain families enjoyed political privileges from the fact of descent from an oligarchic aristocracy, and were therefore accounted noble.

History.—Though political privilege is the mainspring of N., a brief survey of the three types of N., classic or ant., medieval, and modern, will reveal striking differences of origin and development. The types to be discussed are the patriciate of ant. Rome, the aristocracy of Greece, the N. of the Venetian republic, and the feudal aristocracy of England and their modern representatives.

The early Rom. patriciate, which was synonymous with the *populus* or original people of Rome, was based upon an eponymous ancestry (Romulus, founder of Rome) and upon the fact that the privileged members of the *gentes* were descendants of those who first occupied the hills of ant. Rome. Later, when it was shorn of its political privileges, the patriciate retained its spiritual or religious significance, because none but the members of a clan or *gens* could participate in the *sacra* proper to the *gens*, and because from very early in the hist. of Rome certain

offices like those of the *flamens* (q.v.) always went to a patrician.

If any sort of generalisation be possible in the social distinction of a state so full of contradictions and seeping anomalies as auct. Athens, it is that the Athenian N. of the period prior to the Dorian invasion furnished a close parallel to the Rom. *populus*, being tribal in its genesis, and claiming precedence from an original occupancy of the soil; but that thereafter, in the heyday of the *demos*, when the *εὐπατρίδαι* had lost all their political privileges, there was no N. in the true sense at all. But when the Dorians conquered the Peloponnesus, there was an influx of wealthy families and noble immigrant families like the Pisistratidæ and Alcmeonidæ outshone the old Athenian tribal N. in the eyes of the common people and from that time the old military N. of Athens gave place to an aristocracy of wealth.

The hereditary N. of the republic or signory of Venice traced its origin to no original occupancy, nor boasted a descent from a common founder of the race as distinct from past holders of office. The N. of Venice sprang conclusively from a commercial plutocracy and gradually usurped and retained all the political power in the republic until the Church vindicated the rights of the lesser orders (see also MUNICIPALITIES).

The Eng. N. of the Conquest and the Middle Ages was essentially feudal and military, and based upon the solid foundations of landed estates. Like that of the feudal N. of the Normans and Gers., its origin is to be sought in the personal relationship of lord and vassal, and in the system of commendation by which the lord, in return for the allegiance and personal services (generally military or incidental thereto) of his vassal, gave or 'loaned' him land and guaranteed a reciprocal protection. The modern N. of England resembles the old feudal N. in no other respect now than in the fact that it may possess landed estates; but for the rest the Brit. N. consists of a heterogeneous body of peers, some with patents entitling them to sit in the Upper House and some without, and baronets and knights, the great majority of whom possess titles of recent creation, awarded for political or other public services. Only a few of the existing Eng. peerages go back before the time of Wm. Pitt the younger, who himself created over one hundred.

Theory of Nobility.—The theory of N. is biological, and based on the principle that selected stocks should be given opportunity and encouragement to develop and reproduce those qualities which are (a) most desirable in the higher administrative spheres; (b) difficult to acquire without leisure and economic independence; (c) lost again in a few generations of unfavourable environment.

In England emphasis is laid on lineal descent joined to wealth, and intensified environmental training in public schools.

In Scotland and on the Continent less importance has been attached to the environment factor and more to matrimonial discrimination, or 'proof of

nobility' (*preuves de noblesse*), i.e. 'sixteen quarterings' (sixteen great-great-grandparents, or eight great-grandparents) of the individual. The continental N. has always tried to maintain itself as a privileged caste, which has brought it into conflict with the bourgeoisie and proletariat. The Eng. system has been to maintain the peers and their immediate children as a high N. and to sink their junior descendants into a 'middle class.' The Scottish system also has been to sink the junior members of its N. into the mass of the people; but to encourage even the poorest to retain their pride of race and sense of kinship to the chief or chieftain, whilst titles, etc., are regarded as reflecting credit, not merely on the holder, but on the whole clan.

British Nobility.—The term is used in two senses: (1) The 'gentle' classes, true equivalent of the continental *noblesse*, in which knights and baronets, and indeed younger children of peers, are included. In Britain, as on the Continent, the 'proof' of N. (*anglice* 'gentility') is lawful possession of armorial bearings, or paternal descent from an ancestor whom the Crown has either 'ennobled' by such a grant or recognised as already noble (*ur-adel* on the Continent). In England Henry V. definitely laid down that arms are 'tokens of nobility.' In Scotland non-nobles are prohibited by statute from bearing arms, but may be ennobled by grants of same; (2) N. in a restricted sense is applied to peers and their wives (sometimes children), who are equivalent to the *hoch adel* of the Continent. This peerage, or 'high nobility,' consists of the peerages of England and Scotland (created before 1707), of Ireland (created before 1800), and of Great Britain (1707–1800) and of the United Kingdom (since 1800). Each series consists of five degrees, (1) Duke, (2) Marquess, (3) Earl, (4) Viscount, (5) Baron, who differ in rank, but not as to privileges, except that peers of Scotland and Ireland elect sixteen and twenty-eight representatives of their order who, along with all peers of England, Great Britain, and the United Kingdom, form the 'Lords Temporal' of Parliament. The two archbishops and older bishops of the Church of England form the 'Lords Spiritual.' Unelected Scots and Irish peers, and peeresses in their own right, are members of the peerage, but not 'Lords of Parliament.' All peerages are hereditary (usually descending to the heir male of the body of the grantee) except the 'Law Life Peers' or Lords of Appeal, distinguished lawyers raised to the peerage for life to act as judges in the House of Lords.

A dukedom is the first grade of N., but archbishops, the moderator of the Church of Scotland, the Prime Minister, as such, and certain officers of state (including the Lord Chancellor) have precedence. 'Duke' is derived from *dux*, which among Saxons and Romans meant leader of an army. Being the highest dignity at the Crown's disposal, dukedoms have always been sparingly granted. Apparently the whole order became extinct in the reign of Elizabeth, but was revived by James I.,

who ennobled his favourite, George Villiers, as the duke of Buckingham. Many of the present dukes are princes of the blood royal. Marquises, too, exhibit a like conservatism in numbers. Now (and in Britain always), a mere title of honour, it originally denoted those great barons of the empire who held fiefs on the *marches* or borders. *Earls* are created comparatively often; the term 'earl' (or 'earl', a Dan. title which about the time of Ethelred began to supersede that of 'ealdorman,' the chief magistrate of the shire in A.-S. times) denoted the head of a shire. The expression 'belted earl' arises from the mode of investiture of an earl, a belt with sword being buckled round the waist. The next degree, 'viscount,' is derived from *vicecomes*, i.e. the sheriff who presided in the co. court. Barons form the lowest grade of peers; anciently, they were those churchmen or laymen who held land of the king *per baroniam*, i.e. held by honourable service as feudatories of a prince; this still constitutes 'barony' and confers certain privileges in Scotland, without constituting a peerage. Baron or lord-baron is the most general title of N. in England. It was early decided that the fact of holding *per baroniam* did not necessarily give the right to be summoned by writ to the House of Lords. In Scotland the 'minor barons' were exempted from attendance in 1887, whilst the 'greater barons' remained as peers. Peers are created: (1) By writ of summons. Such peerages are not complete until the person honoured takes his seat in the House of Lords, when the title becomes hereditary. (2) By letters patent, which specify the line of descent of the dignity, and the heir specified in the patent succeeds even though the grantee die before taking his seat. Peeresses in their own right who marry commoners retain their titles, but peeresses by marriage lose their titles by remarriage.

See T. Mommsen, *History of Rome*, 1853-56; J. Selden, *Titles of Honour*, 1672; E. P. Shirley, *Noble and Gentle Men*, 1860; M. Geizer, *Die Nobilität der römische Republik*, 1912; and Burke, *Peerage*.

Noble, Sir Andrew (1831-1915), Brit. armament-maker, was b. at Greenock, son of George N., naval officer. He was educated at Edinburgh Academy and Royal Military Academy, Woolwich. Assistant-Inspector of Artillery, 1859, in 1860 he assumed the direction of the ordnance dept. of Sir Wm. Armstrong's works at Elswick, becoming its chairman from 1900. He was awarded the Royal Society's gold medal in 1880.

Noble, Sir Percy Lookhart Harnam (b. 1880), Brit. admiral, entered the navy 1894 and served with the grand fleet, 1914-1919; being captain, 1918; rear-admiral, 1929; vice-admiral, 1935. Rear-admiral commanding the second cruiser squadron, 1932-34, he became fourth sea lord and chief of supplies and transport, 1935-37; commander-in-chief, China station, 1938-1940; admiral, 1939; commander-in-chief, W. approaches in Britain, 1941; and head of the Brit. Admiralty delegation to Washington, 1942-43.

Noble, anct. Eng. gold coin, first minted by Edward III. in 1344. Its original value was 6s. 8d., but, it having increased to 10s. owing to the depreciation of silver, a new coin, called an angel (*q.v.*), of the former value of a N., was issued by Henry VI. On one side of the N. was stamped a ship to commemorate the victory of Sluys.

Noble Gases, see RARE GASES.

Noblesville, cap. of Hamilton co., Indiana, U.S.A., on the White R., 21 m. N.N.E. of Indianapolis; it has manufs. of carriages, iron goods, etc. Pop. 5500.

Noce Dam, in the It. prov. of Trento, across the R. Noce, was begun in 1939. A lake 5 m. in length is formed by 460-ft.-long barrier. Hydro-electric power to the amount of 250,000,000 kw. is supplied for industrial use.

Nocera Inferiore, or **Nocera dei Pagani** (anct. Nuceria), tn. of Campania, Italy, in the prov. and 8 m. N.W. of the city of Salerno, on the R. Sarno. It is the seat of a bishopric, and in the neighbourhood are the ruins of a medieval castle. There are manufs. of textiles. Pop. (com.) 33,800.

Noctiluca, genus of marine flagellate infusorians, about the size of a small pin-head, found in all seas. They are the cause of phosphorescence, a bluish or greenish light being intermittently produced from numerous minute points in the living matter, probably due to a rapid fermentation. The N. moves by using a lash, or flagellum, in a whiplike action.

Noctilucent Clouds (luminous night clouds), very rare clouds which are only recognised after dusk because the sun is still shining at their exceptionally great height (about 80 km.). Usually observed about midnight in N. European latitudes just after the summer solstice they resemble cirrus and have a bluish-white to yellowish colour. Other very high clouds seen after dark are known as *mother-of-pearl clouds*. Lower in average height, they are roughly lenticular in shape with beautiful irisation, whence their name. Prof. H. Mohn first recorded observations of these clouds, mainly from Oslo, but most observations have been made by Prof. Carl Störmer, who pub. coloured photographs of them in *Weather* (vol. 3, Jan. 1948). Mr. G. A. Clarke saw them from Aberdeen on Feb. 6, 1934; but in many years they have not been seen at all. Since 1926, by comparing photographs of the clouds as seen from different places against the stars the heights have been found to vary between 20 and 30 km.—well into the stratosphere. From the size of a large lunar corona seen in 1932, and from the position and colours of the irisation the cloud droplets are estimated to be spherical with diameters from 1/1000 to 1/400 mm., the larger drops being towards the centre of the cloud, and the probable temp. about -70° C.

Nocturn, div. of the night office in the Rom. and other breviaries. Each N. in the present Rom. breviary consists of three psalms and three lessons with their antiphons. The night office was, during the Middle Ages, said in the morning, whence its name of matins, but it is now

generally said by anticipation on the previous evening.

Nocturne, 'night piece' or instrumental serenade, generally of a quiet, lyrical character, but sometimes (as in Chopin) with a more agitated middle section. As a pianoforte piece it originated, not with Chopin, but with John Field (1782-1837), but it existed already as the *lt. nocturno* in the eighteenth century, when however it was similar to the Serenade or Divertimento in sev. movements. The N. in the modern sense is not necessarily slow, soft, and sentimental. Even Field's are not all so, and one is in the curious form of a vocal operatic scene; Chopin's may have agitated middle sections; Debussy's *Fêtes* is a very animated piece; in Vaughan Williams's *London Symphony* the scherzo

CHARLES NODIER

is a N., i.e. a piece suggesting London's gaiety by night.

Nodes. The N. of a planet or any other celestial body are those two points where its orbit is cut by a fixed plane: in the case of the solar system, by the ecliptic. The straight line which joins these points is called the line of N. The point at which the orbit of a planet passes from S. of the ecliptic to N. of it is known as the ascending node, the other and opposite point necessarily being the descending node. The long. of the ascending N. is one of the six 'elements' by which the movements of a celestial body are determined. Owing to the mutual attractions of the planets, the line of N. is continually shifting; alternately advancing and receding. The retrogression of planetary N. never exceeds one degree per century, but owing to the great attraction of the sun the lunar N. complete a revolution in about eighteen years and seven months. The cycle, known as the *Saros*, was discovered by the Babylonian astronomers who observed that the eclipses of the sun and moon recurred in the same order in each cycle, which is 18 years 11 days.

Nodier, Charles (1780-1844), Fr. author,

b. at Besançon. In 1824 he became librarian at the Bibliothèque de l' Arsenal; in 1833 he was elected to the Academy, and in 1843 made a member of the Legion of Honour. He was the centre of the early members of the Romantic school; Hugo, de Musset, and Sainte-Beuve all acknowledged his influence. His best work consists of his fantastic short stories, among which are *Smarra* (1821); *Trilby* (1822); *Histoire du roi de Bohême et de ses sept châteaux* (1830); *La Fée aux miettes* (1832); and *Les de las Sierras* (1838). See Prosper Mérimée, *Portraits historiques et littéraires*, 1874; also lives by F. Wey, 1844; and M. Henry-Rosier, 1931.

Nodules, see ROOT TUBERCLES.

Noel, Conrad le Despenser (1869-1942), Eng. clergyman and socialist. He was son of Roden N., poet. Educated at Corpus Christi College, Cambridge, and at the Chichester Theological College, he worked for some years among the poor of Portsmouth. As vicar of Thaxted from 1910 to 1942 N. was nicknamed the 'red priest' on account of his Socialist views and the red flag he flew from his church; he was a prominent member of the Christian Socialist movement. He lectured to Socialist groups and wrote a number of religious and political works, including *The Labour Party* (1906); *Socialism and Church History* (1910); *Byways of Belief* (1912); *Uplifting the Son of Man* (1919); *Life of Jesus* (1937); and *Jesus the Heretic* (1939). His unfinished autobiography was pub. in 1946.

Noetus (c. A.D. 130-c. 200), native of Smyrna, he became a leader of that branch of the Christian Church which embraced the doctrine called *patrio-passianism*. He was a presbyter of the Church of Asia Minor, but his views led to his excommunication. His contemporary, Hippolytus, in his pub. *Sermon against the heresy of a certain Noetus*, is the authority for his doctrines, which his disciple, Epigonus, preached at Rome.

Nogales, twin city of Morella, Mexico, situated on the frontier line, one half in Mexico and the other in Arizona. It stands at an altitude of 4000 ft. above sea level, and it is here that the S. Pacific Railroad of America connects with the S. Pacific Railroad of Mexico. The main industries in the dist. are mining and cattle ranching. Pop. 14,000.

Nogent-sur-Marne, tn. in the dept. of Seine, France, on the r. b. of the Marne, 6 m. E. of Paris. There are important chemical manufs. and pottery works. Pop. 21,500.

Nogi, Marasuke, Count (1849-1912), Jap. soldier, b. at Yamaguchi of a Samurai family, saw his first military service in the civil war of 1877, in which the Samurai were finally defeated (see JAPAN, *History*). He commanded a brigade in the war against China in 1894, and in the Russo-Jap. war (1904-5) he commanded the Third Army. It was N. who forced Port Arthur to surrender and it was his army's flank march which resulted in the signal and decisive Jap. victory in the battle of Mukden (Feb. 20-March 10, 1905). Together with his wife he committed

'honourable suicide' (hara-kiri *q.v.*), according to the old-estab. custom, on the death of the mikado, Mutsuhito.

Noguchi, Hideo (1878-1928), Jap. bacteriologist and pathologist, *b.* in N. Japan, entered the laboratory of pathology of Pennsylvania Univ. He made researches into immunity against snake poisons and in 1904 pub. *The Action of Snake Venom upon cold-blooded Animals*. In the Rockefeller Institute he did valuable work on the aetiology of syphilitic diseases and puerals; he also studied the aetiology of trachoma (*q.v.*) and yellow fever, of which latter disease he *d.* when conducting investigations in Brit. W. Africa.

Nogués, Auguste (*b.* 1876), Fr. soldier, *b.* in the Haute-Pyrenees, was educated at the Ecole Polytechnique and was an artillery captain in the First World War. After the war he served against the Rifis (see *ABU-EL-KRIM*), 1924-26. Appointed resident-general of Morocco in 1936, and commander-in-chief in N. Africa in 1939, he retained these posts during the Vichy regime. In 1940 he informed the Axis countries and France that he would not surrender N. Africa to any invader, even if he were ordered by Pétain to do so. After the landing of the Anglo-Amor. armies in N. Africa and the assassination of Darlan (*q.v.*) he became a member of Giraud's (*q.v.*) Fr. imperial council and deputy high commissioner for N. Africa, 1942-43. Early in 1943 he declared that he could not understand his unpopularity with the Amers., averring that he was justified in opposing the allied invasion. On June 4, 1943, N., condemned by Gen. de Gaulle as a collaborator with Vichy, submitted his resignation as governor-general.

Noh Plays, see *DRAMA, Japanese Drama*.

Noisy-le-Sec, tn. in the dept. of Seine, France, near the Ourcq Canal. Pop. 16,300.

Nokrashy Pasha, Mahmud Fahmy El (1888-1948), Egyptian statesman, *b.* in Alexandria, was educated at the Higher Training College, Cairo, and at Nottingham Univ. College. He entered the teaching profession and, from 1914 to 1919, was headmaster of Gumalia School, Cairo. After a year as a prov. director of education, he entered the service of the Ministry of Education and soon earned promotion to the post of assistant secretary-general thereof. N. took part in the national agitation for independence and organised sub-committees of the Wafdist movement in Cairo and Alexandria. He became sub-governor of Cairo in 1924 and then under-secretary for the interior. After the murder of Sirdar Lee Stack he was arrested and charged with others with complicity in a number of political crimes, but was acquitted. His first ministerial portfolio was that of communications to the first Wafdist Cabinet in 1930, a post he again occupied in 1936-1937. This proved the turning-point of his career for, in 1937, following the Montreux conference which ended capitulations, he was unexpectedly excluded from the Wafdist Gov. through disagreement with the Wafdist leader over the Blue

Shirt organisation. Soon after this N., with Ahmed Maher Pasha and their respective followers, resigned from the Wafd to form the Saadist party, pledged to uphold the true principles of Saad Zaghlul Pasha. In 1938, when the Saadists joined the Coalition Gov., N. became minister of the interior; in 1939 minister of education; then for the interior again, and, in 1940, minister of finance. In 1945 he succeeded to the premiership and leadership of the Saadist party, following the assassination of Ahmed Maher. Apart from a short period in 1946, when Sidky Pasha (*q.v.*) was Premier, N. was head of the gov. until his assassination on Dec. 28, 1948, besides holding the portfolios of the interior, finance, and foreign affairs. N. was responsible for breaking off the treaty negotiations with Britain and headed the Egyptian delegation to the Security Council of the United Nations (1947). He enjoyed the reputation of being a first-class administrator and was respected by all parties for his integrity.

Nola, city and episcopal see of Caserta, Italy, 16½ m. E.N.E. of Naples. There are remains of a fourth-century church. Giordano Bruno was *b.* here. Pop. 18,400.

Noldeke, Theodor (1836-1930), Ger. orientalist, *b.* at Harburg. His first work was a hist. of the Koran (1859), which won the prize of the Fr. Académie des Inscriptions, and which he rewrote in Ger. as *Geschichte des Korans* (1860). In 1861 he lectured at Göttingen; in 1868 he was prof. at Kiel, and from 1872 at 1906 prof. of oriental languages at Strasburg. His works include *Das Leben Mohammeds* (1863); *Die Altestamentliche Literatur* (1868); *Geschichte der Perser und Araber zur Zeit der Sasaniden* (1879); *Persische Studien* (1888-92); *Sketches from Eastern History* (Eng. trans., 1892); and *Syriac Grammar* (Eng. trans., 1904). See E. Kuhn, *Übersicht der Schriften Theodor Noldekes*, 1907.

Nollekens, Joseph (1737-1823), Eng. sculptor, *b.* in Soho. In 1760 he went to study in Rome, where Garrick met him and commissioned him to execute a bust. This was so successful that Sterne sat to him. He increased his income by buying and selling antiques, and by stock exchange speculation, and was so successful that at his death he was worth £200,000. He returned to England in 1770, and was soon the fashionable sculptor of the day. See G. W. Stonier (ed.), *Nollekens and his Times* (by J. T. Smith, 1928), 1948, and P. Colson, *Private Portraits*, 1949.

Nolle Prosequi, in legal practice an entry in the record of a court which indicates that the crown, in a criminal prosecution, desires to proceed no further with the case. Formerly the practice in entering a N. P. applied both to civil and criminal suits, but is now restricted to the stay of proceedings by indictment or information entered by the attorney-general. In criminal cases when an indictment (*q.v.*) has been found (see *JURY*), proceedings on it can only be stopped by the Crown entering a N. P. against one or all of the defendants. It can only be entered on

the flat (*q.v.*) of the attorney-general or solicitor-general.

Nomad (Gk. *νόμας, νομάδος*—*νέμειν*, to pasture—roaming, especially in search of pasture), member of a race, tribe, or community, who have no fixed abode, but whose chief occupation is the tending of flocks and herds and who wander about, shifting their location according to the state of pasturage, and living in tents on grassland or steppe. The Bedouins or desert-dwellers offer the most characteristic example of Ns., and they even claim to be descended from Ishmael. The Bedouins are found mostly in Arabia or other Middle E. countries such as Iraq and Egypt, have a tribal organisation under sheikhs, tend herds of camels or goats and flocks of sheep and are good horsemen (see **BEDOUINS**). Other examples are the Australian blackfellows and S. African bushmen (*q.v.*) who derive their subsistence from hunting. Gypsy van-dwellers may also be said to lead a nomadic life (see **GYPSIES**). Among the Hamitic tribes of E. Africa the Galla (*q.v.*) and Borana, the Masai (*q.v.*) and Turkana, all cattle-owning people, are still nomadic; but the Nandi and Suk of Kenya, with the Teso of N. Uganda, now live in settled vils. and practise agriculture. See Sir H. H. Johnston, *The Uganda Protectorate*, 1902; W. E. Elardt, *Die Kulturform des Nomadismus*, 1923; and P. G. Merner, *Das Nomadentum in Nordwestafrika*, 1937.

No Man's Land, the name applied to outlying dists. in various countries. It has been used especially to designate the following: (1) Region N. of Texas (Public Land Strip), ceded to U.S.A. in 1850, constituting Beaver co., Oklahoma, since 1890; (2) Narrow dist. between Delaware and Pennsylvania; (3) Small ls. 3 m. S.W. of Martha's Vineyard, Massachusetts, to which it belongs; (4) Region corresponding to what is now Griqualand E., Cape of Good Hope; (5) Tract of S. Australia, 80,000 sq. m. in area.; (6) Battle zone between opposing front-line trenches in the First World War. It was also used as the name of a storage place on eighteenth-century ships.

Nome, term used for a territorial div. of ant. Egypt, and for a prov. of modern Greece.

Nome, tn. on the S. of the Seward peninsula, N.W. Alaska, on the N. shore of Norton Sound, 13 m. W. of Cape Nome. It is the cent. v. of a great gold-mining dist., discovered in 1899. Pop. 1200.

Nom-de-plume, see **PSEUDONYM**.

Nomenclature, see **NAMES**.

Nominalism, as opposed to **Realism**, was one of the two doctrines of the Middle Ages. The two views of **Nominalism** and **Realism** were opposite, and arose from a consideration of the nature of species and genera. N. implies a belief in the theory that 'universals', i.e. genera and species, are only names which express the term of qualities expressed. Nominalists, therefore, held the view that nothing was general but names. The Nominalists, as opposed to the Realists who, with Plato, declare that class terms are real, more real than the individual things which come

under them, take up the cause of common sense, denying that the concept, or class, has an existence of its own beyond the individuals which make up the class. A narrower form of N. held that even concepts or ideas are not really general.

Roscelin in the eleventh century was a great nominalist, but he brought N. under the ban of the church as a heresy by arriving at a tri-theistic doctrine of the Trinity. From then on N. was held to be heretical and rational. Abelard was a conceptualist (*q.v.*), but his conceptualism swayed really to N. and was also condemned by the Church. Later in the fourteenth century William of Occam upheld N., and among more modern philosophers Hobbes and Berkeley may be mentioned as upholders of modified forms of the doctrine.

Neither Realist nor Nominalist had the insight for bringing out the real truth of Plato's doctrine, and extricating it from its connection with the reality of the abstract universal. N. was the natural ally of the scientific spirit, even if this were not consciously present in the minds of the earlier Nominalists, and science is incompatible with an exclusive interest in personal salvation; hence N. was bound to conflict with the whole principle of dogmatism. The earlier N. failed, however, because the age was still in need of the unifying authority of the Church, and Realism had been the philosophical justification of that authority. N. had a revival in the time of William of Occam and the reason for this was that the period of authority was past, and that the period of individualism was at hand, which was to lay the foundations for modern progress. N., by its insistence upon the reality of particular things, justified the growing scientific spirit in its attention to facts rather than to *a priori* dogmas. It justified the revolt of individuals against the stereotyped generalisations of the past, and of nations against the absolutism of the Catholic Church. At its revival, therefore, it was no longer opposed to the needs of the age, but in harmony with them, and its ultimate victory was assured. See also **CONCEPTUALISM**; **REALISM**; **SCHOLASTICISM**. See A. Rogers, *History of Philosophy*, 1921.

Nones, or **The Nones**, in the Rom. calendar the fifth day of all months except March, May, July, Oct.

'March, July, October, May
Make Nones the 7th, Ides the 15th, day.

It was so called because falling on the ninth (nonus) day (reckoning inclusively) before the Ides, and marked the moon's first quarter. Cf. *Kalendar*, Ides. See Smith's or Harper's *Dictionary of Classical Antiquities* under *Calendarium*.

Non-Commissioned Officers, see **RANK**.

Nonconformity, refusal to conform to the doctrines and discipline of an estab. church and generally meaning the N. of Protestant dissenters. In the seventeenth century the word signified the practice of those who, while remaining within the bounds of the Church, yet refused to conform to certain ceremonial practices,

such as the wearing of the surplice, the sign of the cross in baptism, and the use of the ring in marriage. The rise of N. in the present meaning of the term dates from the period immediately following on the Reformation. The last secession took place in 1563, but Puritan violence turned the anger of the state against them, and during the reign of Elizabeth they were persecuted. On the accession of James I., who had been brought up among Presbyterians in Scotland, they expected more favourable treatment, but the issue of the Hampton Court Conference speedily convinced them to the contrary. Owing to the identification of king and bishop, the misgovernment of the king brought odium upon the Church as well as upon the throne, and when, therefore, recourse was had to arms, the resentment of the Parliament was directed against the Church as well as against the royal prerogatives, and the death of Laud soon followed that of his king. The supremacy of Parliament was marked by a vigorous attack on Episcopacy, at first in the interests of Presbyterianism but later in those of Independency. In 1643 the Westminster Assembly adopted the Solemn League and Covenant, which included an article for the abolition of prelacy. But the reaction which followed against the political system of the Commonwealth was directed also against Puritanism. Hence the Restoration of 1660 was followed by the passing of a body of legislation directed against Nonconformists. The Act of Uniformity (1662) was an attempt to remove from eccles. benefices those Puritan ministers who had been intruded during the Commonwealth period. It obliged all those who had not received episcopal ordination to do so, and rather than submit to this a large number of ministers, of whom the number has been variously estimated, quitted their benefices. Other Acts of the Clarendon Code were directed to the repression of N. outside the bounds of the Church, such as the Conventicle Act (1664), which laid penalties upon all attending dissenting conventicles, and the Five Mile Act (1665), which forbade Puritan ministers when travelling to come within 5 m. of a corporate tn. The Test Act (1673), though directed principally against Rom. Catholics, also pressed hard upon Protestant dissenters; and no satisfaction was felt by them at James II.'s Declarations of Indulgence (1687-88), for these, too, were obviously intended for the relief of Rom. Catholics. A change came with the accession of William and Mary, and the Toleration Act of 1689 removed most of the disabilities imposed by the Clarendon Code, though the Corporation Act and the Test Act remained in force until 1828.

In 1730 some attempt at combined action among the Nonconformist bodies was made by the non-corporate union of the three denominations, Baptists, Independents, and Presbyterians. Outside this union the chief dissenting bodies were at this time the Quakers and the Unitarians. But by 1760 another important body was added to them on the secession

of the Methodists from the Estab. Church. The repeal of the Corporation and Test Acts took place in 1828; in 1836 marriage in a dissenting chapel was made legally valid; in 1871 an Act was passed opening the univs. to non-members of the Church of England; in 1880 Nonconformist ministers were allowed to conduct funerals in the par. burying grounds. A great step in the direction of union between the various bodies was the estab. in 1892 of the National Council of the Evangelical Free Churches. A union of Methodist Churches took place in 1932 when the United Methodists combined with the Wesleyan Methodists and Primitive Methodists to form the Methodist Church. *See also* HYMNS, *Nonconformist Hymnody*. For bibliography *see* under BAPTISTS, METHODISM, and other denominations.

Non-contributory Pensions. *see* under NATIONAL INSURANCE ACT (1946).

Non-co-operation. *see* PASSIVE RESISTANCE.

Nonesuch Press. In 1923 Francis and Vera Meynell and David Garnett started the N. P., and the ed. of the *Lore Poems* of John Donne proved the herald of far-reaching changes both in publishing technique and typographic style. The objects of the new press were defined in its first prospectus as follows: 'To choose and make books according to a triple ideal; significance of subject, beauty of format, and moderation of price.' The N. P. by 1949 has produced some eighty limited eds. and thirty-seven unlimited. Perhaps the most outstanding limited eds. are the seven-vol. ed. of Shakespeare and the twenty-three-vol. ed. of Dickens, for in these great works especially Sir Francis Meynell displays his skill both as a typographer and designer. Of the unlimited eds. the Nonesuch Library (also known as the Compendious series) is particularly important. These books are uniform in size, though not in detail, and have had much influence upon publishing methods.

Non-Intervention Committee, committee of various European states set up at the beginning of 1937 to supervise measures agreed on between them to stop the flow of volunteers to both sides in the Sp. civil war, 1936-39. It formulated a plan for watching the Sp. coasts and frontiers which by the autumn had proved unworkable, gaps and loopholes in it having permitted enormous quantities of war material and even whole armies to come to Spain, while Germany sent bombers to attack the tns. of the republicans. Germany and Italy withdrew from the N.-I. C. in June 1937 after the bombing of the Ger. ship *Deutschland*, but later returned. In the last stage of the conflict the committee ceased its activities, the policy of non-intervention having in fact much favoured the insurgents, for the republicans had derived little effective countervailing help even from the Soviet Union. *See further* under SPAIN, *History*.

Nonius, Ferman, *see* NUNKZ.

Nonius Marcellus. Lat. grammarian, probably of the third and fourth centuries A.D. He is noted as the author of *De compendiosa doctrina* valuable

for the fragments preserved from old dramatists, satirists, and annalists such as Ennius, Cato, and Varro. Priscian and Fulgentius borrowed from this work. See eds. of Junius (1565); Gothofredus (1586); Mercier (1583, 1614, 1826); Gerlach and Roth (1842); Müller (1888); Onions, I.-III. (1895); and W. M. Lindsay (1930). See also Pfeuffer and Schwabe, *History of Roman Literature*, II., and Nettleship, *Essays in Latin Literature*, 1885.

Non-Jurors, those clergy of the Church of England who after the revolution of 1688 refused to take the oath of allegiance to William and Mary. They were headed by Wm. Sancroft, archbishop of Canterbury, and included seven other bishops, Ken of Bath and Wells, White of Peterborough, Lake of Chichester, Turner of Ely, Frampton of Gloucester, Thomas of Worcester, and Lloyd of Norwich. About 400 of the lower clergy refused to take the oath, among them being many distinguished ecclesiastics. Some soon returned to the Estab. Church, but the body continued to exist with gradually diminishing numbers well on into the nineteenth century. See T. Lathbury, *History of the Non-Jurors*, 1845, and J. H. Overton, *The Non-Jurors*, 1902.

Non-Metals, one of the two classes into which chemical elements are divided. Their characteristic physical properties are as follows: they may be gases, liquids, or solids at ordinary temps., and most of the liquid and solid N.-M. are easily converted into the gaseous state at comparatively low temps. They are brittle, if solid, generally have a low sp. gr., and are bad conductors of heat and electricity. The chemical properties give a more definite test. The N.-M. form acidic oxides, they are not acted upon by dilute mineral acids, and generally form stable compounds with hydrogen. The distinction between N.-M. and metals is, however, by no means always well defined, and sev. elements, such as arsenic and antimony, possess characteristics of both classes. Examples of N.-M.: hydrogen, oxygen, nitrogen, chlorine, helium, carbon, sulphur, boron, phosphorus, silicon.

Non Nobis Domine, canon by Wm. Byrd (q.v.), which is often sung in place of grace after dinners.

Nonnus, Gk. epic poet of the fifth century A.D. (fl. c. 410), a native of Panopolis, Egypt. His most noted work is the *Dionysiaca* (History of Bacchus). A *Paraphrase of St. John* is also extant (written in Gk. hexameters). N. was probably a Christian. His *Dionysiaca* was ed. by Köchly (1658); by Grife (1819-26), by Marcellus (1856); and by A. Ludwig, 1909-11. See J. Weichert, *Dissertation de Nonno*, 1810; S. S. Uvarov, *Nonnos*, 1817; Naeka, *De Nonno Milatore Homeris*, 1835; Janssen on his works, 1903; and trans. (Ger.) by T. von Schaeffer, 1929-33.

Nonnus (Nonus), Theophanes, Gk. physician of the tenth century (d. A.D. 959). He dedicated his work *Compendium totius Artis Medicæ* to the Emperor Constantine Porphyrogenitus (911-59). It was pub. by Jerimias Martins (1568), and an improved form (1794-97) ed. by J. S.

Bernard. See J. Freind, *The History of Physick*, 1725-26; C. P. J. Sprengel, *Histoire de la Médecine* (trans.), 1815-32.

Nonpareil, printing type (6 point), in which the text of this encyclopædia is set. The Fr. name signifying 'none similar' refers to the exceptional skill displayed in the final cutting of so small a character. See TYPE AND TYPESetting.

Non-Possumus (Lat., 'we cannot'), papal formula used to express refusal, final and absolute, taken from the words of St. Peter and St. John (Acts iv. 19-20). It is said to have been used by Clement VII. in reply to Henry VIII.'s demand for a divorce from Catherine of Aragon.

Non-Suit. Technically a N.-S. no longer exists. Under the former practice N.-S. meant the voluntary abandonment by the plaintiff of his action, either because the judge or jury appeared to be against him or because in argument it appeared that in law he had no case. It differed from an adverse judgment in that it did not bar him from commencing the action again. In the days when forms of action, e.g. detinue (q.v.) trespass (q.v.), were so highly technical that the slightest verbal slip in the pleadings endangered the whole action, N.-S. were frequent, but since the legal reforms of the last century such unsubstantial formalities, and together with them N.-S., have been abolished. Popularly the expression N.-S. is used to denote the fact of the judge having withdrawn a case from the jury either of his own motion or because counsel for the defendant has satisfied him that in law there is no case to answer or no evidence against his client (see also NOLLE PROSEQUI). There is no formality to be observed, and the submission that there is no case can be argued at any stage of the proceedings.

Noon, Malik Sir Feroz Khan (b. 1893), Indian statesman and lawyer, b. at Lahore, son of Nawab Sir Malik Mohammed Hayat Khan N., educated at Chiefs' College, Lahore, and Wadham College, Oxford. He was successively advocate at Lahore high court, 1917-26; member of the Punjab legislative council, 1920-36; minister for local self-government, Punjab Gov., 1927-30; minister for education in the Punjab, 1931-36; commissioner for India in the United Kingdom, 1936-41; member of the viceroy's executive council, 1941-45; Labour member of the governor-general's executive council, India, 1941-1942; and defence member of the governor-general's executive council, 1942-45. Knighted in 1933, N. was a delegate from India to the San Francisco Conference, 1945. In 1946 he renounced his title, in common with the other leading figures in the Moslem League. Later he became a member of the legislative assembly of the W. Punjab, but took no office (1949) in the Pakistani Gov.

Noordostelijke Polder, see NORTH-EAST POLDER.

Noort, Adam van, see OORT.

Nootka Language, see under NORTH AMERICAN NATIVE LANGUAGES, Pacific Areas.

Nootka, or **Mooshaht** (Mowachaht), tribe of the Aht, a div. of the Wakashan

('good') stock of N. Amer. Indians. They dwell on the W. coast of Vancouver Is., near Nootka Sound, and in the S. part of Brit. Columbia. They number about 2000 and many are professedly Christians. The Makaw or Kwakiutl, who settled in Washington, are a branch of the same linguistic stock (Haultzuk div.).

Nootka Affair (1788-90). An incident of the days of Anglo-Sp. colonial rivalry. In 1788 Capt. John Meares, an aggressive Eng. maritime trader, erected a store building on Nootka Is. and built a 30-ton schooner, the *North-west America*, the first ship launched on the Brit. Columbia coast. His evident intention to trade there permanently moved the Spaniards to interference and, in the spring of 1789, a 20-gun Sp. warship appeared off the is. Its commander, Don Joseph Martinez, seized the *North-west America* and other Eng. vessels there and constructed fortifications. Meares was then in Macao, but, on learning what had happened, hastened

new order quickly spread over W. Europe. N. himself, compelled to accept the see of Magdeburg, began the reformation of his clergy, by force when necessary. He upheld the doctrine of the Real Presence and fostered the cult of the Blessed Sacrament. N. was canonised in 1582.

Nord, most northerly dept. of France, adjoining Belgium, and washed by the North Sea, formerly a prov. of Fr. Flanders. It is divided into six arrons., Lille, Avesnes, Cambrai, Douai, Dunkirk, and Valenciennes. The greater part of the surface is flat, fertile, and well cultivated, watered by the Scheldt and the Sambre. The inhab. are half Flemish and half Fr.-speaking Walloons. The chief agric. products are wheat, oats, potatoes, sugar-beets, flax, chicory, and some tobacco. Stock-raising and fishing are important industries. The tn. of Valenciennes lies in the centre of the richest coal-field in France. N. is one of the leading manufacturing depts., making iron and steel

Norddeutscher Lloyd

THE 'EUROPA' (NOW 'LIBERTE'), SISTER SHIP TO THE 'BREMEN'

to appeal to the Brit. Gov., which at once decided to force Spain to a settlement. Spain was in no position to resist, especially as her potential ally, France, was involved in the opening stages of the revolution. The Spaniards accordingly restored Meares's property and, furthermore, agreed that Brit. subjects should have trading and colonising rights N. of the 38th parallel of lat. It was in this way, in 1790, that Spain modified her age-long exclusive claims to the Amer. Pacific coast.

Nootka Sound, harbour of the Pacific coast of Canada, lying behind Nootka Is. on the W. coast of Vancouver Is. N. S., Barclay Sound on the S.W. coast of Vancouver, and Quatsenough Sound on the N.W. coast, all send branches into the heart of Vancouver Is.

Norbert, Saint (c. 1080-1134), was b. of a princely family at Xanten. He led a worldly life at the Ger. court and received holy orders for the sake of material advancement. In 1115, however, a narrow escape from death brought about his conversion. After trying to reform the chapter of canons at Xanten he became an itinerant preacher. Given the ter. of Prémontré near Lao in 1120, he estab. a community of canons regular under the Augustinian rule, since known as Prémonstratensians or Norbertines. His

goods, beet sugar, glass, chemicals machinery, textiles, and porcelain. Cap. Lille. Other tns.: Dunkirk, Cambrai, and Douai. Area 2228 sq. m. Pop. 1,917,500.

Nordau, Max Simon (1849-1923), Ger.-Hungarian physician and author, b. at Budapest, of Jewish descent. Studied medicine and travelled widely. He practised medicine in Budapest and, later, settled in Paris as a physician. Turning to literature, he wrote novels and plays in a satirical vein to illustrate his social theories, but he is more widely remembered for his analytical studies of contemporary society, notably *The Conventional Lies of Civilisation* (1883; Eng. trans. 1884); *Paradoxes* (1885; Eng. trans. 1896); *The Malady of the Century* (1887); *Degeneration* (an attempt to relate genius to degeneracy) (1892-95; Eng. trans. 1895). In these and other critical studies of modern society N. applies the theories of Lombroso (q.v.) and also CRIMINOLOGY to which he was strongly attracted. His other works include *A Comedy of Sentiment* (1891); *The Drones must Die* (1898); *Morganatic* (1904); *The Interpretation of History* (1909); *Zionistische Schriften* (1909, 1923); *Biologie der Ethik* (1921); and essays, fairy tales, and travel books.

Norddeutscher Lloyd (North Ger. Lloyd), Ger. steamship line, was inaugurated by

H. H. Meier, a citizen of Bremen, who in 1857 induced the various shipping industries of the tn. to amalgamate under the name of the N. L. In 1881 the first of the company's Atlantic service boats was built, and from that time until the First World War its prosperity increased. From the headquarters at Bremen many lines of steamers ran to New York, Baltimore, Brazil, Galveston, the R. Plate, etc. Mail steamers ran between Bremen and America, Asia, Australia, etc. There was also a Chinese coasting trade of considerable magnitude. In 1914 the company had 135 sea steamers and hundreds of auxiliary craft totalling nearly 1,000,000 tons gross. As a result of the peace treaty all that remained of the great mercantile fleet was their seaside steamers, lighters, and tugs; but surprising activity produced great recovery, and such large ships as the *Bremen*, the *Europa*, and the *Columbus* (among the biggest merchant ships afloat) were typical of the company's energy. Before the Second World War the total tonnage was nearly 1,000,000. The *Bremen* was burnt at Bremerhaven in 1941, the *Europa* is now the *Fr. Liberté*, and the *Columbus* was sunk in 1939.

Norden, John (1546-11625), Eng. topographer and surveyor. According to Anthony Wood, N. was b. 'of a genteel family,' but there is not sufficient evidence to confirm that he belonged to Wiltshire, and more probably his father was a native of Middlesex. A privy council order of Jan. 1593, addressed to lieutenants and other co. officers, declared that 'John Norden, gent., was authorised and appointed by the Queen to travel through England and Wales and make descriptions, charts and maps,' and the outcome of this order was his first work *Speculum Britanniae, first parte: Middlesex* (1593). N. was the first to project a complete series of co. hist., but he was prevented by monetary difficulties from completing this design. He pub. *Hertfordshire* in 1598, and completed in MS. *Essex, Northampton, Cornwall, Surrey, and Kent*. He was surveyor of crown woods, 1600; surveyor to the duchy of Cornwall, 1605; and, in 1607, surveyed Windsor and its neighbourhood. He pub. *Observations concerning Crown Lands and Woods* in 1618. He engraved a number of maps, in which roads were indicated for the first time. His maps of London and Westminster were dated 1593 but are somewhat later than those of Aggas and van den Wyn-gaerde. By the aid of these maps we can obtain a very fair notion of the extent and major features of Tudor London. His *Surveyor's Dialogue* (printed 1607 and reprinted 1618) is among the more meritorious of the earlier works on agriculture. The first three books deal with the now more or less obsolete rights of the lord of the manor and the various old forms of land tenure, together with the obligations they involved. The later vols. are characterised by shrewd observations on the 'different natures of grounds, how they may be bettered, employed and amended.' In this work N. mentions the famous meadow lands near Salisbury.

Nordenfolt-Palmerantz Gun, see MACHINE GUNS.

Nordenskiöld, Nils Adolf Erik, Baron (1832-1901), Swedish geographer and explorer, b. at Helsingfors, Finland. After sev. successive voyages and explorations with Tonelli in the Arctic Sea, with frequent visits to Spitsbergen, where he measured an arc of the meridian, in 1878-1879 he discovered the N.E. Passage by traversing, along the N. shores of Europe and Asia, the whole Arctic from the Atlantic to the Pacific. He contributed to the science of geographical research, particularly in his work *Perillus* (1897). His pubs. in Eng. include *The Voyage of the 'Vega' around Asia* (1881) and *The Second Swedish Expedition to Greenland* (1885). See life by S. Hedin, 1928.

His nephew, Nils Otto Gustaf N. (1869-1928), explored the Magellan Straits and Patagonia in 1895-97, and Alaska in 1898; he also led the Swedish expedition which discovered Oscar II. Land, 1901-4. See life by G. Bodman, 1928.

Norderney, most important of the E. Frisian Is., in the North Sea, belongs to Lower Saxony, Germany. It is 8 m. long, 1½ m. broad, with an area of 8 sq. m. It is the most popular of Ger. seaside resorts. Pop. 5200.

Nord Fjord, inlet on the W. coast of Norway, extending for about 50 m. inland; the sea enters by two mouths, the Faa Fjord and the Froi Fjord. The scenery is beautiful.

Nordhausen, tn. of Thuringia, Germany. 60 m. from Halle, with distilleries and numerous manufs. including textiles, chemicals, tobacco, and engineering. Pop. 30,000.

Nordic, Nordism, denote the tall, blond, dolicocephalic race found mainly in Scandinavia, and, to much less extent, in Germany, Denmark, and other countries. The theory that the Ns. are a superior race from which all European culture has sprung seems to have originated with Joseph de Gobineau (q.v.), author of *The Inequality of Human Races*, whose pseudo-scientific doctrine found a temporary popularity in the early twentieth century in the U.S.A. and, subsequently, had its effect on the immigration quotas at the expense of people of Jewish or S. European extraction. This theory also finds an echo in Carlyle's works, in Madison Grant's *The Passing of the Great Race*, and in Nietzsche's cult of the 'superman.' It was carried further by the renegade Englishman, Houston Stewart Chamberlain, from whose time it had a great vogue in Germany. Nordism then developed as a political weapon of Ger. imperialism, the Gers. being proclaimed by their propagandists as Ns. (though only some 20 per cent of Gers. can be described as N.), whose mission was to rule all other peoples as being of lower racial value. The extremist advocates of Nordism contended that all great men in hist., science, and art have been Ns., while some even assert that anc. Gk. culture was the work of blond Ns. who conquered Greece 4000 years ago. One school of N. theorists

holds that the Na. are the best of the 'Aryan' races, while others go much further, claiming that Aryan and N. are synonymous (see on this ARYAN OR ARIAN). In fact, the N. race, as distinct from the N. type in Scandinavia and other countries, is mythical. The existence of a common N. primitive people has never been estab., and long centuries of interbreeding has produced innumerable blends of N. with other types. The contention that to Ns. alone are due the achievements of the European peoples is manifestly fantastic. The Nazis, for their own ends, erected Nordism into a veritable state creed. Slavs were contemptuously regarded as 'sub-human,' while the Jews became the special objects of Ger. animadversion and persecution (see also 'MEIN KAMPF').

Nordio Runes, see under RUNES.

Nordland, co. of Norway, having a length of 300 m., lies along the coast. The Vikten Is. and others fringe the coast-line, and the co. includes the Lofoten Is. Bodø, on Salt Fjord, is the chief tn. Area 14,727 sq. m. Pop. 214,700.

Nordlingen, tn. in Bavaria, Germany, situated on the Eger, and 40 m. distant from Augsburg by rail. It was at one time a free city, and is still shut in by walls and towers. Among the various objects of interest are some paintings by Hans Schaufelein, a tower 290 ft. high, St. Saviour's Church of 1422, and a tn. hall in late Gothic style. Pop. 8400.

Nordrhein-Westfalen, see NORTH-RHINE WESTPHALIA.

Nord-Trøndelag, co. of Norway, with a short Atlantic coast-line near the Vikten Is. Long fjords include Folden, Nansen, and Trondhjem, the latter traversing almost half the co. Levanger is the chief tn. Area 8659 sq. m. Pop. 104,600.

Nore, The, sandbank at the mouth of the R. Thames, marked by sev. buoys and at one time by lightships with revolving lights. The N. lightship at the E. end of the sandbank 4 m. N.E. of Sheerness, was removed early in the Second World War, and replaced by the Great Nore Tower which formed part of the Thames defences. Hamblin placed the first light here in 1731. The celebrated N. mutiny occurred in the vicinity in 1797.

Norfolk, Dukes of, see HOWARD.

Norfolk, Henry Fitz-Alan Howard, fifteenth Duke of, see HOWARD.

Norfolk, Hugh Bigod, first Earl of (d. 1176 or 1177), received his earldom as a reward for his assistance to Stephen in obtaining the Eng. crown. He was noted for his treachery and double dealing, even in the faithless age in which he lived. In 1169 he was one of the nobles excommunicated by Becket, and in 1175 was obliged to forfeit his castles. He is supposed to have d. in Palestine.

Norfolk, Roger Bigod, second Earl of (d. 1221), was the son of the first earl of N. During the reign of Henry II. he had little power, but he was in favour during all Richard's reign, being ambas. to France on one occasion. He retained his power during John's reign, save for a

short interval in 1213, but was excommunicated by Innocent II. as one of the twenty-five executors of Magna Carta. On the accession of Henry III. he regained his honours, and his hereditary right to the stewardship of the royal household was recognised.

Norfolk, Roger Bigod, fourth Earl of (d. 1270), marshal of England, was one of the members of the party of reform in opposition to Henry III. He was prominent in the promulgation of the Provisions of Oxford, but later the dissensions of the barons caused him to transfer his allegiance to the side of the king. After supporting Henry III. in 1259, N. joined de Montfort. In 1265 he was one of the five earls summoned to the Parliament.

Norfolk, Roger Bigod, fifth Earl of (1245-1306), marshal of England, was one of the leaders of the nobles in their struggle against Edward I. He and Bohun, earl of Hereford, were foremost in refusing to go on foreign service unaccompanied by their sovereign. In 1297 they secured the confirmation of the charter, which was ratified by Edward at Ghent, and in 1301 signed by him in person.

Norfolk: 1. Maritime co. of E. England, on the North Sea. The coast-line is mainly flat and low, though in places the cliffs reach the height of 200 ft. In parts the sea has much encroached, though near Lynn thousands of ac. of land have in the past been reclaimed from the Wash. The first new enclosure for fifty years was completed at Holbeach in 1948. There are few inlets, and owing to the numerous sandbanks the coast is dangerous. Yarmouth and Lynn are the prin. ports. The fine climate and long stretches of sand have made Yarmouth, Cromer, Hunstanton, etc., favourite watering places. The surface is for the most part level, and includes, in the W., part of the Fen country (*q.v.*) known as the Bedford Level. The prin. rivs. are the Yare and the Great Ouse, with their tribs. One of the chief features of the co. is the broads (*q.v.*), a series of beautiful lakes, famous for their fishing and water fowl, and also for the boating, ann. regattas being held. Windmills are a feature of the broadland, their purpose being to keep the marshes drained by pumping water from the dykes into the rivs.; but to-day the greater number of them are derelict and have been replaced by power-driven plant. Building stone, locally known as 'gingerbread stone,' is quarried at Snettisham and the neighbourhood, clay is dug for bricks and tiles at Hunstanton, Snettisham, etc.; limestone is quarried at Marham, and flints are worked for facing walls, etc. The soil is extremely varied; chalk, sand, and loam being prevalent in different dists. Agriculture flourishes, oats, wheat, and barley being grown in great quantities. Cattle are extensively reared, and the green crops consequently include turnips and swedes; beans are also grown, and some fruit. The prin. manufs. are cloth (worsted having taken its name from the long decayed tn. of Worsted), silk and wool weaving, and boots and shoes. There are a number of flour-mills and mustard

works; agric. implements are made; tanning, malting, and brewing are also carried on; and there are fisheries at Yarmouth. Large numbers of geese and turkeys are reared.

Sandringham is a royal country seat; and there are many fine churches, especially the beautiful Norman cathedral at Norwich (q.v.), originally part of a Benedictine monastery. The vil. churches of the N. marshland are notable for their length and beauty. Among them may be mentioned Walsoken, Emmeth, and West Walton, all near Wisbech; Terrington St. Clement and Tilney All Saints nearer King's Lynn; and Walpole St. Peter,

field and Walter Rye (see under **BLOMEFIELD**, FRANCIS and RYE, WALTER). See F. Blomefield, *Norfolk Genealogy and Heraldry*, 1886-87; W. Rye, *History of Norfolk*, 1885; Norfolk Records in the Public Record Office, 1886-92; W. A. Dutt, *Norfolk*, 1900; *Victoria County Histories: Norfolk*, 1901-6; W. G. Clarke, *Norfolk and Suffolk*, 1921; D. Maxwell, *Unknown Norfolk*, 1925; A. H. Patterson, *Through Broadland by Sail and Motor*, 1930; E. W. Priest, *Vanishing Local Traditions of Norfolk*, 1930; A. Mee, *Norfolk*, 1942; R. H. Mottram, *Norfolk*, 1946; and E. T. Long, *Norfolk* (Batsford-Methuen Little Guides, revised ed., 1949).

John H. Stone

THE NORFOLK COAST: CROMER FROM THE EAST

which is especially notable for its embattled parapets and its gargoyles. At Castle Rising there is a fine Norman church and also the ruin of a Norman castle, while Norwich Castle is still in good preservation. Other interesting feudal and monastic ruins are Castle Acre, Bayham's Abbey, Bacton Abbey, etc. A mile N.W. of Aylsham and 9 m. S. of Cromer is Blickling Hall, a famous Jacobean house built 1619-24) see under **ARCHITECTURE**, *The Renaissance*; BLICKLING). The co. originally formed part of E. Anglia, and suffered many incursions from the Danes. Very many discoveries of relics of prehistoric man have been recorded. With the exception of Wiltshire, N. has more scheduled anct. monuments than any other co.

N. is divided into thirty-three hundreds; there are six co. parl. constituencies and two bor. constituencies. The area is 2018 sq. m. Pop. 504,900.

The leading authorities on the antiquities and hist. of N. are Francis Blome-

2. City and port of N. co., Virginia, U.S.A., on Chesapeake Bay. It exports coal, cotton, lumber, and tobacco, and manufs. hosiery, cotton, silk, machinery, fertilisers, chemicals, cement, lard, tobacco and cigars, and automobiles. It also has a large trade in peanuts. N. builds ships and is important both for its fisheries and its naval base. Pop. 144,300.

3. Tn. of Madison co., Nebraska, U.S.A., 96 m. N.N.W. of Omaha. Pop. 10,100.

Norfolk Island, in the Pacific, about 400 m. N.N.W. of New Zealand, is under Australian Commonwealth Gov. administration. It was first discovered by Capt. Cook in 1774, and was shortly afterwards made a penal settlement. Then it was occupied by the Pitcairn Islanders, who, however, soon deteriorated, owing to intermarriage. Some Pitcairn Islanders still live in N. I. It is the headquarters of the Melanesian Mission, which was

inaugurated in 1867. The is. is 5 m. long and 2½ m. broad, and comprises an area of nearly 13½ sq. m. The soil is fertile, yielding fruits of all kinds, such as oranges, lemons, figs, grapes, bananas, pineapples, etc. Coffee is also grown. The Norfolk pine (*Araucaria excelsa*) (q.v.) is a splendid tree of giant size. The coast of the is. is steep and rugged, and the highest peak is Mt. Pitt (1050 ft.). N. I. is a cable station and has a pop. of 938.

Norfolk Regiment, old 9th Foot regiment, raised in 1685 in the W. of England, but, soon afterwards, designated the 9th (E. Norfolk) Regiment. Of its earlier battles, that of Almanza, though not among its battle honours, is remembered in its annals for the part played in covering the retreat of the Brit. Army under Gen. Ptanhapo. This exploit is commemorated by the figure of Britannia in its badge. The regiment fought in most of the great Peninsular battles, and thereafter had a distinguished record in India, Cabool, Moodkee, Perozeshah, and Sobraon, all being among its honours. In the First World War the first battalion fought in all the prin. battles of the opening months; the second battalion joined the Gallipoli expedition, one of its companies marching across country and losing practically every man. This battalion then joined Townshend's ill-starred force in Mesopotamia and, after strenuous exertions, surrendered in 1916 with the rest of the Brit. force besieged in Kut. Other battles in which one or other of the battalions, regular or territorial, fought were the Somme (Delville Wood), Ypres (Poelcapelle), and Bapaume. In the Second World War one battalion was in Singapore when the is. was taken by the Jap. Other units participated in the Burma campaign, being conspicuous at Kohima, 1944. See F. L. Petre, *History of the Norfolk Regiment, 1685-1915*, 1925.

Norfolk Spaniel, see under SPANIEL.

Norge, see NORWAY.

Norio Alps are named after Noricum (q.v.). Rising between the Drave and Mur valleys, they are a part of the E. Alps, extending N.E. from the Rhaetian Alps. Eisenhut (8000 ft.) is the highest peak.

Noricum, in anct. geography, was a ter. which became converted by Caesar into a prov. towards the end of the first century. It corresponds to the present provs. of Salzburg, Carinthia, and Styria.

Norma (the 'Rule' or 'Square'), small and unimportant S. constellation, catalogued by La Caille, 1752; the brightest star, 4.6; seven other stars between 4.6 and 5.5.

Normal, in geometry, is a straight line drawn from any point on a curve, in its plane, at right angles to the tangent at that point, or a line drawn from any point on a curved surface at right angles to the tangent plane at that point.

Normal Schools, see TRAINING COLLEGES.

Normal Solution, in chem., a solution one litre of which contains the equivalent in grammes of the dissolved substance. Thus the equivalent of sulphuric acid

is 49, so that one litre of N. sulphuric acid solution contains 49 grammes of sulphuric acid. Decil., semi., etc., N. Ss. contain one-tenth, one-half, etc., of the equivalent weight of the dissolved substance per litre of solution. N. Ss. are much used in chemical analysis.

Normal Temperature and Pressure. For convenience the properties of gases are always given on a standard basis of temp. and pressure which is known as *normal temperature and pressure* (N.T.P.). The temp. is taken as 0° Centigrade and the pressure as 14.7 lb. per sq. in., which is the average atmospheric pressure. This may be illustrated by examples: At N.T.P. 1 lb. of air occupies a volume of 12.39 cub. ft. Give the value of C (=constant for any given gas, each type of gas having its own value for C) for air in (a) Centigrade units and (b) Fahrenheit units. Let T = absolute temp. of gas, w = weight of gas under consideration in lb., p = the pressure in lb. per sq. ft., and that for atmospheric air $C = 96$ ft.-lb. Centigrade units or 53.3 ft.-lb. Fahrenheit units:

Centigrade units:

Using the equation $pv = CwT^*$:

At N.T.P. $p = 14.7 \times 144$ lb. per
 $T = 273^{\circ}$ abs. sq. ft.

hence $C = \frac{144pv}{T}$ for 1 lb.
 $= \frac{144 \times 14.7 \times 12.39}{273}$
 $= 96$ ft.-lb. Centigrade units.

Fahrenheit units:

$T = 32 + 460 = 492^{\circ}$ abs.

$C = \frac{144 \times 14.7 \times 12.39}{492}$
 $= 53.2$ ft.-lb. Fahrenheit units.

Again to find the weight of 100 cub. ft. of air at a pressure of 15 lb. per sq. in. and a temp. of 60° Fahrenheit. C for air is 53.2 in Fahrenheit units.

Using the equation $pv = CwT$,

then $p = 144 \times 15$ lb. per
sq. ft.
 $T = 460 + 60 = 520^{\circ}$ Fahrenheit abs.
 $w = \frac{144 \times 15 \times 100}{53.2 \times 15 \times 520}$
 $= 7.85$ lb.

*The best and most convenient form of the characteristic equation of a gas. A perfect gas is one which obeys this characteristic equation; no known gases are perfect. See further on this GAS AND GASES, Van der Waal's Equation. See also E. H. Lewitt, *Thermodynamics applied to Heat Engines*, 1937.

Norman, Sir Henry Wylie (1826-1904), Eng. field marsh.l. He took an active part in the Indian mutiny, being present at Delhi and at the relief of Lucknow. He was made governor of Jamaica in

1883, governor of Queensland in 1888, and governor of the Royal Hospital, Chelsea, in 1901. He was made a field marshal in 1902.

Norman, Montagu Collet, first Baron (b. 1871), Brit. financier and banker, son of F. H. N., banker. Educated at Eton and King's College, Cambridge, he served in the S. African war, and afterwards became a partner in the family banking business and, in 1907, a director of the Bank of England. In 1920 he was made governor of the Bank of England, a post from which he retired in 1944, and a privy councillor in 1923. It was during his governorship that Britain, in common with other countries, after the First World War went off the gold standard, but in 1925 returned to the gold standard so far as foreign payments were concerned, despite the strong condemnation of the policy by Lord Keynes (*q.v.*). In 1931, however, when the financial and economic position had further deteriorated, gold payments were once more suspended and the gold standard has never since been restored (*see further under ECONOMICS*). During the period of his governorship N. was responsible for sev. important financial negotiations, notably those with the U.S.A. in 1923 which resulted in the agreement for the funding of the dept of £978,000,000 to the U.S.A. *See further under BALDWIN OF BEWLEY, STANLEY, first EARL; BANK OF ENGLAND.*

NORMAN ARCHITECTURE
Essendene Chapel, Rutland.

Norman, name given to the people of Normandy and their descendants by the European countries conquered by them. The word is identical with Northman or Norseman, but is mostly restricted to the mixed race which came into existence after the conversion of the heathen Norse settlers and their adoption of Fr. culture. Besides invading and conquering England in the eleventh century, the Ns. conquered and settled in S. Italy and Sicily, where they developed a notable civilisation. *See also under NORSEMAN.*

The term N. architecture denotes the style prevalent in England and Normandy during the eleventh and twelfth centuries, preceding the Gothic. A variety of Romanesque, it is distinguished by the rounded arch and the rectangular or plain round column. Some of the oldest buildings in England are in this style, e.g. the few extant fragments of Edward the Confessor's abbey of Westminster, notably the chapel of the Pyx and the Undercroft beneath the Islip Chapel. The massive N. pillars were sometimes scored with zigzag indentations. Good examples in England are Durham Cathedral and the Abbey Church of Waltham, Essex. *See further under ARCHITECTURE, Romanesque.*

Normanby, Marquesses of, *see* SHEPHERD. JOHN; PHIPPS, CONSTANTINE HENRY; PHIPPS, GEORGE AUGUSTUS.

Normanby, tn. of the Easton U.D.C. in the N. Riding of Yorkshire, 3 m. S.E. of Middlesbrough. It has ironworks, and manufs. bricks. The marquesses of N. take their title from another vil. 5 m. S.W. of Pickering. Pop. 12,000.

Norman Conquest (1066-69). This movement originated in the accession of Edward the Confessor to the throne of England. This prince had spent the greater part of his life in Normandy before his accession to the throne of England. On the extinction of the Dan. dynasty he had been recalled to the throne of England as the nearest representative of the Saxon line. His early education made him particularly susceptible to Norman influence, and during the greater part of his reign a constant intrigue went on between Norman and Saxon court parties for the succession to the throne. Towards the end of his life he came under the influence of the Saxon party, and finally nominated Harold Godwinson as the heir to the Crown. During the temporary exile of the Godwins, however, William the Bastard had visited Edward and alleged that he held from him a promise that on his (Edward's) demise he should come to the throne of England. He had also held Harold a prisoner and had refused him release until he had sworn an oath that he would endeavour to obtain for William the throne of England. On the death of Edward the throne passed by election to Harold, and William, on the receipt of the news, began to prepare for an invasion. He landed at Pevensey Bay in Oct. 1066, and was met at Hastings by Harold's army, which had already practically worn itself out at the battle of Stamford Bridge and by the hurried march S. The Normans were victorious and Harold was slain. It is impossible to enter into the details of the actual conquest here, but we can safely say that by 1072 England lay conquered at the feet of William. The Normans became the owners of the land, and the Saxons were treated, at first at any rate, as a conquered race. But the continental wars in which the Normans were constantly engaged rendered them increasingly dependent on Eng. co-operation, and estranged them in an equal degree from

their former compatriots in France; so that within two centuries the distinction between Norman and Eng. was obsolete in England. At the same time both Eng. blood and Eng. manners were improved by mixture with a higher civilisation; while the perfection to which the ruling race had brought their feudal system helped to strengthen the central power and to unify the nation. Nevertheless there was no clean break with the past, and William made a conscious effort to continue the institutions of the Confeffor, for the greater stability of his own system. The basic difference was the introduction of feudal and tenure, for, in spite of surface similarities, the Saxon system was not built upon the feudal essential, namely, the granting of a definite piece of land in return for defined services, chiefly military. *See also WILLIAM THE CONQUEROR. See K. A. Freeman, The Norman Conquest, 1067-79, and F. M. Stenton, Anglo-Saxon England, 1943.*

Normand, Henri René Le, see LE NORMAND.

'Normandie,' until 1943, largest Fr. merchant steamship (less in tonnage than the *Queen Mary* and *Queen Elizabeth*, but longer than both), belonging, until the Second World War, to the Compagnie Générale Transatlantique, was completed in 1933 at a cost of £10,006,000. She had a tonnage (gross) of 79,280, with a displacement of 53,000 tons; quadruple screw; length, 1029 ft.; beam, 119½ ft.; depth, 91.8 ft.; speed, 28½ knots. The *N.* crossed the Atlantic (Bishop Rock to Ambrose Light) in 1935 in 4 days 3 hrs. 2 min. and in 1937 in 3 days 23 hrs. 2 min. (which time, however, was beaten by the *Queen Mary* in 1938 (3 days 21 hrs. 45 min. and 3 days 20 hrs. 42 min.)) She was taken over during the Second World War by the Amer. Gov. for conversion into a troopship and renamed *Lafayette*. But, while lying at her Hudson R. pier, she caught fire on Feb. 9, 1942 through the carelessness of a workman with his torch, and capsized from the hundreds of tons of water that had been poured into her to put out the flames. The charred hull was not finally raised until Aug. 1943 and the estimated total cost of the complicated and protracted salvage operations, including the pumping out of the ship, was \$3,759,000.

Normandy (Fr. Normandie), formerly a prov. in the N. of France bordering on the Eng. Channel, now divided into the depts. of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is in general a very fertile, richly cultivated land, resembling a garden in many dists. Its chief agric. products are corn, flax, hemp, colza, and fruits (from which cider is largely made); its fisheries and manufs. are of great importance and its horses the best in the country; sheep and dairy-farming are important industries. There are iron mines near Caen. The prin. towns are Rouen, Dieppe, Le Havre, Harfleur, Honfleur, Caen, Falaise, St. Lô, Bayeux, Coutances, Avranches, Alençon, Cherbourg, and Mont-St.-Michel.

In the time of the Romans the country

bore the name of Gallia Lugdunensis II. Under the Frankish monarchs it formed a part of Neustria, and was first called Normandy after Charles the Simple, in 912, had given it to Rolf or Rollo, the leader of a band of Norse rovers (*see NORSEMEN*), to be held by him and his posterity as a fief of the Fr. crown. His descendant, William II., son of Robert II., became duke of Normandy in 1036, and in 1066 estab. a Norman dynasty on the throne of England (*see NORMAN CONQUEST; WILLIAM THE CONQUEROR*). In 1077 his eldest son, Robert, wrested Normandy from him, but it was again united to England under Henry I. in 1105. Henry II., the son of Henry I.'s daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the government of England and Normandy; but in the reign of his son, John Lackland, it was conquered by Philippe Auguste (1203-4). It remained a portion of the Fr. monarchy for more than 200 years, but after the battle of Agincourt (1415) it was reconquered by the Eng., who held it till 1449, when it was finally wrested from them by Charles VII. In 1870 *N.* was partly occupied by the Gers., and in the First World War was the prin. base of the Brit.

Many famous towns, large and small, suffered grievous damage in the campaign of 1944. Le Havre, Caen, St. Lô, and Coutances were among those which sustained the greatest damage. Isigny-sur-Mer, Lisieux, Laigle, and Tilly-sur-Seuilles, to mention but four among many whose names are evocative of old memories, can no longer delight either the eye or the spirit. Much, however, has survived. Bayeux is unharmed, the cathedral at Coutances stands up amidst ruins, Ourstreham's fine church, which the shells for two and a half months daily sought out for destruction, is intact, while many smaller treasures, such as Corneille's house at Canapville, came through safely. For a full account of the battle of Normandy, 1944, *see under WESTERN FRONT IN SECOND WORLD WAR. See P. de Felice, La Basse-Normandie, 1907; H. Prentout, La Normandie, 1910, and Essai sur les origines et la formation du duché de Normandie, 1911; P. Dearmer, Highways and Byways in Normandy, 1924; R. Elston, Travels in Normandy, 1930; C. L. Graves, Deauville Taxi, 1937; A. H. Brodrick (ed.), Normandy, 1947; R. Dutton and Lord Holden, The Land of France (2nd ed., revised), 1947; and the earl of Onslow, The Dukes of Normandy, 1948.*

Norman-French, Fr. dialect which originated after the settlement of the Scandinavian invaders, under Rollo, in Normandy, about 911. *N.-F.* was prominent in the growth of O.F. literature, and can be read in the twelfth-century chronicles of Wace. It was introduced into England at the Conquest (but as later developed in England is also known as Anglo-Fr., differing from *N. F.* as spoken in Normandy by the use of Saxon words for ideas for which there was no Fr. word). *N.-F.* was the language of the court for

sev. centuries, and was used for law reports until the middle of the sixteenth century. In 1362 a statute ordained that pleadings should be in Eng., but should be enrolled in Lat., but the language of the statute book was still Fr. in 1483. The earliest important law treatise in N.-F. is *Britton* (1291) and the latest *Littleton* (1481). A considerable amount of literature, poetry, and prose in N.-F. has been preserved. See W. W. Skeat, *Principles of English Etymology* (2nd series), 1891.

Norman-Neruda, Wilma Maria Francisca, see HALLE, LADY.

Normans. see NORMANDY; NORSEMAN.

Normanton, tn. in the W. Riding of Yorkshire, England, situated on the Calder, 24 m. from York. Besides an old Norman church there are traces of a Rom. encampment in the vicinity. There is a grammar school of the sixteenth century. N. is an important railway junction, and has railway workshops and coal-mines. Pop. 19,200.

Norms, in Scandinavian mythology, is the name given to three maidens who symbolise the past, present, and future, and are called Urd, Verdandi, and Skuld. They weave man's destiny and are also occupied in watering the root of Igdrasil, the tree of life, by means of the Holy Urdar Fount.

Noronha, Fernando de, see FERNANDO DE NORONHA.

Norrbotten, northernmost and largest co. of Sweden, bordered by Norway, Finland, and the gulf of Bothnia, and including a part of Lapland. There are iron mines at Gällivare, as well as many forests, the lumber being carried on the numerous lakes and rivs. Area 40,754 sq. m. Pop. 232,000.

Norris, Charles Gilman (b. 1881), brother of Frank N. (q.r.), Amer. author and editor, b. at Chicago; assistant editor of *Country Life in America*, 1903, and art editor of *American Magazine*, 1908-13. N. has written novels dealing with such themes as hereditary influences, eugenics, modern education, business morality, and women in business; they include *Amateur*, or *the Education of Griffith Adams* (1915); *Salt* (1917); *Brass* (1921); *Bread* (1923); *Pig Iron* (1925); *Seed* (1930); *Zest* (1933); and *Hands* (1935).

Norris, Frank (1870-1902), Amer. novelist, b. in Chicago. He attended courses at the univs. of California and Harvard, and while a student began his first ambitious realistic novel, *McTeague*, which appeared in 1899. When he left Harvard in 1895 he became a newspaper correspondent in S. Africa, where he was stricken with fever, and the results of this so weakened his constitution that he d. seven years later. N. was something of a mystic, contemplating the 'elemental' passions which he transmitted to his characters, and he had an epic mind able to grasp the spirit of America. He planned to write a trilogy on the battle of Gettysburg. This work was never written, nor was the last part, *The Wolf*, of his 'Epic of the Wheat,' of which the first two parts, *The Octopus* and *The Pit* appeared in 1901 and 1902 respectively. The second vol. of this

trilogy, *The Pit*, had an enormous vogue in its day. It dealt largely with the speculation in grain in the Chicago wheat pit. His Californian novels are *Moran of the Lady Letty* (1898); *Blitz* (1899); *McTeague* (1899); and *A Man's Woman* (1900). He also wrote a critical work, *The Responsibilities of the Novelist* (posthumously, 1903).

Norris, John (1657-1711), Eng. philosopher and poet, b. at Collingborne-Kingston, in Wiltshire. He was rector of Bemerton church, near Salisbury, for twenty years. He was an idealist and a student of Plato and Malebranche. His pub. works include *Poems and Discourses occasionally written* (1681); *A Collection of Miscellanies* (1687); *An Account of Reason and Faith in relation to the Mysteries of Christianity* (1697); *An Essay towards the Theory of the Ideal or Intelligible World* (1701-4); and *A Philosophical Discourse concerning the Natural Immortality of the Soul* (1708). He also trans., in collaboration with Francis Digby, Xenophon's *Κύριον Ηθικά* or *The Institution and Life of Cyrus the Great* (2 parts, 1685). An ed. of his poems, ed. by A. B. Grosart, was pub. in 1871. See E. J. Powicke, *A Dissertation on John Norris*, of Bemerton, 1894, and F. I. Mackinnon, *The Philosophy of John Norris of Bemerton*, 1910.

Norris, Sir John (c. 1547-97), Eng. soldier, a son of Henry N., baron N. of Ryecote. He served as a volunteer under Adm. Coligny in the Fr. civil wars and in the disastrous undertaking of the earl of Essex to colonise Ulster. N., in a vain effort to improve the fortunes of Essex, advanced against the Scottish allies of the Irish in the is. of Rathlin and massacred the islanders who had all taken refuge in the castle there. He served in the Low Countries from 1577 to 1585 at the head of another party of Eng. volunteers fighting on behalf of the states-general in their revolt against their Sp. rulers. N. showed exceptional prowess in the relief of Steenwyk, which was besieged by the Spaniards under Count von Rennenberg. He was sent again to Ireland in 1585, but this did not offer a wide enough field for his ambition. The news that the Spaniards were besieging Antwerp aroused all his ardour on behalf of his former allies and he returned to the Netherlands in 1588 as ambas. In the following year he commanded, with Drake, the fleet that ravaged the coasts of Spain and Portugal, and in 1591 he served Henry IV. of France in his conflict with the League in Brittany. N. returned to Ireland (1597) to aid in reducing Tyrone. After fighting and negotiating with the O'Neills in Ulster and warring in Connaught, which he failed to pacify, he asked to be recalled. This was refused but he was superseded in his military command. There is a monument to him in the church of Tattendon, Berkshire.

Norris, Sir John (1660?-1749), Brit. admiral. He distinguished himself under Shovell in the battle off Malaga (1704) and in the taking of Barcelona in 1705, for which services he was knighted, as well as receiving a sum of 1000 guineas. In

1739 he was appointed admiral and commander-in-chief of the Eng. fleet. He retired from active service in 1744.

Norris, Kathleen (*née* Thompson) (b. 1880), Amer. novelist, b. at San Francisco; married Charles Gilman N. (q.v.), 1909. Author of *Mother* (1911); *Saturday's Child* (1914); *Sisters* (1919); *The Sea Gull* (1927); *My California* (1933); *Hearthbroken Melody* (1938). The wholesome if sentimental preoccupation, with little domestic comedies or tragedies, is the key note of all her novels.

Norristown, bor. of Montgomery co., Pennsylvania, U.S.A., on the Schuylkill R., 18 m. N.N.W. of Philadelphia. There is a good trade in textiles, and important iron works, screw factories, brick works, and granite and marble quarries. Pop. 38,100.

Norrköping, tn. and port of Sweden in Östergötland, 113 m. from Stockholm, on both banks of the R. Motala. The tn. is modern in appearance. There are paper, textile, and cotton mills as well as ship-building yards. Pop. 78,300.

Norrland, *see under* SWEDEN.

Norse Languages. This group of languages, also known as Scandinavian or N. Germanic, is a sub-branch of the Germanic main branch of the Indo-European (q.v.) family of languages. Norse may be subdivided into three periods: (1) Primitive or Early Norse, termed in Scandinavian languages *urnordisk*, spoken till c. A.D. 700 in central and S. Scandinavia, in Denmark and N. Slesvig, and partly also in Finland and Estonia. This language is preserved in about 100 runic inscriptions (*see under* RÚNES) and sev. hundred loan-words penetrated into the Finnish and Lappish languages. It appears to have been fairly homogeneous throughout the whole ter. Its nearest relation was Gothic (q.v.), and both groups are still considered by some scholars as forming a linguistic main group, termed *E. Germanic*, whereas the other Germanic groups of languages (including Eng. and Ger.) were called by these scholars *W. Germanic*. This subdivision, however, is nowadays rejected by the experts. In the first and second centuries A.D. Primitive Norse began to differentiate from the other early Germanic dialects, but it still preserved the early Germanic vowels and endings. (2) The second main period, known as Viking Norse (A.D. 800-1100) is the period of vital phonetic changes and of the development of the various dialects. Already in the eighth century Norse had undergone a considerable transformation, and at the end of this century Primitive Norse must be considered as non-existent, although the Scandinavians themselves still considered their language (then called *Donsk tunga*, 'Danish tongue') as one and the same. At that period, however, the Norse stock of phonetic sounds reached between thirty and forty, and therefore the common Teutonic runes became inadequate to represent all the sounds. Therefore it became the habit to represent different but allied sounds (such as *k* and *g* or *t* and *d*) with the same rune, and owing to this confusion of spelling some of the

runes began to fall into disuse: from about A.D. 800 a system of sixteen runes (reduced the original twenty-four) came into use: these are known as the Nordic or Scandinavian runes (*see under* RÚNES). At that period Norse seamen, the Norsemen or Northmen, known as Vikings, or 'sons of the fiord', descended from the coasts of Denmark, Norway, and Sweden, to ravage and plunder on the N. seas and off the coast of Great Britain. By the middle of the ninth century they were gaining their spoils as far S. as the waters of the Mediterranean (there and in France they were called Normans); in the far N.W., and perhaps in America (named by them Vinland); and in the S.E. they successfully fought against the Slavs of Novgorod and founded a new Russian monarchy about A.D. 862. Owing to this extraordinary territorial expansion, the Norsemen brought their dialects to the Orkney Is. and the Shetland Is. (where they were spoken from A.D. 800 to A.D. 1800), the Hebrides and the Isle of Man (800-1450), N. Scotland and parts of Ireland (800-1250), the Faeroes, Iceland, and Greenland, E. England (Northumbria, E. Anglia, and 'the five Danish boroughs': 875-1175), Normandy (900-1100), parts of Russia (862-1300?), and so forth. This territorial expansion certainly contributed to the further differentiation of the language, which we can study in the numerous runic inscriptions (*see under* RÚNES), and the Scandinavian literature which was then arising. About A.D. 1000, with the definitive introduction of Christianity, the difference between *W. Norse* (Norway and its dependencies, including Iceland) and *E. Norse* (Sweden, Denmark, and their colonies) was already marked. Generally speaking, *W. Norse* preserved more primitive forms. The eleventh century witnessed the development of the sub-dialects of *W. Norse* into Norwegian (q.v.) and Icelandic (q.v.) and of *E. Norse* into Swedish (q.v.) and Dan. (q.v.). (3) While the N. L. of the first two periods are mainly preserved in runic inscriptions, the third period, called *Literary Norse*, c. A.D. 1100-1500, is the period of the great Early Scandinavian literature. Mention may be made of the Icelandic sagas, the great prose epic, celebrating the *sigu-öld*, the epoch of the original colonisation of Iceland, c. 890-1030, and composed in the twelfth and the thirteenth centuries. During the third period the N. L. fully developed into the modern Scandinavian languages, each of them having various dialects. These can be classified in the following groups: (i.) the dialects of Iceland and Greenland; (ii.) the dialects of the Faeroe Is.; (iii.) the N. Scandinavian group (N. Norway and N. Sweden); (iv.) the W. Norwegian group; (v.) Middle Swedish; (vi.) the dialects of the Is. of Gotland; (vii.) S. Scandinavian, including S. Sweden and Bornholm, the Dan. Is., and Jutland and N. Slesvig.

Norsemen, in the strictest sense of the word, denotes the early dwellers in Norway; but the application of the term is sometimes extended to all Scandinavia. Between, say, 780 and 850 the hunting

economy of N. was strained, and emigration on a large scale took place. This factor was responsible for the Norse invasions of Europe which began on the E. coast of England in the year 787. Known to the Eng. as 'Danes,' they were almost subdued by Alfred the Great; but they eleventh century, under Canute. It was at the end of the eighth century that they reached the Shetlands, Orkneys, and Hebrides. In Ireland they were also very powerful, and about 840 were masters of most of the northerly part of that country, founding their kingdom of Dublin. They reached the Faeroe Isles and Iceland about the end of the ninth century, and from Iceland visited Greenland and thence travelled in the eleventh century to N. America. They also pillaged the land of the Frisians and Flanders. In 843 they estab. themselves on the R. Loire, and a few years later had planted camps on most of the Fr. rivs. They obtained possession of Paris in 845 (sacking the city), and again on three later dates. In 859 and 860 they sailed into the Mediterranean Sea, attacking Spain and the is. near and settling on the R. Rhône. A short time after they arrived in Italy, and continued to plunder tns. In the year 912 Rollo was made by the Fr. king the owner of the duchy of Normandy (q.v.); it was from this that the future conquerors of England had their beginning. But in the S. regions, the true N. became absorbed into the alien race. See G. B. Depping, *Histoire des expéditions maritimes des Normands et de leur établissement en France au dixième siècle*, 1826; O. Delarc, *Les Normands en Italie*, 1883; P. B. du Chailu, *The Viking Age*, 1889; C. F. Keary, *The Vikings in Western Christendom*, A.D. 789 to A.D. 888, 1891; I. Fischer, *Die Entdeckungen der Normannen in Amerika*, 1902; Katharine F. Boulton, *Asgard and the Norse Heroes* (Everyman's Library), 1903, 1914; A. W. Brögger, *Ancient Emigrants*, 1929; T. D. Kendrick, *A History of the Vikings*, 1930 (with good selective bibliography); and T. C. Lethbridge, *Merlin's Island*, 1948.

Norte de Santander, dept. of Colombia, lying in the N.E., with Venezuela to the E., the dept. of Magdalena to the N. and W., Santander to the S.W., and Boyacá to the S. The cap. is Cúcuta. Area 8295 sq. m. Pop. 409,700.

North, Eng. family, among whose prominent members are: *Edward N.*, first *Baron N.* (1496-1564), chancellor of the Court of Augmentation, who was raised to the peerage in 1554. *Sir Thomas N.* (1535-1601), a man of letters, chiefly distinguished for his trans. of Marcus Aurelius and Plutarch's *Lives*, which latter work was largely drawn upon by Shakespeare. *Francis N.*, first *Baron Guilford* (1637-85), a lawyer, solicitor-general, 1671; attorney-general, 1673; chief justice of common pleas, 1675-82; lord chancellor, 1682; raised to the peerage, 1683. *Sir Dudley N.* (1641-91) (q.v.), one of the few important exponents of free trade before Adam Smith. *John N.* (1645-83), prof. of Gk. at Cambridge, 1672; prebendary of Westminster, 1673; master of

Trinity College from 1677 until his death. *Roger N.* (1653-1734), a lawyer, the author of *Lives of the Norths* (Francis N., Sir Dudley N., and Dr. John N.), an Eng. classic (issued 1742-44), collected and ed. by Henry Roscoe in 1826 and by A. Jessopp (including Roger N.'s autobiography) in 1890. *Frederick N.* (q.v.), second earl of Guilford.

'North,' Christopher (Scottish author), see WILSON, JOHN.

North, Sir Dudley (1641-91), Eng. economist, son of Dudley, fourth Lord N. He made a fortune in trading with the Levant and subsequently became a commissioner of customs and entered Parliament when, according to his brother, Roger N., he assumed the place of 'manager for the Crown in all matters of revenue.' As an economist he is remembered by his *Discourses upon Trade*, principally directed to the cases of the interest, coinage, clipping and increase of money (pub. anonymously in 1691). This work did not attract notice on its pub. nor does it seem to have been used by subsequent political economists. But it was ed. by J. R. McCulloch for the *Select Collection of Early English Tracts on Commerce*, printed by the Political Economy Club, London, in 1856. N. is highly praised by Wilhelm Roscher (q.v.) who includes his name among those who in the seventeenth century gave England the lead in Europe. Roscher points to the similarity of N.'s work to Adam Smith's classic and the tract does in fact anticipate Adam Smith's doctrines and those of the earlier free trade school to a marked degree, while being free from the prejudices and fallacies of the mercantile system (q.v.).

LORD NORTH

North, Frederick, second Earl of Guilford, better known as Lord North (1732-1792), Eng. statesman, entered Parliament in 1754, and was a junior lord of the Treasury from 1759 to 1766, in which year he became joint-paymaster of the forces. In 1767 he became chancellor of

the exchequer and leader of the House of Commons in the Grafton administration, and three years later he became Prime Minister. In that high office he acted as the mouthpiece of the king, who ruled the House of Commons by a group of 'King's Friends,' and, by appeals to his loyalty, induced N. to carry out his will. N. was opposed to the Amer. war, but allowed the king to influence him against his better judgment. He resigned in March 1782 but with Fox formed a gov. which endured from April to Dec. 1783, after which he did not again hold office. He succeeded to the earldom in 1790. An able financier, he was a weak man, and responsible for much of the troubles that arose in the earlier years of the reign of George III. See R. Lucas, *Lord North, Second Earl of Guilford, 1732-92, 1923*, and life by W. B. Pemberton, 1938.

North, Sir Thomas (1535?-1601?), Eng. translator, second son of the first Lord N., is said to have studied at Cambridge. He entered Lincoln's Inn in 1557, but devoted himself to literature rather than to law. He is best known by his classic trans. of Plutarch's *Lives of the Noble Grecians and Romans*, from the Fr. of Amyot, who himself had added charm to Plutarch's pedestrian style. N.'s trans. is in a vivid, dramatic, idiomatized Eng. and is a masterpiece beyond either Amyot or Plutarch. It was the repository from which Shakespeare drew his knowledge of anct. hist: in *Antony and Cleopatra* and *Coriolanus* N.'s language is often followed. Another trans. was from an It. version of an Arabic book of fables, and bore the title *The Morale Philosophie of Doni*.

North Adams, city of Berkshire co., Massachusetts, U.S.A., on the R. Hoosac, 52 m. N.W. of Springfield. It carries on cotton and woollen manufs. Pop. 22,200.

North Africa, see under AFRICA; also CYRENAICA; LIBYA; MOROCCO; TRIPOLI-TANIA; TUNIS.

North Africa, Second World War Campaigns in, see AFRICA, NORTH.

Northallerton, mkt. tn. and cap. of N. Riding of Yorkshire, 40 m. N. of Leeds. It is the site of an old Rom. camp, and All Saints' church dates from the twelfth century. The remains of a Carthusian priory are near by. Leather goods and engineering products are made. Pop. 7000.

Northam: 1. Par. of Devonshire, England. It is on the Torridge, about a mile from Bliford, and includes the watering place, Westward Ho. There are golf links on N. Barrows. Pop. 6000. 2. Tn. in York co., W. Australia, in the Avon valley, 66 m. N.E. of Perth. It is a junction for the S. line to Albany, and the centre of a rich farming dist. Pop. 4700.

North America (Geology; Archaeology; Ethnology).

Geology.—The oldest part of N. A. lies to the E., the dists. of New England, N. New York, and the Blue Ridge being the earliest parts of the continent to rise above the sea. The dist. is chiefly floored with Archean formation where it is associated with Cambrian and Silurian beds. The

Adirondack Mts. and the Appalachian Mts. are surrounded by Cambrian and Silurian formations. Scattered here and there are patches of Jura-Trias, some of which contain large deposits of coal. These areas widen further northwards, similar phenomena being found in the Hudson valley. There is also a carboniferous formation, loaded here and there with anthracite coal deposits. Bordering Lake Superior are areas of Algonkian formation in which vast iron-ore deposits are found. Towards the Atlantic are soft Tertiary beds which trend southwards to Florida. In the Appalachian valley are alternate beds of Algonkian, Cambrian, Silurian, and Devonian deposits, bearing evidence of considerable erosion. The Mississippi valley is floored with carboniferous layers containing large quantities of coal, and in S.E. Missouri are extensive Silurian areas holding iron and zinc. Of more recent formation are the great plains of N. A., composed mainly of Cretaceous and Tertiary beds, the oldest formation being Oklahoma, where Jura-Trias predominate. That remarkable region the Cordilleras, reaching through the Rocky Mts. group, presents all geological stages from Silurian to Tertiary. The Sierra Nevada is a monoclinical range descending westwards to California, most of it being granite. In anct. times the N. part of the continent was buried under ice during the movement of a great glacier from the N. Traces of this exist as erosion in Canada and deposition in the U.S.A. The great prairies of N. A. are composed of transported soil, mainly loess (q.v.), and form part of a great belt which reaches through Europe to Russia, thence from Turkestan to China, reappearing in N. A. Wind played an important part in the origin of this belt, attacking the finer elements of glacier débris and depositing them over a wide area, where they became modified by water.

The chief feature of Canadian geology is the great area known as the Canadian or Precambrian Shield or the Laurentian Plateau (see LAURENTIAN ROCKS). This shield is underlain by formations of the Precambrian age, which occupy nearly the whole of the country E. of a line joining Lake Winnipeg and Great Bear Lake, excepting the Maritime Provs., the N. of Ontario and Quebec, and a part of Ontario adjacent to the S. coast of Hudson Bay. The Precambrian rocks include the oldest known geological formations. Surrounding this Precambrian area is a wide extent of flat-lying sedimentary formations of Paleozoic, Mesozoic, and Cenozoic age. As one approaches the Atlantic and Pacific coasts, the flat-lying sedimentary series yield to great assemblages of folded sedimentary and volcanic rocks pierced by granite bodies and forming the Appalachian system of mts. on the E. and the Great Cordillera on the W. In the extreme N. an analogous mt. range stretches from Greenland westward into Ellesmere Is. The Precambrian formations are prolific in mineral deposits of great number, variety, and extent. They occur generally at or near the contact

of the intrusives and the intruded rocks, and among them are the gold deposits of Porcupine and Kirkland Lake, associated with intrusions of porphyry, the silver deposits of Cobalt, S. Lorrain, and Gowganda, associated with diabase sills, the vast nickel-copper deposits of Sudbury, associated with norite, the auriferous copper sulphides of W. Quebec, the copper-zinc sulphides of Flin Flon and the iron ores and iron pyrites of Ontario; in the Grenville-Hastings area are found deposits of galena, mica, graphite, feldspar, magnesite, kaolin, molybdenite, talc, and apatite.

Archæology.—The first significant discovery of archaeological remains in N. A. was in 1902, when a skeleton was unearthed at Lansing, Kansas, and in Florida human remains have been found, accompanied by objects of human handiwork, but no definite age has been assigned to these finds. Mineralised bones were discovered near Osprey, Manatee co., in 1880. The features of the facial bones bear close resemblance to those of Florida Indians. Some remains found near Nebraska, identified as the Nebraska Loess man, were found in 1906, accompanied by flint implements. Considerable archaeological finds were discovered in the Los Angeles area, including a number of animal bones of the Quaternary period, and in 1914 a female human skeleton bearing similarity to the Californian Indian was found. Pleistocene remains were unearthed between 1913 and 1916 near Florida, including fossilised plant remains and vertebrate fossils. Perhaps the most complete Pleistocene skeleton yet found is that of the Lone Wolf Creek, Colorado. A similar discovery was made near Folsom, New Mexico, in 1925. The Field Museum expedition in 1931 found traces of three distinct cultures at Lowry Ruin, Colorado. The walls show fragments of painting in black and white, and date back 3000 years, having been covered for at least 1000. Prehistoric designs representing sun, rain, lightning, and clouds are apparent, and masonry and ant. Indian tribe. An imperial archaeological survey of the Brit. Columbian coast was made in 1938, and much active research followed.

Ethnology.—The Indians of N. A. are said to have come originally from the E. hemisphere. Hitherto N. A. has yielded no palæolithic remains either of human beings or human implements. It is reasonable to assume that a migration took place from N. Asia via the Behring Strait. The theory claims some support by reason of the similarity in feature and speech in Eskimo types on both sides of the strait. Indeed Palæo-Asiatic tribes such as the Chukchee and Yukaghin are markedly similar to the Amer. types found among the Dene and Haida tribes, and a Palæo-Asiatic link is pointed out by some authorities with the Amer. Indians (see AMERICAN INDIANS). In E. Siberian races the point of resemblance is greatest.

For geography, climate, products, manufs., forms of gov., hist., etc., see ALASKA; CANADA; UNITED STATES OF

AMERICA; and articles on the provs. and states of these countries.

Ruedemann and R. Balk, *Geology of North America*, 1939; S. Northey, *The American Indian*, 1940; and the pubs. of the U.S. Geological Survey. There are details of recent work in the Digest of *American Journal of Archaeology*, of which vol. II. was pub. in 1947.

North American Indians, see AMERICAN INDIANS.

North American Native Languages. Among the better known larger groups of languages spoken in N. America are Eskimo (now considered by some scholars as a branch of the Ural-Altaic linguistic family (*q.v.*)), Athabaskan, Shoshonean, Algonkin, Caddoan, Iroquois, Muskogean, and Siouan, all of which are considered as Amer. Indian or Amerind, or 'Red Indian languages.'

The Eskimo, or Inuit, occupy more than 5000 m. of seaboard, from N.E. Greenland to the mouth of the Copper R. in W. Alaska. The numerous Eskimo dialects (respectively spoken in Greenland, Kuskokwim, Labrador, Baffin Land, the Aleutian Is., and so forth) differ very widely, especially in their vocabularies, and employ different alphabets. The Athabascans (or Athabascans), subdivided into two branches, the N. (Déné or Tinné) and S. (Navaho, Apache, Hupa), once occupied a wide area in the N.W. from the Rockies almost to Hudson Bay, small detachments spreading westwards to Washington, Oregon, and California, and in the S.W. (Colorado, New Mexico, and Arizona). Navaho is one of the main languages; it is spoken by some 25,000 people, living in N. Arizona. Hupa is spoken in the ter. lying on the lower Trinity R. in N. California. The Shoshoneans were mainly centred in the region of the Rocky Mts. The Algonkins are much better known: their main linguistic branches are Blackfoot or Siksika, Micmac, Cheyenne, Arapahoe, Cree, which was reduced to writing about 300 years ago, Chippewa or Ojibway, Fox, and Lemnienape and some other languages, which are less important.

The Caddoans live mainly on the Red R. in Louisiana, along the rivs. of N.E. Texas, in Kansas, and Nebraska. This linguistic group consists of four major languages, Caddo, Pawnee, Wichita, and Kitsai or Kichai. The term Iroquois was originally applied to a group of five, and later six, tribes (Mohawk, Oneida, Onondaga, Cayuga, Seneca, Tuscarora), at the time united in a strong confederacy. Cherokee is now the main Iroquoian language; the Cherokees formerly lived in what is now N. Georgia and N. Carolina, but were moved to Indian ter. in 1838-39; they employed their own script, a syllabary which was the most developed writing ever created by an Amer. native. Huron and Attiwandaron are extinct; some other languages, such as Wyandot,

are still spoken. Muskogean ter. extends along the river, flowing into the gulf of Mexico parallel to the Mississippi. The following are the main languages belonging to this group: Muskogee or Muskokee, Creek, Seminole, Chickasaw, and Choctaw. Winnebago (Minnesota and Wisconsin) is one of the oldest Dakota languages. The Assiniboin or 'Stone Sioux' is another branch; it separated from the main stock about 300 years ago. An important dialect, originally spoken by a numerous tribe inhabiting Missouri and Arkansas, it is nowadays spoken by only 2200 people living in Oklahoma.

Pacific Areas.—The ethnical hist. and linguistic situation of the native pop. of the 'Pacific slope' are entirely different from those of the rest of N. America. The following are some of the main languages spoken in the extreme W.: Chinook, which embraces a number of closely related dialects originally spoken on both sides of the Columbia R. from the Cascades to the sea; Tillamook, spoken on the Oregon coast S. of the Columbia R.; Kutenai, spoken in the area from about 50° N. lat. to N. Idaho and Montana. Other languages spoken in Brit. Columbia belong to the Wakashan group; there are three main dialects, each divided into sub-dialects differing in phonetics and vocabulary, Kwakwaka' being one of them. The Salish or Flathead tribes of the coast and the Kalispel constitute the Salishan linguistic group. Tsimshian and Nootka are spoken on the Skeena R. in N. Brit. Columbia and on the is. further to the S. Tsekma was spoken in the S.W. of the state of Oregon. Maidu or Pujunan, comprising various dialects, is spoken in N.E. California; Dieguens is spoken in S. California; Pima is spoken in S. Arizona by a semi-civilised tribe, and Zuni is now spoken only by 2000 people on the Zuni reservations in New Mexico. See under LINGUISTIC FAMILIES; see also LANGUAGES, CLASSIFICATION OF; MEXICAN (AND CENTRAL AMERICAN) NATIVE LANGUAGES; SOUTH AMERICAN NATIVE LANGUAGES.

'North American Review,' critical review, reputed to be the oldest magazine in the world. It was the lineal successor of the *Monthly Anthology*, which was begun by Phineas Adams in 1803. The first number was pub. by Wm. Tudor, its first editor, in 1815. Practically every notable Amer. writer, together with some of the greatest lights of contemporary thought in England, at one time or another contributed to its columns. One of its most celebrated editors was James Russell Lowell (1862-72). It claims to be the recognised channel in America for the most comprehensive discussions of important public questions; a character which it acquired under the editorship of Allen Thorndyke Rice, who purchased it in 1877, and was editor for twelve years. Rice drew his contributions not, as his predecessors had done, from Amer. writers only, but from every part of the world. It is pub. monthly. The offices are at 9 East 37th Street, New York.

Northampton, Spencer Joshua Alwyne Compton, second Marquess of (1790-1851), Eng. politician, b. in Wiltshire. He was associated with Wilberforce in the anti-slavery campaign, and assisted Sir James Mackintosh in his efforts towards the reform of criminal law. From 1838 to 1849 he was president of the Royal Society.

Northampton, William Parr, Marquess of (1513-71), was the brother of Catherine Parr, the sixth wife of Henry VIII. He was created earl of Essex in 1543 and marquess of N. in 1547. He played an important part during the reign of Edward VI., supporting the cause both of Somerset and Northumberland. On the death of Edward VI. he favoured the accession of Lady Jane Grey, and as a consequence was condemned to death, but the sentence was afterwards commuted to the forfeiture of his titles and estates. On the accession of Elizabeth he was again taken into favour and was created marquess for a second time in 1559.

Northampton: 1. Co. tn. of Northamptonshire, England, a mkt. tn. and parl. co., and municipal bor., on rising ground on the l. b. of the Nen, 67 m. N.W. of London by railway. In the centre of the tn. is a spacious market square. The prin. edifices are the shire hall, the grammar school, the tn. hall, the numerous churches, sev. of which are unusually interesting, as St. Peter's, a restored and beautiful specimen of enriched Norman, and St. Sepulchre's, one of the very few round churches in the empire, and supposed to have been built in the twelfth century. N. is the seat of a Rom. Catholic bishop. Boot and shoe making is the staple industry. Leather, hosiery, and lace are manufactured. Iron and brass foundries are in operation, brewing is carried on, and there is printing, brick making, and the manuf. of plastics. N. returns one member to the House of Commons. N., a very anct. tn., was held by the Danes at the beginning of the tenth century, and was burned by them in 1010. After the Conquest it was bestowed on Simon de St. Liz. In the seventeenth century it suffered flood and fire. Pop. 19,500. 2. City in Hampshire co., Massachusetts, U.S.A., on the r. b. of the Connecticut R., 8 m. N.W. of Holyoke. It has manufs. of silk, brushes, cutlery, etc. There are the Smith College for women, the Burnham School for girls, and the Clarke School for the deaf in the city. Pop. 24,700. 3. Post tn. in the Victoria dist. of W. Australia, 262 m. N.N.W. of Perth. Pop. 1200.

Northamptonshire, midland co. of England. The surface is mainly level or broken with low hills, and the scenery is beautiful and well wooded, the co. being famous for its trees. It includes part of the Fen country (q.v.), what is known as the 'soke' of Peterborough being land reclaimed from the Fens. The prin. rivers are the Avon, Nene, Welland, Cherwell, Leam, and Ouse. The Grand Union Canal crosses the co. Ironstone, limestone, and clay are worked, and a

particular kind of building-stone known as Weldon or Stamford marble. The mild climate and level surface, in addition to a rich soil, are admirable for agriculture, and almost the whole of the co. is under cultivation. Farming of all kinds flourishes, wheat and barley being the prin. crops, while cattle and sheep are reared extensively. Apart from agriculture the main industries are the iron works carried on at Kettering, Wellingborough, etc., and the manuf. of boots and shoes, Northampton being the centre of the trade for England. Since 1933 iron ore has been quarried at Corby (*q.v.*) and iron and steel foundries estab. The co. is divided into four co. constituencies and one bor. constituency (the co. tn.), each returning one member to Parliament.

D. M. L. 15h

SULGRAVE MANOR, NORTHAMPTONSHIRE
The ancestral home of the Washington family.

N. was originally included in the Mercian kingdom, and was part of Tostig's earldom in the eleventh century. At Harrington has been excavated a small fortified homestead of the early Iron Age. Earthworks and Rom. remains have been found and Watling Street and Ermine Street both cross the co. In 1215 the barons besieged Northampton Castle, held by King John, and in 1264 the castle was wrested from the younger Simon de Montfort by Henry III. Henry VI. was defeated at Northampton during the Wars of the Roses, and later the famous battle of Naseby (1645) took place in the co. There are few monastic remains, the most important being the abbey church of Peterborough (Medeshamstede), now the cathedral (Norman), commenced by Penda in 665; but there are some beautiful churches of Norman date. There are famous market crosses at Brigstock, Helpston, Higham Ferrers, and Irthlingborough. The ruins of Eotheringay Castle, where Mary Queen of Scots was executed, are also in the co. The family of George Washington, first president of the U.S.A., originated at Sulgrave Manor in N., whence

his great-grandfather John Washington migrated in 1657. The area is 909 sq. m. Pop. 359,700. See J. Taylor, *Bibliotheca Northamptonensis*, 1869; Victoria Co. History: *Northamptonshire*, 1908; W. Dry, *Northamptonshire*, 1920; S. H. Beaver, *Northamptonshire and the Soke of Peterborough* (ed. by L. D. Stamp), 1944; and A. Mee, *Northamptonshire*, 1945.

Northamptonshire Regiment. The 1st Battalion was originally the 48th (Northampton) Foot, and was raised in 1740; the 2nd Battalion was the 58th (Rutlandshire) regiment of Foot, raised in 1755. The 48th served first as marines and took part in the battle of Culloden (1746). The 58th had a fine record in the Peninsular war and also fought in the Crimean war, at Sebastopol, in S. Africa (1879), at Tirah (1897-98), and at the Modder R. in the S. African war. The 1st Battalion went out to the W. front as part of the 2nd Infantry Brigade, 1st Div. of the original B.E.F. in 1914, suffering very heavy losses in resisting the Ger. attack of Nov. 2, 1914, near Hoge Wood. The 4th Battalion (T.A.) took part in the Suvla landing in 1915 and later (1916) in the second battle of Gaza. Service or 'Kitchener' battalions of the regiment fought in the Somme battles of 1916, and were conspicuous in 1917 for their part in the defence of the Lombardy light-house. In the last year of the war they fought at Villers-Bretonneux, Bapaume, Epéhy, and in the Cambrai-St. Quentin battle. In the Second World War they fought in many of the most critical battles of the Burma campaign. In Italy other units were part of the Eighth Army (*q.v.*) and took part in many of the chief engagements from Sicily to S. Italy and in the battles N. of Bologna.

North Andover, twn in Essex co., Massachusetts, U.S.A. The chief trade is in wool and machinery. Pop. 7500.

North Atlantic Treaty, signed on April 4, 1949, at Washington by the U.S.A., Great Britain, Canada, France, and the other 'Benelux' (*q.v.*) countries, by which the U.S.A. associated herself with the W. European countries in security arrangements for their common or mutual defence against possible aggression. The pact had its provenance in the list, of the two years 1947-48 during which failure to come to terms with the Soviet Union and its satellites forced the W. countries to seek economic and security arrangements among themselves. For the terms of the pact and its evolution from the 'cold war' between the W. powers and Russia, the voluntary association of a 'W. Union', the Brussels Treaty (1948) (*q.v.*), and the Vandenberg resolution urging the association of the U.S.A. with regional defence agreements, see *EUROPE, History*, - *Russian Intransigence*, et seq. The N. Atlantic Council, at Washington, approved (Nov. 1949) the estab. of a committee under the treaty, which is to be responsible for advising the council on the financial and economic aspects of measures for the defence of the N. Atlantic area. The committee will co-operate closely with the N. Atlantic military organisation and par-

ticularly with the military production and supply board estab. by the defence committee. The committee's functions will also include consideration of plans for the mobilisation of economic and financial resources in time of emergency. The secretariat and working staff of the committee are to be located in London.

North Australia, see **NORTHERN TERRITORY**.

North Bay, tn. and watering-place of Ontario, Canada, on Lake Nipissing, 190 m. N. of Toronto. N. B. has foundries and machine shops, manufs. railway cars and ships, minerals, pulp and paper. There are gold and silver mines in the neighbourhood. Pop. 12,000.

North Berwick, seaside resort and royal burgh of Scotland in E. Lothian co., 22½ m. (by rail) E.N.E. of Edinburgh. It has become popular as a watering-place, having a good beach and fishing, and two fine golf courses. It was made a royal burgh by Robert III.; the ruins of a Cistercian abbey founded by David I. are in the neighbourhood. One mile to the S. is the hill called N. B. Law, rising to 612 ft.; 3 m. to the E. of the tn. are the ruins of the fourteenth-century Tantallon Castle, whilst 2 m. to the S.W. is Dirliton Castle, built in the twelfth century. Pop. 3500.

North Borneo, **British**, see **BORNEO**, **BRITISH NORTH**.

North Brabant, prov. of the Netherlands in the S. of the country. Cattle is raised, wheat grown, and sugar-beet produced in the N.E. There are textile industries and the manuf. of incandescent lamps. Chief tn. is Hertogenbosch. Area 1920 sq. m. Pop. 1,168,000.

North Braddock, bor. of Pennsylvania, U.S.A., in Allegheny co., 9 m. S.E. by E. of Pittsburgh. There are manufs. of steel rails. Pop. 15,600.

Northbridge, tn. in Worcester co., Massachusetts, U.S.A., 11 m., S.E. of Worcester. It is engaged in the manuf. of cotton goods. Pop. 10,200.

North Bridgewater, see **BROCKTON**.

Northbrook, Earl of, see **BARING**.

North Cape, headland on the Is. of Magerø, Norway. It is, with Knivskjærøde, which is slightly further N., the most northerly point of Europe, being in lat. 76° 11' N.

North Carolina (Tar Heel State or Old North State), S.E. Atlantic state of U.S.A. The coastal plain is fringed by a margin of swamps and shoals which are extremely treacherous to navigation. The largest of these swamps is known as Dismal Swamp. The Piedmont plateau region is bold and somewhat rugged in contour. The chief ranges of the Appalachian Mt. region are the Blue Ridge and the Unaka Mt. range. The highest peak of the Unakas is Mt. Mitchell (6711 ft.). The mts. of this region are for the most part clothed with dense forests. The scenery is exceptionally beautiful, Asheville being the most famous resort with a fine golf course. N. C. is exceptionally rich in minerals, which include clay products, mica, feldspar, barytes, talc, kaolin, asbestos, granite, monazite, zircon, columbite, wolframite,

etc. In 1946 mineral products were valued at \$20,428,000. The chief occupation is agriculture. Maize is the prin. crop (65,000,000 bushels in 1947). The chief cash crops are cotton, tobacco, and peanuts. Cultivation of cotton on 619,000 ac. in 1917 produced nearly 410,000 bales. N. C. leads usually in the production of tobacco (915,000,000 lb. in 1947), and of sweet potatoes. Also grown are peaches and *sorgo* syrup. The ann. lumber cut is about a billion feet, chiefly yellow pine. Tar and rosin are also flourishing trades. The state is second only to Massachusetts in cotton and textiles (183,000 workers), and leads in cigarette manufs. (70 per cent. of the country's production). The manuf. of furniture, rayon, aluminium, and the processing of foods are also carried on. Fisheries in the state are valuable. The cap. of the state is Raleigh (47,000) and the chief port is Wilmington (33,400), the largest city being Charlotte (101,000). Other cities are Winston-Salem (79,800); Durham (60,200); Greensboro (59,300); Asheville (51,300), and High Point (38,500). The state is represented in Congress by two senators and twelve representatives. Its General Assembly has a Senate of fifty and a House of Representatives of 120 members, elected for two years. N. C. was one of the original thirteen states. The ter. was discovered by Amadas and Barlow in 1584, and a colony settled in Roanoke Is. in 1585-86, the famous 'vanished colony' which in 1587 was found to have disappeared without leaving a trace. The ter. was granted to various 'proprietors' by Charles I. and Charles II., but in 1728 the Crown resumed control. The pop. consists of over 99 per cent. native-born Amers., of whom 27.4 per cent. are Negroes. The percentage of illiteracy is still somewhat high, but is being rapidly reduced by compulsory attendance at the schools. There is the state univ. at Chapel Hill and Duke Univ. at Durham, endowed with \$15,000,000 by J. B. Duke, the cigarette millionaire, the college of agriculture and engineering at Raleigh, and the college for women at Greensboro. There are separate schools for white, coloured, and Indian children. There are twelve state-supported teachers' colleges, six white, five Negro, and one Indian. The area of the state is 52,426 sq. m., of which 3868 sq. m. are inland water. The pop. in 1940, was 3,571,623 (estimated pop., July 1944, was 3,534,545). See R. D. Connor, W. K. Boyd, and J. G. Hamilton, *History of North Carolina, 1584-1912*, 1919; A. R. Newsome, *North Carolina Manual*, 1929; S. H. Hobbs, *North Carolina: Economic and Social*, 1930; H. T. Lefler, *North Carolina's History told by Contemporaries*, 1934; Federal Writer's Project, *North Carolina: a Guide to the Old North State*, 1939; and A. Henderson, *North Carolina, The Old State and the New*, 1941.

Northcliffe of St. Peter in Thanet, Sir Alfred Charles William Harmsworth, Viscount (1865-1922), Brit. newspaper proprietor; b. at Chapelizod, Dublin, eldest child of Alfred Harmsworth, a barrister of Eng. birth. He started in

journalism as a reporter for the *Hampstead* and *Highgate Express*, and later he became assistant editor of *Youth*, a paper linked with the *Illustrated London News*. After an attack of pneumonia in 1884, he had to live out of London, and worked for Illife & Sons, Coventry. Saving about £1000, he returned in 1887 to London opening as a publisher at 26 Paternoster Square. On June 2, 1888, he pub. the first number of a snippet weekly, first called *Answers to Correspondents*, but soon merely *Answers*, modelled on the pattern of Newnes's *Tit-Bits*, begun 1881. He was assisted in this enterprise by his brother Harold Sidney, afterwards the first Lord Rothermere. In 1892 they were selling 1,000,000 copies weekly. In Aug. 1894 N. bought the *Evening News*, a Conservative paper. The same year he equipped the Jackson arctic expedition at his own expense. On May 4, 1896, he began pub. of the *Daily Mail*, a revolution in journalism from its inception, with ideas of make-up and presentation of news-items adapted from current Amer. journalism. One prov. newspaper after another was acquired by Harmsworth. Innumerable, as years went by, were the subsidiary Harmsworth journals, pub. by Amalgamated Press. In 1904 he was made a baronet, and in 1905 he became Baron N. In 1906 he and his brother acquired forests in Newfoundland, in order to make their own paper. In 1908, with the utmost precaution to insure secrecy of the negotiations, he became proprietor of *The Times* (see H. Kitchin, *Moberley Belland 'The Times'*); he retained the controlling interest until his death. Through the *Daily Mail* he had been popularly supposed to have made the S. African war; and in the First World War he continually offered instructions and awarded commendation and rebuke but he declined the Ministry of Air when Lloyd George offered it to him in Nov. 1917. He was made a viscount that year, and became director of propaganda in enemy countries, in which work he was extremely successful. From the end of 1918 he suffered much in health, and his mind was affected by his malady. He went for a tour round the world in 1921, but received no benefit. He d. in London, 1922. He was married, but left no issue.

That N. was a great journalist is not open to doubt. His aim was not so much to 'amuse' as to humanise and extend the scope of the daily newspaper. He was the first to see that women, as well as men, could be interested in a newspaper. A notable quality of N. was his prescience. He foresaw the possibilities of aviation more clearly than most, except the experimental pioneers themselves and the military advisers. His part in the First World War in moulding and interpreting public opinion was often of importance. But in Fleet Street his name will probably be mainly associated with raising the status of the ordinary journalist. It was well said that nothing unclean or indecent was allowed in any of the journals under his control. The point is a minor one, but it is one that could not be

made of the older school. Through his numerous pubs. N. exercised tremendous influence and was one of the most dynamic personalities of his generation in Great Britain. See Sir M. Pemberton, *Lord Northcliffe, a Memoir*, 1922; M. Wilson, *Lord Northcliffe*, 1927; H. Hamilton Fyfe, *Northcliffe: an Intimate Biography*, 1930; T. Clarke, *My Northcliffe Diary*, 1931; and Sir J. A. Hammerton, *With Northcliffe in Fleet Street*, 1932.

Northcote, Henry Stafford, Baron Northcote of Exeter (1846-1911), Eng. statesman, b. in London, was the second son of Sir Stafford Henry N., first earl of Iddesleigh. He entered the Foreign Office in 1868, and on various commissions acquired considerable experience. In 1877 he became private secretary to his father, then chancellor of the exchequer, and in 1880 became a member of Parliament. He held minor appointments until 1900, when he was raised to the peerage and made governor of Bombay, in which position he greatly distinguished himself. The Commonwealth of Australia was formed in 1901, and three years later N. went out as governor-general.

Northcote, James (1746-1831), Eng. painter, b. at Plymouth. In 1773 he began his studies under Sir Joshua Reynolds (of whom he wrote a life, pub. 1813) and at the Royal Academy schools. He went to Italy in 1777, and on his return to England he became famous as a portrait painter. In 1786 he was elected associate of the Academy, and his historic picture, 'The Young Princes murdered in the Tower,' was completed in that year. This was followed by 'The Burial of the Princes' and 'The Death of Wat Tyler.' 'The Entombment' and 'The Agony in the Garden' are among his last works. Much information about N. as an individual is contained in articles pub. in 1826 by Wm. Hazlitt in the *New Monthly Magazine*; these appeared in book form in 1830 as *Conversations with James Northcote Esq., R.A.* (new ed. by F. Swinnerton, 1919).

Northcote, Sir Stafford, see IDDESLEIGH.

North Dakota, N. central state of the U.S.A., bounded on the N. by Canada and known as the Northern State. The physical features are bold and simple. Three vast tablelands rise successively from E. to W. The Red R. flows through the northernmost of these tablelands, which has a mean breadth of 50 m. and a mean elevation of 900 ft. The second tableland has a mean breadth of 180 m. and a mean elevation of 1400 ft. The third and most westerly tableland is called the Coteau du Missouri, and covers half the state. This plateau is watered by the Missouri. The rainfall is low, and the winters cold but sunny. Devil's Lake, or Minniwaukon, in the N.E., has no outlet, and is salt. The valley of the Red R. is very fertile, and produces fine wheat crops. N. D. leads usually in the production of barley, spring wheat, rye, and durum wheat. Other important products are flax seed, potatoes, hay, oats, and maize. Horse and cattle raising flourishes. The mineral resources consist chiefly of

coal, in the Coteau du Missouri, and great lignite deposits. The co. seat is Bismarck (15,500); other cities: Fargo (32,600); Grand Forks (20,200); and Minot (16,600). The state sends to Congress two senators and two representatives. It has a Senate of forty-nine members elected for four years, and a House of Representatives of 113 members elected for two years. There is a state univ. and a state agric. college. Area 70,665 sq. m., of which 611 sq. m. are water. It was first settled about 1800. The state formed part of the Louisiana Purchase and remained for a long time unorganised. The part E. of the Missouri R. was attached to the ter. of Minnesota; the part on the W. to the ter. of Nebraska. Dakota was organised as a ter., 1861. N. D. was admitted as a state in 1889. Pop. (1940) 642,000 (a decrease of 39,000 since 1930). See C. Lounsbury, *Early History of North Dakota*, 1913; Z. I. Trinka, *North Dakota To-day*, 1919; L. F. Crawford, *History of North Dakota*, 1931, and *North Dakota*, 1938; and Federal Writers' Project, *North Dakota: a Guide to the Northern State*, 1938.

North Downs, see DOWNS.

North-East Passage, route, finally found by A. E. Nordenskiöld (1859-1930) in 1878-79, from Europe and the Atlantic through the Arctic Ocean round the N. coast of Asia to the Pacific Ocean.

North-East Polder, or **Noordoostelijke Polder**, area of Holland, consisting of part of what was once the Zuider Zee, now called IJsselmeer. Its reclamation, completed in 1942, has provided Holland with an additional 120,000 ac. of agric. land.

North-East Provinces, China, see MANCHURIA.

North, winter winds experienced in the gulf of Mexico and Texas regions. Cold N. or N.W. winds, often with snow, occurring in winter, the Norther is produced by a strong depression over the W. Caribbean Sea.

Northern Circars, The, see CIRCARS.

Northern Dialect, see under ENGLISH LANGUAGE, *Middle English*.

Northern Diver, Great, see LOON.

Northern Ireland, see IRELAND, NORTHERN; ULSTER.

Northern Lights, see LIGHTS, NORTHERN.

Northern Nigeria, see NIGERIA.

Northern Pacific Railroad, with over 6750 m. of railway track, operates mainly in the states of Minnesota, N. Dakota, Montana, Idaho, Washington, and Oregon, with Pacific coast terminals at Seattle and Portland, and middle W. terminals at Minneapolis, St. Paul, and Duluth. The road was constructed under an Act of the U.S. Congress in 1865, and was completed in 1883. It does an enormous freight business, especially with cargoes of grain, timber, and mineral ore.

Northern Rhodesia, see RHODESIA.

Northern Territory, formerly **Alexandra Land**, name given to the N. portion of S. Australia, N. of 26° S. lat. and extending between 129° and 138° E. long. with a length of 560 m. The region formerly belonged to New S. Wales, but was annexed to S. Australia in 1863 and trans-

ferred to the Commonwealth in 1911. In 1927 the N. Ter. was divided, for administrative purposes, into N. Australia and Central Australia, the dividing line between these two ters. being 20° S. lat. By an Act of 1931 the whole of the N. Ter. was placed under one administrator. The coast was surveyed by Philip Parker King in 1818, and by J. C. Wickham and John Lort Stokes in 1838 and 1839. Port Darwin, the present cap., was discovered in the latter year. The interior was explored in 1855 by A. C. Gregory. Leichhardt visited the site of Port Essington after a trying journey of 3000 m., during which he and his party were attacked by aboriginals, and his naturalist, John Gilbert, was killed (1845). His route is marked by a procession of names which he gave to features that he discovered, amongst these being Calvert and Roper R.s., named after members of the party. Two years later Leichhardt embarked on his last fateful journey, whence neither he nor any of his companions returned. There is reason to believe that they met disaster somewhere in N. Australia. Arnhem Land has in recent years been explored by D. F. Thomson. He found that the native inhab. have been strongly influenced by Malay or Macassar visitors. Indonesian characteristics are preserved in vocabulary, ceremonial life, and material goods, such as the dugout canoe, smoking pipe, and calico. The low, flat coastline seldom reaches a height of 100 ft. Sandy beaches, mud flats, thickly fringed with mangroves, prevail. Sandstone, marl, and ironstone form the occasionally cliffy headlands. The sea front of more than 1000 m. is indented by bays and inlets and intersected by numerous rivs., of which the Roper R. is the chief. Many of the rivs. are navigable for considerable distances from their estuaries. Inland there is a general rise southwards to the 18th parallel where the higher lands form the watershed between the rivs. flowing northwards to the sea, and those forming the scanty supply of the interior system. Towards the centre of the continent the land over a wide area is of considerable elevation (1700 ft.) and there are sev. mt. ranges, generally with an F. and W. trend.

The high hopes once centred on Port Essington came to nothing, for the place was too far outside the track of shipping going through Torres Strait, and little now remains of it or of the other one-time busy little settlements of Fort Dundas and Raffles Bay. The linking of S. Australia with Port Darwin owed much to the foresight of Charles Todd, superintendent of telegraphs of S. Australia; for it had been proposed by the cable company concerned, to make either Norrington or Burketown, at the head of the gulf of Carpentaria, the objective of the cable from Java; but Todd, to the great advantage of S. Australian interests, successfully urged the claims of Darwin instead and the Overland Telegraphic Line was completed under his guidance by Aug. 22, 1872. In the eighties some thousands of Chinese

and other aliens were employed on the railway construction works for the Palmerston Pine Creek Railway. This led to legislation in 1876 in Queensland restricting the employment of alien labour, the first phase of the subsequent national restrictive policy culminating in the White Australia ideal. This restrictive action by Samuel Griffith, attorney-general of Queensland, had a direct bearing on N. Ter. hist., for eventually S. Australia, yielding to the general public sentiment, abandoned the project of developing the ter. by any but white people.

Much of the country is desert, but near the coasts sugar-cane, cotton, and fruits are grown, and elsewhere pine, fig, and orange trees. But at present agriculture is insignificant and the peanut is the only crop which is marketed for export. N. Ter. is rich in mineral resources, though these have been but little developed until recent years. There is considerable activity in gold-mining near Tennant Creek. Other minerals worked include tin concentrates, wolfram, tantalite, and mica. Total value of minerals in 1936 was £A128,000; in 1948 the value was £A281,026. The immediate surroundings of Port Darwin consist of woodlands like those of the S. parts of Australia. Gum-trees shade the undergrowth. The scarlet banksia and yellow bottle-brush flowers and many other trees or shrubs vary the sombrely tinted vegetation. Graceful palms and thousands of ant-hills make up the tropical landscape. Among the birds are honey-eaters, butcher-birds, and brown hawks. There are extensive lagoons on the Ten-Mile plains on which grow milk-wood trees and pandanus palm. Near the Ten-Mile are the so-called 'Cemetery Plains,' a swampy area of ant-hills. Heavily covered with scrub the undulating country stretches northwards and eastwards from the Ten-Mile. The jungle of N. Ter. is covered with a deep layer of dead and decaying vegetation. The giants of the jungle are wild fig, while parasitical creepers swathe the trees, and immense leafy cables festoon the jungle. Bird life in the jungle is prolific—the Torres Strait pigeon, scrub turkey, fruit pigeon, and cockatoo. Horses, cattle, sheep, and pigs are reared. The ordinary types of native Australian fauna are found. Marsupials, birds, crocodiles, tortoises, snakes (non-venomous), and frogs abound. The white ant is a pest, and mosquitoes and sand flies are troublesome, especially in the wet season. Buffalo formerly existed in large herds. N. Ter. is potentially a great source of meat production with its 300,000 sq. m. of cattle-producing land; 2,500,000 head of cattle could be carried even without development. Communications for cattle transporting are a problem to be solved; the Federal Gov. has initiated a trunk route into the Kimberleys and the N.W. of the N. Ter. A regular demand is a vital necessity, and this may well be provided by the long-term agreements entered into with Australia by Britain.

The climate is tropical, the wet season lasting from Nov. to April; the ann.

rainfall is about 60 in. The S. part of the ter. is generally sandy with a small rainfall, but it can be watered by means of sub-artesian bores. Though the climate is tropical, it varies considerably over the whole ter. The proximity of the sea in the N. keeps it fairly equable in the coastal region, but further S. the climate is of a continental type, showing a great variation between the hottest and coldest months.

The chief is, off the coast of N. Ter. are Goulburn, Valentia, Templar's, Darch, Croker, and Melville. S. Goulburn has sea-is. cotton and chicken pearl-shell, and is suitable for coco-nut cultivation. Croker Is. is well timbered, Melville Is. (2400 sq. m.) has pearl fisheries. The first landing was effected on this is. at an unnamed point 10 m. N.E. of Cape Keith.

The prin. exports of N. Ter. are cattle, pearl-shell, and trepang. Value of commerce in 1947-48: imports, £A277,000; exports £A73,000. Mother-of-pearl shell was discovered in 1884 in Port Darwin harbour. The pearl-shell and trepang fisheries are valued at over £30,000.

The area of N. Ter. is 523,620 sq. m. The coast-line is 1040 m. in length. In 1888 the pop., exclusive of aboriginals in the N. Ter., reached 7533; in 1929 the pop. excluding aboriginals, was only 4470. The estimated pop. in 1947 was 10,870. The estimated number of aboriginals (including half-castes) in the middle of 1947 was 12,200. Railways: Port Augusta to Oodnadatta (later extended to Stuart (Alice Springs), 292 m. from Oodnadatta and 981 m. from Adelaide). The terminus of the N. Australian Railway is at Birdum (316 m. from Darwin), while the Central Australia Railway extends as far N. as Alice Springs. Two new roads were constructed during the Second World War: Newcastle Water-Mt. Isa (Queensland) and Darwin-Alice Springs (970 m.). There is an airfield at Darwin. See M. Terry, *Across Unknown Australia*, 1925, and *Through a Land of Promise*, 1927; H. Basedow, *The Australian Aboriginal*, 1925; A. G. Price, *The History and Problems of the Northern Territory, Australia*, 1930; C. P. Conigrave, *North Australia*, 1936; C. T. Madigan, *Central Australia*, 1936; C. Warner, *A Black Civilization: a Social Study of an Australian Tribe*, 1931; and D. F. Thomson, 'Arnhem Land: Explorations Among an Unknown People' (*Geographical Journal*, 1948-49).

Northern Union, Eng.: rugby football union formed in 1893, to avoid the ban on professionalism within the Rugby Union, and renamed the Rugby League in 1922. See further under FOOTBALL.

Northfield: 1. Dist. of Worcestershire, England, a suburb and bur. constituency of Birmingham. There are manufs. of nails and other hardware products. Pop. 46,000. 2. Vill. of Washington co., Vermont, U.S.A., 35 m. from Burlington. Here is Norwich Univ., removed in 1866 from Norwich. 3. Tn. in Franklin co.,

Minnesota, U.S.A., 42 m. N.E. of Springfield. It is the bp. of Dwight L. Moody; it possesses a seminary and a training school, and is the rendezvous of the annual summer conference of Christian workers. Pop. 2000.

Northfleet, tn. in the co. of Kent, England, 1½ m. W. of Gravesend. It is engaged in the manuf. of paper, chemicals, and cement. Pop. 16,400.

North Foreland, see FORELAND, NORTH AND SOUTH.

North Foreland, Battles off the, were three battles of the Dutch wars. The first battle commenced on June 2, 1653, between fleets commanded by van Tromp and De Ruyter on the Dutch side, and Monck, Deane, Penn, and Lawson on the Eng. During the first day's fighting Deane was killed, but Blake came to the reinforcement of the Eng. at night with eighteen fresh ships, and on the next day the Dutch were obliged to retire. They had eleven ships captured and seven or eight sunk in the action. The second battle was one of the hardest fought and most disastrous battles of the second Dutch war. The Eng. fleet, under the command of Monck, engaged the Dutch fleet, commanded by De Ruyter, in the Downs, on June 1, 1666. The fighting went against the Eng., who eventually had to retire with a loss of twenty-one vessels against the Dutch loss of seven ships only, although the victors were not in much better plight than the vanquished. An Eng. victory was gained in the third engagement, of July 25 and 26, 1666.

North German Confederation, league of Ger. states estab. in 1867, linking under Prussian leadership the twenty-two states N. of the R. Main. The king of Prussia was president and commander-in-chief of the army of the confederation. *See also* under GERMANY, History.

'North German Gazette' (formerly *Die Norddeutsche Allgemeine Zeitung*, later called *Die Deutsche Allgemeine Zeitung*), a daily paper estab. in Berlin in 1861, and known throughout Europe as a semi-official jour. As a medium of communications against France, practically dictated to the editor by Bismarck, the *N. G. G.* not only focused the attention of Europe on its columns, but estab. itself as the authoritative organ of the Ger. Gov., a position which it only lost when the chancellor attacked the policy of Emperor William I. It remained the semi-official organ of the gov. until the revolution, and it was sold to Hugo Stinnes in 1920. It again became one of the mouthpieces of the gov. under the National-Socialist regime.

North German Lloyd, see NORDDEUTSCHER LLOYD.

North Ham, vil. of Canada in Wolfe co., Quebec. Pop. 1400.

North Holland, see HOLLAND, NORTH.

North Island, see NEW ZEALAND.

North Kazakhstan, region of the Kazakh S.S.R., lying on the N. border. The Ishim R. traverses the region of which Petropavlovsk is the chief tn. It is in the black earth steppe region and produces

grain, especially wheat, and beet. There are iron-ore deposits between the Ishim and upper Irtysh Rs.

North Lancashire Regiment, see LOYAL REGIMENT.

Northmen, see NORSEMEN.

North Land (Leninland or Severnaya Zemlya), Russian is. of the Arctic Ocean, N. of Cape Chelyuskin.

Northolt, vil. of Middlesex, England, 2½ m. S.S.W. of Harrow. There is an aerodrome, used as a fighter station in the Second World War, and now an airport. Smaller than the London airport, and used mainly by smaller aircraft, it deals almost exclusively with home and European traffic. All the operators in W. Europe were using it in 1949 and its daily traffic average was about eighty aircraft movements, 1200 passengers, and twelve tons of freight. The airport is regarded as a temporary terminal for European traffic and plans have been drawn up to replace it in 1956 by an airport on the E. side of London. By then, it is estimated, 6000 passengers will pass daily through the continental terminal.

North Ossetian A.S.S.R., autonomous republic of the R.S.F.S.R., in the Caucasus. The Terek R. traverses the republic, the main tns. of which are Orjoni-kidze, the cap., Alagir, and Balta. Mt. Kazoek lies on the S. frontier with the Georgian S.S.R. Pop. 152,000.

North Park, one of the 'parks of Colorado,' U.S.A., in Larimer co., its area is 2000 sq. m., and it stands at a mean elevation of from 8000 to 9000 ft. It is noted for its big game.

North Plainfield, bor. of New Jersey, U.S.A., in Somerset co., 12 m. S.W. of Jersey city. Pop. 10,000.

North Pole, see ARCTIC EXPLORATION.

North-Rhine Westphalia, land of the Brit. occupation zone of Germany, consisting of the Regierungsbezirke Köln (Cologne), Aachen, and Düsseldorf of the former Rhine Prov.; the former prov. of Westphalia; and the former Land Lippe. The cap. is Düsseldorf. The area is 34,076 sq. km. and the pop. (1948) 12,640,000, of whom 32,000 were displaced persons living in camps. *See further* under RUINE PROVINCE; WESTPHALIA.

North Riding, see YORKSHIRE.

Northrop, John Howard (b. 1891), Amer. biochemist and biologist, b. at Yonkers, New York, and educated at Columbia Univ. (B.S. 1912; Ph.D. 1915; D.Sc. 1937). Since 1916 he has worked at the Rockefeller Institute for Medical Research, Princeton, New Jersey. N. is the author of a book on crystalline enzymes, and shared the Nobel prize in 1946 for his work in this sphere. He pub. *Crystalline Enzymes* in 1939.

North Sea, or German Ocean, European sea, bounded on the E. by the continent of Europe, on the W. by Great Britain; on the S. it is connected by the straits of Dover with the Eng. Channel and the Atlantic; and on the N. it extends to the Shetland Isles, joining the Norwegian Sea in the N.E. The N. S. is very shallow, the Continent and Britain once being coterminous. Its mean depth is about

fifty fathoms. The Dogger Bank stretches across the N. S. from E. to W. The coasts of the N. S. are mainly flat; the Eng. coast consists of sandy cliffs and beaches, and the continental coast consists of marshes and protecting banks. The N. S. waters are composed of a mixture of Baltic water through the Skagerrak Atlantic water through the Shetland-Faroe channel, and Arctic water through the Norwegian Sea, and consequently there is a great variety of temp. and salinity in various parts of the sea. The union of the N. tidal wave and that from the straits of Dover sends high tides to London, a fact which is invaluable for shipping purposes. The Atlantic tides, which have a salinity of 35 *pro mille*, send out considerable heat. The fisheries of the N. S. are the most productive in the world. A Convention regulating the policing of the fisheries was concluded in 1882 by the European countries interested. Trawl fishing is extensively carried on in the shallow parts of the sea, and yields vast supplies of haddock, cod, whiting, halibut, sole, brill, turbot, plaice, etc. Line fishing is practised in the deep waters. The courses of the herring shoals round Britain are remarkable. In Shetland herring fishing commences in June, and later at various stages southward down the Brit. coast, till it ends in the late autumn and winter fishing off Norfolk. The maximum length is 600 m., and its greatest breadth is 400 m.; its area is 162,000 sq. m.

North Sea-Baltic Canal, see KAISER WILHELM CANAL.

North Shields, see SHIELDS, NORTH.

North Somerset, see SOMERSET.

North Staffordshire Regiment, see STAFFORDSHIRE REGIMENTS.

North Staffordshire University College, planned to open in 1950 to serve the heavily populated area around Stoke-on-Trent. A number of features distinguish the college from other Eng. univ. colleges. The chief force behind its inception was the activity of the city council of Stoke-on-Trent, the bor. council of Burton-on-Trent, and the co. council of Staffordshire, a corporate work paralleled only by the estab. of the 'Town's College' by the Edinburgh tn. council in 1563. Again, other univ. colleges have had to pass through a period during which external degrees only, of London Univ., could be taken, but the N. S. U. C. was empowered to organise from the outset its own examinations for a B.A. degree, although the univs. of Oxford, Manchester, and Birmingham sponsored the college and appointed representatives to an academic council responsible for the maintenance of academic standards. The normal B.A. degree course was fixed at four years, the first to be an obligatory study of general subjects; this is designed to prevent over-specialisation whilst still allowing the college to serve the technical and scientific needs of the area. Commencing with some 150 to 200 students, of both sexes, the maximum capacity of 800 was aimed at by 1953. Keele Hall, some 5 m. from Stoke-on-Trent, was acquired as a central

site: the capital expenditure for further building was made the responsibility of the Univ. Grants Committee in consideration of the fact that the three interested public authorities contribute some 25 per cent, instead of the usual 14 per cent, of the running costs. The first principal was Lord Lindsay of Birker.

Northstead, Manor of. Appointment to the crown stewardship of this Yorkshire manor serves as an excuse for the resignation of a member of Parliament. This is effected in accordance with the Place Act of 1742. See further under CHILTERN HUNDREDS.

North Sydney: 1. Residential suburb of Sydney, New S. Wales, Australia. It is situated on the N. shore of Port Jackson, and it possesses one of the largest suspension bridges in the world. Pop. 26,000. 2. Seaport of Canada, on Cape Breton Is., Nova Scotia, 8 m. N.W. of Sydney. It possesses 3000 ft. of quayside, and a depth alongside of from 15 to 28 ft. of water. Coal is mined. Pop. 8000.

North Tarrytown, vil. of Westchester co., New York, U.S.A., 26 m. N. of the city of New York, on the Hudson R. Near here is Sleepy Hollow of Washington Irving's *Legend of Sleepy Hollow*, and it is also the burial place of Irving. It possesses an old Dutch church, dating from 1699. It. manufs. automobiles. Pop. 8800.

North Tonawanda, city in Niagara co., New York, U.S.A., on the Niagara R., 10 m. N. of Buffalo. Its greatest amount of trade is carried on in lumber, but it also manufs. iron, nuts and bolts, boilers and engines, and merry-go-rounds, drawing its electric power from Niagara Falls. Pop. 20,200.

Northumberland, Dukes and Earls of. Since the time of the Norman Conquest there was an earl of N., but the title did not become hereditary until 1377, when Henry, Baron Percy, became earl. The title of duke of N. was held by John Dudley from 1551 until his death in 1553; he was a soldier and politician of Edward VI.'s reign, but was executed for plotting the exclusion of Mary Tudor and the accession of his daughter-in-law, Lady Jane Grey. The ducal title was held by George Fitzroy, a natural son of Charles II., from 1683 until his death without issue in 1716.

Except for a period of forfeiture, from the death in 1408 of the first earl until its restoration to his grandson, the title of earl remained in the Percy family (*q.v.*) until the death of the eleventh earl in 1670; his daughter married Charles Seymour, duke of Somerset, and their son Algernon, seventh duke of Somerset, became earl of N. in 1749. Dying without issue, his son-in-law Sir Hugh Smithson became earl and took the name of Percy; in 1766 he was created duke of N. The fourth duke *d.* in 1875, the title passing to his grand-nephew George, earl of Beverley; from him are descended the later dukes of N. See G. Brunan, *History of the House of Percy* (ed. W. A. Lindsay, 1902).

Northumberland, most northerly co. of England. The coast-line is flat and sandy, the cliffs are low, and there are few inlets. There are sev. ls., the most important being Holy ls., or Lindisfarne, and the Farne ls. The surface from the low plains in the E. rises to a moorland region in the centre, and so upward to the Cheviot Range, reaching its greatest elevation in Cheviot Peak (2676 ft.). The chief rivs. are the Tweed, Aln, Coquet, Wansbeck, Blyth, and Tyne; the Tweed being famous for its salmon fishing and the Coquet for its trout. In the S. lies the big coalfield; lead and zinc are found, and building-stone is quarried. The soil varies very much, and a large proportion is permanent pasture. Oats and barley are the prin. crops. Sheep rearing is carried on very extensively, there being a particular breed known as the Cheviots; cattle are also reared. The Tyne forms the great manufacturing centre, the

JOHN DUDLEY, FIRST DUKE OF NORTHUMBERLAND

industries including shipbuilding, iron-works, blast furnaces, rope-works, chemicals, potteries, brickfields, and glass factories. Machinery and tools are also manufactured. N. Shields is the centre of the sea-fisheries, and Hexham has a large glove factory. The Tyne has the largest coal-shipping trade in the world, Newcastle being the prin. port. Other ports besides those on the Tyne are Blyth, Amble, Alnmouth, and Berwick. The co. is divided into three parl. divs., each returning one member. There are extensive Rom. remains in N. The co. originally formed part of the Saxon kingdom of Bernicia, which became merged into the kingdom of Northumbria (q.v.) about the end of the sixth century. It suffered considerably from the border raids, but there are some fine old buildings, notably Lindisfarne Priory (1093), Hexham Priory Church, built over the crypt of Wilfred's Abbey of St. Andrew, and the castles of Alnwick, Dilston, etc. The co. also includes such famous battlefields as Otterburn and Flodden Field, and is the

home of the great Percy family. Area 2018 sq. m. Pop. 730,400. See *Victoria County History: Northumberland*; *Newcastle-upon-Tyne Public Library, Local Catalogue of Material concerning Newcastle and Northumberland, 1932*; and Ann Sitwell, *Northumberland, 1949*.

Northumberland Fusiliers, Royal, raised privately in 1674 to assist the Dutch in their struggle with France, in 1685 became the 5th regiment of the line. It fought at the battle of the Boyne, served in the Seven Years' war and in the Amer. War of Independence, and fought in most of the great battles of the Peninsular war, winning the nickname of the 'Fighting Fifth.' In 1836 it became a fusilier regiment, and served in the Afghan war 1878-80, at Khartoum, and at the Modder R., and other battles in the S. African war (1899-1902). In the First World War the 1st Battalion was part of Shaw's 9th Infantry Brigade in the original B.E.F. In that war the N. F. comprised, besides three regular and special reserve battalions, five territorial force battalions, and a score of service (new army) battalions. The 1st Battalion was prominent at the capture of Glivenchy (Oct. 1914) and in the storming of Aubers. Various units fought in the Somme battles of 1916, and, together with sev. Canadian units, the N. F. suffered very severe losses in the La Boisselle-Contalmaison region. The 9th Battalion greatly distinguished itself in the fighting near Mametz wood. In 1918 units of the regiment took part in the dour fighting on the Menin Road-Polygon Wood front of the Ypres salient. In the Second World War the N. F. served on the W. front and in N.W. Europe. They fought in the battle of Normandy, 1944, and in the advance to the Rhine, while other units were part of the Eighth Army (q.v.) and fought in the battles for Sicily, in those on the advance to Rome, and in the bitter struggle for the Gothic line.

Northumberland Strait separates Prince Edward Is. from Nova Scotia and New Brunswick. Length 130 m., breadth 8 to 30 m.

Northumbria, one of the greatest of the A.-S. kingdoms, situated between the Humber and the Forth, originally consisted of two independent kingdoms, Bernicia and Deira. Of the former kingdom Ida was the first ruler (547-59), and he was succeeded by his four sons, who ruled in succession. The first ruler of Deira was Ella (560-1605), and he was succeeded by Ethelfrith, who united the two kingdoms in 605. Edwin, son of Ella, defeated and slew Ethelfrith, and succeeded to the throne of N. He extended the frontiers to the coast (including Anglessey and Man), and during his reign the kingdom was the most powerful in England. After his death the kingdom disintegrated, and did not recover its former position till Oswy became king of Bernicia and annexed Deira. Oswy won a victory over Pereda of Mercia and incorporated the N. part of Mercia in his kingdom. Mercia recovered her ter. in 658, and N. pushed her frontiers northward, annexing Strathclyde and Dairiada.

In 685 the Picts recovered their independence. Aldfrith, the son and successor of Oswy, made no further attempts to extend his kingdom. Under his patronage learning flourished. The successors of Oswy were incompetent rulers, and henceforth the decline of the kingdom is rapid. In 768 Alchred, king of N., sent an embassy to Charlemagne. The first Dan. raids occurred c. 793. In 827 Eanred, king of N., formally acknowledged the supremacy of Egbert I., king of Wessex. Egbert II. reigned till 878, and was the last Eng. king of N. Subsequently N. acknowledged the overlordship of Alfred the Great. N. was for a considerable period the chief seat in England of literary and missionary activity. In the Golden Age of the Conversion Cuthbert flourished in his monastery at Lindisfarne. Bede at Wearmouth and Jarrow, and Wilfrid at Hexham and Ripon. In 731 Bede at Jarrow wrote his famous *Ecclesiastical History*. The stone crosses, Ruthwell and Bewcastle as early examples, and the schools of York and Ripon as later developments, are evidence of the beauty and power of Northumbrian sculpture. It was not till the reign of William the Conqueror that N. really became an integral part of England. See R. H. Hodgkin, *History of the Anglo-Saxons*, 1939 ed., and T. D. Kendrick, *Anglo-Saxon Art*, 1938.

Northumbrian Dialect, see under ENGLISH LANGUAGE, Old English.

North Walsham, see WALSHAM.

North-West Frontier Province and Oudh, see UNITED PROVINCES.

North-West Frontier, The, of the Indian sub-continent. It is one of the great frontiers of the Commonwealth, nearly 2000 m. in length, extending from the Karakoram Mts. in the N. of Kashmir to the Arabian Sea. In the far N. it is bordered by Sinkiang; thence, for a short stretch, it borders Russian Turkestan along the Pamirs, then turns S., and for the rest of its length lies through the mt. hinterland of the Afghan border tribes. From Chitral to Baluchistan, the boundary is the 'Durand line,' agreed with the Afghan Gov. in 1894. Throughout its length the frontier traverses Moslem ter., the greater part of which is occupied by fanatical tribesmen. Sinkiang, too, is predominantly Muslim. On the Kashmir side, in this region, are the small semi-independent Muslim states of Hunza and Gilgit. Before the independence of India the Brit. Gov. of India was responsible for defending the N.-W. F., and most of the Brit. Indian Army was concentrated on the frontier or in cantonments in the Punjab near by. But though in 1949 the Pakistan Gov. had fewer forces at its disposal the position, in one respect, was more favourable for Pakistan than it was for the Brit. authorities, because as a great Muslim power it was likely to continue to attract a degree of loyalty from the tribesmen never given to Britain. Pakistan therefore withdrew most of its regular forces from the frontier, relying on the Frontier Irregular Corps and a few aeroplanes to keep the peace. There were,

however, signs that this state of equilibrium might not continue, an uncertain factor being the attitude of the Afghan Gov. towards the Durand line settlement, which they had always regarded as one which deprived them of the allegiance of the tribes on the Indian side of the line. In 1947, after the decision to partition India, an effort was made to satisfy Afghan sentiment by holding a plebiscite in the N.-W. F. Prov. on the issue whether the Afghans there wished to join India or Pakistan. The plebiscite resulted in Pakistan's favour, a result which was resented by the Afghan Gov., which had intimated to Britain that it did not regard the prov. as a part of Brit. India. Despite propaganda from Kabul that Afghanistan was no longer interested in the idea of the independence of the N.-W. F., it was obvious that official circles in Kabul still entertained hopes of Afghanistan *irredenta* and backed their hopes by moving two divs. of troops to the frontier adjacent to the Khyber Pass. See also KHYBER PASS. See Sir W. R. Barton, 'The North-West Frontier,' in the *Fortnightly*, Aug. 1949.

North-West Frontier Province, founded in 1901, forms the most northerly div. of Pakistan, lying between lat. 31° 4' and 36° 7' N., and long. 69° 16' and 74° 7' E. It is composed of the former Punjab dists. of Bannu, Kohat, Peshawar, Dera Ismail Khan, the Hazara dist., and the mountainous region near the border of Afghanistan inhabited by independent tribes.

Between the settled dists. of the N.-W. F. P. and the Afghan frontier lies tribal ter. This is divided into five political agencies: Malakand (Swat, Chitral, and Dir), Khyber, Kurram, N. and S. Waziristan. There are further areas under the political control of the deputy commissioners of the six dists. of the N.-W. F. P., and known as tribal areas. In the agencies and tribal areas are five states: three in the Malakand Agency (Swat, Chitral, and Dir States) and two (Ainab and Phulera States) in the tribal areas adjoining Hazara dist. This tribal ter. has an area of 24,986 sq. m. with a pop. of 2,500,000.

The prin. crops are maize and bajra in the cold weather, and wheat, barley, and grain of various kinds in the spring; rice and sugar canes are grown in Hazara, Peshawar, and Bannu, and cotton and tobacco in Peshawar. The climate presents a great variety of conditions; there are two seasons of rainfall, the monsoon and the winter rains, both somewhat uncertain. The prin. industry is agriculture. The prov. is irrigated (area irrigated is about 389,000 ac.) by various canals owned either by private individuals, dist. boards, or the gov.; railways run from Rawalpindi to Peshawar and Jamrud, to Kushalgar and on to Thel, and from Nowshera to Dargal. A railway through the Khyber (27 m. long with thirty-four tunnels) from Jamrud to the Afghan frontier, was opened in 1925. There is a hydro-electric power station at Malakand. The chief tns. are Peshawar (173,400) and Dera Ismail Khan. The prevailing language is Pushtu (an Indian

tongue mixed with Punjab words) and most of the inhab. are Pathans. The area of the whole prov. is 39,370 sq. m., of which 14,290 sq. m. represent the settled dists., as opposed to the agencies and tribal areas, the former being the prov. proper, under a governor. There is a single-chamber Legislative Assembly of fifty members, and a council of ministers to advise the governor. Pop. 3,038,000, about 91 per cent being Muslims.

The frontier ter. was annexed in 1849 and put under a board of administration at Lahore. In 1901 the frontier dists. were separated from the Punjab under the name of the N.-W. F. P. See Sir J. Doule, *The Punjab, North-West Frontier Province and Kashmir*, 1916; C. M. Enriquez, *The Pathan Borderland* (Calcutta), 1921; C. C. Davies, *The Problem of the North-West Frontier*, 1932; Sir W. Barton, *India's North-West Frontier*, 1939; and R. North, *The Literature on the North-West Frontier*, 1947.

North-West Highway System, the Canadian section (1257 m.) of the Alaska Highway. See ALASKA, *The Alaska Highway*.

North-West Mounted Police, famous force of paid and uniformed military police organised by the Canadian Gov. in 1873 under civil law and popularly known as the 'Mounties.' Though the Red R. Rebellion had ended in 1871, there was no security in the thinly pop. W. for life or property after (Gen. Wolsley's soldiers had been withdrawn. The problem was met first by sending a garrison to replace Wolsley's soldiers and then by raising the N.-W. M. P. In the summer of 1874 their scarlet coats (scarlet was chosen for the tunic because it was admired by the Indians on the Canadian side of the border) appeared on the prairies for the first time, when a detachment of 300 men marched from Dufferin, now the border tn. of Emerson, to posts on the plains. This land march, ending where Fort McLeod was built, is one of the most memorable episodes in the hist. of the N. W. M. P. The mounted police were never a large force and always depended on their reputation for integrity, fairness, and courage rather than on numbers. They soon dealt with law-breakers, whisky runners vanished, and Fort McLeod became a centre for the maintenance of law and order on the border lands of the W. The police also had an important part in the difficult problem of the half-starving Indians of the prairies and much of the work of persuading them to go on the Reserves was entrusted to the mounted police. Their forts had been centres for the distribution of food, and from those centres the tribes were shepherd northward to the wooded country where lands had been set apart for them, and the 'mounties' were always regarded by the Indians as friends. In 1920 the police were given duties in various parts of the Dominion and the name was changed to the Royal Canadian Mounted Police.

North-West Passage, see under ARCTIC EXPLORATION.

Northwest Territories. The mainland portion of Canada, N. of lat. 60°, between Yukon Ter. on the W. and Hudson Bay on the E., together with the ls. between the Canadian mainland and the N. Pole, including those in James Bay, Hudson Bay, and Hudson Strait, comprises the N. Ters.; the region includes the former N. Ter. and Rupert's Land except such areas of these as form the Yukon Ter. and the provs of Alberta, Manitoba, and Saskatchewan. There are three administrative dists., Mackenzie (527,490 sq. m.), Keewatin (228,160 sq. m.), and Franklin (554,032 sq. m.).

Along the shores of the Arctic Ocean and stretching far inland lies a country covered with a sort of Arctic grass, which has considerable nutritive value. S. of this region are the forest lands, chiefly black spruce, white spruce, and larch. In the W. part of the ter. is the great water system of the Mackenzie, which includes the Athabaska and Slave Rs., with Great Bear and Great Slave Lakes. Great Bear Lake is fourth and Great Slave Lake fifth in size of the lakes of N. America. The Mackenzie R. and its lakes extend 1460 m. N. and S.; with the addition of its trib., the Athabaska, its length is 2525 m. The large alluvial plains of its basin grow vegetables and wheat, oats, and barley; while trees a foot in diameter grow in its delta, within the Arctic Circle.

The fur trade and mining are the chief industries. Furs to the value of \$1,743,710 were obtained in 1944-5; the most valuable is white fox, and others include beaver, mink, lynx, and red fox. Gold and silver and other minerals are mined on the N. shore of Great Slave Lake in the Yellowknife Region. Uranium concentrates and radium are produced from pitchblende ore at the Eldorado mine on Great Bear Lake. A large oilfield was found in 1943-44 in the Lower Mackenzie Basin, petroleum being produced at Norman Wells. Natural gas is found. Mineral products (excluding pitchblende products) were valued at \$1,039,525 in 1946. There is a fishery on Great Slave Lake, and reindeer herding as a native industry is being developed. To aid the development of the N. Ters. a highway of 315 m. is projected from Hay R. to Notikewan in Alberta, and a 8000 h.p. hydro-electric plant on the Snare R. 94 m. N.W. of Yellowknife.

The area is 1,304,903 sq. m. The 1941 pop. was 12,000 (including approximately 2300 whites, 4300 Indians, and 5400 Eskimos); largely owing to increased mining activity the 1948 pop. had risen to an estimated 16,000. See R. Finnie, *Canada Mores North*, 1942, 1947; C. C. Lingard, *Territorial Government in Canada: the Autonomy Question in the Old Northwest Territories*, 1946; N. Polunin, *Arctic Unfolding*, 1948; and the pubs. of the Bureau of N. Ters. and Yukon Affairs, Dept. of Mines and Resources, Ottawa.

Northwich, tn. of Cheshire, England, on the R. Weaver, 18 m. E.N.E. of Chester. Among the few anct. relics in the tn. is the picturesque church of St. Helen, which belongs to the sixteenth century. The

chief industry is the manuf. of chemicals, the works being among the most extensive in the world. There are also shipyards, steel-works, and iron foundries. The tn. was once subject to numerous land subsidences caused by the pumping of the brine used for the manuf. of salt and alkali, but since the introduction of controlled pumping in recent years the subsidence has been negligible. Pop. 19,200.

Norton, Caroline Elizabeth Sarah (1808-1877) later **Lady Stirling-Maxwell**, Eng. poet and novelist, b. in London, was the granddaughter of Richard Brinsley Sheridan, the dramatist. The unhappiness of her married life led her to interest herself in the amelioration of the laws regarding the social condition and the separate property of women and the wrongs of children. Her poems *A Voice from the Factories* (1836) and *The Child of the Islands* (1845) had as an object the furtherance of her views on these subjects. Her efforts were largely successful in bringing about the needed legislation. Her chief works are *The Sorrows of Rosalie* (1829); *The Undying One* (1830); *The Dream* (1840); *The Child of the Islands* (1845); *The Lady of La Garaye* (1861); and the novels *Stuart of Dunkath* (1851) and *Lost and Saeed* (1863). See J. G. Perkins, *The Life of Mrs. Norton*, 1909; and Alice Acland, *Caroline Norton*, 1948.

Norton, Charles Eliot (1827-1908), Amer. man of letters, b. at Cambridge, Massachusetts, U.S.A. He occupied the chair of hist. of fine art in Harvard Univ. from 1873 to 1898. He was joint editor of the *North American Review* with James Russell Lowell (1861-68), and a founder and co-editor of the *Nation* (1865). His chief works are *Considerations of Some Recent Social Theories* (1853), an attack on experimental Socialism; *Notes of Travel and Study in Italy* (1860); and *Historical Studies of Church Building in the Middle Ages* (1876). But he will be chiefly remembered for his trans. and studies of Dante's *Vita Nuova* and *Divina Commedia*, and his *History of Ancient Art*, 1891. He also ed. Carlyle's *Reminiscences* (1887), making good the blunders made by Froude in 1881, and *The Poems of John Donne* (1895). N.'s *Letters* were pub. in two vols. in 1913. See life, ed. by S. Norton and M. A. de Wolfe Howe, 1913.

Norton, Thomas (1532-84), Eng. dramatist and lawyer, b. in London. He entered Parliament in 1558, and was appointed to the office of Remembrancer of the City of London in 1571. He collaborated with Sackville in the composition of the first Eng. tragedy, *The Tragedie of Gorboduc* (1561), written in blank verse.

Norton: 1. Par. and vil. of Derbyshire, England, 8 m. N.W. of Chesterfield. Pop. 2000. 2. Par. and vil. of Durham, 1½ m. N. of Stockton-on-Tees. Pop. 330. 3. Par. and tn. of E. Riding, Yorkshire, on the Derwent, 17½ m. N.E. of York. It is noted for the training of racehorses. Pop. 5000.

Norton Sound, inlet of the Bering Sea, Alaska, lying S. of Seward Peninsula. Norton Bay and Godolphin Bay are on

the N. shore. Length 150 m; width 100 m.

Norumbega, name of unknown origin, found especially in sixteenth- and seventeenth-century maps to indicate a region or city on the E. coast of N. America. It is probably mythical but has been identified with Vineland, the Norse settlement supposed to have been discovered by Ericsson or by Karksefni, the name of which is derived from the legend that grapes were found there.

Norwalk: 1. Health resort of Connecticut, U.S.A., in Fairfield co., at the mouth of the R. N., on Long Is. Sound, 12 m. W.S.W. of Bridgeport. The harbour is excellent. The oyster fisheries are extensive; other industries include shipyards, iron works, and foundries. Pop. 36,000. 2. Co. seat of Huron co., Ohio, 51 m. W.S.W. of Cleveland. Pop. 8000.

Norway (Norwegian *Norge*), Scandinavian kingdom occupying the W. and N. part of the Scandinavian peninsula. It is surrounded on three sides by the sea, on the S. by the Skagerrak, on the W. by the North Sea and Atlantic Ocean and on the N. by the Barents Sea. It is therefore cut off from Europe except for the land connection through Russia and Finland. It extends from the is. Krage in the S.W. (lat. 57° 57' N.) to Knivskjeldoen on Mageroy, W. of the N. Cape (lat. 71° 11' N.) in the N. E.; and its most westerly point is Husoy in the Sognefjord (long. 4° 30' E.) and the most easterly Kiberg near Vardo (long. 31° 10' E.). The length of the coast, disregarding indentations, is 2100 m.; including the coastline of long inlets and of large is. it is at least 16,400 m. or more than half the circumference of the earth. Area 124,500 sq. m. (8900 being is. or skerries). By the treaty of 1920 Norway was given sovereignty over Svalbard (Spitsbergen) and Bjornoya (Bear Is.) and, including these, the total area is 155,000 sq. m. In the Middle Ages the kingdom of Norway was twice as large as it is to-day but much was ceded to Denmark; and at different periods Norway had various trib. lands, such as parts of Ireland, Scotland, the Hebrides, Lapp districts, Greenland, Iceland, and others. The Norwegian-Swedish frontier is 1025 m. long and the Norwegian-Finnish 572 m.; the total land frontier being nearly 1600 m. Norway consists of a high plateau, intersected in the S.E. by great valleys and in the W. by deep fjords and bays. More than half its surface is over 2000 ft. high. The interior is generally so mountainous that the pop. is settled almost entirely along the coast. Only in the great valleys of S. Norway and in the Trondheim Depression is there a high density of pop. inland. Pop. at the end of 1946 was estimated to be 3,123,000, giving a density of about 25 per sq. m. With the exception of some 20,000 Lapps and Finns, living in the most remote N. regions, the inhab. of Norway are generally a Scandinavian race, akin to the N. Germanic nations of Aryan descent.

Physical Features.—Certain fundamental physical features characterise the topo-

graphy of Norway, and variations in their form and type heighten the variety of the landscape. The prin. features are the skjærgaard and the strand flat; the fjords; the gorges; the plateaus, with summits rising above their surfaces; ice-sheets; and valleys, often deeply incised. The skjærgaard is the is. zone of striated rock with little vegetation. The outer is. are low-lying, but towards the mainland they are higher. The strand flat is a series of rock terraces along the borders of many of the is. and in the mouths of some of the fjords. The fjords have all the characteristics of glaciated valleys, being long, narrow, and straight, with uneven floors. The gorges extend inland above the level of the fjords and torrents flow down from the high uplands in great falls, roaring through the gorges. The plateaus are the upland surface above the gorges and rise steeply from the W. coast towards the main watershed of Norway, and they are more extensive in S. than in N. Norway.

(a) *Southern Norway*.—The great barren plateau known as the fjeld occupies the W. part of much of S. Norway. It is diversified by fjords, gorges, and valleys, and its main sub-divs. are the viddas Jostedalshædd and Rørosvidda, collectively known as the Langfjeld, and the Dovrefjeld, Trollheim, and Rørosvidda, collectively the Dovrefjeld. The viddas stretch for miles of barren, wind-swept rock varied with wild moorland and bog and numerous lakes and rivs., which enhance the general desolation. The Jostedalshædd region, lying N. of the Sognefjord, is an immense ice-cap extending over 580 sq. m. The Jotunheim is the wild, mountainous region lying below the Jostedalshædd and the Boverdal on the W., and the Gudbrandsdal on the E. It is a region of towering snow-covered peaks, the highest being Galdhøipiggen (8097 ft.), the highest mt. in Norway, Glittertind (8041 ft.), and Skagstølstind (7887 ft.). The Dovrefjeld is a sea of barren rocky summits with patches of moorland and peaks rising above the general level of the plateau. The highest peaks are Rondslottet (7162 ft.), Snibetta (7500 ft.), and Storond (7027 ft.). There are sev. deep forested valleys cutting across the fjeld and providing through routes from Oslo. The Trollheim, which extends northward to the Trondheim depression, is barren and rocky in its highest part, but towards the coast the plateau decreases steeply in height and contains large forested areas. The S.E. lowlands consist of the valleys of the great rivs., flowing S. to the Skagerrak and S.E. to the Oslofjord, together with the plains lying round their mouths along the coast. It is a pleasant undulating countryside and the rivs., with their waterfalls, are conducive to agriculture and industrial development. The largest of the valleys of this region, the Setesdal, is followed by the R. Otra for 150 m. to its outlet in the Kristiansandsfjord. Other rivs. of this region are the Toppdalselv and the Nidelv. Between the viddas and the lowland to the E.

is the Telemark, a region of many lakes and riv. valleys, with bare outcrops and patches of conifers. It is broken by three main riv. systems. The rivs. feed the Totakvand, characterised by a remarkable series of locks, and the Tinnsjø, which flows in a deep forested valley to the great Rjukan falls. Below Lake Tinnsjø it descends by a series of great falls to the Hitterdalsvand. All these rivs. flow into the Norsjø and drain into the Lange-sundfjord by the Skien R. E. of the Telemark many rivs. flow S.E. towards the Oslofjord. The Langen, flowing through Namdal, reaches the sea in Larviksfjord. Another similarly named riv. rises in a lake in the heart of the Dovrefjeld, flows into Lake Mjøsa, below which it is called the Vorma as far as its confluence with the Glomma. Lake Mjøsa, the largest lake in N., lies in an open wooded valley with gently sloping hills on each side. The Glomma, which follows the Osterdal, has a course of 400 m. from its source in the Rørosvidda to its mouth on the E. of Oslofjord. The current of the Glomma is swift and the riv. is used, especially in spring floods, for floating timber. The Dramselv, draining the Tyrifjord (a lake), descends in a broad valley to Høksund where it veers E. and flows through a wide cultivated valley to Drammen at the head of the Dramsfjord, the northerly part of the Oslofjord. Oslo itself lies in a small depression at the head of the fjord; low hills covered with spruce and pine extend westwards from the city and northward the hills rise higher to the forest of Nordmarken. The Begna, rising in the S. of Jotunheim, flows through the Valdres valley in a number of lakes and a gorge below the Strøndefjord, joining with the Randølv, and thence descends through a broad valley by a series of rapids.

(b) *Northern Norway*.—The main topographical divs. of N. Norway are the Trondheim Depression, and Trøndelag, Nordland, Troms, the coastal is. between Altafjord and Majeroey, and the plateau region of Finnmark. Towards the S. of the Trondheim Depression are the E. Highlands (highest point, Storsola, 5600 ft.). The dominant feature of the lowlands of the Trondheim Depression are the Trondheimfjord, the Suasavæn lake (30 m. long) and Namdal. The country surrounding the fjord and lake is undulating and includes the rich region of good farms and large coniferous forests. The R. Namsen, flowing along the Namdal into the Namsenfjord, is the prin. riv. of the Trøndelag. The Nordland includes all Helgeland as far N. as Ofotfjord. Sev. snow-fields rise in isolated peaks above the level field, the largest being Sulltjelma (6300 ft.) and Blaumannsæen (4800 ft.). In the Troms region the E. highlands occupy the coastal part of the mainland. The coast N. and S.E. of the Malangenfjord in this region is cut up into narrow peninsulas which have a wild and grand aspect with mts. beetling above the steep slopes of the rugged coast. Finnmark plateau is a vast stretch of barren

country extending from the W. watershed of the Altafjord across the N. part of Norway to the Finnish frontier. The coast is formed by low cliffs unscreened by ls. and exposed to the Arctic. The chief fjords are the Altafjord, Porsangerfjord, Laksefjord, Tanafjord, and Varangerfjord. All cut deeply southwards into the plateau, except the Varangerfjord, which runs W. The plateau is dissected by numerous riva., of which the Alta, Tana, Neiden, Munkelv, and Pasvik are the chief. The Tana and the Anarjokka, its confluent, form the frontier with Finland for 150 m., the Pasvik for 80 m. The Munkelv, which rises in Finland, has only a few m. of its course in Norway.

(c) *The Coasts.*—The remarkable development of fjords results in a coastline of amazing complexity. The rugged shores often rise in sheer walls of rock from the water's edge, which restricts navigation to a few well-defined routes. A screen of reefs fringes the mainland between Cape Lindesnes (the most southerly point of the Norwegian mainland) and the Skjens R. Cape Lindesnes is a craggy headland at the end of a rocky forested peninsula. There are no large fjords extending far inland in this part of the coast such as are to be found on the W. coast, but there are many inlets, of which Kristiansandsfjord and Topdalsfjord together form the largest. The Oslofjord extends N. from the Skagerrak for 80 m. from 59° N. lat. Its shores are not very steep and the outer part is undulating forested land. It is a region of numerous scattered farming communities, with some large industrial towns. (Drammen, Tønsberg, Oslo, Halden, etc.). From Cape Lindesnes northward are the Rosfjord and Grønsfjord with steep rugged shores, the Lyngdalsfjord and Listerfjord each side of the Lister Peninsula, characterised by a steep coast as far as Arnasira, craggy and treeless N.W. of that place. The coast of Jaeten is unlike any other part of the Norwegian coast, there being no ls. or fjords, though on the Stavanger Peninsula there are some ls. and large inlets. The Haugesund Peninsula is divided into distinct regions by sev. narrow fjords which are generally frozen in winter. The Hardangerfjord penetrates the mainland for 70 m. in a N.E. direction, while the main branch, the Sörfjord, runs S.W. for 24 m. There are extensive farmlands along both shores of the Sörfjord. Between the Hardangerfjord and the Sognefjord (about 80 m. N. of the Hardangerfjord) the coast is characterised by channels and lesser fjords, which form numerous ls. and peninsulas and a most irregular coastline. Bergen is the nodal point of this region and lies sheltered at the foot of steep hills. The Sognefjord extends eastward into the mainland for about 100 m., and is for the most part narrow. The fold on each side increases from 2000 ft. to 5000 ft. at the landward end and many streams flow into the fjord. Cultivable land here is rare. The coast of Salten from the Lofoten ls. is pierced by large fjords, which almost touch the Swedish frontier. The whole coast here

is a labyrinth of complicated channels running between ls. and promontories.

Climate.—There are striking differences in the Norwegian climate, which changes markedly from the coast inland, or from W. to E. Apart from general influences such as the ocean, altitude, and lat. the weather of Norway is controlled by depressions along its shores. Most pass along its W. shore and bring S. and S.W. winds on the coasts. Less often they pass along the S. coast and into the Baltic, while some cross the peninsula in the region of Trondheim. In winter the lowest temps. are experienced in Finnmark and around Röros, i.e. in the country furthest from the sea or from the influence of the Gulf Stream. At the latter place, for the first three months of the year, the temp. rarely rises above freezing point. Some of the coastal waters have quite mild winters. The highest temps. are to be found in the valleys immediately N. of Oslo, the July mean being 63° and the absolute maximum as much sometimes as 95°. Frost is frequent in all but the outer coastal areas. There are great contrasts of rainfall due to distances from the sea and altitude. The coastal mt. region has a high rainfall. In the regions near the N. Cape storms are almost incessant, and rage with great violence. In the W. there are areas with falls up to 120 in., but at no great distance from the coast falls of 10–12 in. are common. Winter temps. decrease northwards, and N. of Trondheim the monthly mean is below freezing-point until spring, and on the mild W. coast snow falls on about forty days in the year, but inland there is naturally a higher snowfall. Sev. of the mts. rise above the limit of permanent snow. Fog is frequent on the S. coasts. In winter it is less widespread in the interior and is concentrated mainly in the E. valleys. The longest day, which in the S. is 18 hrs., may be said to be nearly three months in the high lats. of the N. dists. where the longest night lasts almost an equal length of time. The protracted winter of the N. regions follows almost suddenly on the disappearance of the sun, whence the absence of solar light is compensated for by the frequent appearance of the aurora borealis, which shines with sufficient intensity to allow of the prosecution of ordinary occupations (*see also* MIDNIGHT SUN).

Flora and Fauna.—Norway has a luxuriant vegetation, despite its N. situation. It lies mainly within the area of coniferous forests, which are characteristic of cool temperate regions. Vegetation in the N. and on the field of W.-central Norway consists chiefly of shrubs, arctic plants, and mosses. The richest vegetation is round the Oslofjord and the great lakes Mjøsa, Randsfjord, and Tyrifjord. Scotch pine and Norway spruce are the most important conifers. In the coniferous zone very little other vegetation can survive, but in the bogs and marshes are sphagnum, ling, bilberry, and cloudberry. Willow and lichen grow in the field region of the S.W. There are no trees in the

willow zone. Dwarf birch and willow shrub, however, form a dense growth of bushes. Reindeer moss predominates in the lichen belt. Herbaceous arctic plants also grow in the willow and lichen belts. The white *Ranunculus glacialis*, a food for reindeer, occurs on high mts. The fjords of W. Norway are barren and their sides afford little soil for vegetation. In the Trondheim Depression spruce is the predominant tree. N. of that region birch is the important forest tree. With the exception of the forest trees there are few plants of economic value in Norway, but seaweeds have some value for their salts of iodine. Peat bogs are extensive. The most characteristic of the arctic animals of Norway are the reindeer, arctic hare, arctic fox, lemming, and wolverene. These are found throughout most of N. Norway. The reindeer are largely tame and are herded by Lapps, but there are wild reindeer in Finnmark and in the mts. of central and S. Norway. Lemmings migrate in great numbers towards lower land pursued and destroyed in equally large numbers by wolves, foxes, and hawks. The wolverine or glutton is valuable for its fur. The elk, red deer, roe deer, and reindeer are the only wild ruminants. The elk (*q.v.*) is found in most of the forest regions of E. Norway. The bear, lynx, wolf, fox, otter, and various species of marten were, until recently, widespread and numerous, but the larger beasts of prey are now rare. The bear is almost exterminated and only found immediately N. of Trondheim. The badger occurs in S.E. and S. Norway. The beaver has almost died out. The white whale appears off the N. shores. Bearded seal and walrus sometimes visit the far N. Reptiles include the lizard, slow-worm, and common viper. Most Norwegian birds are migratory. Those which breed in Norway are geese, wader, crane, curlew, snipe, sparrow, and falcons. The mild climate of the S. and W. causes birds such as the starling, blackbird, woodcock, duck, and swan to winter there. Along the W. and N. coasts there are numerous colonies of sea-birds, including gulls, terns, gulliemots, razor-bills, puffin, kittiwake, cormorant, and eider ducks. Other coastal birds are sheldrake, heron, lapwing, oyster-catcher, and sea-eagle. Lowland birds are thrush, kestrel, skylark, jackdaw, wren, and corn-crake. The most important game-bird in the lowlands is the partridge. On the higher land are black grouse, willow grouse, blackcock, capercaillie and ptarmigan. Black duck, golden plover, and ruff are found by marshes and lakes. Other common birds are the swallow, bullfinch, golden eagle, crow, blue-tit, and magpie. Fish occur in most of the rivers and lakes. The commonest in the W. and N. coast rivers are char, salmon, and trout. Grayling, perch, pike, turbot, and other fish of E. and central European origin occur in the waters of E. Norway. The sea-fish include finbacks (rorqual), dolphin, porpoise, cod, pollack, haddock, whiting, ling, herring, and sprat. Mackerel and tunny are the only S. visitors which dis-

appear in the winter. The Greenland shark comes into the fjords and coastal waters.

Production and Industry.—The occupations of the Norwegian people are to a very large extent determined by the natural conditions of the country. Agriculture plays so important a part that Norway was almost entirely an agr. country until the beginning of the twentieth century, when hydro-electricity was first used for large-scale industry. Since then, with abundant cheap power, many manufacturing industries have grown up, notably the electro-chemical and electro-metallurgical, although most raw materials have to be imported. At

Royal Norwegian Embassy

HARDANGERFJORD, WESTERN NORWAY

the end of 1947 the total production of electricity amounted to 11,598,000,000 kWh., of which 11,500,000,000 kWh. were produced by hydro-electric plants, 18 per cent of the available water-power being developed for electricity production. About 80 per cent of the pop. have electricity in their homes. About 800,000 are occupied in agriculture and forestry; 200,000 in fishing and hunting; 800,000 in industry and handicrafts; and 600,000 in commerce and transport. Norway, as has been seen above, is barren and mountainous for the most part and the acreage under cereals is not great: in 1947 the acreage was: wheat, 72,000 ac., barley 96,600 ac., oats 187,100 ac., rye 3,300 ac., and hay 1,475,700. The forests are one of the chief natural sources of wealth. There are 29,000 sq. m. of forest land, largely under pine, and state forests cover 5200 sq. m. The essential part of the growth is used in the paper industry. Pyrites and iron ore are the chief minerals; but silver, copper, nickel, zinc, lead, and molybdenum are among other ores and minerals found,

while among metals and alloys are aluminium, nickel, copper, ferro-alloys, etc. The richest mines are situated in the S., and chiefly in the dist. of the Glommen, as the celebrated and anct. silver-works of Kongsberg, the copper-mines of Røraas and Kaafjord, and the numerous iron shafts on the S. declivities of the mts. between Kongsberg and Glommen. The output of the sea-fisheries is large, totalling over 750,000 tons in 1945, more than 550,000 being herring and 119,000 cod. Whale-oil production averaged over 1,000,000 barrels between 1933 and 1937, but fell to 730,000 barrels in 1939; in 1947 it was 980,000. Industry is chiefly based on the primary products of the country (wood and fish) and on water-power. The pulp and paper industry, the canning industry and the electro-chemical and electro-metallurgical industries are the most important industries from the export standpoint. Trade in 1948 was valued at 3,600,000,000 kroner for imports and 2,000,000,000 kroner for exports. Imports from Norway to the United Kingdom in 1948 were £18,448,000 and exports to Norway from the United Kingdom £32,568,600. The registered Norwegian mercantile marine (as at Nov. 1, 1949) was (ships over 100 gross tons only) 2089 vessels totalling 4,981,200 gross tons. Ships on order or under construction totalled 1,813,800 gross tons. The total tonnage of the mercantile marine is expected to reach 6,000,000 gross tons in 1951. After the Ger. invasion of 1940 many Norwegian vessels crossed over to Brit. ports. There are 2373 m. of state railways and about 100 m. privately owned. Of this mileage 1897 m. have a gauge of 4 ft. 8½ in. and 533 m. a gauge of 3 ft. 6 in. Aviation is controlled by 'Scandinavian Airlines System,' a merger of Det Norske Luftfartsselskap, Dan. Airlines, and Swedish Airlines being carried out in 1946. All services are co-ordinated, though the three companies still exist as independent units. There was a fleet of seventy planes in 1945; 92,603 m. were covered in summer 1948.

Total revenue and expenditure in 1947-48 were respectively 2,184,458,000 and 2,308,717,000 kroner.

The chief tns. are Oslo (formerly Kristiania), 418,000; Bergen, 108,900; Trondheim, 56,400; Stavanger, 49,200; Drammen, 26,600; Kristiansand, 24,100; Haugesund, 18,600; Alesund, 18,000; Moss, 17,000; Skien, 14,700; Fredrikstad, 14,100; Kristiansund, 12,900; Sarpsborg, 12,800; Tønsberg, 11,400; Arendal, 11,300; Tromsø, 10,800; Horten, 10,800; Narvik, 10,200; Hamar, 10,200.

Constitution and Government.—The Constitution of Norway is dated May 17, 1814, and has been modified since that date. It vests the legislative power in the Storting (Parliament), the representative of the sovereign people. The royal veto in regard to Acts may be exercised twice, but a Bill which passes three separate Stortings becomes law without royal assent. Every Norwegian subject of 23 years of age, subject to residential qualification, is entitled to vote.

Since 1938 the electors choose their 150 representatives every fourth year. Representatives must be voters in the dist. from which they are chosen, but this does not apply to ex-Cabinet ministers. By a law of 1938 all branches of the gov. services, including the State Church, are open to women. The Storting, when assembled, divides itself by election into two sections, the Lagting and Odelsting, one-quarter and three-quarters of the members respectively. Questions relating to the laws must be considered by each section separately. All new laws must first be laid before the Odelsting, from which they pass into the Lagting for acceptance or rejection. If the two sections do not agree, they assemble in common session and the final decision goes by a majority of two-thirds. The same majority is required for alterations in the Constitution. The executive is represented by the king, who exercises his authority through a council of state (Statsraad). The ministers are entitled to be present in the Storting and to take part in the debates but may not vote.

Religion and Education.—The evangelical Lutheran religion is the national Church and the only one endowed by the State. Its clergy are nominated by the king. All religions are tolerated, but Jesuits are, conformably to the constitution, excluded from the country. There are about 91,000 dissenters.

Education is compulsory from the age of seven to fourteen years. In 1944-45 there were 445 rural school dists. with 236,230 pupils and in the tns. 55,830 pupils. Most of the 280 secondary schools are mixed. Norway has two univs., at Oslo (founded in 1811) and at Bergen (opened in 1948). There is a univ. college of science and technology in Trondheim, a univ. college of commerce in Bergen, and a univ. college of agriculture near Oslo. There are sev. high schools, special schools, technical, art, industrial, and craft schools, a veterinary college, and a teachers' training college.

Defence.—The army of Norway is a national militia. Service is compulsory and universal, liability commencing at eighteen and continuing till fifty-five. The strength, training, and organisation of the army is (1949) under consideration. The Ger. invasion of 1940 greatly upset Norwegian mobilisation, for it embraced all the chief ports simultaneously and these were the main mobilisation centres. The only div. that was able to mobilise almost complete was in the far N. The navy has eight destroyers, five torpedo-boats, three corvettes, five submarines, eleven minesweepers, fifteen motor torpedo-boats, three motor launches, and three fishery protection vessels. Some ex-Ger. minesweepers are being refitted. Personnel includes 4046 men, and 897 men in coastal artillery. The air defence, divided into four commands, is largely equipped with Brit. aircraft.

History.—There is good evidence of the presence of sub-Paleolithic man in N. Norway, and modern research has been directed to the prov. of Finnmark where

traces of the earliest settlers in Scandinavia have been found on the banks of the fjords.

The vikings play a part in the obscure and somewhat fabulous early hist. of Norway, which is comprised in that of other Scandinavian countries. The viking period, however, ended early in the tenth century with more settled conditions in Norway, and its conversion to Christianity. The sea-rovers were, moreover, never more than a fraction of the people, most of whom were peaceable farmers and fishermen. Harald Haarlagre (Harald the 'fair-headed') was the first to bring all the settled parts of Norway under one rule. He was descended from the kings of Vestfold, a dist. W. of the Oslofjord, and was son of Halfdan the Black who ruled further N. He began to reign some time after 864, and from his time the hist. of Norway is comparatively full and authentic. When his own inherited kingdoms were secure, Harald, fired by Charlemagne's example, marched into and subdued the Trondheimers. But it was only after sev. more years that he routed the chiefs of the W. coast in a great battle at Hufsfjord near Stavanger. His defeated enemies had to take an oath of fealty to him and the fylke-kings (the 'fylker' were the old tribal divs.) were replaced by *jarls*, removable at his pleasure. Harald d. c. 933 and left his kingdom to be divided among his many sons, making Erik, his favourite son, a sort of suzerain. Erik at once tried to secure all for himself and to that end murdered two of his half-brothers. In 934 Haakon, a younger son of Harald, was summoned from England and, with the help of Sigurd, drove Erik into flight from Norway. Haakon restored to the Norwegians the rights and liberties of which they had been deprived; but although his attempts to convert his subjects to Christianity failed, his reign was for the most part peaceful despite a dangerous relaxation of central control. In 961 Haakon was killed in combat with Dan. invaders led by Erik and, in the ensuing years, Norway was much disturbed until the arrival of Olaf Trygvason, grandson of one of the murdered half-brothers of Erik. Olaf, who had been a well-known viking leader and was a man of splendid physical endowment and great energy, was the founder of Nidaros (later called Trondheim), for many years the Norwegian cap. After a reign of only five years he perished in a seafight with Dan. and Swedish ships under Earl Erik, son of Hakon, and the kingdom was then divided for the most part between the Swedish and Dan. kings and Earl Erik. Another seafaring king like Olaf Trygvason was Olaf Haraldsen, a descendant of Haarlagre, who came to the throne as Olaf II. c. 1015. Olaf II.'s policy was the double one of establishing both the royal power and the Christian Church on a national basis in opposition to the local chieftains who were claiming dists. by hereditary title. But though he strictly enforced the laws and gave Norway comparative stability,

he too was doomed to perish at the hands of his foes, being killed at the battle of Stiklestad (1030). This victory, however, served to increase the influence of Denmark whose king, Knut, sent Svend Knutson to rule as viceroy. On Knut's death in 1035 Knutson was expelled and Magnus, son of Olaf II., was brought from exile in Russia. Olaf II. is commonly reputed to have been the first to awaken a national consciousness and came to be regarded as the national champion, while his zeal for the Church sanctified his memory, so that later he was extolled as the patron saint of Norway. On Hardeknut's death (1042) Magnus inherited the crown of Denmark. He made his nephew Svend Estridson his viceroy, but the latter, with the aid of Harald Haardraade, tried to secure his own independence. Haardraade, who was a half-brother of Olaf and a great warrior, came to terms with Olaf and together they ruled Norway. Under Olaf III. (Olaf Kyrre), son of Haardraade (killed at Stamford Bridge, 1066), Norway enjoyed peace and prosperity. Sigurd, a son of Magnus, was the last of the line of Harald Haarlagre to wield undisputed sway over Norway, and with his death ended what has been called the 'classic period of Norwegian hist.'

After the death of Sigurd there ensued a long period of internecine strife over rival claims to the throne, and in these conditions the power of the aristocracy and the political influence of the Church both tended to grow at the expense of the king. When Magnus V., son of Erling Skakke, who was not of royal blood, was chosen king in 1161 it was thought expedient that the arch-bishop of Trondheim should crown him and thereby at least make the kingship nominally dependent on the goodwill of the Church. In 1181 Magnus was defeated and killed on the Sognefjord by the Birkebeinar, desperate armed followers of Sverre, who claimed to be of royal descent. Sverre, an able and strong ruler, set out to make the royal power supreme over both national Church and State, and his efforts to achieve his purpose were largely successful by the time of his death (1202). Pretenders to the throne were not finally crushed until 1240. Haakon Haakonson (Haakon IV.), however, succeeded Sverre and ruled until 1263. It was during his long reign that Iceland became directly dependent on Norway, but an attempt to bring the Hebrides and other Scottish is. into the same relationship utterly failed and they were ceded later to Scotland by Magnus VI. in whose reign the relations of the crown with the old aristocracy were to some extent improved. Erik, his son and successor, d. in 1299. His only child, the 'Maid of Norway,' was drowned on the way to Scotland and the crown then passed to Haakon Magnusson (Haakon V.), his brother. Haakon V. left no son and the crown then (1319) passed through his daughter to the reigning house of Sweden. The child Magnus VII., hereditary king of Norway and grandson of Haakon V., was elected king of Sweden in 1319, so that the two

kingdoms became nominally united. From that time until the twentieth century the hist. of Norway is inextricably interwoven with that of other parts of Scandinavia. The union, accidental in its origin, was so unsuccessful that it was arranged that Haakon, younger son of Magnus, should reign over Norway. Haakon VI. d. in 1380 and Margrete, his wife, daughter of Valdemar, king of Denmark, acted as regent in both countries, even after her son's (Olaf) death in 1387. In Sweden Albert of Mecklenburg, who had been chosen to replace the deposed Magnus, became so unpopular with his nobles that they asked Margrete to assume power, and in 1389 Albert was defeated by her army at Falköping and Margrete was now *de facto* mistress over all Scandinavia, while in 1397, by the union of Kalmar, the three countries were declared to be 'eternally' united under one sovereign.

After 1412 Sweden revolted against the union because the more important posts were held by Dan. nobles. Christian of Oldenburg (Christian I.) who succeeded to the crown of the three countries in 1448 could not establish his power over Sweden and, in 1523, Sweden finally seceded from the union. In 1525 the Danes set up the duke of Holstein as king with the title of Frederick I., but his zeal for Lutheranism made enemies of the Church in Norway. Frederick d. in 1533 and Christian III. was chosen king by the Dan. council. He too was an extreme Lutheran, but an attempt by the opposition, under Archbishop Olaf Engelbriktsson (or Engelbrechtsson), to reject him having proved abortive, Norway became practically a prov. of Denmark, the people, who were scarcely more numerous than in the years preceding the Black Death, being too scattered in remote settlements to have any true understanding of political conditions. Thus Norway had to all intents ceased to exist as a sovereign state and for a long time appeared only in Dan. hist. It was concerned only indirectly with the wars in which Denmark, under Christian IV., became involved, but its actual disintegration seemed to be imminent when, in the disastrous war of the Danes under Frederick III., Trondheim was lost to the Swedes (1658). But the Norwegians asserted themselves and most of the lost ter. was soon recovered. Norway's fortunes began to revive with the growth of her maritime trade during the wars of the Dutch with the Eng. and Fr. But in 1717-18 Norway was invaded by Charles XII. of Sweden, whose purpose was to obtain a portion of ter. with which to negotiate peace with his enemies; but in the result Sweden's power was so weakened that she no longer constituted a threat to her Scandinavian neighbours.

During the Napoleonic wars Norway was faced with economic chaos and famine owing to her dependence on blockaded Denmark. In 1810 the Fr. marshal, Jean Bernadotte, was elected king of Sweden as Karl Johan and the old king (Charles XIII.) being ailing, Bernadotte became the effective power. Bernadotte's

candidature was popular in Sweden owing to his kindness to Swedish prisoners during the war with Denmark. But as king of Sweden he was almost necessarily led into tortuous ways and now made the acquisition of Norway the keystone of his whole policy, his aim being to divert the popular ambition of Sweden from the conquest of Finland. This project received support from England and other powers in consideration of Sweden's aid against Napoleon. Norway was then again the victim of blockade, and national bankruptcy soon followed. After his success at Leipzig Bernadotte defeated the Danes, and under the ensuing peace treaty of Kiel (1814) the king of Denmark renounced all rights in Norway, though the Norwegian dependencies, Iceland, Greenland, and the Faeroes were reserved to Denmark. The Norwegian people, however, who were not consulted on this arrangement, were intensely hostile to it. The result was that Prince Christian Frederick, next in succession to the Dan. king, was sent to Norway as regent. He soon abdicated, and Norway was at length declared, 'a free, independent, indivisible, and inalienable kingdom united with Sweden under one king,' under the Act of Union of Aug. 6, 1815. This second union with Sweden, which was maintained from 1815 to 1905, was purely personal in the sense that the king was the sole connecting link.

The two states had their separate and very different systems of government, defence, finance, and laws, and their economic and political interests were diverse and often antagonistic. The Norwegian view was that the two states were intended to be on a footing of absolute equality, but the Swedes claimed that Norway was no more than ceded ter. enjoying only a nominal autonomy. Only after the accession of Oscar II. in 1872 did the situation become less strained. Under the Liberals, in 1883, the king yielded to the Norwegian desire that the ministers and state councillors should have the right of access to the Storting and of participation in its debates, thereby establishing ministerial responsibility in Norway. But Norway still had no foreign minister and claimed that her divergent economic interests entitled her to have separate consular services. In 1892 and 1898 these questions brought Norway and Sweden to the verge of war. In 1905 the Norwegian ministry of the day resigned following the king's (Oscar II.) veto of a measure for a separate and independent Norwegian consular service and his refusal to form another gov. The Storting then claimed that Oscar had abjured his constitutional functions and ceased to be king of Norway, and that the union with Sweden was at an end. This was confirmed by a Norwegian referendum by 259,563 votes to 69,284 against, and a treaty was signed at Karlstad, Oct. 6, 1905, defining the terms of separation, including the delimitation of a 'neutral' zone, and Norwegian fortifications were dismantled. There was a small popular demand for

establishing a republic, but the peasantry were one strong factor against it, and the Storting chose Prince Charles, second son of the then Crown Prince Frederick of Denmark to be king. He was elected by referendum (Nov. 18, 1905) and was crowned as King Haakon VII. on June 22, 1906, in Trondheim cathedral. Princess Maud Alexandra, the youngest daughter of Edward VII. of England, his consort, became queen.

In the First World War N. adopted an attitude of strict neutrality, but her timber and mining industries suffered heavy losses and the national debt increased enormously, speculation became widespread, wages rose with the cost of living, and this economic confusion was enhanced by the fall of the currency. Victories at the election of 1927 gave the Labour party fifty representatives in the Storting and a Labour Gov. was formed in 1928, but it soon went out of office with the threat of complete disarmament and financial chaos. Unemployment reached its highest point during the time of the Liberal Gov., under Mowluckel (1933), and when this gov. was defeated it was succeeded in 1935 by an all-Labour Gov.; but the Labour party had learned its lesson and increased the vote for defence (1937). In 1920 Norwegian sovereignty over the Spitzbergen Archipelago (known as Svalbard) was affirmed by international treaty. A long-standing dispute over Greenland came before the International Court of Justice at The Hague but the Court upheld Denmark's claim (1933). In 1939 N. annexed part of the Antarctic coast between 20° W. and 45° E., the land within, and its territorial waters.

On April 9, 1940, the Ger. minister at Oslo presented a series of demands to the Norwegian Gov., e.g. that the gov. should appeal to the people and army to refrain from resisting the Ger. troops. But already sev. hours before these demands were delivered, Ger. forces had begun the attack on Norway. Norway refused to submit to the Ger. demands. Naval and military operations were carried on against overwhelming odds by the brave Norwegian Army assisted by Brit. and Fr. forces until June 10. After the Gers. opened their offensive on the W. front the Allies gave notice that they must withdraw their forces from N. Norway. The Norwegian Gov. decided therefore on June 7 to end the defence of N. Norway two days later at midnight, and continue the fight outside Norway. The king and members of the Norwegian Gov. were in London on June 10. The Gers. took over the administration assisted by an administrative council. On Sept. 25 the Ger. Reich's commissar for Norway by a decree excluded the king, the legal gov., and all political parties, and estab. a council of commissars of the Quisling (q.v.) party. On Feb. 1, 1942, the Ger. commissar appointed Vidkun Quisling, the notorious Norwegian traitor, as 'minister president' of a puppet gov., an appointment at once repudiated by the *de jure* Norwegian Gov. in London.

One of Quisling's first acts in the in-

terests of his new masters was to attack the schools and teachers in the vain hope of 'nazifying' them; but, apart from alienating the teachers, he came into conflict with the State Lutheran Church. He also tried to establish a corporative assembly, called the *Riksting*, on the model of the Ger. *Arbeitsfront*, but most of the workers resigned from the trade unions which were to form the new Labour front and Quisling had to abandon his plan. The usual Ger. repressive measures, as put into operation in other occupied countries, followed in 1943 in the shape of concentration camps, labour conscription, and police purges. The Nazi rector of Oslo Univ. tried to assume dictatorial powers over the admission of new students regardless of their academic qualifications. The students resisted, and the consequence of their hostility was relegation to a concentration camp and the closing down of the univ. But from outside Norway the Norwegian Gov. continued to direct the growing participation of Norway in the allied war effort. The Norwegian Navy was strengthened by an increase in its personnel to over 5000 men. Corvettes carried out much convoy work; Norwegian fighter planes had shot down 137 Ger. planes by the end of 1942, and the Norwegian Army continued its intensive training. In 1944 (Jan.) Norwegian patriots discovered that Quisling had promised Hitler that he would mobilise 75,000 young Norwegians for military service with the *Wehrmacht*. The unmasking of this plot compelled the Gers. and Quisling to postpone its operation for some months and when they did begin to put their plans into execution the struggle against mobilisation was effectively assisted by sabotage on the part of the increasing resistance movement. In the years of the Ger. occupation the financial burden on Norway was very heavy, and was higher in proportion to the pop. than in any other occupied country.

In Oct. 1944 the Red Army, pursuing the retreating Gers. from Finland, crossed the Norwegian border and took Kirkenes, the vital base from which the Gers. had directed their attacks against the convoys to Murmansk. They soon cleared the Varanger Peninsula, and by the close of the year nearly half of the county of Finnmark was liberated. Inside this area some 25,000 Norwegian civilians, who had succeeded in evading compulsory evacuation, set about the task of repairing their damaged tus. and vils. Norwegian forces all through 1944 helped not only in preparations for the liberation of Norway, but also in the general allied offensives against the Reich. On May 7, 1945, Gen. Bohme, Ger. commander-in-chief in Norway, broadcast Germany's surrender, and the Norwegian home forces took over strategic points all over the country. By Sept. some 225,000 Gers. had been evacuated; the Russian forces in N. Norway returned home in the same month, while Amer. and Brit. forces left before the end of the year. King Haakon returned to Oslo on June 7. After the liberation the collaborators were brought to justice. Quisling himself, and others, were executed.

Knut Hamsun, the novelist and Nobel prize-winner, who had actively supported the Gers., was arrested, but the capital charge against him was dropped because of his mental deterioration: he was heavily fined. In the parl. elections of Oct. the Labour party, already the largest in the Assembly, increased its representation to 76 out of 150, thus securing a majority over all other parties.

Reconstruction was soon set on foot. An expansion of hydro-electric power was projected, with new plants of 425,000 kWh. Also was begun the construction of iron-works at Mo-i-Rana in N. Norway, at a cost of 200,000,000 kroner, as well as twelve new factories for fish-drying and salting. Clearly, however, Norway could

estab. in March 1949 for mutual co-operation on economic matters.

In matters of political alignment it was ultimately estab. that Norway would take her place amongst the W. nations. Although in 1917 a three-year plan, for the reorganisation of defence had been drawn up, the experiences of Ger. occupation decided that Norway must seek security, as well as economic stability, in concert with others. This did not, however, prevent the rejection of an Amer. proposal to place Antarctica under international administration; Norway expressed her readiness to participate in international scientific exploration of the area but wished to retain the sovereignty of her sector. Negotiations were opened in Nov. 1948 to set up a military pact for the collective defence of Norway, Sweden, and Denmark, but a fundamental difference of view became apparent. Sweden, who had been able to preserve her neutrality in the Second World War, and who was, moreover, so closely situated to Russia, wished this union to remain strictly a neutral bloc; Norway, a Ger.-occupied land, and with a geographically Atlantic outlook, insisted that she was a part of W. Europe. Denmark's views were midway between the two, but nearer that of Norway. Ultimately, therefore, the plan was abandoned, and Norway joined the N. Atlantic Treaty (q.v.) which later she ratified in July 1949. Simultaneously with the decision Norway rejected, as being unnecessary, a Russian proposal for a non-aggression pact. In May Amer. defence assistance was requested in accordance with the principles of the treaty. In May 1949 Norway signed the Statute of the Council of Europe. In the election of Oct. 1949 the Labour party was again returned to power, with a further accession of strength at the expense of the Communists, who did not win a single seat.

Music.—No national music was written in Norway until the Romantic Movement began in 1840 with the 'national revival' in which Ludvig M. Lindeman (1812-87) collected many of the rural melodies which had survived through the Dan. period. Some of these tunes have connections with the *kjemperiser*, ballad material common to all Scandinavia; the *springdansen* is the same as the Swedish polka. However, two Norwegian dances, the *gangar* and *halling*, have no parallel, and their rhythms have inspired most Norwegian composers. In vocal music, too, Lindeman found strange medieval survival, reminiscent of old church chants, yet showing even older, simpler structure. The influence of this vocal music on the *kjemperiser* produced music of almost monumental character; in addition to these heavy melodies there are light, airy embellishments of the melody arising from the peasant love of the patterns of unison music. This, together with the surprising rhythm, created a unique Norwegian folk music, knowledge of which is essential before Norwegian classical music can be understood. The most typical instruments were the *langeleik*

Karl Johansgata, Oslo, June 7, 1945.

not play in isolation and the main problems lay in the field of collaboration with Scandinavia and the W. nations. Norway had been a member of U.N.O. from its inception, and a Norwegian, Trygve Lie, became secretary-general of the organisation in Feb. 1946. In Feb. 1948 Norway announced her agreement with the aims of Marshall Aid (q.v.), and undertook to participate in the economic co-operation of the sixteen Marshall Aid countries. In addition there was set up a Joint N. Committee of N. Denmark, Sweden, and Iceland for economic affairs and to consider the eventual estab. of a N. Customs Union. In Oct. 1948 Norway received from the Economic Co-operation Administration a loan under the European Recovery Programme of \$35,000,000. The total of Amer. aid in 1948-49 amounted to \$84,000,000. Norway also entered into the intra-European payments scheme. A joint Anglo-Norwegian committee was

(plucked strings) and the *hardingfele*, the eight-stringed violin.

Ole Bull (1810-80), the violin genius, was the first great name in Norwegian music, though he only wrote down two tunes. Halfdan Kjerulf (1815-68) was the first composer, the founder of romanticism. The springlike work of Rikard Nordraak (1842-66) included many songs, and the air of the national anthem.

The composer who is inseparable from Norwegian folk music is, of course, Edvard Grieg (*q.v.*) (1843-1907). Among his contemporaries were Johan Svendsen (1849-1911), restrained classical composer; Christian Sinding (1856-1941), disciple of Wagner; and the female pianist and composer of songs Agathe Backer Grøndahl (1817-1907).

The founding of the Philharmonic Society in 1919 gave new scope for major orchestral works. With main emphasis on national themes Harald Saeverud (1897) and Klaus Egge (1908) have written works which have won international repute. Composer of atonal music is Fartein Valen (*b.* 1887) the most learned of Norwegian composers to-day, Ludvig Irgens Jensen (*b.* 1894) most known for his magnificent symphony *Heimferd* is a conscientious and highly gifted composer of works of great formal beauty.

Literature.—The literature of Norway cannot be taken as a whole; for the old sagas, the poetry, and historical legends were written in old Norse, which was the language of the colonists of Iceland from Norway, and is so bound up with Icelandic literature that it cannot be separated therefrom (see ICELAND, *Literature and Language*). Similarly, till well on into the nineteenth century, the sources of Norwegian literature must be found in Denmark and in Dano-Norwegian, though many of the greatest writers, such as Holberg, Tullin, and Wessel, were Norwegians by birth. The separation of Denmark from Norway constitutionally in 1814 must be the starting-point in a brief outline, giving the names of the more outstanding figures, many of whom are treated in separate articles in this work. The poets of May 17, 1814, the inaugural day of Norwegian independence, the 'Tretoll,' Conrad Schwach (1793-1860), Mauritz Hansen (1794-1842), and Henrik Bierregaard (1792-1842), did much for the new school; but the greatest early figures were Henrik Wergeland (1808-45), a poetic genius of national tradition who also preached universal values, and his great opponent Johann Welhaven, classicist and conservative (1807-73). Wergeland's sister, Camilla Collet (1813-95), was an early realistic novelist, and her great novel, *The Governor's Daughters*, is a landmark in the women's suffrage movement. The most important event in nineteenth-century literature, however, was the national revival. It was a period of large-scale rediscovery of the old medieval songs and tales. Perhaps the most significant work was done by the linguist and vernacular poet Ivar Aasen (1813-96) who traced the connection between the

various dialects and Old Norse and whose grammar and dictionary form the basis of the *Landsmaal* movement which aims at eventual unification of the dialectal elements in Nynorsk (and what is known as Samnorsk). Aasmund Vinje (1813-70) wrote fine lyrical poems in the vernacular medium, and, incidentally, wrote a report on Britain, *A Norseman's Views on Britain and the British* (1863).

Of the next period the great names are those of Henrik Ibsen (1828-1906) and Bjørnstjerne Bjørnson (1832-1910), whose reputation and influence were world wide. Ibsen's first plays, such as *Warriors at Helgeland* (1857), borrowed their themes from national legends; but the early *Lady Inger* (1855), with its strong characterisation, more clearly foreshadowed his later triumphs. Yet even at this time he showed himself to be violently hostile to tradition and orthodox opinion, his *Lore's Comedy* (1862) ridiculing the hypocrisies of domestic life. In 1865, while abroad in voluntary exile from the storm of abuse he had aroused, he wrote his great poetic drama *Brand*, a study of a saint who sacrifices all for his fanatic faith, and soon afterwards *Peer Gynt*, his most popular and influential dramatic poem. These won him instant fame and a gov. pension. In 1877 he began to write the series of prose plays on which his international reputation rests, and his work took mainly the form of political and social satire, for which he found abundant themes in the smug and narrow provincialism of the urban life he knew. Thus *A Doll's House* (1879) turns on the awakening of the sense of individual responsibility in a woman who has always been treated as a spoilt child, and an equally famous play is *The Wild Duck* (1881), a satire on impractical idealism. In technique the first of these two plays marks a turning-point in the hist. of European drama. Naturalness of dialogue and situation, adherence to the unities of time and place, the disappearance of soliloquy, the avoidance of the conventional happy ending, are all so familiar to-day that we are apt to forget that these fundamental changes are due to Ibsen. One strong ground of criticism of Ibsen was that he seemed unable to keep away from the topic of disease in its hereditary aspect, as in *Ghosts* which appeared in 1881, and again, that his philosophy of life was too uncompromising. But whether his beliefs were justified or not he made people think and he swept away the fashionable, complicated plots which had no relationship to everyday life. In a word, he brought ethics and sociology to the stage without offering quick remedies to secure an unreal denouement, his later pieces being in this respect a great contrast to such plays as *The Pillars of Society* (1877) which, while adhering to his salient idea that absolute truth at any cost is essential in life and in society, reveals some of the faults of the 'well-made' play demanded by convention. His later works are *Hedda Gabler* (1890); *The Master Builder* (1892); *Lille Eyolf* (1891); *John Gabriel*

Borkman (1896); and *When We're Dead Awaken* (1900); all are chiefly developed from ideas contained in his earlier works. (See also under ISEN.) Björnson gave life to conventional characters, but never shook off the influence of Scribe. Like Ibsen he took the problems and tragedies of everyday life as themes for his later plays, such as *Leonarda*, the story of a woman who falls in love with her adopted daughter's fiancé and goes away so as not to wreck the girl's happiness; *The Editor*, an attack on unscrupulous newspapers; *A Bankruptcy*, on the tyranny of big business. But Björnson handled his themes differently from Ibsen and was essentially a humanitarian whose views were obvious, while he manufactured evidence to prove a case, and some of his characters are really only illustrations of an argument. He lacked Ibsen's concentrated technique and creative imagination; but the passionate honesty of his own character was expressed in the appeal in his plays for a higher standard of truth in journalism, in finance, in monarchy, an appeal for less casuistry and more truth. His novels are generally on pastoral life and contain some of the most delicate pictures of peasant life in modern fiction. Others are psychological novels, on heredity and education (see further under BJÖRNSSON).

Of this period was also Jonas Lie (q.v.). Lie (1833-1908) was not a great creative artist, but stories like *The Commodore's Daughter* (1892) and *Dyre Rein* (1896) are skillfully narrated and show great power in identifying himself with the peculiarities of Norwegian sentiment. His style, almost too colloquial, lacks the charm of Björnson and the art of his successors. Alexander Keilland (1849-1906) a writer with a subtle ironic touch, wrote novels of great force and vitality, attacking social and moral prejudices. A few years younger is Arne Garborg (1851-1924) who was early the recognised leader of the *Landsmaal* movement and the president of *Det Norske Samlaget*, a literary society formed in 1868 for the propagation of the *landsmaal* (New Norse) as a literary language. His novel, *Peasant Students* (1883), the theme of which is the danger of giving up one's culture for social advantages, is an important commentary on Norwegian national life. As a dramatist he achieved some success with his *Irreconcilables* (1888), a play on political corruption. But it was as a poet that Garborg won his greatest success, his *Haugtussa* (1895), the story of a peasant girl with second sight, taking rank among the masterpieces of Norwegian literature.

Modern Norwegian literature has not surpassed the high level of that of the last decade of the nineteenth century. Though there are many well-known names, they have not reached the international standard of Ibsen, Björnson, Garborg, or Lie. The form chiefly adopted has been the novel, especially the naturalistic, inspired by Fr. and Russian models, and poetry has occupied an important place. The early nineties were notable for a

reaction against the rather tedious problem novel, while some attention was paid to lyric poetry of an indeterminate character. But out of this transition period rises the most dominating modern figure in Norwegian literature, that of Knut Hamsun (b. 1859). Hamsun utilised his experiences as an emigrant to America and of the harsh conditions of life in the Lofoten Is. to produce the remarkable novel *Sull* (*Hunger*, 1921), a novel of the psychology of starvation and of the reactions of a hypersensitive soul to environment. His work is characteristic for its vitality and extreme subjectivity. *Pan* (1920) has a great poetic beauty. *Markens Grøde* (*Growth of the Soil*, 1920), a study of man against nature, is his greatest novel. Almost equally popular is Johan Bojer (b. 1872), the sober pragmatist and the antithesis of prose-poets like Hamsun and Hans Kinck (1865-1926). He is typically national in thought and language. His favourite theme is the intense preoccupation of his fellow countrymen with politics in its devastating consequences on the home. His best novels are *Den Store Hunger* (*The Great Hunger*, 1918), *Liv* (*Life*, 1911), *Dyrendal* (*God and Woman*, 1919), and *Den Siste Viking* (*The Last of the Vikings*, 1921). With a greater depth and veracity than Bojer, though lacking his narrative style, is Sigurd Christiansen (b. 1891). Kinck is regarded as the conscious linguistic artist who seeks his character studies in the peasantry of the fjord dists. and employs their dialect to lend colour to their intense, if animal life. His best known novels are *Sneskavlen brast* (*The Avalanche*, 1918-19), and *Driftkaren* (*The Cattle Dealer*, 1908), which latter is considered to be one of the greatest of Norwegian national dramas, full, as it is, of terrific grandeur. A calmer mentality pervades the work of Trygve Andersen (1866-1920), whose prose style of classical purity matches the monotony of his themes. His *Cancellraadens Dage* (*In the Times of the Court Councillor*, 1897), short stories, and *Mot Kveld* (1900), which treat of aspects of social decay, are his most notable works. Peter Egge (b. 1869) who, like Strindberg, is for ever dwelling on the personal conflict between man and woman, also enjoys considerable popularity. Amongst his prolific writings are *Inde i fjordene* (*By the Deep Fjords*, 1920); *Jægtvig og hans Gud* (*Jægtvig and his God*, 1920); *Hansine Solstad* (*Hansine Solstad, the History of an Honest Woman*, 1929). Of the still more recent novelists, the best known is Sigrid Undset (1882-1949) whose *Jenny* (1911), a novel on family life in a moralist vein, achieved great success, but which in the opinion of her fellow countrymen has been easily surpassed by such later work as her historical trilogy *Kristine Lavransdatter*, *Kransen* (*Garland*, 1920), *Husfrue* (1922), and *Korset* (1922), a novel portraying the Norway of the fourteenth century. Her later work, after her conversion to Catholicism, includes *Den brændende bust* (*The Burning Bush*, 1932) and *Madame Dortha* (1940).

Another twentieth-century novelist is Cora Sandel. Of the 'New Norse' school a conspicuous figure was Jens Tvedt (1857-1935), who depicts the westland peasants' life in a wealth of dialect idiom. In contrast with the objective realism of Tvedt, as exemplified in *Madli un' Apalen* (*Madli under the Apple Tree*, 1900), is the subjective moodiness of Rasmus Løland (1861-1908), whose stories of child life have won high praise. Among *riksmaal* writers are Andreas Haukland (b. 1873), a prose-poet of the Arctic shores, and Hans Aanrud (b. 1865), who paints the folk life of the eastland with a quiet humour rare in Norwegian literature. Among the regional prose writers is Olaf Benneche (b. 1883), an historical novelist. Perhaps the outstanding lyric poet of modern Norway is Arnulf Øverland (b. 1889), whose fastidious sense of words is complemented by a strong passion for social justice; he was one of the earliest opponents of Nazism. Other modern lyrical poets are Nils Vogt (1864-1937), whose reflected poetry is unequalled in Norway, and Olaf Bull (1883-1933), whose poetry recalls that of Keats and Herman Wiltonvey (b. 1886), a *plein air* singer. Tore Ørjasæter (b. 1886) is a lyric-epic poet of great sincerity. In the field of non-lyrical poetry must be mentioned Olaf Aukrust (1883-1929), a visionary *landsmaal* poet whose *Himmelvarden* (1916) forms an impressive collection of religious-philosophical poems. With Olaf Duun (1876-1939) *landsmaal* came into its own; in his deep insight into the peasant character Kristofer Uppdal (b. 1878) portrays the labouring classes in the same medium. Nils Kjaer (b. 1870), one of Norway's few notable essayists, exhibits considerable diversity, and has also produced successful comedies. The most conspicuous of modern Norwegian dramatists was the aristocratic individualist Gunnar Heiberg (1857-1929), whose *Balkonen* (*The Balcony*, 1894) and *Kjerlighedens Tragedie* (*The Tragedy of Love*, 1904) are considered to be Norwegian classics. Of more recent drama the most important work has been by Helge Kroeg (b. 1889), and by Nordahl Grieg (1902-43) who was shot down over Germany. Norway thereby losing a playwright and poet of great promise.

Art.—Prehistoric pictures still exist in Norway, similar to the cave paintings of the Pyrenees: bold, naturalistic scenes of elk and reindeer hunting, of whaling and fishing. With the dawn of civilised society came the formation of a definite national style in art, evolving from the rhythmical Celtic carving known all over Scandinavia and in Celtic Britain. This style was influenced not directly by Greece and Rome, as with the rest of Europe, but by all manner of local arts discovered (and plundered) by the vikings. Then, as to-day, it was rich dramatic contrast which characterised Norwegian art. Even after the decline of Norwegian power in the Middle Ages, the stately Gothic style imported from the S. was superimposed upon this dramatic Norwegian element—literally so in the carving in the 'Stave'

churches of Sognefjord. However, at the collapse of the Norwegian state, art styles became scattered and localised, developing and continuing in different ways in small areas.

When independence returned, in the nineteenth century, all these localised styles became the tribe of a renewed stream of Norwegian style in art. The lively landscape work of I. C. Dahl was the first recognisably Norwegian art of the modern age; natural romanticism predominated, as in the work of Fearnley, Gude, and Tidemand, the great portrayers of peasant life.

It was not long before the tide of Fr. Impressionism swept in, strengthening the dramatic quality of colour and style even more. The 'most dramatic and explosive force' in all Norwegian art, produced by this period, is Edvard Munch, 'the Viking with the whole high-tensioned soul of our age.' A similar national synthesis of style is sought for in the world of sculpture by Gustav Vigeland, who created the vast fountain project in Oslo's largest park, comprising scores of individual and group sculptures. For some years Vigeland practically monopolised Norwegian sculpture, and only since about 1920 has a new school appeared, under the teaching of Rasmussen, and including Seland, Pettersen, Vaa, and Dagfin Werenskiöld. At the same time painting has produced many artists whose expressionistic use of colour is linked with the traditional dramatic style: Thorvald Erichsen's sunshine-filled works have peculiarly soft, rich, and tender colouring, while Ludvig Karsten fills his canvas with shattering colours and vibrating light, in contrast with the severe linear style and clear colouring of Harald Sohlberg; the emotional nature scenes of Nicolai Astrup contrast with the grim city paintings of A. C. Svarstad; some of the liveliest portraits have been produced by Henrik Lundh. Monumental artists, largely influenced by Matisse, include Sørensen, Krohg, and Revold (frescoes in Bergen Stock Exchange, 1918). In late decades the contrasting elements of national romanticism and international classicism seem to have succeeded in combining to form something typically Norwegian in painting style. Modern Norwegian painting strikes one as a daring and highly talented experiment in colour. The younger phalanx, among them Midelfart Lie, Jørgensen and Steen Johnsen carry on the exploration of Norwegian landscape. Especially the dist. of Telemark, with its richness of light effects, has attracted a wide range of artists. A very vigorous painter with a keen sense of social injustice is Reidar Aulie, but perhaps the most outstanding of all are Kai Jøll and Arne Egeland who, the former with his cult of fertility, the latter with his revolt, both carry on the Munch tradition.

Norway and Denmark, German Invasion of (1940). In March 1940 Prof. Koht, Norwegian Prime Minister, was sending protests to Germany against the sinking of Norwegian ships, just as earlier he had protested to the Brit. Gov. against the brilliant Brit. naval feat of rescuing some 300 Brit. prisoners from the *Altmark* (see NAVAL OPERATIONS). With equal energy he was now, early in April, protesting against all violations of Norwegian neutrality from whatever side they might come. Like other neutrals Prof. Koht was living in an unreal world, which had no place in the totalitarian conception of international relations. It is, however, more than probable that he was so terrified of Germany that he was morally compelled to disregard the lessons of earlier victims of Germany. Ger. U-boats were now flagrantly ignoring Norwegian neutrality by sinking ships in their territorial waters, among them, scores of Norwegian vessels. The Allies, therefore, countered these violations by laying mines in Norwegian waters, which mine-laying also served the useful purpose of checking supplies of iron-ore coming down from Narvik through these waters

to Ger. ports. The Norwegian Gov. protested against this violation of international law by Britain much as a householder might protest against a police officer for smashing his fence in order to arrest a murderer. But the ink of this protest was scarcely dry before Germany invaded Norway in such circumstances of time and equipment as made it abundantly clear that the attack, far from being an unpremeditated retort to the Allies' minelaying, had been planned for months beforehand, even to such details as the construction of special landing barges for troops. Moreover the decoying of the Brit. Navy northwards towards Narvik while the Ger. transports were carrying troops across the Skagorakk was also a manoeuvre that required time to prepare and effectuate. The excuse for the invasion of Denmark and Norway was the 'hunger blockade' of the Allies and their violation of 'the concept of neutrality.' The Reich Gov. also declared that it had indubitable evidence that the Allies intended to occupy certain parts in the N. states within the next few days, 'an ingenious travesty of the fact that during the Russian invasion of Finland, the Brit. Gov. would have sent an expeditionary force to Finland but for the Scandinavian Gov.'s refusal to allow it to cross their frontiers.' Dr. Goebbels's broadcast on April 9 to the Ger. people that Norway and Denmark had been 'taken under the protection of the Reich to forestall allied occupation,' and identical proclamations to the armed forces and people of Denmark and Norway, were made by the respective Ger. commanders of the invading forces in those countries. At dawn on that day strong mechanised Ger. units crossed the Schleswig frontier near Flensburg and Tonder and proceeded to the rapid occupation of the whole country, which was accomplished within a few hours without encountering any organised resistance. Simultaneously Ger. troops were landed from warships and transports at Copenhagen, Korsor, and other places. The Ger. invasion was accepted by the Dan. Gov. under protest and they and the king called upon the people 'to adopt a calm and controlled conduct,' declaring it to be their duty to refrain from resistance. In fine, the Danes were justifiably afraid of having their tns., open or otherwise, laid flat by Ger. bombers if they made any show of defence. The Norwegians, on the other hand, refused to accept the Ger. ultimatum and their gov. ordered a general mobilisation. But already the Gers. had landed troops at Bergen, Stavanger, Trondheim, Egersund, Narvik, and other places and all these tns. were soon in their hands. Troops were also landed in Oslo Fjord. These Ger. landings were effected by Ger. marines disguised as merchant seamen, who had previously arrived at these ports in Ger. cargo ships. They quickly overpowered the port officials by means of hand grenades and seized the key buildings and aerodromes. The Norwegian Parliament and King Haakon and the royal family left Oslo

for the N., aided by the failure of the naval invasion of the cap. In the late afternoon Oslo was occupied by the Gers. as a result of surprise airborne landings. The Norwegian coastal batteries in Oslo Fjord fired on Ger. naval units which were forcing their way to the cap. by that route, and sank the cruiser *Blücher* and the gunnery training ship *Brummer*. During an attack on the Horten Fort, near Kristiansand, the Ger. cruiser *Karlsruhe* was sunk. Meanwhile Narvik had been taken after resistance by two old Norwegian defence vessels had been overcome by ten Ger. destroyers. Brit. naval and air forces promptly counter-attacked and a number of Ger. ships, including transports, were sunk (see NAVAL OPERATIONS). On April 10 a Brit. destroyer flotilla under Capt. Warburton-Lee (killed in action and posthumously awarded the V.C.) made a most successful attack on a number of Ger. destroyers in Narvik waters and on April 13 another strong force of Brit. destroyers under Vice-Ad. Whitworth sank four Ger. destroyers in Narvik Bay and pursued and destroyed three others. The previous day air operations were carried out by the Brit. Air Force and Fleet Air Arm against Bergen, Trondheim, Stavanger and Kristiansand. Brit. troops were landed at sev. points on the Norwegian coast and more Ger. transports were sunk, while the Ger. pocket battleship *Admiral Scheer* was hit by a torpedo. At the same time a Polish submarine, the *Orzel*, serving with the R.N., torpedoed the Ger. transport *Rio de Janeiro*. The R.N., however, sustained losses, including the submarine *Thistle*. An allied force under Maj.-Gen. Carton de Wiart, V.C., effected a landing at Namsos and advanced in the hope of capturing the Trondheim-Namsos railway line. Ger. landings were, however, made in Trondheim Fjord, and heavy Ger. counter-attacks were delivered by these troops in the Trondheim area (April 23), and later the Gers. captured the important position of Stenkjer, while the Allies were forced to withdraw from positions near Lillehammer, it being evident that the Gers. would make every effort to establish contact between their forces N. of Oslo and those in the Trondheim area by a thrust up the Osterdal valley. Early in May Chamberlain announced that the Brit. troops in S. Norway had been withdrawn from Aandalsnes, the Brit. Gov. having decided that they must abandon any idea of taking Trondheim from the S. Brit. losses, however, were slight on land, but, on the sea, during the three weeks that had now elapsed, the R.N. had lost four destroyers, three submarines, one sloop, and five trawlers. The Ger. losses at sea were, however, so heavy that they permitted of an important redistribution of the main allied fleets. In the following month the Allies withdrew from N. Norway, losing the aircraft-carrier *Glorious*, besides two more destroyers in the operation of embarkation. The loss of Narvik was important both from a material and psychological standpoint, for it was from this port that the much-needed

Swedish iron-ore was shipped for Germany, though before abandoning it the Brit. forces had prevented the use of the port for some time; and furthermore, the abandonment of the whole Norwegian adventure, superadded to the fact that the Allies had been forestalled by the Gers., involved much damage to allied prestige. This failure led to a most acrimonious debate in the House of Commons in which the Chamberlain Gov.'s whole conduct of the war from the very beginning was so severely criticised that its majority sank to a figure that must involve resignation. Members of all parties called for a drastic reconstruction of the gov. with the result that Chamberlain resigned and was succeeded by Churchill. It is not a little curious that the Brit. Gov. did not foresee the Ger. attack on Norway. The concentration of barges and other types of flat-bottomed boats suitable for landing troops and the practice in their use were well known to the secret service and must have been observed by the R.A.F. But the Brit. Gov. failed to draw the right inference and evidently imagined that the boats were intended for the purpose of negotiating the flooded areas of Holland. Even at the eleventh hour they did not realise that the dispatch of strong Ger. naval units to the N. waters of Norway was a decoy to draw the Brit. fleet away from the Skagerrak where they could have destroyed most of the Ger. transports and accompanying vessels and then sailed N. to destroy the rest of the Ger. naval units. The result of the Ger. success was of course to place the entire Norwegian coast in their hands as a base for future operations against the Brit. Isles. See H. K. Lehmkühl, *The Invasion of Norway* (pub. by authority of the Norwegian Gov.), 1940, and *Hitler attacks Norway*, 1943; Lord Strabolgi, *Narvik and After*, 1940; and C. J. Hambro, *I saw it Happen in Norway*, 1940.

Norwegian Sea, name given to the part of the N. Atlantic Ocean which stretches between Norway and Greenland, and between the Arctic Ocean and about lat. 61° N. It is connected with the Arctic in the far N. between Svalbard (Spitzbergen) and Greenland, by a wide, deep opening. An extensive seal and whale fishery is carried on, especially off the N. and E. coasts of Jan Mayen Is. Area 100,000 sq. m. Mean depth 870 fathoms. **Nor'-wester**, prevailing wind of S. Is., New Zealand. It causes a heavy rainfall on the W. slopes of the S. Alps, and becomes a warm and dry *fohn* wind over the plains to the E. of the mts.

Norwich, city and co. bor. in the centre of the E. portion of the co. of Norfolk, England, 20 m. from the coast and situated in the valley of the Wensum, about 115 m. N.E. by N. of London. It is accessible from London by the N.E. Region railway and from the Midlands by the Midland Region Railway, and is reached by the R. Yare from the broads of Norfolk and Suffolk. Fragments of the anc. walls, which were 4 m. in circuit, remain. On a mound, which existed before 1100, with pleasure gardens occupying the moat,

stands the famous Norman castle. Built soon after the Conquest to dominate E. Anglia, it was destroyed in the earl of Norfolk's rebellion against William I., and the present building, an almost cubic block, is attributed to Wm. Fitz-Osbern. It suffered capture by Flemings in 1174 and by Fr. troops in the reign of King John, but its military importance declined with the coming of artillery and the gradual settlement of the country. It was given to the co. by George III. and was used as a jail until 1837, when the prison on Mousehold was built. Refaced in 1834-39, the keep was opened in 1894 as the Norwich Castle Museum, where are to be found important collections of antiquities, paintings by artists of the 'Norwich School,' water-colours bequeathed by J. J. Colman in 1942, raptorial birds and flint implements. The cathedral was founded by Bishop Hubert de Losinga in 1096. Fire claimed a large part of the building in the thirteenth century; the present structure is composite but mainly Norman. The exceptionally long nave of 401 ft. has a fine vaulted roof with 328 sculptured bosses and lofty triforium arches. The apse is Norman, the only other being at Peterborough. At the E. end is a unique original bishop's throne in stone. The Late Perpendicular spire (312 ft.) is of the fifteenth century and is the second highest in England (Salisbury being 404 ft.). There are two original Norman chapels at the E. end. The finely vaulted quadrangular cloisters (1297-1430), enriched with carved bosses, have been recently restored. The oak choir stalls, sixty-two in number, are beautifully carved and date from the fifteenth century. The tomb of Edith Cavell lies on the S. side of the cathedral in the part known as 'Life's Green,' and her memorial stands on Tombland.

There are over thirty city churches, mostly built of flint in Late Decorated or Perpendicular style. The largest, St. Peter Mancroft, dating from 1430 to 1455, is one of the finest par. churches in England; its tower is 102 ft. and the church contains the tomb of Sir Thomas Browne, whose statue stands on the Haymarket near by. St. Andrew's Church, rebuilt 1506, contains elaborate tombs of the Suckling family and a memorial tablet to 'Abraham Lincoln' of great interest to Amers. The fifteenth-century church of St. Peter Hungate is now an eccles. museum. Air raids in the war cost the city sev. churches, including that of St. Julian, associated with Dame Juliana, said to be the first woman writer in the Eng. tongue. The grammar school, originally a charnel-house chapel of c. 1315, was converted into a grammar school in the reign of Edward VI. Lord Nelson, George Borrow, and Rajah Brooke of Sarawak were scholars there. The guildhall (1407-13), a quaint flint building, housed, until the opening of the new city hall, a superb collection of civic plate. The city hall, opened in 1938 by the king and queen, is typical of modern civic architecture. Historical and industrial plaques on the entrance doors are note-

worthy and the clock tower is 185 ft. high. The garden of remembrance was designed by Lutyens and involved the destruction of many period buildings over a wide area; some, however, including the church of St. Peter Mancroft, the guildhall, and Queen Anne buildings, remain. The fifteenth-century St. Andrew's Hall was at one time the nave of the church of the Dominicans or Blackfriars. Other notable features are the fifteenth-century Maid's Head Hotel; Suckling House, sixteenth-century banquetting hall; Erpingham Gate, built by Sir Thomas Erpingham, 1420; Ethelbert Gate, commemorating a riot between monks and citizens, 1272; the Bridewell, built 1370, now a museum of local industries; Pull's Ferry, anot. water-gate; and the thirteenth-century Bishop's Bridge, one of the oldest bridges in England. The chief parks are Eaton Park and Earlham Park. Other parks and open spaces include Mousehold Heath, Chapel-field Garden (the central public garden of Norwich), Waterloo Park, and the quaint cobbled and gabled 'Tombland' which derives its name from the toom or wasteland of the old Franciscan monastery. Theatres include the Maddermarket, home of the Norwich Players, and the Theatre Royal.

The staple industry of Norwich, employing over 10,000 hands, is that of higher grade shoes. Other large industries include those of mustard, starch, cereals, confectionery, electrical engineering, brewing, silk and silk dyeing, and weaving. For centuries Norwich has been the leading mkt. tn. in E. Anglia. There are large cattle, provision, and fish markets. The Norwich provision market is of very anct. origin.

Norwich is administered by a mayor, sixteen aldermen, and forty-eight councillors, and returns two members to Parliament.

Norwich had no widespread central devastated area as a result of the enemy air raids, but in few places outside London was there such considerable damage scattered over the city as a whole. During 1940-43 some 340 persons were killed and nearly 1100 injured. Some 2082 dwelling houses were destroyed and 2651 seriously damaged. Norwich was the victim of the so-called 'Baedeker' raids on April 27-28, 1942. Many historical monuments were damaged or destroyed; the cathedral and castle, however, suffered little serious damage. Pop. (estimated 1946) 114,750. There is a long hist. of Norwich in the Norfolk Directory, c. 1862. See also J. Sillett, *Collection of Views of Churches, etc.*, 1828; W. Bye, *Norwich Castle*, 1921; R. H. Mottam, *Assault Upon Norwich* (the official account of the air raids on the city, 1944; and A. Kent, *Norwich Inheritance* (photographs), 1948.

Norwich: 1. City of Connecticut, U.S.A., on the R. Thames, 40 m. S.E. of Hartford. It is a flourishing industrial centre, manufs. woollens, razors, velvet and cotton goods, and cutlery. It was settled in 1659, when 9 sq. m. were bought of Unos, an Indian chief, for the equivalent of £70. Pop. 23,600. 2. Cap. of Chenango co., New

York, U.S.A., on the Chenango R., 50 m. S.E. of Syracuse. Pop. 8600.

Norwood, Sir Cyril (b. 1875), Eng. educationist, son of a clergyman, was educated at Merchant Taylors' and at St. John's College, Oxford, of which college he was president from 1934 to 1946. He secured the first place in the civil service examination for first-class clerks and for two years served in the Admiralty. At twenty-six he left the service to become a master at Leeds Grammar School. In 1906 he was elected headmaster of Bristol Grammar School and ten years later he went to Marlborough College, where he introduced some rather drastic reforms (1916-25). In 1926 he became headmaster of Harrow. He made a name by the reforms he introduced into the different schools under his care and has written on educational subjects. He was knighted in 1938.

Norwood, Frederick William, Brit. preacher, b. in Australia and educated at Ormond College, Melbourne. D.D., Oberlin College, Ohio. After holding livings at Canterbury, Victoria, and N. Adelaide, he was appointed minister of the City Temple, London, 1919, and remained there until 1936. He was minister in Vancouver from 1939 to 1943 and then at St. James's Church, Montreal. He continued to live in Canada after his retirement, which he spends in literature, lecturing, and special preaching. Among his books the best known are *Indiscretions of a Preacher* (1932) and *Preaching in our Generation* (1942).

Norwood, Gilbert (b. 1880), Eng. classical scholar. He was prof. of Gk. at Cardiff from 1908 to 1926 and then went to Toronto Univ. as prof. of classics. His pubs. include *Greek Tragedy* (1920); *Writers of Greece* (1925); *Greek Comedy* (1931); and *Pindar* (1945).

Norwood, Richard (1590?-1675), Eng. mathematician. In 1616 he was sent to the Bermudas to survey the newly settled is., and was accused of having reserved for himself some of the best land there; he certainly resided there during the civil war, carrying on his profession of teacher of mathematics. He pub. a map of Bermudas in 1622; *The Gunner, shewing the whole Practice of Artillerie* (1628); *Trigonometrie, Or the Doctrine of Triangles* (1631); *The Seamans Practice* (1637); and *The Doctrine of Triangles* (1667).

Norwood: 1. Suburban dist. of S. London, a mile S.W. of Dulwich. It consists of Upper, Lower, and S. N., and forms the S. portion of the bor. of Lambeth. Pop. 85,600. 2. Tn. of Adelaide co., S. Australia, forming a suburb 3 m. N.E. of Adelaide. There are market gardens, and brewing is carried on. Pop. 16,000. 3. Tn. of Ohio, U.S.A., in Hamilton co., forming a S.W. suburb of Cincinnati. It manufs. playing cards, office furniture, safes, electrical goods, etc. Pop. 34,000. 4. Tn. of Massachusetts, U.S.A., in Norfolk co., 14 m. S.S.W. of Boston. N. has manufs. of printing materials and binding plants. Pop. 15,300.

Nosari, Nausari, or Navasori, tn. of

Bombay, India, on the l. b. of the Purna R. (which is navigable up to here), and 19 m. S.E. of Surat. It has a colony of Parsee cotton weavers. Pop. 16,500.

Nose, organ of smell. It consists of an external portion and an internal part divided into two nasal cavities. The outer N. has the shape of a triangular pyramid. The bony structure of the N. consists of the short nasal bone which is connected with the forehead by a bridge. Besides this bone, the N. is supported by cartilages, of which the five chief are the cartilage of the septum and the upper and lower lateral cartilages. The cartilage of the septum forms the supporting part of the vertical partition which separates the right and left nasal cavities. The lower part of the septum is not formed

SECTION OF THE NASAL REGION
SHOWING THE RIGHT NASAL
CAVITY

A, frontal bone; B, nasal bone; C,D, nasal cartilages; E, nasal palate; F, superior ethmoidal concha; G, inferior ethmoidal concha; H, inferior turbinal (maxillary concha); I, opening of Eustachian tube; J, opening to sphenoidal sinus.

by the cartilage of the septum, but is freely movable, and is on this account called the *septum mobile nasi*. The upper lateral cartilage is triangular in shape, and serves as a continuation of the nasal bone. It is joined at its lower edge on each side by fibrous tissue to the lower lateral cartilage. This consists of two plates: the outer one is oval and communicates with the inner one by a rounded piece which forms the point of the N. The lowest part of the N., or 'wing,' is formed of skin externally and internally. The orifices or nostrils are guarded by small hairs, or vibrissae, which serve to protect the nasal cavities from dust, small insects, etc. Above the aperture in each nostril is a slightly expanded cavity, the *vestibule*, which is prolonged towards the tip as a pouch, or *ventricle*. Above the vestibule the nasal passage, or *fossa*, is divided into two parts, the upper or *olfactory*, and the lower or *respiratory*, portion. The fossae are divided into three passages or *meatuses* by three *turbinated*, or scroll-like, bones. The meatuses communicate with the ethmoidal, sphenoidal, and frontal cells.

The olfactory region is lined with mucous membrane, yellowish in colour, and containing olfactory glands, or glands of Bowman, embedded in it. In the respiratory region the mucous membrane is covered by columnar, ciliated epithelium, and contains many cells secreting a watery fluid. The N. is supplied by branches of the facial nerve, the ophthalmic, and others for the conveyance of motor impulses and of ordinary tactile sensations. The sense of smell is conveyed by olfactory nerves arising from the olfactory bulb and distributed over the mucous membrane of the olfactory region. Here they are connected with rod-like cells; these cells pass between the columnar epithelium to the surface, where a delicate filament serves as a free end; at the other end of each cell the filament becomes continuous with an olfactory nerve filament. It is not definitely known whether the external stimulus which gives rise to the sensation of smell is physical or chemical in its nature. In 1918 Prof. W. R. Miles of Yale Univ., after experiments with insects, put forward the theory that the sensation is due to infra-red radiations which the nose is able to receive. The substance exciting the smell must be in a finely divided state, and is usually a vapour or gas. The free ends of the olfactory filaments are usually covered with a thin layer of fluid. If the fluid is too thick, as in catarrh, or if it is replaced by a dry crust, the efficiency of the olfactory organ is diminished or temporarily destroyed. The exciting substance becomes dissolved in the watery fluid, and so affects the cell filaments. In order that solution may be effected readily, a certain amount of pressure is necessary; that is, the air containing the substance must be driven with some force against the membrane by sniffing. The organ of smell is probably not so delicately differentiated in man as in some of the lower animals. The sense is quickly fatigued, so that a delicate odour is sometimes not perceived after the initial experience; most persons also find it difficult to discriminate in a mixture of smells, and probably only the predominating odours in a host of smells are perceptible to man, although the lower animals might be able to discern many.

Diseases, etc.—The N. may be fractured by direct violence, and if adequate treatment is not resorted to, a displacement of the septum may result, leading to nasal obstruction and possible complications. *Aene rosacea* is a skin affection characterised by congestion of the capillaries of the outer N. and later by hypertrophy of the sebaceous follicles. The N. has then a swollen appearance, and the course of the dilated capillaries can be plainly seen. It occurs in dyspeptics, alcohol- and tea-drinkers, and is known as 'brandy nose' or 'whisky nose,' though the cause may not be the use of alcohol. Sulphur ointment is useful as a local application, but the condition is only cured by the removal of the predisposing cause. Lupus and erysipelas are also likely to affect the N. Rhinitis is a very common complaint. It

involves inflammation of the mucous membrane of the N.; its acute form is coryza or cold in the head. Chronic rhinitis is due to repeated attacks of the acute form, and produces in the early stages hypertrophy of the mucous membrane, and in the later stages atrophy of the mucous membrane, together with the formation of dry crusts, or scabs. Fibrinous rhinitis is a rare form, in which a false membrane is developed in the N. Epistaxis is bleeding from the N. The cause may be a high arterial pressure due to one of a variety of conditions, and in many cases is itself a remedial effort of the organism. Where the bleeding continues the patient should rest quietly on the back, and tanno-gallic acid should be applied locally. If the hemorrhage resists these measures, the N. must be plugged. Polypi, or tumours, may be formed on the mucous membrane. A soft mucous polypus can easily be removed and does not usually recur, but fibrous polypi have a tendency towards malignancy. Sinusitis, or inflammation of the chambers of the skull which open from the N., is of common occurrence.

Nosean, or **Noselite**, aluminosilicate and sulphate of sodium ($3\text{Na}_2\text{Si}_2\text{Al}_2\text{O}_6\cdot\text{Na}_2\text{SO}_4$) closely allied to haunynite (*q.v.*) and the artificial ultramarines. It occurs in cubic crystals, usually dodecahedrons, of various colours and sometimes opaque. Found in the Laacher See (Rhine-land), the Albau Mts. (Rome), Kaiserstuhl (Haden), and in sev. of the haunynite localities.

Noske, Gustav (1868–1946), Ger. politician. *b.* at Brandenburg, served an apprenticeship as a carpenter but soon took up political journalism and in 1906 entered the Reichstag. In the First World War, which split the Ger. Socialist party, N. sided with the majority Socialists under Scheidemann and Ebert. He was governor of Kiel, Oct.–Dec. 1918. On the proclamation of the republic there ensued a struggle between the majority Socialists who favoured a democratic regime, and the Spartacist extremists. N. eventually succeeded in suppressing the Spartacist revolt notwithstanding the fact that the rebels were numerous and well armed. Following the defeat of the Spartacists in Berlin by N.'s composite force under Gen. Lüttwitz (Jan. 1, 1919) N. was appointed minister of defence in the Coalition Gov. of the Weimar Republic (Feb. 6, 1919). He was now the strongest man in Germany and a great asset to the Weimar Gov. because he attracted to it Conservatives who would otherwise have remained hostile. In this, however, he dug his own political grave, by misplaced confidence in certain reactionary elements, and in the result the threats from the fight over the Versailles Treaty culminated in the Kapp *putsch* (March 1920) and the Weimar Gov. fled from Berlin for a brief interval. After Kapp had been starved into surrender, the gov. returned but was later involved in conflict with a newly formed Red Army in the Ruhr. N. marched gov. troops to the disaffected area, but being in the neutral zone he provoked the occupation

by the Fr. of Frankfurt and other tns., and as a sequel to these events, which profoundly shocked Germany, N., already discredited by the consequences of his encouragement of old army influences, had to resign. Later he became president of the prov. of Hanover. N. was arrested by the Nazis after the bomb plot against Hitler in July 1944 and sent to a concentration camp but later moved to the Moabit prison where he was found when the war ended. He pub. *Kolonialpolitik und Sozialdemokratie* (1914) and *Von Kiel bis Kapp*, 1920.

Nosology (Gk. νόσος, disease; λόγος, science), that branch of medicine which treats of the distribution and arrangement of diseases into classes, orders, etc. The most popular system is that of Dr. Farr (1837) which has taken the place of Cullen's. The term is also applied to collection of evidence as to whether a particular condition should be regarded as a special disease.

Nossairians, or Alawis, see ANSARS.

Nossi-Bé, is. 8 m. from the N.W. coast of Madagascar, belonging to France. It is 14 m. long by 10 m. broad with an area of 130 sq. m. It is volcanic and mountainous. Rice, maize, manioc, bananas, coffee, and sugar are grown. Cap. Hellville. Pop. 12,000.

Nostalgia (Gk. νόστος, return home; άλγος pain), home-sickness. It is sometimes an early phase of melancholia, but is usually a psychic manifestation merely. It varies in intensity from a sentimental inclination to think fondly of the homeland to an uncontrollable desire to return and a settled dislike of one's present surroundings. The onset may be gradual, or may be precipitated by any critical or disturbing occurrence. It is very common among people who have previously dwelt in agric. and pastoral dists. where the inhab. are inclined to be clannish and intolerant of innovations. The cause of the condition is undoubtedly the realisation of the change of circumstances, and the absence of familiar people and impressions. That there is no organic lesion in this form of melancholia is attested by the fact that the condition immediately disappears when the desire to return has been accomplished.

Nostradamus, or Michel de Notre-Dame (1503-66). Fr. astrologer, of Jewish extraction, b. at St. Rémy, Provence. For many years he practised as a physician, and gained high reputation for his skill in stemming the tide of the great plagues of Lyons. Catherine de' Medici brought him to her court, and he was physician to Charles IX. His *Centuries*, prophecies in rhymed quatrains, was pub. in 1555, and aroused universal interest and excitement. See lives by E. Jaubert, 1656; E. Bareste, 1840; and C. Wollner, *Das Mysterium des Nostradamus*, 1926.

Nota, Alberto (1775-1847), It. comedy writer, b. at Turin. He was greatly influenced by Molière, but he followed his model too closely to give his own individuality scope and freedom. His best work is perhaps *La Lusignhierra*. Collected eds. of his plays were pub. at

Florence in 1827 and at Turin in 1837 and 1842.

Notables, The, advisory assemblies of notable personages summoned by the kings of France in times of stress. These assemblies had no constitutional authority whatever, and their transactions were of a purely private and confidential nature. Richelieu consulted this body in preference to the states-general. The best known was that convoked by Louis XVI. in 1787 at the instigation of Colonne; it was called in order that the privileged classes might be prepared for, and give their consent to, a more equitable system of tax collecting. Louis XVI. again summoned the N. in 1788.

Notary Public. The office of N. P. is of great antiquity, and its origin is to be traced to the professional writers or scribes who made drafts of public and private instruments. According to Brooke (*Treatise on Notaries*, 1901) the name was applied amongst the Jews to the royal secretaries who wrote the letters and edicts of the king, kept the register of his troops, and attended to his revenue and expenditure; to scribes who copied and interpreted sacred writings, and to officials who wrote and prepared legal documents. The same authority finds analogous officials in anct. Syracuse, Egypt, Greece, and Rome. The term *notary* itself is derived from Lat. *notus*, meaning the system of stenography in vogue among the early Rom. scribes, though later it appears to have been applied to the clerks or registrars attached to the prov. and municipal magistrates and officials of the emperor's privy council, while those who prepared private deeds and documents were specifically known as *tabelliones* from *tabellio*, the thin waxed tablets used in drafting. There is no European nation without its N. P., though their duties differ considerably in different countries. In England the duties of a N. P. are very circumscribed, and in status he is far below, for example, the N. P. of France. The Eng. notary's chief duties are to note and protest bills of exchange, to authenticate copies of private documents and deeds, to draft and attest instruments like powers of attorney about to be sent abroad, and receive affidavits of mariners, and administer oaths. A great many of the functions of a notary are, however, in England performed by solicitors, e.g. the preparation of wills and contracts, and hence it is that this official's duties are so commonly associated with protesting bills of exchange on dishonour. The utility of 'a notarial act' (i.e. the act of authenticating or certifying a document or entry by a written instrument under the signature and seal of a N. P., or an instrument attestation, or certificate made or signed by a N. P.) is that it is by the custom of all merchants accepted as unimpeachable evidence of the legal validity of the transaction recorded by it, notwithstanding that such transaction may have no validity in the country where it actually took place. The powers of a N. P. in America are wider; they may take depositions and do other acts relating to

the recording of testimony, and take proofs of debts in bankruptcy. In England Ns. P. who have always been civil and canon law officials are appointed by the archbishop of Canterbury. In America, they are appointed by the state-governor, and with the advice of either the council or the senate of the state.

Notation (Lat. *notatio*, *noto*, to mark), in music, the art of writing music in notes, i.e. representing musical sounds and their various modifications, by notes, signs, etc. From 990 to 1050 N. was much improved by Guido of Arezzo, who founded our present system. The anct. Gk. system was phonetic; also the modern Arabian system, the old tablatures, and Tonic Sol-fa methods of to-day. Sound, key distance, and scale relationship are their bases. The diastematic system of 'N. by intervals' comprised the neums (or neumes), representing groups of notes, and first came into use about the seventh century. The neums are still to be found in the plainsong manuals of the chord. The pitch of sound is now expressed by the positions of notes and the presence of clefs on sets of five lines, called 'staves' (which began as a single line and afterwards had companion lines added to it). Their relative duration is defined by variously shaped notes. Key and rhythm are indicated by signatures. Present N. is somewhat inadequate to the demands of modern music, because atonal writing involves frequent accidentals. Various new systems have been suggested, but the obstacle to reform is the vast mass of printed music.

In mathematics N. is the elaborate system of signs, symbols, numbers, and letters which has been evolved gradually to meet the needs of discovery. There is no accepted world system of N., but there is enough uniformity to enable mathematicians in different countries to understand each other. N. is of fundamental importance to mathematics, as language is to philosophy, and the progress made would have been impossible by the use of words alone. For a full treatment see F. Cajori, *A History of Mathematical Notation*, 1928.

Scales of N. are the various systems of writing numbers, the common and only one in practical use to-day being the denary scale or scale of ten, ten being the radix. On this scale 12 means $10 + 2$. There can be binary, tertiary, etc., scales with radices of 2, 3, etc. On the nonary scale, for example, where the radix is 9, 12 means $9 + 2$, which would be written 11 in the ordinary scale. Each branch of science has its own particular system of N., based on mathematical N. and adapted for special needs, see CHEMISTRY, PHYSICS, etc. See also DECIMAL SYSTEM; SIGNS; SYMBOLS.

Notched-Bar Test, method of testing relatively ductile materials. A notched metal bar is struck by a heavy pendulum, the energy required to break the bar being expressed in foot-pounds.

Notes and Queries, weekly paper of quaint or unknown or little-known facts, phrases, archaisms, and bibliographies of interest to the literary world, estab. in

1849 by the antiquary, Wm. John Thoms, with the object of 'providing a paper in which literary men could answer one another's questions.' A full account of the hist. of *N. and Q.* from the pen of Thoms will be found in some of the 1876 and 1877 numbers. Thoms was himself a great contributor to the paper, some of his most arresting articles being, 'The Death Warrant of Charles I., another Historic Doubt,' 'Lord Chatham and the Princess Olive,' and 'Hannah Lightfoot.' Its motto was, until 1923, Capt. Cuttle's, 'When found, make a note of.' In 1920 it was bought by *The Times*, and in 1939 by the Oxford Univ. Press.

Notes, Bank, see BANKS AND BANKING.

Nothochloa, genus of ferns of delicate appearance, the fronds being green on the upper surface and powdery or scaly white underneath. A number of species are grown in stovehouses and greenhouses.

Nothoscordum, genus of bulbous plants (family Liliaceae) bearing umbels of white, yellow, lilac, rose, or purple flowers. *N. fragrans* and a few other species are hardy; others are grown in cool greenhouses.

Nothotherium, see SLOTH.

Notice, Equitable and Judicial: Equitable.—It is a principle of equity (q.v.) that an equitable as distinct from a legal (i.e. common law) interest in property is in no way binding upon the person who obtains the legal interest, unless he ought in conscience to respect the equitable interest, and in general his conscience can only be affected by *notice*, actual or constructive, of the existence of the equitable interest; e.g. A, the owner of an estate, creates an equitable mortgage of it to B; then without disclosing such mortgage, A makes another equitable mortgage of it to C. C is ordinarily postponed to B in the matter of repayment of their loans because later in point of time; but if, *assuming that at the time he took his mortgage he had no notice of the existence of the mortgage to B*, he subsequently induces A to convey to him the legal estate whether by way of mortgage or otherwise, he can ignore B's mortgage altogether. By constructive notice is meant either knowledge of a fact from which the existence of an equitable interest ought to have been inferred, or the possibility of discovering its existence by the usual method of investigating title.

Judicial.—A court of law is said to take *judicial notice of a fact* when it accepts it in evidence without proof. All judges take judicial notice of *inter alia*: (1) All Acts of Parliament, public or private, and all unwritten laws and legal principles acted upon by the courts of Great Britain; (2) all general customs decided by a superior court of law of equity to have the force of law; (3) the course of proceeding, and all rules of practice of the Supreme Court; (4) the general course of proceeding and privileges of Parliament; (5) the ordinary course of nature, and natural and artificial divs. of time; (6) the ordinary meaning of Eng. words; (7) the existence of every state and sovereign recognised by this country; (8) the signatures of high court judges; and (9) all matters which they are directed by statute to notice.

See Taylor, *On Evidence*, and Stephen, *Digest of Evidence*.

Notker, or **Balbulus** (the Stammerer) (c. 840-912), Swiss monk, b. in E. Switzerland. He was a musician at the monastery of St. Gall. He wrote on musical notation, the organ, and the perfection of plainsong, and as a composer contributed to the development of liturgical sequences. See S. Singer, *Die Dichterschule von St. Gallen*, 1922.

Notification of Diseases. It is compulsory in Great Britain, under the Infectious Diseases Acts of 1889 and 1899, to notify the local medical officer of health of cases of certain infectious diseases, such as diphtheria, scarlet fever, typhoid fever, etc., so that effective steps may be taken to prevent, by isolation, etc., any spread of the disease. The duty of giving notification falls upon the head of the family, but it is usually performed by the doctor attending the case. Failure to notify involves a penalty of 40s. Certain other diseases, such as chicken-pox, cerebro-spinal fever, etc., may be made compulsorily notifiable in special areas by order of the local authorities.

Note, tn. in the prov. of Syracuse, Sicily, 2 m. inland. There are Christian catacombs, Gk. cemeteries, and prehistoric tombs. A medieval tn. occupied the site of Netum, a Sikel city, 5 m. to the N., but was overwhelmed in an earthquake. The present tn. was constructed ten years later in 1703. There is trade in wine, oil, and corn. Pop. 33,800.

Notochord, supporting rod of closely packed cells characteristic of those animals which comprise the phylum *Chordata*. The N. runs lengthwise from anterior to posterior ends, and is situated immediately ventral to the spinal cord. The members of the sub-phylum *Acrania* lack a skull and backbone; they comprise (1) the Cephalochordata, such as *Amphioxus* (q.v.) which are named from the extension of the N. to the extreme tip of the 'head,' (2) the Tunicates or Sea Squirts, which possess a N. in the larval stage, though it is lost in the adult. (3) the Hemichordata, e.g. *Balanoglossus*, worm-like animals with the N. restricted to the region of the proboscis. In the remaining sub-phylum, *Cranialia* or *Vertebrata* (fishes, amphibians, reptiles, birds, and mammals), a skull with a cranium enclosing the brain is formed, and the N. becomes surrounded by the vertebrae of the backbone. In some lower forms of vertebrates, such as the lamprey, the N. persists in the adult, but in most it can be recognised only in the embryo, and is soon obliterated by the backbone which develops around it.

Notornis, see TAKAHAE.

Nôtre, André Le, see LE NÔTRE.

Notre Dame Bay lies between Fogo Is. and Cape St. John, on the N. coast of Newfoundland in the bay of Exploits; at the E. end is a large archipelago.

Notre-Dame de Paris (Our Lady of Paris), most important cathedral of Paris. Construction was begun in 1163, on the site of an anct. Merovingian cathedral, and continued until 1245, when the general scheme was completed. There was an

overall restoration in 1845-64 under the direction of Viollet-le-Duc. It is a fine example of the two first periods of Gothic, the great rose-window, the apse, the towers, and the doors being especially noteworthy, and possesses the Crown of Thorns and a fragment of the Cross. The fountain of Notre-Dame is situated in the square of the archbishopric, which occupies the site of the old palace, sacked in 1381. It was built in 1842-46 by Vigoureux, in the Gothic style. See M. Aubert, *Notre-Dame de Paris*, 1928.

Nottingham, Earls of, see FINCH, HENEAGE, and HOWARD OF EFFINGHAM.

Nottingham, city and co. bor. of England, cap. of Nottinghamshire, on the Trent, 125 m. N.N.W. of London by rail, and an important rail centre. The R. Trent is navigable to the sea, and gives access to Newark, Gainsborough, and the Humber ports. At the Nottingham end of the navigation there are adequate basins, warehouses, and transport sheds. The prin. industries include the manuf. of lace, hosiery, chemicals, mechanical products, tobacco, cycles, and general engineering works. Other important industries are bleaching, dyeing, spinning, tanning, brewing, and furniture. The water supply, health services, gas, public lighting, and transport undertakings are all owned and controlled by the municipality. The amenities of the city include numerous public baths, libraries, and parks, an art gallery, and two museums. Over 20,000 houses have been built by the N. Corporation and it is estimated that a further 20,000 will be required during the next twenty years. There is a central retail market, a wholesale market, a cattle market, and a public abattoir, all municipally owned. The famous N. Goose Fair is held in Oct. each year.

The prin. public buildings are the Council House, opened in 1929 by the Prince of Wales, the guildhall, and N. Castle, originally built on Castle Rock by William the Conqueror, dismantled during the Protectorate, restored in 1878, and now the Castle Museum and Art Gallery. The collections include examples of N. alabaster carving, a local industry of the fourteenth and fifteenth centuries. Other important buildings are the churches of St. Mary (fifteenth century), St. Peter (partly twelfth and partly fifteenth century), St. Nicholas (1678), and the Rom. Catholic cathedral of St. Barnabas (designed by Pugin), and the Shire Hall, Althorpe Hall, etc.

Facilities for educational advancement in the city are on a wide and generous scale, extending from nursery schools to a fine univ. The education authority is responsible for primary, secondary, and grammar school education, and development is taking place to provide all forms of educational activity as envisaged by national legislation. In the sphere of further education, a college of art and crafts, a technical college, and many evening institutes have been provided. There are two high schools, namely, the boys' and the girls'. Ancillary services

provided by the Education Committee include the school health service, school clinics, a child guidance clinic, open-air schools, and a school meals service. The N. Playhouse Theatre, a non-profit-making venture, was begun in Nov. 1948 and is run by a trust representing the various interests of city and univ. N. Univ. (q.v.) is housed in a beautiful new building erected by Sir Jesse Boot, later the first Lord Trent, in a park on the outskirts of the city in a setting of exceptional beauty, and was opened by George V. in 1928. The park adjoining the college is 220 ac. in extent.

Within a few minutes from the centre of the city is Wollaton Park (744 ac. in extent) with its magnificent Elizabethan hall, now a natural hist. museum. There are many fine parks and recreation grounds catering for all types of sport and recreation. Newstead Abbey, the home of Lord Byron, the poet, and of great historical interest, came into the possession of the corporation in 1931, the ceremony of handing over the property being performed by M. Venizelos, then Prime Minister of Greece. The abbey contains many fine Byron relics.

The Rom. station of Margidunum at E. Bridgford was an important site on the Rom. Fosse Way between Leicester and Lincoln. A fort of Claudian age has been very thoroughly excavated in recent years. The A.-S. named the tn. Snotengaham and occupied it for a long period from about the sixth century A.D. N. was one of the 'Five Burghs' occupied by the Danes. William the Conqueror occupied the tn. in 1086. In 1589 the Rev. Wm. Lee invented the first stocking frame here. At N. Richard Arkwright first erected his spinning frames and Hargreaves his spinning jenny. Charles I. raised his standard here in 1642 and the next year the tn. and castle were taken by the Parliamentarians. Serious riots, occasioned by the introduction of machinery, took place in 1811-12 and 1816-17. Sherwood Forest (the legendary home of Robin Hood) has long been shorn of its mighty grandeur, but remains of it still exist in the Dukeries in the N. part of the co.

The city, which has four members of Parliament, is governed by the city council, consisting of sixty-four elected members. There is a lord mayor, a sheriff, sixteen aldermen, and forty-eight councillors. Pop. 285,000. See D. Gray, *Nottingham Through Five Hundred Years: a Short History of Town Government*, 1949.

Nottinghamshire (Notts), midland co. of England. The surface varies, part of it being a continuation of the Yorkshire plain, rising towards the S.W., where the Robin Hood Hills reach an elevation of over 600 ft. Near to these hills lies Sherwood Forest, famous for its connection with Robin Hood, and now mostly included in the parks that form what is known as the Dukeries. The prin. rivs. are the Trent, Erewash, Soar, and Idle. The Fosse Dyke and Nottingham and Grantham canals connect the Trent and the Witham. On the W. border lie the

Cresswell Crags, in which are some famous caves, where remains of mammoth, cave lion, etc., have been found. On the S.W. there are extensive coal-mines, Nottingham and Mansfield being the chief centres. Sandstone, limestone, and clay are worked. The prin. manufs. are lace and hosiery; there are also silk, worsted, woollen- and cotton-mills, iron foundries, and cycle works, and at Beeston machinery and motor works, while there are tobacco factories at Nottingham. The greater part of the co. is under cultivation, and there are numerous hop gardens. Agriculture and farming flourish in the N.E. and S.E. and there are large apple and pear orchards. It is divided into five parl. divs., each returning one member. In ant. times it formed part of the kingdom of Mercia, and was subjected to many incursions from the Danes. At the time of the dissolution of the monasteries there were forty religious houses in N., but the only important remains are those of Newstead Abbey. There are some fine churches, including Southwell Cathedral of Norman date, and some splendid modern mansions in the Dukeries. Area 827 sq. m. Pop. 719,200. See Victoria County History, *Nottinghamshire*; also White, *History, Directory and Gazetteer of Nottingham*, 1853, and A. C. Wood, *A History of Nottinghamshire*, 1947.

Nottinghamshire and Derbyshire Regiment, see *SHERWOOD FORESTERS*.

Nottingham University, at Highfields, 2½ m. from the centre of Nottingham, England, is on an ideal site in open country. It is a development of the former Univ. College, which owed its origin to elvic enterprise and was opened in 1881. In 1903 the college received its royal charter of incorporation, and in 1920 it estab. the first fully constituted dept. of adult education in the country. The foundations for an independent univ. for Nottingham were laid by Jesse Boot, first Lord Trent, the Nottingham industrialist, who spent about £1,000,000 on the univ. park and buildings and thereby ensured the ultimate success of Univ. College. It developed rapidly, and in 1938 received a supplementary charter which greatly improved its constitution and paved the way to full univ. status. In July 1948 a royal charter was granted to the college, which thus became the twelfth independent Eng. univ. to achieve full univ. status. Developments since 1945 have included the creation of chairs of law and philosophy, a readership in theology, the transfer to the univ. of the Midland Agric. College as its school of agriculture, and the foundation of the institute of education. In 1949 N. Univ. had 2189 students, the ann. intake being about 650. On May 3, 1939, the second Lord Trent was installed as the first chancellor of the univ.

By the good fortune of its site Nottingham is able to set its main univ. buildings and residential halls in one place together, instead of having them scattered about the city. It is planned to make the univ. wholly residential for 3000 students by building nine new halls and generally to

develop the univ. into a true academic community with a life and spirit of its own. The Senate House and main univ. building was finely placed by Morley Holder on the upper slopes of a broad-backed ridge overlooking the ornamental lake of Wollaton Park. It was built to provide for the main needs, other than residential, of a univ. college of 500. Two halls of residence, Hugh Stewart Hall and Florence Boot Hall, were built for men and women students respectively. The problem of the univ. authorities is how to provide for all the needs of a great modern univ. without destroying the amenities and park-like character of its original setting. With the present main building, or Senate House as its pivot, the lay-out of the univ. council's development plan provides for a univ. campus stretching across the crown of the ridge. The new main buildings are to be grouped around this centre and erected on three sides of a large quadrangle opening on to the Senate House. These buildings would include the library, the great hall, lecture rooms, and the schools of music and fine art. The union house, which is to be the social centre of the univ., is to be erected adjacent and to the E. of the Senate House. The science dept., and the proposed institute of physical education are placed on the E. side of the univ. site, while the chapel will be built to the W. of the Senate House. This master plan has been framed to provide for the growth of an integrated univ., with its central buildings harmoniously grouped to provide for teaching, administration, research, and social amenities, and its residential colleges planted in beautiful surroundings in the vicinity. For the full realisation of the plan a site of not less than 340 ac. is required. The univ. owns or leases at present 170 ac. and there is unspoilt parkland surrounding the present site to provide amply for future needs.

Notting Hill, dist. of London, England, near the W. end of Hyde Park, 4 m. W. of St. Paul's, part of the bor. of Kensington. It is a favourite residential dist.

Notus (Gk. name for the S. or S.W. wind), see **AUSTER**.

Nouméa, or **Numea**, also called **Port-de-France**, cap. of the Fr. colony of New Caledonia, on the bay of N. on the S.W. coast of the is. It has an excellent harbour, a gov. house, museum, college, and barracks. It was an aircraft-carrier base in the Second World War. Pop. 10,100.

Noumenon (from Gk. *noûn*, to know), in philosophy, a term introduced by Kant (q.v.) and rarely used apart from the consideration of his own philosophy. According to him, noumena are the real objects in themselves lying behind the phenomena, a phenomenon being defined as the 'undetermined object of an empirical intuition.' The noumenal world he held at first to be completely unknowable, since we can only recognise phenomena; but later he teaches that introduction to it is given by the practical reason, the capacity which we exercise as moral agents.

Novae, or **New Stars**, are stars which are

suddenly perceived, after having been previously invisible. The outburst of brilliance is usually temporary. Probably new stars of small brilliancy are of not infrequent occurrence, but of the larger magnitude, such, for instance, as are visible to the naked eye, the number has been few. One such was observed by Hipparchus, the father of astronomy. Tycho Brahe observed the brightest recorded nova on Nov. 6, 1572, in the constellation of Cassiopeia, and in Oct. 1604 Kepler and Galileo saw one in Ophiuchus. The latter, and one seen in Vulpecula by Anthelm in 1670, were the only N. seen in the seventeenth century; but eight were found in the nineteenth. Since 1900 nearly 100 N. have been discovered, though generally they were invisible to the naked eye. The discovery of N. has been facilitated by the examination of photographic plates. Two of the most important N. in recent years have been Nova Aurigae (1892) and Nova Persei (1901), both of which were discovered with the naked eye by Dr. Anderson at Edinburgh. When discovered on the morning of Feb. 22 the magnitude of the latter was 2.8, next day it was ten times as bright, outshining all northern stars, after which it declined till in 1903 it was of the twelfth magnitude. In 1918 Nova Aquilae achieved a brightness second only to Sirius; in 1912 Nova Puppis reached the first magnitude. It is probable that the outer envelope of the star is blown off by some immense explosion. Occasionally super-N. are discovered. These increase in brightness much more than ordinary N., but are so far away that they are known only by photographic records.

Novaes, **Bartholomeu**, see **DIAZ**, **BARTHOLOMEU**.

Novæsiurm, see **NEUSS**.

Nova-Gôa, see **GÔA**.

Novák, **Vítězslav** (1870-1949), Czech composer, b. at Kamenice. He was the son of a doctor, but lost his father early and had to support the family by teaching. While studying law at Prague Univ. he attended the Conservatoire, studying the pianoforte with Jiránek and composition with Dvořák, who persuaded him to devote himself wholly to music. He soon made a career as a distinguished teacher of composition, and in 1909 was appointed prof. at the Conservatoire. After the First World War, which regained his country's independence, he became prof. of the 'Master School' and was its director in 1919-22. Works include operas, *The Imp of Zríkor*, *A Night at Karlstein*, *The Lantern*, *The Grandfather's Will*, and *The Wood Nymph*; ballets, *Signorina Giocatta* and *Nikolina*; cantatas, *The Storm*, *The Spectre's Bride*, and choral ballads; symphonic poems, *In the Tatra*, *Eternal Longing*, *Toman* and *The Wood Nymph*, octets *The Corsair* (after Byron), *Maryša*, *Lady Godiva*, instrumental pieces, and songs, *Manfred* (ballad after Byron), *Songs of Winter Nights*, *Pan*, *Exoticism*; song cycles, *Gypsy Songs*, *Melancholy*, *In the Valley of a New Kingdom*, *Melancholy Songs of Love*, *Nocturnes*, *Eroticism*, etc.

Novalis, literary name assumed by

Friedrich von Hardenberg (1772-1801), Ger. poet and philosopher, b. at Oberwiesedestadt, Thuringia. In 1789 N. was sent to Jena to study; in 1792 he went with his brother Erasmus to Leipzig Univ., and in the succeeding year to Wittenberg, where he completed his studies. On leaving Wittenberg he went to Armstadt, where he became enamoured of the fifteen-year-old Sophie von Kuhn. In 1795 N. went to Weissenfels, and was made auditor of the Saxon Salt Works, of which his father was director. The death of Sophie and of his brother Erasmus, both in 1797, was a severe shock to N. *Hymns to the Night* (1800) were written about this time. The tragedy aroused in N. a poetic and mystic strength. Feeling himself ecstatically united with the dead beloved, he tried to free the spirit from material things. Thus originated his system of magic idealism. N., one of the most important of the early romantics, commenced the romance *Heinrich von Oesterlingen* in 1800, but never completed it. His works were collected and ed. by his friends L. Tieck and F. Schlegel in 1802. Later eds. are those of J. Minor, 1907; P. Kluckhohn (with diaries), 1928; and C. Seelig, 1946. See studies by E. Hellborn, 1901; R. Samuel, 1925; and J. von Minnegorode, 1941.

Novara (anct. *Novaria*), tn., the cap. of a prov. of the same name in Piedmont, Italy, 27 m. W. of Milan. It has a magnificent cathedral dating from the fifth century, and rebuilt in the eleventh. There are important textile manufs. It was ceded to the house of Savoy in 1735. In 1849 Charles Albert, king of Sardinia, was defeated here by the Austrians, and forced to abdicate. Pop. (tn.) 52,000, com. 62,500.

Nova Scotia (Fr. *Acadie*), prov. of the dominion of Canada, lying between 43° and 47° N. and 59° 40' and 66° 25' W. It consists of two portions, N. S. proper, a large peninsula, and the is. of Cape Breton (g.v.), separated from it by the Gut of Canso. N. S. proper extends 280 m. N.E. and S.W., or, including Cape Breton Is., 350 m. long from N.E. to S.W. The Isthmus of Chignecto, 11½ m. wide, connects it with the prov. of New Brunswick. The Cobequid chain of hills stretches from E. to W. and terminates at Cape Chignecto. The highest point is the Ingouish Mt. Beyond the fir-studded cliffs of from 200 to 600 ft., which here and there overhang the coast, lies the fertile valley of the Annapolis. On the Atlantic side of the coast between Cape Canso and Cape Sable is situated the harbour of Halifax. The Pictou harbour is the most important on the N. coast. Minas Bay, an inlet on the E. arm of the bay of Fundy, penetrates some 60 m. inland, and terminates in Cobequid Bay. Sable Is. is the most important is. off the coast of N. S. The prin. rvs. are: the Annapolis, Avon, Shubenacadie, the E., Middle, and W. rvs. of Pictou, the Musquodoboit, and the Labadee. The fresh-water lakes are Lake Rossignol, situated in Queen's co., and 20 m. long; Ship Harbour Lake, 15 m. in length; and Grand Lake, both of which

are in Halifax co. The climate of N. S. is more temperate than that of New Brunswick, and the air as a general rule is very wholesome. The pop. is 635,000; area, 21,068 sq. m. The cap. is Halifax (pop. 70,500). Other large tns. are Sydney (28,300); Glace Bay (25,147); Dartmouth (10,347); and Truro (10,300). Indians are scattered throughout the prov. The Nova Scotians are mostly Rom. Catholics, Presbyterians, and Baptists; there are not many Anglicans. The local council consists of a House of Assembly of thirty members, at the head of which is appointed a Lieutenant-governor by the Federal Gov. for a term of five years. Education throughout the prov. is free and compulsory. Chief univs.: King's College, Halifax (Anglican), founded in 1790; Acadia Univ., Wolfville (Baptist), founded in 1839; St. Francis Xavier, Antigonish (Rom. Catholic), founded in 1886; and the Dalhousie Univ., Halifax (undenominational), founded in 1818. An agric. college was founded at Truro (1905).

Agriculture is important, especially poultry raising, dairy farming, and fruit growing, particularly apples. There is much interest being shown in land-breaking and under-drainage, and in pasture improvement by fertilisation. The fisheries are also an important industry in N. S., employing over 18,000 men, and being valued at over \$13,000,000, with an invested capital of over \$15,000,000. No ood fish in the world stands the tropical climate like that cured by Nova Scotian fishermen. Lumbering, the manufacturing of wood-pulp for paper, and mixed farming occupy an important section of the pop. In N. S. the greater part of the forest land, amounting to 15,200 sq. m., has passed into private ownership, but the system of disposal of timber by licences to cut is now being followed. What remains vested in the Crown is administered by the chief forester under the minister of lands and forests. The prin. trees are spruce, fir, pine, birch, hemlock, oak, and maple. The leading manufacturing industries are steel products, pig and rolled iron and ferro-alloys; fish-curing; saw-mills; biscuits and confectionery; dairy produce; railway rolling stock; hosiery; and castings and forgings. Manufacturing is, to a considerable extent, dominated by the steel industry. The gross value of manufacturing products is almost \$200,000,000. The chief mineral product is coal (which was produced as early as the eighteenth century) which is subjected to a royalty of 12½ cents per long ton. There are 1000 sq. m. of known coal-fields. Other minerals are gold, salt, lead, zinc, copper, clay products, manganese, gypsum, and limestone. The ann. value of the mineral production of N. S. is from \$25,000,000 to \$30,000,000. All minerals in N. S. (except limestone, gypsum, and building materials) are the property of the Crown, and are administered by the minister of public works and mines. The Intercolonial Railway, owned and worked by the dominion gov., is the chief means of communication with the other provs.

forming part of the Canadian National Railroad system. The Canadian Pacific Railway has running powers within a certain part of the prov.

The hist. of N. S. dates from the visit of the Cabots in 1497-98, but not until 1604 was any attempt at colonisation made by Europeans. In that year a number of Fr. colonists estab. themselves here. The settlements formed on the modern sites of Annapolis and St. Croix (New Brunswick) were assailed by the Jesuits in 1613 and by the Eng. colonists of Virginia, both of whom expelled the Fr. The old name of the colony, which was Acadia, was changed for N. S. by Sir Wm. Alexander in 1621, who received a grant of the peninsula from James I., intending to colonise

Novatian, priest or presbyter at Rome in the third century. He was converted to Christianity after reaching manhood, and was admitted to holy orders by Fabian. In the discussion about those who had lapsed during the Decian persecution (250-51) N. opposed the policy of leniency adopted by Cornelius, bishop of Rome. N. was in consequence put forward by his followers as an anti-pope. A Rom. synod pronounced him schismatic, and he was excommunicated and d. in prison. His bones were brought to Rome, where he was honoured as a martyr. His influence spread, and Novatianism was estab. in Carthage, Alexandria, Constantinople, and

the whole of it. The Fr. were granted the possession of the colony by the treaty of St. Germain-en-Laye (1632). The Fr. settlers, however, quarrelled among themselves, and Cromwell in 1654 sent a force to occupy the settlement. Charles II., by the treaty of Breda (1667), restored N. S. to the Fr.; but not until Britain took possession of the colony in 1713, according to the treaty of Utrecht, was peace possible among the colonists. In the treaty of Paris (1763) France resigned all claim upon the country, and in 1820 Cape Breton united with N. S. Representative gov. was granted as early as 1758, and a fully responsible legislative assembly was estab. in 1848 through the instrumentality of Joseph Howe. In 1867 the prov. entered the dominion of Canada.

Philpot, *The Province of Nova Scotia: Resources and Development*, 1930; T. M. Longstreth, *The Sunrise Province of Canada*, 1935; G. Patterson, *Studies in Nova Scotian History*, 1940; and L. R.

in Asia until the seventh century. His followers claimed to be especially pure, and adopted the name of Cathari. In their doctrine they denied the power of the Church to absolve from mortal sin, and excluded all convicted sinners from the communion of the Church. See A. d'Ales, *Novatien*, 1925, and N. Kriebel, *Studien zur Trinitätslehre bei Tertullian und Novatian*, 1932.

Novation, merging of one legal obligation into another so as to extinguish the former and give a right of action only on the latter. For example, A owes B £100 for money lent, and later signs a cheque for the amount. B cannot sue A on his personal obligation to repay, but only on the cheque; and if the bank on which the cheque is drawn should fail in the meantime B would never get his money. A N. is invalid unless both parties consent to it. The term N. is rarely employed in Eng. law, the effect of merger of old obligations being determined either by the ordinary principles of contract (*q.v.*) or by statute.

Novaya Sibir, see NEW SIBERIAN ISLANDS.

Novaya Zemlya. Arctic land off the coast of European Russia, to which it belongs. It consists of two large is. separated by the Matochkin Shar. N. Z. forms a continuation of the Paš Khoy hills, with Vaigach Is. between it and the mainland. A number of fjord-like inlets lie on the E. coast of N. Z. between the Matochkin Shar and 75° N. The W. coast is fretted with bays and promontories. On the S. is situated the bay of Sakhanikha. Further N. the Kostin Shar Straits separate Mezhdusharskiy Is. from the coast, to the N. end of which is S. Goose Cape, thus forming the S. extremity of Goose Is.; in 72° N. Moller Bay lies between Goose Land and Cape Britwin, with sev. minor bays. On the W. coast of the N. is. are Krestovaya, Mashigin, and Nordenskjoeld Hays, and to the N. are sev. groups of is., Gorbovy, Pankratier, the Gulf Stream Is., and the Orange Is. N. Z. is mountainous, possesses many lakes and streams, and is intersected by deep narrow valleys. Very little is known of the interior. The Novgorod hunters are said to have visited the is. in the eleventh century. With the discovery of the N.E. passage in 1553 began a series of expeditions. In 1556 Stephen Borough was the first W. European to reach the E. extremity of the is. Baron Nordenskjoeld (q.v.) investigated the whole of N. Z. in 1876-77. Among the later explorers are H. J. Pearson (1895-97) and O. Ekstam (1900-3). The climate varies in parts, and glaciers are rare. There is practically no animal life on the is. There are a few lemmings and brown and white bears. On the coast abound birds, whales, seals, walrus, and dolphins. There is a small Russian colony on the S. is. Total land area (estimated) 35,150 sq. m. See A. P. Engelhardt, *A Russian Province of the North*, 1899; *Report of the Scientific Results of the Norwegian Expedition of Novaya Zemlya*, 1921, 1922.

Novel. The term N. may be said to denote a prose story. In its original use it meant a fresh story, but very soon it came to denote any story or tale in prose as opposed to a story in verse, which latter retained its old appellation of romance. Medieval romance dealt with a legendary past. The N., which seems to have had its origin in Italy soon after the Renaissance through the stimulus of foreign travel, dealt with the realities of everyday life and therein lay its fundamental attraction. Italy was indeed the home of the N., for it was there in 1350 that Boccaccio wrote his prose tales of amorous adventure, the *Decameron*, styled 'Novella Storia' or 'Fresh Tales,' which had so profound an influence on the subsequent development of prose fiction. Nowadays the term romance is sometimes loosely used as a synonym for N. or fiction—an instance of deteriorated meaning of a word; while, in a narrower sense, the term romantic is used to differentiate Ns. of adventure or fancy or historical Ns. from realistic Ns., which are designed to represent life as it is rather than as idealised.

ANCIENT CLASSICAL PROSE FICTION.—The earliest Gk. compositions of a fic-

titious character known are the *Milesiaca*, or *Milesian Tales*, said to have been written chiefly by Aristides. Clearchus, a disciple of Aristotle, wrote a hist. of fictitious love adventures, and is thus, perhaps, to be considered the first European Gk. novelist, and the first of the long series of *Erotikoi*, who reach down to the thirteenth century A.D. Not long after came Antonius Diogenes, whose romance, in twenty-four books, entitled *Tà úπερ Θούλην Ἀστέρα* (Of the Incredible Things beyond Thule), was founded on the wanderings, adventures, and loves of Dinias and Dercyllis. The first names that occur in the new series are Lucius of Patra (*Patrensis*) and Lucian, who flourished in the second century A.D. The next notable name is that of Heliodorus, bishop of Trikkas of the fourth century A.D. This Christian writer, whose *Lores of Theagenes and Chariclea* is really the oldest extant *erotic* romance, far excelled all his predecessors in everything that can render a story interesting or excellent; and Tasso, Guarini, d'Urfé, and sev. other modern writers have drawn many particulars—sometimes almost verbatim—from the stories in the *Theagenes and Chariclea*. The work that next invites our attention in point of time, the *Daphnis and Chloe* of Longus, is of a totally different character. It is a simple and picturesque prose-pastoral, with no poisonings, murders, magic, supernaturalism, or impossible exploits. *Daphnis and Chloe* is the only pastoral romance produced by any Byzantine author. Of three Xenophons, also noted among the *Erotikoi*, and of uncertain date, the best is Xenophon of Ephesus, whose romance, entitled *Ephesiaca*, or *the Loves of Anthia and Abrocomas*, is in ten books. Then there appeared a work which was essentially a romance, and was composed expressly for the purpose of recommending the ascetic form of Christian life, the *Barlaam and Josaphat*, the author of which is unknown. During the Middle Ages this was trans. into every language of Christendom. In the second century Apuleius wrote his *Ass* (called from its excellence the *Golden Ass*). It supplied Boccaccio with some of his stories, and the author of *Gil Blas* with picturesque incidents.

CHINESE PROSE FICTION.—For an account of the novel in the Mongol dynasty see CHINA, *Chinese Literature*.

ROMANTIC FICTION IN WESTERN EUROPE is the product of new historical circumstances, which were but slightly affected by Byzantine influences. The *Erotikoi* reflect a corrupt and decaying civilisation; but medieval romances suggest a youthful, vigorous, and growing social life. They appear to have had their root and foundation in chivalry, and although the exploits and the marvels may have often been derived from foreign sources, yet the spirit, scenery, sentiment, and life of the legends reflect the characteristics of the earlier ages of feudalism. Medieval romances are divisible into three great series: (1) those relating to Arthur (q.v.) and the Knights of the Round Table; (2) those relating to Charlemagne (q.v.)

and his Paladins; (3) those relating to Amadis de Gaul (*q.v.*) and his descendants. Besides the three distinct series of romance above mentioned, a fourth perhaps deserves mention, in which the heroes of antiquity are grotesquely tricked out in the costume of medieval knights. The prin. are the romances of *Jason and Medea*, of *Hercules*, of *Edipus*, and of *Alexander*. They are all written in Fr., and the first two profess to be the work of a Raoul le Febvre.

DEVELOPMENT AND INFLUENCE OF FICTION IN ITALY.—The It. originated no romances of the kind described above. The earliest It. work of this sort is the *Cento novelle antiche*, commonly called *Il Novellino*. It is a compilation by different hands, all unknown. It was followed in 1358 by the *Decameron* of Boccaccio, finer in point of humour, sentiment, and style, but not more original in the matter of story than *Il Novellino*. Its influence on early European literature was prodigious. Chaucer and Shakespeare in England were greatly indebted to it for incidents and plots; while in France Boccaccio had a number of distinguished imitators. In his own country his influence was so overwhelming that for some centuries It. novelists could do nothing more than attempt to copy him. The prin. of these imitators are Franco Sacchetti, Ser Giovanni, Massuccio di Salerno, Sabadino degli Arienti, Agnolo Firenzuolo, Luigi da Porta, Molza, Giovanni Brevio, Girolamo Parabosco, Marco Cademoste da Lodi, and Giovanni Giraldo Cinthio. Cinthio was the greatest favourite of all the It. novelists with the Elizabethan dramatists. Besides these we may mention Antonio Francesco Grazzini, Straparola, and Bandello. A very different class of fiction is the *spiritual romance*. It originated in the bosom of the Church. The first of the series is *Barlaam and Josaphat*, but by far the greatest work of the kind produced during the Middle Ages is the *Legenda Aurea*, or Golden Legend. Besides these may be mentioned a species of spiritual tale, the *Contes Drolats*, prevalent in France during the twelfth and thirteenth centuries, which was written by monks.

ROMANCE OF THE SIXTEENTH AND SEVENTEENTH CENTURIES.—During the sixteenth and seventeenth centuries four different kinds of N. were cultivated: (1) the comic romance, (2) the political romance, (3) the pastoral romance, (4) the heroic romance.

Comic Romance substantially begins in modern times with Rabelais (*q.v.*), styled by Sir Wm. Temple the 'Father of Ridicule.' Rabelais, in his inimitable burlesque romance, scoffs (with the tone of a sceptic, however) at the vices of the clergy, the crooked ways of politicians, and the jargon of philosophers. The next remarkable romance of a comic nature is the *Vita di Bertoldo* (1618) of Julio Cesare Croce, a work recounting the humorous and successful exploits of a clever but ugly peasant, which for two centuries was as popular in Italy as *Robinson Crusoe* or *Pilgrim's Progress* in England. A few

years later appeared *Don Quixote* (1605) (see CERVANTES), in which 'war to the knife' was proclaimed against the romances of chivalry. Almost contemporaneous with *Don Quixote* was another Sp. romance, Matteo Aleman's *Life of Guzman Alfarache* (1599, trans. 1623) which gave birth to a host of Sp. romances with beggars and scoundrels for heroes, of which the best is the *Lazarillo de Tormes* (1586) by Diego de Mendoza. In the following century France produced, among others, Scarron's *Roman comique* (1651-57) and Furetière's *Roman bourgeois* (1666).

Political Romance.—The earliest of the series is the *Utopia* (1516; first trans. from original Lat. into Eng. 1551) of Sir Thomas More; next comes the *Argenis* of Barclay, pub. in 1621; and to the same class belong a variety of Fr. romances, of which by far the most famous is the *Télémaque* (1699) of Fénelon.

Pastoral Romance.—The first important work of the kind is the *Arcadia* (1506) of Sannazzaro, written in It. It was followed by the *Diana* (1559) of Montemayor, written in Sp., sev. of the episodes of which are borrowed from the It. novelists, while Shakespeare has in turn directly taken from it the plot of the *Two Gentlemen of Verona* (1623) as well as some of the most amusing incidents in his *Midsummer Night's Dream* (1600). In this class may be included also Sir Philip Sidney's *Arcadia* (1590).

Heroic Romance.—The first of this heavy series was the *Pierreux* (1632) of Marin le Roy de Gomberville. His successor, La Calprenède, wrote *Cassandre* (10 vols., 1644-49), *Cleopâtre* (12 vols., 1647 ft.), and *Pharamond* (1662). But the most prolific of the school is Mlle de Scudéry, whose prin. romances are *Artamène ou le grand Cyrus* (1648-53); *Clebe* (1654-61); *Ibrahim, ou l'illustre Bassa* (1661); *Histoire romaine*, and *Almahide* (1661-63).

NOVELS AND ROMANCES OF THE EIGHTEENTH CENTURY.—The two European nations that most brilliantly distinguished themselves in the dept. of fiction during this century were England and France.

English Prose Fiction.—During the age of Elizabeth and her immediate successors, the imaginative genius of England, from various causes, had taken an almost exclusively poetical direction, and, with the exception of Sidney's pastoral of *Arcadia* (1590) and Bunyan's *Pilgrim's Progress* (1678), we meet with nothing in the shape of a N. or a romance for 100 years. It is certain that at the beginning of the eighteenth century England was entering on the most prosaic, unimaginative, and unheroical period of her hist. Its characteristics are faithfully reflected in most of its novels, which possess a great historical value apart altogether from their literary merits. The first name that occurs is that of the notorious Aphra Behn, the greater number of whose novels, of which *Oroonoko* (1678) is the best known, appeared towards the close of the reign of Charles II. But the first novelist of great genius belonging to the new era is Daniel Defoe, the father

of modern Eng. prose fiction in whose writings—*The Adventures of Captain Singleton* (1720), *The Fortunes of Moll Flanders* (1722), *The History of Colonel Jack* (1722), etc.—the coarse, homely, unpoetical, but vigorous realism of the time is strikingly apparent. *Robinson Crusoe* (1719) is the finest and the most famous of all that class of fiction which was extensively cultivated in both France and England. After Defoe comes Samuel Richardson, with *Pamela* (1740), *Clarissa* (1747), and *Sir Charles Grandison* (1753). Fielding thought Richardson untrue to nature and wrote his first *N. Joseph Andrews* (1742) as a burlesque on the style of his predecessor. Like his subsequent performances, *Tom Jones* (1748) and *Amelia* (1752), it represents society as Fielding's sharper eyes saw it—on the whole gross, vulgar, and impure. T. G. Smollett writes in the same spirit as Fielding. His chief works are *Roderick Random* (1748), *Peregrine Pickle* (1751), *The Adventures of Ferdinand Count Fathom* (1753), and *Humphry Clinker* (1770). Richard Sterne exhibits a genius so whimsical, peculiar, and original that it is almost impossible to class him with any of his contemporaries.

In 1766 appeared Oliver Goldsmith's *Vicar of Wakefield*, in which a change for the better, from a moral point of view, is first noticeable. With the exception of Richardson, all the novelists above mentioned are usually described as humorists. The pub. of Percy's *Reliques* re-awakened an interest in the age of chivalry and romance. The first of the modern romantic school was Horace Walpole, whose *Castle of Otranto* appeared in 1769. He was followed by Clara Reeve, the authoress of *The Old English Baron* (1777); but the greatest genius in this line was undoubtedly Mrs. Radcliffe, whose *Mysteries of Udolpho* (1794) and other works were once abundantly imitated. Her ablest successors were Matthew Gregory Lewis, author of *The Monk* (1795), and Charles Robert Maturin, author of *Fatal Vengeance, or the Family of Montorio* (1807).

Romance in which the Incidents, though Natural, are purely Imaginary.—This class corresponds with the modern conception of the N., and probably had its prototype in *Zayde* (1670) and *La Princesse de Clèves* (1678) by Mme La Fayette; but the first great name that adorns it is that of Marivaux, whose *Vie de Marianne* (1731) and *Paysan Parvenu* (1735) were long in high favour. Next to Marivaux comes the Abbé Prévost, chiefly remembered by *Manon Lescaut* (1731). Other writers belonging more or less strictly to the same div. are Mme Riccoboni and Rousseau.

Humorous and Satirical Romance.—By far the most celebrated specimens of this kind of fiction are the *Diable boiteux* (1707), the *Gil Blas* (1715-35), and *Le Bachelier de Salamanque* (1736) of Le Sage. Voltaire may fairly claim to rank among these in virtue of his *Zadig* (1748), *L'Ingénu* (1757), *Candide* (1759), and *La Princesse de Babylone* (1768).

Fairy Tales, etc.—The immediate forerunner and prototype of the Fr. fairy tales

was the *Pentameron* (1788) of Signor Basile. This attracted and stimulated the fancy of Charles Perrault, whose *Histoires ou contes du temps passé* appeared in 1697. His prin. successors were the Comtesse d'Aulnoy, Mme Murat, and Mlle de la Force.

PROSE FICTION OF GERMANY DURING THE EIGHTEENTH AND EARLIER NINETEENTH CENTURIES.—Towards the close of the century writers became more numerous, and as the literary activity of many of them continued on till the first or second quarter of the nineteenth century, it will be most convenient and natural to treat both centuries together. The first eminent Ger. novelist of this period was Wieland (*Geschichte des Agathon*, 1766-67, and *Oberon*, 1780). The prin. names of novelists influenced by Richardson and Fielding are August la Fontaine, Wetzol, Maler, Müller, Schulz, and Hippel. Almost contemporary with these there flourished for a brief period (1780-1800) a school whose works had their poetic counterpart in Schiller's *Die Räuber* (1781). The chief writers of this *Sturm und Drang* period are Cramer, Spiers, Schlenker, and Velt Weber. Alone and far above all others in abundance and originality of fancy, humour, and pathos, towers Jean Paul Richter (*Quintus Fixlein*, 1796). Apart from all schools stands Johann Wolfgang von Goethe (q.v.), whose *Ns.* (*Die Leiden des jungen Werthers*, 1774, *Wilhelm Meisters Lehrjahre*, 1795-98, *Die Wahlverwandtschaften*, 1809, *Wilhelm Meisters Wanderjahre*, 1829), as well as his poems, are poetic-philosophic efforts to represent, perhaps to solve, the great facts and problems of human life and destiny. *Wilhelm Meister* became the prototype of the romantic N. and influenced in particular Franz Sternhald's *Wandernungen* (1798), by Ludwig Tieck, and Wackewoder, and Novallis's *Heinrich von Ofterdingen* (unfinished, pub. among his Works, 1802). Other distinguished names are those of De la Motte Fouqué, Adelbert von Chamisso, Achim von Arnim, Clemens Brentano, and E. T. A. Hoffmann.

SOME ENGLISH FICTION OF THE NINETEENTH CENTURY.—The century began with the ironical, perceptive genius of Jane Austen, but her immediate influence was annulled by Scott's *Waverley Ns.*, which set the fashion for historical romance throughout Europe. Though he had some antecedents, including Maria Edgeworth's picture of Irish life in *Castle Rackrent* (1800), Scott may be said to have been the real inventor of the historical N. Possessed at once of far greater antiquarian learning, imaginative genius, sound sense, and instinctive taste than any of his 'romantic' predecessors, he knew precisely what to shun and what to choose. The political reaction that took place in Britain showed itself in literature too, and Sir Walter Scott was its grandest representative. He strove to delineate the past as it seemed in the eyes of men who were dubious of the present and afraid of the future. The overpowering genius of

Scott necessarily led to endless imitation, but the only one of his followers who holds a tolerably good position in literature is G. F. R. James. Galt and Wilson portrayed aspects of Scottish life which the author of *Waverley* (1814) had passed over. After Scott Bulwer (Lord) Lytton developed romantic and historical fiction, but his domestic Ns. reflected Jane Austen's belated influence on the popular taste. Her powers of observation were inherited by George Eliot, who in 1858 pub. in two vols. *Scenes of Clerical Life*. Her later Ns. entitled her to rank as one of the three great Eng. novelists of the nineteenth century. The other two, Dickens and Thackeray, brought the Eng. social N. to its zenith and with their work may be linked the philanthropic Ns. of Mrs. Gaskell and the 'Barnesshire Ns.' of Anthony Trollope. Among much talented and individual work may be noted the nautical Ns. of Marryat; the political Ns. of Benjamin Disraeli; the sporting and military Ns. of Charles Lever; the brilliant 'muscular Christian' Ns. of Charles Kingsley; the 'governess Ns.' as they have been aptly denominated of Charlotte Brontë; the 'school' novels of Thomas Hughes and Dean Farrar; and the 'sensational' Ns. of Wilkie Collins, Miss Braddon, and others. Other authors not less eminent are Mrs. Oliphant and Charles Reade. One novelist of this period stands apart from his contemporaries: Thomas Love Peacock, who invented a N. of shadowy characters, containing irony, and conversation, and a mockery of romantic excesses.

TENDENCIES IN THE EUROPEAN NOVEL IN THE SECOND HALF OF THE NINETEENTH CENTURY.—At the century's beginning, in addition to the lyrical and personal romances of P. R. Chateaubriand and Mme de Staël, the Fr. N., in the hands of De Vigny, Victor Hugo, and, in its decline, of Dumas père and Eugène Sue, was mainly historical. The influence of Goethe and the Ger. romance was manifested in France in the idealistic Ns. of George Sand. Then, with a greater admixture of realism, come the Ns. of Honoré de Balzac, who set out to give an exact picture of contemporary manners. Allied to him in the 'realist' school are Stendhal and Prosper Mérimée, while the second half of the century is dominated by Gustave Flaubert, who succeeded in fusing the romantic and the realistic. He, like Balzac, portrayed the physical environment of life as the determining factor in character, and from his work derives the modern N. as a conscious artistic form. Before Flaubert and his contemporaries the only comparable author is Jane Austen, who is their equal in form. From Flaubert are descended directly such later Eng. writers as George Moore, and others who reveal more or less directly the influence of the Fr. naturalistic movement from Flaubert to Zola are Hardy, Gissing, and Conrad. Leaving aside a romantic recrudescence by followers of George Sand—Feuillet, Cherbuliez, and Fromentin—the naturalist N. was further developed by the brothers

Goncourt and Alphonse Daudet, but naturalism was not formulated into a theory of art until Émile Zola did so. He and De Maupassant were responsible for the spread of naturalism throughout Europe, evidenced in the Norwegian August Strindberg, in the Ger. social Ns. of Spielhagen, Theodor Fontane, Otto Ludwig (*Zwischen Himmel und Erde*, 1855), J. Gotthelf, and Gottfried Keller (*Der grüne Heinrich*, 1851-53), and in the Sp. realist, José María de Pereda, followed by Armando Valdes. In the It. N. Fr. influence is recognisable. The chief of the It. realist school is Giovanni Verga, whose most prominent followers were Luigi Capuana, De Roberto Fogazzaro, and D'Annunzio, all of whom also achieved European reputations, though their talent is more romantic than that of their contemporaries. In England the influence of the Fr. naturalists is seen especially in the works of Arnold Bennett, but the Eng. social N. is indigenous, and has tended towards sociological study—witness the work of H. G. Wells and John Galsworthy. The Eng. N., a fact which Flaubert deplored, is looser in structure, and in this respect is allied more with the Russian N. than with the Fr.

The first part of Tolstoy's *War and Peace* appeared in 1865 and the N. was completed four years later. Realism, which in W. Europe was a moral revolt against untrue romanticism, was, in Russia, a natural growth free from theorising, being present before Tolstoy in Gogol and Turgenev, and after him in Goncharov and Dostoevsky. The contribution of the Russian novelists, epitomised in Tolstoy, is in the shift of emphasis from the physiological to the psychological. Though Tolstoy was Russia's greatest novelist it was Turgenev who influenced European literature most, since he combined Russian concentration on the psychology of his characters with Fr. artistry and compactness of form. By this fusion Turgenev may be said to have bridged effectively the gap between W. and E. European literary currents. Henceforward novelists tended to follow a general European pattern and to divorce themselves more and more from their national background. Turgenev had direct literary descendants in the Amer. Henry James and the Eng. John Galsworthy; and has strongly influenced contemporary Eng. novelists, notably Rosamond Lehmann and Charles Morgan. The more violent treatment of Dostoevsky has been adapted completely and successfully only by D. H. Lawrence, although his style has influenced other writers in lesser degrees. The emphasis on the psychological seconded by the growth of scientific psycho-analysis was the dominant feature in the work of many other late nineteenth- and twentieth-century novelists; in England these included Hardy, Meredith, Joyce, Aldous Huxley, and Virginia Woolf; in France Anatole France, Gide, Barrès, Mauriac, and Proust; in Germany Thomas Mann and Jacob Wassermann; in Austria Stefan Zweig; in Russia, Tchekov, Gorki,

and Pilnam; and in Spain Pérez Galdos and Azorin.

The internationalisation of the N., for which Turgenev must be held primarily responsible, has been one of the most remarkable features of twentieth-century development, especially in England. Previously novelists had been susceptible to foreign influences, but their work had usually retained a distinctively national stamp. From about 1880 onwards this is gradually changed. In Hardy and Meredith foreign influence is not allowed to hide a fundamentally Eng. creation. Hardy possessed the breadth of vision of Flaubert and Balzac and the psychological interest of Turgenev; but he remains supremely a descendant of the Shakespearean school of tragedy. In many of Meredith's works, such as *The Egoist*, the influence of Turgenev and the Fr. school is very marked; but the connection between such Ns. and the Eng. Restoration tradition of the comedy of manners is retained. But later writers frequently dismiss or overlay such foundations. The works of Virginia Woolf, T. S. Eliot, Lawrence, and Joyce owe comparatively little to the country of their authors' birth. Eng. novelists have been particularly affected by foreign trends; in Russia and Germany the N. has retained a much more national flavour. It has been suggested that by the nineteen-thirties Eng. novelists were borrowing from the fund of European ideas more than they gave; but contemporary novelists, such as Maugham, have maintained a distinctive Eng. school, while absorbing the best of foreign ideas and forms. Many outstanding novelists, however, have continued to rely heavily on European, particularly Fr., tradition: of these Charles Morgan has been the most successful, and his books are possibly more widely known in France, the country of his literary adoption, than in England.

THE MODERN NOVEL.—Since other classes of imaginative literature, both the drama and some kinds of poetry, are so closely akin to the N. it is not easy to discuss fundamental questions regarding the N. without trenching upon matters relating to these other classes. Thus the *Aeneid*, *The King and the Book*, and *The Dynasts* are essentially Ns. in verse and, apart from points of poetic technique, any discussion of the N. in general applies as validly to them as, for example, to *War and Peace* and *Martin Chuzzlewit*. If the N. is merely 'a long story usually in prose,' can there be any value in a discussion either of its form in general or of its tendencies? Or again, if its form is not limited, as is that of the drama, by conditions of presentation, why should it have a form at all? Generally speaking, as Mr. Percy Lubbock has shown in his book on the N. (*The Craft of Fiction*, 1921), novelists have never paid any undue regard to form, and the whole course of European fiction shows that the main preoccupation of the novelist who has a story to tell is to tell it and to use any form which seemed to him to be the most suitable vehicle for conveying his inten-

tion. This would certainly seem to be true of the Ns. of the last century, and in this connection it is probably misleading to speak of the 'modern' or contemporary N. when that term should, strictly, include only the works of a few writers who have attracted notice from professional critics on account of some conspicuous quality or even want of quality, but accompanied by some creative force; and some prominent critics are agreed that if vague ethical or sociological considerations are allowed to override aesthetic considerations the whole art of the N. is in danger of dissolution, particularly as the aesthetic is the primary consideration for by far the greater number of Ns. produced. Much that is ill-founded and conflicting has been said by both critics and novelists about the relation of the N. to life, for truth to life means different things to different readers and most readers have a sure enough grasp of life through reflection upon experience not to be at all likely to turn to fiction for further instruction. The collapse of the N., as indeed of other forms of literature in Germany and Italy in the past decade or more, is an eloquent commentary on the results of the interference with art by totalitarian govs. making use of intimidation and control of production in order to force upon artists the attitude that they regard as proper.

The twentieth-century European N. is distinguished by variety and licence of experiment. The novelist has become the purveyor of life's experience for the benefit of those whose experience is limited, and this has approximated fiction to journalism (not in a derogatory sense). It has been well said that H. G. Wells was a pioneer in the attempt to transform the N. into an intellectual clearing-house. The result of this attempt has been to bring into vogue the unsymmetrical or shapeless N. Wells's later Ns. and those of Proust, Joyce, Virginia Woolf, and Dorothy Richardson and, in America, Wm. Faulkner, Ernest Hemingway, and many others (see next section) are amorphous in the sense that they all show a strong tendency to free the art of N.-writing from the accepted canons of plot and dialogue so as to give scope for altogether wider activities. The element of justification in this 'shapeless' construction was that the 'realism' or 'naturalism' of the older Ns., such as those of Zola, the Goncourt brothers, George Gissing, and Arnold Bennett, was not really true to life. Hence this reaction to ultra-realism and the N. which pretends to reveal the 'stream of consciousness,' i.e. the N. which aims at getting rid of everything that might stand between the reader and the reflections in the character's mirror of consciousness. But this experimentation went to extreme lengths, as in Joyce's *Ulysses* (1922) in which the 'recurrent themes' and 'internal rhythms' seem to have no permanent value (see further under JOYCE, JAMES). *The Voyage Out* (1915) and other Ns. of Virginia Woolf reveal a world of radiance and a high degree of sensitiveness, emotional

and intellectual, yet are often fragmentary in presentation and wanting in continuity of narrative. But in these 'shapeless' Ns. the characters seem to have no existence outside the author's mind. At least the characters of Wells, Galsworthy, Bennett, and Conrad were substantial. Proust's method attracted many copyists after his death in 1922. His long continuous *N. A la recherche du temps perdu* (trans. as *Remembrance of Things Past*, 1913) is a highly subjective work, which explores consciousness regardless of time sequence and with a leisurely reflectiveness. His characters' sole aim seems to be to 'fill an infinite void of leisure with the satisfaction of insignificant appetites and the stimulation of largely artificial emotions.' The reader is indifferent to their fate, for their whole world dissolves into complete passivity, aimlessness, and futility. How different from the state of positive anxiety with which one follows the fortunes of the characters in a N. by Fielding, Trollope, or Hardy. Twentieth-century naturalism may be said to have ended with Arnold Bennett's *Riccymann Steps* (1923); but the Ns. of the 'shapeless school' which displaced it and seek realism in form rather than in content can hardly be condemned because they so far evade life as to avoid the central issues of our age, such as the threatened disintegration of society in the Fascist-Communist struggle. The day of the experimentalist may be said to be always dawning, but that of the traditionalist can never be said to be definitely past. Joseph Conrad was an experimentalist in a traditionalist framework. By contrast with his introspective brilliance Hugh Walpole was a mechanical traditionalist, painstaking, solid, undistinguished. E. M. Forster, in method, is a mid-nineteenth-century novelist, displaying an orderly unfolding of story and character. Imagination is the most powerful element in his universe. Life as he sees it is supremely strange and it is only through the imagination that man can hope to penetrate its mystery. Sentimentality, which is pervasive in Virginia Woolf, is idealistic and incidental to Forster; while half-heartedness about sexual love may be said to be another impression made by both these novelists. A. P. Herbert's *The Water Gypsies* (1930) is, in form, traditional, but has much in it that is fundamentally true to life. Its method is in sharp contrast with that of D. H. Lawrence, whose *N., Lady Chatterley's Lover* (1928), illustrates the author's constitutional inability to deal dispassionately with certain emotional relationships (see further under LAWRENCE, DAVID HERBERT). Markedly different from the Ns. of the experimentalists is the work of such writers as J. B. Priestley, whose *The Good Companions* (1929) is a reversion to the hurly-burly of Dickens's world; G. B. Stern, whose *Tents of Israel* (1924), a 'family chronicle' N., has few superiors in that category; and Tennyson Jesse, whose *The Lacquer Lady* (1929) is remarkable for vivid portrayal of varied experiences. The Ns. of Aldous Huxley seem to stand alone—

devastating satires with something of the unemotional precision of the analytical chemist. His *Point Counterpoint* (1928) and *Antic Hay* (1923) are essentially the Ns. of a moralist who is out to expose by the process of stripping off the masks of falsity and cant, the ugliness of bohemianism and other aspects of contemporary life. Wyndham Lewis suggests that all art to-day is in fact satire. Thus he assumes that the Amer., Faulkner, is a 'fierce moralist, who operates upon the satiric plane, armed with sardonic weapons of aggression against the victims of his ethical rage,' and it is obvious that his own Ns. are of this genre. In this period too there were occasional successful essays in the field of fantasy, such as David Garnett's *Lady into Fox* (1922) and Sylvia Warner's *Lolly Willowes* (1926).

The aftermath of the First World War brought Ns. of disillusionment such as Erich Remarque's *Im Westen Nichts Neues* (trans. as *All Quiet on the Western Front*, 1929); Richard Aldington's *Death of a Hero* (1929), C. E. Montague's *Dusenchment* (1922) and H. M. Tomlinson's *All Our Yesterdays* (1930)—books of very varying literary quality but all alike a protest against war, without any attempt to exploit the social background as a cause of war. Among other novelists who have taken the war as their theme are Robert Graves, R. H. Mottram, Arnold Zweig, Josef Hasek, and Herbert Read, whose Ns., unlike Tolstoy's masterpiece of the Napoleonic wars, deal rather with particular experiences than with general truths. Few of them have rivalled Henri Barbusse's *Le Feu* (1916), which, in descriptive narrative, shirks nothing in the task of reflecting the fatigue, tedium, and horror of war. Two other notable war Ns., *Her Privates We*, by Private 1922 (Frederick Manning) (1930), and *War is War*, by Private N. (1930), the former, perhaps, the best Eng. N. on the war, are the work of educated and imaginative men and not the unvarnished tales of characteristic private soldiers. Mottram's *The Spanish Farm* (1921), a dispassionate and detached war N., is more remarkable for its central character, who seems to typify the Fr. farming woman in a war-scarred region throughout the centuries, than for its narrative of experiences. H. E. Reade's *In Retreat* (1925), on the Fifth Army, is pseudo-fictional. Robert Graves's *Goodbye to All That* (1929), like Stephen Graham's *Private in the Guards* (1919), is a protest against military discipline and snobbery. *The Case of Sergeant Grischa* by Arnold Zweig (1929) is a fine literary performance, yet its merit lies more in the travels of its unemotional hero than in its war interest. Hasek's *The Good Soldier Schweik* (1930) is an extravagantly comic satire on military tyranny and pomposity. In Germany, before the Hitlerian regime, there was a literature of revolt, which included the Ns. of Heinrich and Thomas Mann, Theodore Plivier, and Ludwig Renn, most of it unknown in England. The Ns. of Heinrich Mann, the acknowledged master of Wassermann and

Feuchtwanger, portray a Germany in all its recent vulgar prosperity in the decades preceding the First World War. Thomas Mann's Ns. are better known in England and America. His chief N., *Buddenbrooks* (1901), may be described as the Ger. counterpart of the *Forayle Sagu*. After the collapse of the Weimar Republic and the dawn of Fascism in Germany, came writers like Baldor Olden, whose Ns. give true pictures of demagoguery in the Fatherland; but such writers were either forced to escape or run the risk of internment in a concentration camp. Ger. literature as a whole, following the Nazi condemnation of the Ns. of Remarque and Hans Fallada, merely extols the law of the jungle. Thomas Mann, who left Germany in 1933 and became an Amer. citizen, pub. in 1948 *Dr. Faustus*, perhaps his greatest N.

Soviet novelists are also circumscribed in their activities by the political outlook of the regime. Among the best-known of Ns. of the revolution and civil war are Sholokhov's *And Quiet Flows the Don* (1934)—familiar to Eng. readers—and Alexey Tolstoy's *Darkness and Dawn* (1935), a picture of the Russian intelligentsia during and after the First World War. Sholokhov's *Virgin Soil Upturned* (1935) is a masterly presentation of peasant life. Kataev's *Forward, O Time* (1934) is an example of the type of N. which purports to reflect the tempo of the five-year plan. The Ns. of Ilya Ehrenburg picture the unhappy Russian intellectual of the old type who cannot adjust himself to the new standards of objectivity.

The Second World War, apart from providing new material, did not greatly affect N. writing. New writers came to the fore and estab. ones produced new work. Among those deserving special mention are Graham Greene, a powerful writer on themes of a spiritual nature and great psychological insight (*Brighton Rock*, 1938, *The Power and the Glory*, 1940, *The Heart of the Matter*, 1948); Evelyn Waugh, who is chiefly a satirist (*Brideshead Revisited*, 1947); Ivy Compton Burnett, Rosamund Lohmann, H. E. Bates, F. L. Green, Henry Greene, and Storm Jameson (*The Moment of Truth*, 1949). The tendency of the younger novelists was a concern with the deeper realities of life rather than with manners, and the school of James Joyce and Virginia Woolf has not found a great following. Of the older generation W. Somerset Maugham is the doyen, a member of the realist school and of great technical skill (*Of Human Bondage*, 1915, *The Moon and Sixpence*, 1919, *Cakes and Ale*, 1930). He also, in *The Razor's Edge* (1943), left the ironical social scene for a deeper theme. Aldous Huxley has been drawn towards a sort of eclectic mysticism, exemplified in *Time Must Have a Stop* (1944), and Charles Morgan, leaving the philosophic heights of *The Fountain* (1933), has written searching Ns. on moral problems (*The Judge's Story*, 1948, and *The River Line*, 1949). Good work has also been done by Elizabeth Bowen, Christopher Isherwood, Nigel Balchin, and Gerald Butler.

Of Fr. novelists, the most outstanding are André Gide (*Les Faux Monnayeurs*, 1926), Georges Duhamel (*Les Pasquiers*, 1933-44), and François Mauriac (*A Woman of the Pharisees*, 1946).

THE AMERICAN NOVEL.—The epistolary N. of Richardson had its vogue in America with such authors as Sarah Morton and Hannah Foster, but the first professional novelist was Charles Brockden Brown, whose novel, *Wieland*, appeared in 1798. He reflects the theories of Godwin and the Eng. revolutionaries, and his books have the romantic realism of the European terror N. But his qualities are American, and with Fenimore Cooper (*The Last of the Mohicans*, 1826) romance and adventure became the substance of American fiction with influence in Germany and France and on the Eng. nautical N. The work of his followers (Noel, Thompson, W. G. Simms) culminated in the romances of Hermann Melville (*Typee*, 1846, *Moby Dick*, 1851). In 1850 *The Scarlet Letter* appeared and Hawthorne's romances from 1850 to 1870 shared their popularity with Harriet Beecher Stowe's sentimental tales (*Uncle Tom's Cabin*, 1852). The short story of Bret Harte and his imitators obscured the N., but W. D. Howells and Henry James had begun writing, and in the eighties came a renaissance of the N. Howells was strongly affected by his admiration for Tolstoy, while Zola's influence was also making itself felt. With the exception of historical romance in the manner of Stevenson (Mary Johnston, Winston Churchill, the early Booth Tarkington), naturalism prevailed in fiction (Edgar Howe, Hamlin Garland, Henry Fuller, Ambrose Bierce, Stephen Crane, Frank Norris, and, in the twentieth century, Theodore Dreiser and Sherwood Anderson). Satire of contemporary American life has found its exponents in Sinclair Lewis and Fannie Hurst, while satire of a different order—an idealist reaction against naturalism—is found in the work of J. B. Cabell. Cabell is a stylist; and delicacy of perception and expression characterises the New England school of fiction which, naturalist in the main with Henry James at its head, includes important contemporary novelists, Willa Cather, Edith Wharton, and Joseph Hergesheimer. Of a different order is the work of Thornton Wilder, who seeks his inspiration in the romantic past of Sp. America or the Aegean isles.

Contemporary American literature seems to show that while critics are still debating the nature of the relation between fiction and social purpose, the largest reading public has, of its own motion, enthusiastically sought a whole series of romantic novels of which the two most popular, Hervey Allen's *Anthony Adverse* (1933) and Margaret Mitchell's *Gone with the Wind* (1936), have had an international vogue. Among still living novelists, whose reputation seems most securely founded in America, are Sinclair Lewis, Theodore Dreiser, and Willa Cather; but, whereas the two first named belong definitely to the post-war era of the 1920's, Miss Cather's realistic pictures of a re-

cently forgotten Amer. past belong to no school of fiction and her *My Antonia* (1918) and *The Song of the Lark* (1915) are regarded as part of permanent Amer. literature, and this may also be true of her later books, even the somewhat experimental *Death Comes to the Archbishop* (1927). More recent writers of note include Ernest Hemingway, Erskine Caldwell, and Pearl Buck. Pearl Buck's novels of Chinese life, particularly *The Good Earth* (1931), won for her the Nobel prize, she being the third Amer. to be so honoured (the other two being Sinclair Lewis and Eugene O'Neill). Ernest Hemingway and Erskine Caldwell have most distinctive styles and are noted for an ideology of Socialist affinities. Two of Caldwell's best novels, *Tobacco Road* (1932) and *God's Little Acre* (1933), as also many of his short stories, are concerned with the life of the depressed agric. classes of the S. and are instinct with grim realism and vivid creative imagination. Other novelists are John Steinbeck, whose *Of Mice and Men*, 1937, belongs to the robust school of Hemingway; Marjorie Kinnan, who writes of Florida life; and Elizabeth Madox Roberts, who deals poetically with the rural S. Other well-known novelists are Thomas Wolfe, *Dos Passos* (*2nd Parallel*, 1930), Wm. Faulkner, Upton Sinclair (*Oil*, 1927), Thornton Wilder, the author of *The Bridge of San Luis Rey* (1927), and John Marquand (*Wackford Post*, 1939, *So Little Time*, 1944).

Novellæ, see JUSTINIANUS, FLAVIUS ANICIUS.

Novello, Clara Anastasia (1813-1908), Eng. soprano singer, daughter of Vincent N., b. in London and trained in Paris.

She made her first public appearance in England in 1832, and from then until her retirement in 1860 she was regarded as one of the greatest vocalists in concert, opera, and oratorio, both in England and on the Continent. See her *Reminiscences* (1910), compiled by her daughter Contessa V. Gigliaccci.

Novello, Ivor (b. 1893), original name Ivor Novello Davies, b. at Cardiff, son of Clara Novello Davies (1861-1913), Brit. singing instructor, choral conductor, and founder and conductor of the Royal Welsh Ladies Choir. N. first appeared on the stage in 1921, but had already won some success as a song writer, his *Keep the Home Fires Burning* being very popular during the First World War. His musical plays and revues include *Tabs* and *The House that Jack Built*, and, as his own actor-manager, *The Rat* (written in collaboration with Constance Collier). His own plays include *The Truth Game* (1928) and *Symphony in Two Flats* (1929); while other plays which he acted in and managed were *Murder in Mayfair* (1934); *Glamorous Night* (1935); *Carless Rapture* (1936); *Crest of the Wave* (1937); *The Dancing Years* (1939); *Perchance to Dream* (1945); and *King's Rhapsody* (1949). He has also acted star parts in many films.

Novello, Vincent (1781-1861), Eng. musician and composer, was b. in London, where he held posts as organist from 1796 to 1822. He ed. the Masses of Haydn and Mozart, the works of Palestrina, and other fine music hitherto unknown in England. He composed a vast quantity of sacred music, and with his pub. of the first vol. of his original work in 1811 laid the foundation of the publishing firm of N. and Company. He was the founder of *Musical Times*, and shared in the foundation of the London Philharmonic Society. See M. Cowden-Clark, *The Life and Labours of Vincent Novello*, 1863.

November, eleventh month of the year, derives its name from the Lat. *novem* (nine), as, until the Julian arrangement, it was the ninth month of the old Rom. year, which began in March. There are thirty days in the month; the 11th was considered by the Romans as the beginning of winter, and the *epulum Jovis* (banquet of Jupiter) was held on the 13th.

Novgorod, formally known as Veliki Novgorod (Great Novgorod), tn. of Russia, cap. of the N. Region of the R.S.F.S.R., and formerly the seat of an archbishop of the Orthodox Gk. Church. The tn. is situated 119 m. S.S.E. of Leningrad, and lies on the banks of the Volkhov, 2 m. from its source in Lake Ilmen. Pop. 40,000. The kremlin, or citadel, is situated on the north shore of the riv., and includes the cathedral of St. Sophia, which was built about the middle of the eleventh century. It fell into decay, but was restored between 1893 and 1900. The Yaroslav Tower is historically connected with the common council, which used to meet there. There is also a monument erected to commemorate the thousandth anniversary of the foundation of Russia (built 1862). Another similar monument

was erected to perpetuate the repulse of Napoleon in 1812. Previous to the Tatar invasion N., with Kiev, was the chief centre of the Russians. In 997 its inhab. obtained from their own prince, Yaroslav, a charter of self-government, and for five centuries this charter was regarded as the chief written testimony of the independence of N. in its struggles with the princes. The people of N. (who are said to have numbered 400,000 in the fourteenth century, but it may be assumed that it was once over 100,000) selected their princes from the sons of their liberator Yaroslav, or some other branch of the family of Rurik. They carried on trade with the Hansatic and Scandinavian cities, and colonised the basins of the northern Dvina. They also descended the Volga in the fourteenth century, and made trading expeditions as far as Siberia. Their peace was at last disturbed by their struggle against the Suzdal reign, followed by the encroachments of the Swedes and Gers. These invaders they repulsed in the battles of Ladoga (1240) and Pskov (1242). The marshes of their country prevented a Mongol invasion in 1240-42. Ivan III. and his Muscovite followers in 1556 attacked her after depriving her of two colonies; and she at last had to fight desperately for her liberty, which she did with small success under Marthe Boretskaya, the mayor. Ivan III. entered N. and deprived her of her charter. Ivan IV. (the Terrible) burnt the city in 1570, and put some 15,000 of its inhab. to the sword.

In the Ger. invasion of Russia in 1941 N. suffered great destruction.

Novgorod-Syeverak, tn. of the Chernigov Region of the Ukrainian S.S.R., 110 m. N.E. by E. thereof, on the r. b. of the Desna. Pop. 10,000.

Novi, or **Novi Ligure**, tn. of Piedmont, Italy, in the prov. of, and 14 m. S.E. of the city of, Alessandria. Weaving and the manuf. of silk goods are important industries. Pop. 21,100.

Novice, person who, after a period of probation as a postulant, is admitted to a religious order to be trained in the religious life, with a view to becoming a professed member of the order. The period of training, called the novitiate, varies in length with different religious orders.

Novikov, Nikolai Ivanovich (1744-1818), Russian author, b. at Avdotino in the gov. of Moscow, who founded a review at Moscow entitled *Travellers* (the *Painter*) in 1769, and managed the *Gazette of Moscow*. The review was suppressed in 1774. N. did not spare himself in endeavours to improve social conditions and to advance public education. He was imprisoned by Catherine II. in 1792, and was not released until the reign of Paul I. His works include *Library of Old Russian Authors*, in 30 vols., and the *Dictionary of Russian Writers*.

Noviodunum, see **NEVERS**.
Novi-Sad, cap. of Vojvodina Prov., Yugoslavia, 42 m. N.W. of Belgrade. There is an airport; cotton goods and pottery are made. Pop. 77,100.

Novo, see **CASTELNUOVO**.

Novocaine, synthetic alkaloid which in the form of its hydrochloride, $C_{15}H_{18}O_2N_2.HCl$, is widely used as a local anæsthetic in dentistry, etc. It is much less toxic than cocaine, which it has largely displaced.

Novo-Cherkask, or **Novo-Tcherkask**, tn. of the Rostov Region of the R.S.F.S.R., at the junction of the Don and the Aksai, 40 m. from the sea of Azov. Locomotives are made at N., and there is trade in wine, anthracite, timber, and corn. Its new cathedral was completed in 1904. Pop. 81,300. See also **EASTERN FRONT IN SECOND WORLD WAR**.

Novo-Georgievsk: 1. Or **Krylov**, tn. in the Kirovograd Region of the Ukrainian S.S.R., at the junction of the Tyasmin and the Dnieper, 17 m. W.N.W. of Kremenchug, has a large trade in timber, grain, and cattle. Captured by the Gers. in the invasion of the Ukraine, it was recaptured by the Russians in March 1944. Pop. about 15,000. 2. Or **Modlin**, fortress of Poland, 23 m. N.W. of Warsaw, at the junction of the Narv and the Vistula. N. sustained severe sieges in 1813, 1830-1831, and in Aug. 1915. Taken by the Gers. in 1941, it was recaptured by the Russians in 1945.

Novo-Moskovsk, tn. of the Dnepropetrovsk Region of the Ukrainian S.S.R., 10 m. N.E. of Dnepropetrovsk, on the R. Samara. Pop. 15,000.

Novorossisk, seaport of the Krasnodar Ter. of the R.S.F.S.R., on the Black Sea, 60 m. S.W. of Ekaterinodar, has an excellent natural harbour supplemented by a breakwater. There are four large cement works located on the harbour front. A mt. of raw material supply lies immediately back of these plants, the rock being quarried and hauled down to the water's edge for an average distance of 2 km. The largest of these plants was built fifty years ago by Fr. concessionaires. N. exports petroleum, wheat from the pro-Caucasus, wheat and timber from the Volga lands, and cement, and boxboard. Possession of the port was hotly contested in 1912-43 (see further under **EASTERN FRONT; RUSSO-GERMAN CAMPAIGN IN SECOND WORLD WAR**). Pop. 95,300.

Novosibirsk, cap. of the region of the same name in the R.S.F.S.R., is the centre of a coal-mining and an important industrial tn. Pop. 405,600.

Novo-Tcherkask, see **NOVO-CHERKASK**.

Novo-Zaporozhe, see **ZAPOROZHE**.

Nowá Sól (Ger. *Neusalz*), tn. of Silesia, Poland, on the Oder, 18 m. from Glogow (Glogau). There are manufs. of yarn, paper, soap, and iron. Pop. 16,400.

Nowgong: 1. Dist. of Assam, India. Area 3898 sq. m. Pop. 710,800. 2. Cap. of the above dist., on the Kalang R., 60 m. E. by N. of Ganhati. Pop. 5400. 3. Tn. and cantonment of Bundelkhand, India. Its college was estab. in memory of Lord Mayo. Pop. 6000.

Nowshera, or **Naushara**, tn. and cantonment of the N.W. frontier. Prov. of Pakistan, 25 m. E. of Peshawar. Pop. 7000.

Noyes, Alfred (b. 1880), Eng. poet and

author, *b.* in Staffordshire and educated at Exeter College, Oxford, began his literary career as a contributor to various magazines, among them *Blackwood's*, the *Spectator*, *Fortnightly Review*, the *Bookman*, the *Cornhill*, and the *Nation*. He has also written for Amer. pubs., and in Feb. 1913 left England for a tour in the U.S.A., where he lectured on poetry. In 1914 he was elected to the professorship of modern Eng. literature on the Murray Foundation, Princeton Univ., resigning in 1923. His *Torch-bearers* is one of the very few recent attempts at epic poetry which have achieved any measure of success. It is an epic of man's conquest of scientific knowledge, and may, in this respect, be compared with Miss B. Sackville West's epic *The Land*. Elgar and other composers have set sev. of his lyrics to music. In 1930 N. was received into the Rom. Catholic Church. Among his works are *The Loom of Years* (1902); *The Flower of Old Japan* (1903); *The Forest of Wild Thyme* (1905); *Drake* (1908); *William Morris* (Eng. Men of Letters, 1908); *The Enchanted Island and other Poems* (1909); *The Temple of Beauty* (1910); *Tales of the Mermaid Tavern* (1913); *Rada* (play, 1915); *A Salute from the Fleet* (1915); *Walking Shadows* (short stories, 1917); *The Elfin Artist* (now poems, 1920); *Selected Verse*, including 'The Victory Ball' (1921); *The Torch-bearers* (an epic of scientific discovery), vol. i.—*The Watchers of the Sky* (1922); *The Hidden Player* (novel, 1924); *Songs of Shadows-of-a-Leaf* (lyrics, 1924); *The Torch-bearers*, vol. ii.—*The Book of Earth* (1925); *Ballads and Poems* (1927); *The Torch-bearers*, vol. iii. (1930, in one vol. 1937); *The Unknown God* (1934); *Voltaire* (1936); *Orchard's Bay* (1939); *The Last Man* (1940); *The Edge of the Abyss* (1944); *Shadows on the Down* (verse, 1945); and *Portraits of Horace* (1948).

Noyes, John Humphrey (1811–86), founder of the Perfectionists, *b.* at Brattleboro, Vermont, U.S.A. He eventually founded a community at Putney, the tenets of the sect being Communism in everything, including marriage. The sect afterwards went to Oneida, New York, but N. found himself in difficulties owing to his free ideas with regard to marriage. He wrote *The Doctrine of Salvation from Sin explained and defined* (1843); *The Bercan* (1847); and *History of American Socialism* (1870).

Noyon, *tu.* in the dept. of Oise, France, 67 m. N.E. of Paris. Its cathedral dates from the twelfth century, and was severely damaged by bombardment in the First World War. It has also a bishop's palace. The chief industries are sugar refining, tanning, and the manuf. of textile goods, chemicals, and sheet-iron. N. is the bp. of Calvin. Pop. 6600. See R. L. Stevenson, *An Inland Voyage*, 1878, and M. Aubert, *Noyon et ses environs* (Paris), 1920.

N.S.D.A.P., abbreviation for *National-sozialistische Deutsche Arbeiter-Partei*, or Ger. Workers' party. See NATIONAL SOCIALISM.

Nu, Nun, in Egyptian mythology, father of the eight anct. cosmic gods of Egypt at Hermopolis. A personification of the primeval waters containing the germs of all existence. Out of N., on the first day of creation, rose the sun-god in the form of Khepera.

Nuba, black aboriginal people dwelling in the S.E. quarter of Kordofan, Anglo-Egyptian Sudan, remarkably heterogeneous in physical type and language. They are pagans, living in autonomous groups under the control of their *mek*s and rain-makers and observing the cult of the spirits of the dead. Their prov., the N. Mts., like certain other inland parts of the S. Sudan, is most difficult of access. The numerous rocky massifs, rising sheer from the plain, are covered with thorny scrub and honeycombed with deep and intricate caves, and lie amid the swamps of the Upper Nile and Bahr-el-Ghazal riv. systems. There has been frequent trouble with the N. and various punitive operations in the N. Mts. have been due to one or other of sev. causes or a combination of them, namely, inter-int. feuds and pillaging forays, attacks on Arabs or police or travellers in the plains, and refusal to pay taxes or hand over captives to the gov. Early in 1915 there were protracted operations against the N. *mek*, Feki Ali of Jabel Mirl, who only surrendered in Nov. of that year. The problem of the rifles held by the N. in their mt. fastnesses is a difficult one and, it is said, will be solved only by time and the exclusion of all material that can be used for the making of gunpowder. In 1928, in order to facilitate administration, the N. Mts. prov. was amalgamated with Kordofan. See Sir H. Macnichael, *The Anglo-Egyptian Sudan*, 1934, C. G. and B. Z. Seligman, *Pagan Tribes of the Nile Sudan*, 1932; and S. F. Dadel, *The Nuba: an Anthropological Study of the Hill Tribes in Kordofan*, 1947.

Nubeculae Major and Minor, see MAGELLANIC CLOUDS.

Nubia, tract of country, with no precise limit, in N.E. Africa, anciently known as Ethiopia, and, broadly, lying between Egypt and the Gezira area. The ancients gave the name of Ethiopia to the W. bank of the Nile, from Meroe to the bend of the riv. The name may have been derived from the Egyptian and Coptic *Noub*, or Gold, a name still retained in Wady Noub, which extends from the frontier of Dongola, north of the Wady Seboua, above Derr. The tract between Seboua and Aswan is called the Wady Kenous. Diocletian removed hence a Libyan tribe, called Nobate, to the dist. above Syene to oppose the Blemmyes, who inhabited the W. desert, now held by the Ababda and Bisharin Arabs. The modern inhab. of N. consist principally of Arabs, who invaded the country after the rise of Mohammed, and merged with older races, the prin. tribes being the Djowabere and El Gharbye, who inhabit from Aswan to the Wady Halfa.

An Egyptian Gov. expedition of 1931, which was led by W. B. Emery, excavated the fifth- and sixth-century tombs of the Blemmyes, at Qustul and Ballana.

It seems that in the fourth millenium B.C. N. had been inhabited by a people identical with those of Egypt, lacking Negro characteristics and resembling the Temehu, or Libyans, of the W. desert. Later the Libyans tended increasingly to settle in N. on the W. bank of the riv. By about 2000 B.C. the fusion of these races had produced a pop. resembling that of to-day in physical characteristics, while the rulers of Egypt had estab. garrisons and colonies in what is now Dongola prov. Under Sesostris, Pharaoh of the twelfth dynasty, Kerma was rebuilt as one of the chief administrative centres of N. and it remained so till its destruction in 1600 B.C. About 950 B.C. Libyans obtained

But final disaster overwhelmed Meroë about A.D. 350 at the hands of the Ethiopian king of Axum. From the third to the sixth centuries, when it was converted to Christianity, the S. part was a pagan and independent Nubian kingdom: it had been settled by the Blemmyes who inherited a great part of Meroitic culture. Northern N. became converted to Christianity in the sixth century and a form of Christianity based on the foundations laid by Julianus and Longinus remained the official religion of N. until superseded by Islam 700 years later. It was probably in the sixth century that the tn. of Dongola was founded and made his cap. by Silko, a convert who styled himself 'prince

NUBIA: THE TEMPLE OF ISIS PHILÆ

A photograph taken after the creation of the Aswân Dam, which caused the partial submersion of the island and its famous buildings.

control in N. and there founded an independent monarchy with its centre at Napata, near the holy hill of Barkal (in Dongola). Kashta, a Libyo-Sudanese, in the eighth century conquered Egypt as far as Thebes. In 660 B.C. a Nubian king reoccupied the Delta, but soon afterwards was driven out by Assurbanipal, and in 654 B.C. the Nubian dynasts had withdrawn beyond the cataracts. There they consolidated their power and for three and a half centuries the Napatan kingdom prospered from the swamps of the White Nile to the Aswân cataract. About 300 B.C. the sovereignty passed to Meroë (q.v.). The appearance, shortly before the beginning of the Christian era, of the Rom. legions in Ethiopia ended in the destruction of Napata (23 B.C.) and henceforth the two kingdoms of Napata and Meroë were again reunited under the rule of Meroë after a period of internecine strife in Ethiopia during which the ruling house at Napata had regained some influence.

of the Nubians and all the Ethiopians'. In A.D. 641 the ruler of Egypt sent 'Abdulla ibn Sa'ad with 20,000 men to invade N., but they made no great advance and soon returned. A few years later 'Abdulla, as governor of Upper Egypt, again invaded N., destroyed Dongola, and concluded a treaty with the Nubians which subsisted for some 600 years of varied observance. About the middle of the ninth century the period of Arab domination in Egypt ended and the Mamelukes (q.v.) usurped power. The immediate result was that large numbers of Arabs migrated southwards and settled among the Nubians and north of Halfa they won over a proportion of the Nubians to their faith but further S. they made no impression. Little more is recorded of N. until, about A.D. 1200, it was visited by Abu Salih, the Armenian, who found that it contained seven bishoprics, including one at Dongola. But under Beybars, the Mameluke imperialist, N. was laid waste.

Henceforth it could offer but little resistance. The encroachments of the Arabs increased each year. Sultan after sultan sent armies to capture slaves and plunder. The Christian barrier set up in the sixth century now finally crumbled before the Arab hordes. In the thirteenth, fourteenth, and fifteenth centuries the northern and central regions of the Sudan fell to the Arabs, and those of the older inhab. who were not forced into the S. fastnesses became merged with the Arabs, thus evolving the characteristic type of the present day.

The part of N. between Aswân and Wady Halfa is called Lower N., and is under Egyptian jurisdiction; Upper N. belongs to the Anglo-Egyptian Sudan. The chief attractions of this country to travellers are the numerous temples and other anct. remains of the Egyptians, extending from Philæ to the Isle of Argo. These consist of the temple of Isis, in the Isle of Philæ, founded by Nectanebo I., and continued by the Ptolemies; the temple of Deboud, built in honour of Amen Ra, by Ataramen, and continued by the Romans; Tafta or Taphis, the modern Kalabsha, built by Rameses II.; the rock temple of Beit o Welli, recording the conquests of the same monarch; Wady Halfa, built by Osertesen I.; the rock temple of Ibsamboul, built by Rameses II.; Gebel Addeh, built by Horus of the eighteenth dynasty; Ibrim, built by Amenophes II.; Amada, founded by Thothes III.; Gherseh, Seboua, and Derrî, built by Rameses II.; Dakkoh, the anct. Pseleis, built by Ergamenes; the Colossus of the Isle of Argo; and the Pyramids of Meroë and Tanquassi. *See also ETHIOPIA.* *See J. L. Burckhardt, Travels in Nubia, 1819; E. A. Wallis Budge (ed.), The Egyptian Sudan, 1907; and Nubian Texts, 1909; Sir H. MacMichael, The Anglo-Egyptian Sudan, 1934; J. and A. Hamilton, The Anglo-Egyptian Sudan from Within, 1937; R. L. Hill, A Bibliography of the Anglo-Egyptian Sudan from the Earliest Times to 1937, 1939; W. B. Emery, Nubian Treasure: An Account of the Discoveries of Ballana and Qustul, 1918; and J. Spencer Trimingham, Islam in the Sudan, 1949.*

Nuble, Iuland prov. of Chile, immediately S. of lat. 36° S., and crossed by long. 72° W. Wheat, wine, timber, and cattle are produced. Its cap. is Chillan. Area 5485 sq. m. Pop. 243,200.

Nucellus, in botany, the part surrounding the embryo sac in the uniovular ovaries of a plant. The N. is a mass of tissue and the embryo sac embedded in it contains an abundance of protoplasm and a number of small cells. Surrounding the N. are an inner and outer integument or envelopes of ovule.

Nuceria, *see* NOCERA INFERIORE.

Nucleus (Lat. *nucleus*, kernel; cf. *nuz*, nut). 1. *Astronomy*: the name given to the central portion of a comet. A bright comet consists of three portions, the star-like N., which fades by insensible gradations into the coma or nebulous haze surrounding it, and the tail, stretching in a direction away from the sun. The nuclei and comas of different comets vary in

luminosity, but it is rarely that they can be separated by the naked eye.

2. *Biology*: A N. is usually a spherical or ovoid body present in most living plant and animal cells, and playing an important role in their activity. The N. of cells of higher plants and animals is bounded by a fine membrane enclosing nuclear sap, and within which is a network, the reticulum, of fine linen threads carrying granules and knots of chromatin. One or more masses of chromatin, the nucleoli, are usually present within the N., and may function as a store from which chromatin can be drawn, or as collections of waste chromatin eliminated during div. Nuclear div. initiates cell div. The chromatin aggregates as chromosomes, constant in number and form for each species of plant and animal. Half of each chromosome passes to each of the two daughter nuclei, thus ensuring equal distribution. Such div. is mitotic. Div. by constriction of the N. is amitotic. In fertilisation the number of chromosomes is doubled by the fusion of paternal and maternal nuclei, so sooner or later in the life hist. a reducing div. occurs, and in this the paternal and maternal chromosomes are segregated, whole chromosomes passing to each daughter N. The N. controls metabolism and cell-wall formation (*see* CYTOLOGY; HEREDITY). Bacteria and blue-green algae have no organised nuclei.

Physics.—The existence of a 'unit' more fundamental than the atom was revealed by the experiments of J. J. Thomson in 1895, on the conduction of electricity through highly rarefied gases. This unit, named the electron, was found to carry a negative charge of electricity, and was a constituent of every atom. The net charge on a whole atom being nil, it was theoretically evident that there must also be a unit carrying a positive charge of electricity in the make-up of an atom. The products of the spontaneous disintegration of radioactive atoms confirmed this conclusion, for while the β -particles were found to be electrons, the α -particles were found to carry positive charges. The general nature of each and every atom was finally discovered by Rutherford and his collaborators by the remarkable experimental method of firing α -particles into atoms. Approximately 1 in 10,000 α -particles was deviated from this straight course, and the manner of its deviation indicated that it had closely approached the positively charged component of the atom whose existence had been predicted theoretically. Moreover since the vast majority of the 'shots' aimed at the atom were not deflected, it was clear that this positively charged component occupied an exceedingly minute portion of the space taken up by the atom, and that the atom consisted very largely of empty space. Exact computations led to the conclusion that every atom consists of a minute though relatively massive N. carrying a positive charge, and performing the function of the sun of a solar 'system' in which the planets are the electrons revolving rapidly in their distant orbits. Since the atom

as a whole is neutral, the positive charge on the N. is exactly equal to the sum total of the charges on the planetary electrons. Further the chemical and physical properties of an element were shown to depend on the charge on the N. of its atom. Evidence provided by the disintegration of radioactive atoms, supported by further experiments of Rutherford and Blackett, led to the conclusion that atomic nuclei had a complex structure. By bombarding nitrogen atoms, for example, with α -particles, Blackett showed that it is possible to break up these nuclei, that they then emit protons (positive units of electricity) and electrons. Later work showed that other atoms emit neutral γ -particles which are electrically neutral, and have masses nearly equal to those of protons. The simplest atom, that of hydrogen, has a N. consisting of one proton, round which a solitary electron revolves in a distant orbit. The next lightest atom, that of helium, has a N. consisting of two protons and two neutrons; it thus has a net positive charge equal to that of two protons, so that there are two planetary electrons. The heaviest known atom, that of uranium, has no fewer than ninety-two electrons describing orbits round a N. having a net positive charge equal to that of ninety-two protons. Now the mass of an electron is very small, being about $\frac{1}{1836}$ of the mass of the proton. Hence the mass of an atom is largely concentrated in its N., and it might appear from the above that the helium atom would have four times the mass of the hydrogen atom; that the mass of any atom would be a simple multiple of that of the hydrogen atom. This is only approximately true, and the explanation of this apparent anomaly is foreshadowed by the recollection of the fact that there is a third product of the spontaneous disintegration of the nuclei of radioactive atoms, viz. γ -rays. The theory of relativity teaches that radiation, too, possesses mass, so that the nuclei of radioactive atoms lose mass in three ways: by the loss of a β -particle (or electron), by the loss of an α -particle (now known to be the N. of a helium atom), and by the emission of γ -radiation. Similarly the fact that the mass of any atom is not a simple multiple of the mass of an hydrogen atom is explained (as Jeans put it) by the presence of 'a third ingredient which we may describe as electro-magnetic energy. We may think of this, although with something short of absolute scientific accuracy, as bottled radiation.' As is shown by their radioactivity certain types of atomic nuclei are unstable, and disintegrate spontaneously with the emission of a relatively light component such as an electron or a particle. A few of the heaviest nuclei (e.g. those of uranium) disintegrate in a different way when bombarded by neutrons, breaking down into a few parts with roughly equal masses. These processes of nuclear fission lead to the release of much greater amounts of energy than do ordinary radioactive changes, and have been used in atomic bombs: they may in the future

provide an important source of energy for peaceful uses as well. See also ATOM AND ATOMIC THEORY; ATOMIC BOMB. See E. R. Rutherford, Sir J. Chadwick, and C. D. Ellis, *Radioactive Substances and their Radiations*, 1930; and E. da C. Andrade, *The Atom and its Energy*, 1947.

Nudd, or Ludd, deity of the Brit. Celts, confounded in later times with a legendary Brit. king of the same name. Tradition has it that his temple stood on Ludgate Hill in London and that he was worshipped chiefly at Lydney in Gloucestershire, where the remains of another temple to him have been found with inscriptions mentioning him by name. His Irish equivalent is Nuada Argetlam (N. of the Silver Hand).

Nudaea, see NADIVA.

Nueces, riv. of Texas, U.S.A. It rises in Edwards co., and flows into Corpus Christi Bay, gulf of Mexico, after a southerly and south-easterly course of 315 m. It contributes largely to irrigation, draining an area of 19,000 sq. m.

Nuer, tribe of the Nilotic sub-racial unit known as the Nilotes (q.v.). The N. inhabit the swamp region on both sides of the White Nile S. of its confluence with the Bahr-el-Ghazal, and their ter., estimated at 26,000 sq. m. in area, lies between that of the Shilluk (q.v.) and that of the Denka (q.v.) in the Upper Nile Prov. of the Anglo-Egyptian Sudan. The N. pop. is about 450,000 and is prone to inter-tribal feuds. In 1917 Brit. troops were sent into the N. country, as well as against the Dinka. In Feb. 1928 the N. took to the swamps but were bombed out by the R.A.F. and surrendered. After this the Brit. authorities abandoned punitive patrols, and concentrated on road construction, the creation of a neutral zone between the N. and the Dinka, and the provision of various civilising influences such as dispensaries. The solidarity of the tribe is secured by its clan organisation (see on this under NILOTES) and a clan often gives its name to an area. N. life depends on cattle camps (*vees*), consisting of a nucleus of the dominant clan (*dyel*) owning the area around which is gathered a host of strangers (*ruil*), i.e. folk who are not members of the *dyel*, often husbands of the women of the clan who have not left the home of their fathers on marriage. Since marriage with a clansman is not allowed, girls must marry a stranger or a member of the Denka tribe. Children of these marriages grow up in the maternal grandfather's home; hence their descent is traced through their mothers (on the kinship system of the Nilotes generally see under NILOTES). The N. differ from the Denka in their social-political organisation; there is no *livine* king or rain-maker, but, instead, a *kuor muon* or land chief who gives judgment on disputes, in collaboration with the old men of the clan, and awards compensation to the injured party. Rain-making among the N. is of far less ritual importance than among either the Shilluk or the Denka. Forehead scarring is, however, important; incisions are made on a scale not found in

the other peoples and have much greater social significance. In their religion, Kwoth is the name for God, who is associated with the firmament, but the word also denotes any spirit except 'ghost.' When the 'sons of Kwoth' or 'sky-spirits' enter into a man he becomes a prophet (*guk*). These sky-spirits are associated with certain natural phenomena or human relations in much the same way as the gods of classical or Norse mythology, if with less subtlety. Thus Deng, much the most powerful, is associated with sickness, Wu with war, Col with thunder and lightning, Mabith with hunting, while the W. N. have adopted Nyakang (*q.v.*) of the Shilluk as a son of Kwoth, having powers over fish. See H. C. Jackson 'The Nuer of the Upper Nile Province,' *Sudan Notes and Records* (vi.), 1923; E. E. Evans-Pritchard, *Witchcraft, Oracles and Magic among the Azande*, 1937 (accounts of his expeditions to and work among the tribes of the S.W. Bahr-el-Ghazal, including the N.); and C. G. Seligman and Brenda Z. Seligman, *Pagan Tribes of the Nilotic Sudan*, 1932.

Nueva Esparta, state of Venezuela, comprising Margarita and other is. There are pearl fisheries. Cap. La Asuncion. Pop. 69,200.

Nueva Laredo, port of entry into N. Mexico, on the Rio Grande, opposite Laredo, Texas. Cattle and cotton are raised in the dist., and some industries, including cotton textiles and soap-making, are carried on. Pop. 29,000.

Nueva Leon, state of Mexico in the N. part of the republic, stretching from the Amer. border, 300 m. S., to the tropic of Cancer. It is practically all mountainous. Monterey, the cap., is a city of some 185,800 inhab., entirely surrounded by mts. From Monterey there is a railroad to Laredo, another to the port of Tampico, and another to Matamoros on the Amer. frontier. The natural resources are silver, lead, copper, gold (in small quantities), and oil (not yet developed). Manufs. include beer, iron and steel, glassware, furniture, cotton goods, shoes, and enamel ware. Area 25,134 sq. m. Pop. 541,100.

Nueva San Salvador, see SANTA TECLA. Nuffield, William Richard Morris, first Viscount (b. 1877), Eng. motor manufacturer and philanthropist, b. at Worcester, and educated at Cowley vil. school, near Oxford. He began business as a cycle-maker and repairer in a shed at Cowley, and later made motor-cycles. N. built his first motor-car in 1911 and, a year later, opened a car factory. The first 'Morris Cowley' assembled not many years before the First World War, was a challenge to the whole Brit. motor market. At that time Brit. motor-cars were not in favour, almost the only reliable machine being a monopoly of the rich. Morris (as he then was) cut his selling price and offered a dependable car at £165. To do this he had to open a new factory, at Cowley, which had now become a township housing hundreds of his employees. The First World War brought a temporary halt to the enterprise, and, in that period, N. made mine-sinkers. After the war he

made cars on mass-production principles. By 1925 the Cowley works were producing 50,000 cars annually. In 1938 the factories covered 120 ac. and employed 16,000 persons. Just before the Second World War N. celebrated the sale of the millionth Morris car. His business was expanded by the purchase of the assets of Wolseley Motors Ltd. for £730,000 in 1927 and by the absorption of the Riley business. His success has been phenomenal, and he will be remembered also as a philanthropist. By 1938 he had given £11,500,000 for research, education and charity, including £3,128,000 to Oxford Univ. alone, where he founded four medical professorships in 1937. Subsequently he made a gift of no less than £10,000,000 to found one of the biggest charitable trusts ever conceived. This, the N. Foundation, will derive an ann. income of £400,000 to be devoted to medical research, the development of medical and health services, trade and industrial research, social studies, and the care and comfort of the aged. By 1943 he had presented out of his private purse something approaching £28,000,000. He was created baronet in 1929, baron in 1934, and viscount in 1938, and received honorary M.A. and D.C.L. degrees from Oxford Univ.

Nuffield College, research college of Oxford Univ. endowed by Viscount Nuffield (*q.v.*) on Oct. 8, 1937. His offer of that date was to found a college 'to encourage research especially, but not exclusively, in the field of social studies, and especially by making easier the co-operation of academic and non-academic persons.' The offer was accepted by the univ. and the terms of the deed were embodied in a statute approved by Congregation on Nov. 30, 1937. The college is under the control of the Hebdomadal Council and comprises full-time official fellows conducting research, faculty fellows already holding offices in the univ. or the colleges which would qualify them to assist in its work, and visiting fellows competent to further its researches by virtue of their experience in the professions or in industry or commerce. In addition there are a number of resident post-graduate students receiving emoluments when in need of them. Apart from All Souls, N. C. is the only college in Oxford which is not primarily for teaching. Lord Nuffield also provided the site, a central one facing the castle mound and fronting New Road. One of his incidental aims in giving the site and benefaction was to save for worthy use the only site then still available within the limits of the old city. It will fill part of the gap between the older colleges of Worcester and Pembroke. The outbreak of war prevented building and the college therefore rented houses in Banbury Road and Woodstock Road. The new building, begun in 1948 and designed by Harrison, Barnes, & Hubbard, is in the Cotswold Gothic style and is to be built of Clifsham stone. The whole design is to be built by stages. The first stage is the building of the warden's house, which, however

will be used temporarily to house the college.

Nugent, James (1822-1905), Eng. philanthropist, b. at Liverpool. In 1872 he founded the Catholic Total Abstinence League of the Cross, which had many branches both in this country and America. He also estab. the 'Save the Boy' refuge and a Magdalene home.

Nugent, Sir Richard fifteenth Baron Delvin (1583-1642), Irish nobleman; took part in the rebellion of Tyrone and Tyrconnel (1603). He was imprisoned in Dublin but succeeded in making his escape. He was subsequently pardoned by James I. and created earl of Westmeath (1621).

Nulliswang, see NEW-CHWANG.

Nuisance, comprehensive term in law. Though it is not difficult to say what acts or omissions in practice constitute a public or common N., and render the offender liable to criminal proceedings, it is by no means easy to say exactly when an act or omission will amount to a private N., so as to ground a civil action at the instance of an individual. In principle the distinction between public and private Ns. is not one of kind, but depends rather upon the extent of the operation of the evil, and it is for a jury to say whether a sufficiently large number of people are or may be affected so as to render a N. criminally punishable. The difficulty of determining in any individual case whether an act amounts to a private N. arises from the fact that private Ns. for the most part concern one's control or enjoyment of land or house property, and neither judges of fact nor juries are disposed to curtail the liberty of the subject by construing as a N. an act which is incidental to or arises out of the carrying on of an otherwise legitimate business. A public or common N. is an act or omission which disturbs or is liable to disturb the normal state of order and comfort of the public. Public Ns. are indictable (see INDICTMENT) as misdemeanours, but will also form the ground of a civil action at the instance of any one or more persons who can prove that they are peculiarly aggrieved or affected in some way over and above the annoyance caused to the public at large. The chief classes of public Ns. are: (1) The carrying on of offensive or dangerous trades or manufs.. In these cases it must be shown that the trade or manuf. in the way it is carried on is so offensive to the senses of smell and hearing as to detract sensibly from the enjoyment of life and property in its neighbourhood. (2) Ns. to highways, bridges, and public rivs., e.g. pitching rubbish on to a road, polluting a riv. with factory refuse, causing riotous crowds to assemble, etc. (see also HIGHWAYS). (3) Disorderly houses, gaming and betting houses, unlicensed or improperly conducted playhouses. (4) Lotteries (q.v.). (5) A large and heterogeneous number of acts empirically referred to the class of Ns. by various judicial decisions, e.g. eavesdropping, keeping a corpse unburied if the defendant can afford the burial, publicly exposing persons afflicted with infectious diseases.

Private Ns. include *inter alia*: (1) Acts derogating from the enjoyment by an owner or occupier of land or house property of which he is actually in possession, e.g. flooding by the diversion of a watercourse, undermining by excavation. (2) Acts amounting to obstructions of rights of way or other easements or rights over the property of others, e.g. unlawfully enclosing a common, putting a gate across a public footway. (3) Acts amounting to a continuous interference with the health or comfort of another in the occupation of his property. It is to be noted that a person is not debarred from a remedy by reason of having 'come to the N.' though the question whether comfort or convenience is in fact materially interfered with will depend partly on 'the character of the neighbourhood and the pre-existing circumstances' (Pollock, *On Torts*); but the plaintiff may well have disintitiled himself by long acquiescence.

The prin. and most effective remedy for a private N. is the injunction (q.v.), to the claim for which may be added a claim for damages. Abatement, or self-redress, though often successfully carried out in the case of obstructions to highways, is both hazardous and unsatisfactory. In the case of a public N. a local sanitary authority can require the offender to abate the N. within a specified time, and, if he omits to do so within the period allowed, can not only itself abate or remove the N., but recover expenses and penalties from the offender. See Pollock, *On Torts* (14th ed.), 1939; Salmond, *Law of Torts* (10th ed.), 1945; Winfield, *Textbook of Law of Tort* (3rd ed.), 1946; and Clerk and Lindsell, *Law of Torts* (10th ed., 1947); and also Steer, *Law of Smoke Nuisances*, 1938.

Nukha, tn. of the Azerbaijan S.S.R. 60 m. N.E. of Kirovabad. The breeding of silkworms and a silk industry are carried on. Pop. (Tatars and Armenians) 25,000.

Nukualofa, tn. on the N. coast of Tongatabu Is., cap. of the Friendly Is. Pop. 3000.

Nulla poena sine lege, i.e. no penalty can be imposed on a person found guilty of a crime unless it is explicitly provided for by law. This legal principle and its correlative, *nullum crimen sine lege* (no act is a crime unless it is so defined by law), were applied in the consideration of atrocities committed by the central powers during the First World War and of new crimes which science made possible, committed by belligerents, during the Second World War. See under CRIMES, WAR.

Nullification, in the hist. of the U.S.A., a term used to denote the action of a state for rendering null and void any Act of Congress, or Federal Act, regarded by the state as unconstitutional. The application of the doctrine of N., or, more fully, N. and secession (i.e. from the Union), received its strongest expression in S. Carolina in 1830, during the agitation against the notorious Tariff Act of 1828, which imposed excessive duties on raw material and imported manufs., and

which has ever since been known as the 'Tariff of Abominations.' The S. Carolina 'Nullifiers,' having obtained no relief from Congress up to 1831, inaugurated a campaign for the calling of a state convention to nullify the tariff. This policy at once split the whole country into two factions—the 'Nullifiers,' or 'the State Rights and Free Trade Party,' and the 'State Rights and Union Party.' Congress then made various concessions by amending the Tariff Act. But the antipathy between N. and S. was too deep to allow the Nullifiers to win in the long run, and later a compromise was effected and the Ordinance of N. repealed. The doctrine of N. is no longer a rated principle. The civil war settled for all time the right of a state to withdraw from its contract with the Union. See *The Cambridge Modern History*, vol. vii., 1905.

Nullity of Marriage, a decree of N. of M. may be petitioned for by a man or woman on any of the following grounds: the fact of a former undissolved marriage; impotency of either of the two parties; relationship of the parties within the prohibited degrees of affinity; marriage without licence or pub. of banns; force, fraud, or mistake; wilful refusal to consummate; venereal disease or pregnancy by some third person existing at the time of marriage on the part of the person against whom the decree is sought. In the 1949 Convocation of Canterbury the Lower House suggested a commission on the law of N. The archbishop of Canterbury thought there was a need for such a commission to review what had become a complex and confused situation, both as to the eccles. and the civil law, and that it would be of benefit to the Church and possibly to the State to have a commission of persons skilled in theological, canon, and civil law, together with people with medical knowledge, to study all the issues involved.

Numantia, anct. tn. of Spain, in Hispania Tarraconensis. It commanded a position of great natural strength, being situated on a steep hill. In 131 B.C. it was besieged by the Romans, under Scipio Africanus the Younger, and for fifteen months it resisted famine and the sword, when it surrendered. The tn. was razed to the ground, and the few survivors were sold as slaves. The title 'Numantinus' was given to the victor Scipio. The vil. of Guarray marks the site of the anct. tn. Excavations of 1905-10 revealed the entrenchments of Scipio.

Numa Pompilius, second king of Rome, who belongs to legend and not to hist. He was a native of Cures in the Sabine country, and was elected king one year after the death of Romulus. His reign is supposed to have lasted from 715 to 673 B.C. He was instructed by the *camena* or water-nymph Egeria, who visited him in a grove near Rome, and who honoured him with her love. It was he who first appointed the pontiffs, the augurs, the flamines, the vestal virgins, and the Salii. He founded the temple of Janus, which remained always shut during his reign.

Number Sequences, see SERIES.

Numbers, The Book of, forming the fourth book of the Hexateuch (q.v.), deals with the travels of the Israelites from the second to the fortieth year of the Exodus. It also contains various collections of laws, as, for example, in chaps. v. and vi. The particular institution of the Levites and a treatment of the priestly duties receive much attention (chaps. iii., iv., viii., xviii.). As in the case of Exodus (q.v.) the two main lines of narrative are J, E, and P, which generally appear side by side, but are sometimes harmonised. The first ten chapters and the later ones in Levitical regulations are mainly due to P. See commentaries by W. Attersoll, 1618, and L. Elliott-Binns, 1927.

Numbers, Theory of. This science consists of the investigation of the properties of whole or integral N., all incommensurable Ns. being excluded. It may be considered as including the investigation of rational fractions. An idea of the problems confronting the theory may be obtained by considering indeterminate equations. If a given equation contains two or more unknown quantities it is called *indeterminate*, i.e. no definite solution to the equation is possible. This also applies to the case of sev. equations, the total number of equations being less than the total number of unknown quantities contained in them. The problem in the theory of N. is to find every possible solution in which the unknown letters are integers. Sev. interesting properties of integers are proved by this theory. It is easily proved that the number of prime N. is infinite. The problem of finding in how many ways a composite number, i.e. a number which is divisible by N. other than itself and unity, can be resolved into two factors, is solved generally. It also proves that the product of n consecutive N. is divisible by $n!$, i.e. $n(n-1)(n-2) \dots 1$, thus $20 \times 21 \times 22 \times 23$ is divisible by $4!$, i.e. $4 \times 3 \times 2 \times 1$.

Sev. other important properties are proved, among which Fermat's theorem is perhaps the most important. This states that if p is a prime number, and N is a positive integer not divisible by p , then $N(p-1) - 1$ is a multiple of p . The interest of this branch of algebra is purely theoretical. The data of practical applications of mathematics are in the nature of things only approximate, and thus any solution given in whole N. is of very little interest. The first consideration of the theory probably took place in India, but the first book on the subject was written by Diophantus, the theory sometimes being called Diophantine Analysis. For further reading the most interesting books are Legendre's *Théorie des Nombres*, while the beginner will find a suitable introduction to the subject in such standard works on algebra as Hall and Knight's *Higher Algebra*. For more advanced treatment and extension of the subject to algebraic N. see L. E. Dickson, *Theory of Numbers*.

and for the general principles of number see G. H. Hardy, *Pure Mathematics*.

Numea, see NOUMÉA.

Numerical Aperture, see MICROSCOPE AND MICROSCOPY, *Components*.

Numerianus, Marcus Aurelius, Rom. emperor, was the son of the Emperor Carus, whom he accompanied on his expedition against the Persians. Carus was assassinated in A.D. 283, and N. was elected emperor by the soldiers, but was himself assassinated eight months later, whilst on his way back to Rome.

Numidia (Gk. *νυμίδες*, nomads, the land of Nomads), name given by the Romans to a part of the N. coast of Africa, corresponding to some extent with the modern Algiers. It was bounded on the W. by the R. Mulucha (now Moluya), which separated it from Mauritania; on the E. by the R. Tusca (now Wadi-el-Berger), which separated it from the ter. of Carthage; on the S. it reached to the chains of Mt. Atlas. The inhab. of N., as of Mauritania, belonged to the race from which the modern Berbers are descended.

Numerals. A numeral is a sign employed to express a number. It has long been recognised that the N., inaccurately termed 'Arabic' N., which nowadays are commonly used in daily life, are of comparatively recent origin. Counting is nearly as old as speech and the N. are as old as writing. In anct. times, and in some instances down to modern times, each language had its series of N. Thus the number of systems of notation employed was about the same as the number of written languages, and in some cases a single language had sev. systems. The Egyptians, for instance, had three systems of N., respectively for the hieroglyphic (*q.t.*), hieratic, and demotic scripts. The Gks. had two systems of numerical notation, and the Romans frequently changed their numerical symbols. The great majority of the numerical systems is based on five or some multiple of five, but there are traces of systems based on four (the Nabataeans had a sign for 'four'; the number 'eight,' 'acht,' 'octo' = Sanscrit *as-tau* = 'two fours'); the duodecimal system (which has left its traces in 'dozen,' 1 ft. = 12 in., etc.) combined with five has given the hexagesimal system employed in Egypt and, especially, in Mesopotamia. The Maya and Aztec systems of notation were based on twenty, and curiously enough the Fr. preserve traces of an anct. vigesimal system, perhaps of the Celts, in the numbers *quatre-vingts*, *quatre-vingt-dix*, *soixante-dix*. Nowadays numerical notation is mainly based on ten. In the hist. of the N. five main categories or systems can be distinguished.

The Primitive Pictographic Notation.—The number is given by repetitions of the symbol representing the object in question, e.g. 'five men' represented by the symbol 'man' repeated five times; this notation system is often found in pictographic documents of N. Amer. natives. Many primitive tribes represent the N. by the repetition of the vertical or the horizontal stroke, 'one' by one stroke,

'two' by two strokes, etc.; such tribes have little need for or interest in numbers of any considerable size. The primitive tribes of New S. Wales have but four numerical words in their vocabulary, 'one,' 'two,' 'three,' and 'many.' In various primitive forms of speech the number five is expressed by the word 'hand' or 'the hand finished,' ten by 'two hands' or 'two hands finished.' In some primitive S. Amer. dialects 'all the fingers' means ten; 'all the fingers and toes,' twenty; 'fingers and toes of two men,' forty; 'one of the other hand,' six; 'foot one,' eleven; 'foot two,' twelve; and so forth. In some Eskimo dialects the word 'man' also means 'twenty,' and 'two men,' forty.

The 'Hieroglyphic' Systems of Numerical Notation consisted of repetitions of a single unit, with the use of 'hieroglyphics' for higher numbers, and sometimes introducing the principle of multiplication when repetitions become too many for practical use. In the cuneiform (*q.v.*) Babylonian system, the numerical notation for small numbers was quite simple; 'one' was represented by a short, straight, vertical stroke, or rather wedge, 'two' to 'nine' by two to nine short strokes, 'ten' by an angle, and 'hundred' by a short vertical wedge followed by a short horizontal wedge. Sometimes 'ten' was represented by a vertical crossed by a horizontal stroke, 'twenty' by a vertical crossed by two horizontals, etc., and the units were represented by horizontal and not vertical strokes. The tens were sometimes represented by circles, and the units by a kind of crescent. In larger numbers, which were not standardised, the vertical stroke also stood for 60, 3600, and in general for 60 to the *n*th degree. The angle also stood for 10×60 , 10×3600 , etc., i.e. for 10×60 to the *n*th degree. The value to be taken entirely depended upon the context; 3600 was sometimes represented by a kind of irregular square consisting of four short oblique strokes; the same symbol with a small angle inside denoted (3600×10) 36,000; and with two similar angles, 72,000. (For the Egyptian N. see under HIEROGLYPHIC, HIERATIC, AND DEMOTIC WRITING, *Numerals*). In the anct. Cretan script a stroke represented the unit; a dot, 'ten'; a longer stroke, 'hundred,' a lozenge, 'thousand'; at a later stage the units were represented by upright lines, the tens by horizontals, the hundreds by circles, the thousands by circles with four spurs, and the ten thousands by similar signs with a dash in the middle.

The Chinese had, and still have, various numerical systems. The 'rod' N. are quite simple; the units 1 to 5 consist of one to five vertical strokes; 6 to 9 by one to four vertical strokes with super-scribed bar; and the tens by horizontal strokes or by a combination of horizontal and vertical strokes (see Fig. 1a). The hundreds were written like the units and so on. These N. were frequently written in the monogram form (see Fig. 1b). In the present Chinese system there are signs for the numbers 1 to 9 (1 to 3 con-

sisting of one to three horizontal strokes), for 10, 100, 1000, and 10,000. The number 25,847, e.g., may be written either from the top downwards or from left to right, as follows: 2 (10,000s), 5 (1000s), 6 (100s),

final forms of the letters *k*, *m*, *n*, *p*, *s* were respectively used for 500, 600, 700, 800, 900. The Heb. numeral forms now recognised are, shown in Fig. 2. The thousands were represented by the same

FIG. 1. CHINESE 'ROD' NUMERALS
a, numbers 6 to 90; b, the number 40,431 in monogram form.

4 (10s), 7, i.e. the symbol 'two' followed by the symbol 10,000, the symbol 'five' followed by the symbol 1000, the symbol 'six' followed by the symbol 'hundred' and so on.

The Maya and Aztec numerical systems were vigesimal, and they wrote 20 as we write 10, using their characters for '20' and zero. In the Maya system 1 to 4 were represented by dots; 5, 10, 15, by sticks, lines, or bars, and 20 perhaps by the moon. The symbols for the multiples of 20 (400, 3000; 160,000, etc.) are still uncertain; it may be, however, that they had the 'place-value' notation. In the Aztec system 1 to 19 were represented by dots or circles, 20 by a religious banner, 400 (20 × 20) by a pine tree 8000 (20 × 20 × 20) by an incense-pouch. The most important feature of the Maya system was their zero, the importance of which was recognised by the Maya many centuries before any other people in the world; this symbol was similar to a shell, having numerous variants. The highest number found in a Maya inscription is 1,841,639,800 days, corresponding to over 5,100,000 years.

The Alphabetical Systems.—The Jews, like the Syrians, the Arabs, and some other peoples, used the letters of their alphabet for numerical symbols, taking the first letter for 1, the second for 2, the tenth for 10, the eleventh for 20, and so forth, the last one (the 22nd) denoting 400. In the Talmud the numbers above 400 are

א	ב	ג	ד	ה	ו	ז	ח	ט	י
1	2	3	4	5	6	7	8	9	10
כ	ל	מ	נ	ס	ע	פ	צ	ק	
20	30	40	50	60	70	80	90	100	
ר	ש	ת	י	כ	ל	מ	נ	ס	ע
200	300	400	500	600	700	800	900		

FIG. 2
HEBREW NUMERAL FORMS

formed by composition (500 = 400 + 100; 900 = 400 + 400 + 100); in later times the

letters as the units, sometimes followed by a kind of apostrophe.

The Gks. used the letters of their alphabet for numerical notation in the same

α	β	γ	δ	ε	Ϝ	ζ	η	θ
1	2	3	4	5	6	7	8	9
ι	κ	λ	μ	ν	ξ	ο	π	Ϛ
10	20	30	40	50	60	70	80	90

Ϡ	Β	Υ	Δ	Ε	Ϝ	Ζ		
1000	2000	3000	4000	5000	6000	7000		
		η		θ				
		8000		9000				

FIG. 3
GREEK NUMERICAL SYSTEM

way as did the Jews. Since they had twenty-four letters in their 'classic' alphabet, and for a more satisfactory system of N. they needed twenty-seven letters, they retained the anct. North-Semitic-Gk. letters *digamma* (as 6), *koppa* (as 90), and *sampi* as 900. Originally the capital forms were used; at a later stage the minuscule were employed. To distinguish the N. from letters a bar was commonly written over each number (Α), but sometimes the letter was written as if lying on its side (Ϡ). The thousands were often indicated by placing a bar to the left or, in modern Gk. type, as α, β, γ, etc. Thus this Gk. numerical system is as shown in Fig. 3. The myriads (= 10,000s; were represented by M or Μ (10,000), Μ (20,000), Μ (30,000), and so on, or by a special symbol (Ω) superscribed on units.

The Gks. had also the numerical system known as Herodianic (so named after the grammarian Herodianus, late second century A.D., who fully described it) or Attic (it is the only system found on anct. Attic inscriptions) or acrophonic (the initial of the name of the number being used as its symbol), while simple vertical strokes were used for the numbers 1 to 4. Thus Γ (an old form for Π, initial of ΤΕΝΤΕ, *pente*), five; Δ (ΔΕΚΑ, *déka*), 10; Η (ΗΕΚΑΤΟΝ, *hekaton*), 100; Χ (ΧΙΛΙΟΙ, *khilioi*), 1000; Μ (ΜΥΡΙΑΙ, *myriai*), 10,000. These N. were frequently combined in ligatures. Tens of thousands were sometimes indicated by dots. Special symbols were sometimes used for fractions, sometimes an accent or a line above the numeral indicated the fraction: as, for instance, ν or $\nu' = \frac{1}{2}$, $\gamma' = \frac{1}{3}$, $\nu\gamma' = \frac{1}{4}$, or $\frac{1}{5}$, $\gamma\gamma' = \frac{1}{6}$, $\delta' = \frac{1}{8}$.

The Etrusco-Roman Numerals.—The origin of the Etruscan and Rom. N. is still obscure (apart from the N. 1 to 4, which were represented by one to four vertical strokes (I, II, III, IIII)). Etruscan had special symbols for 5, 10, 50, 100, and 500. According to some scholars (e.g. Mattheus Hostus, sixteenth century, or De Feis, nineteenth century), they were based on number 5; thus Λ for 'five' would be the inverted form of V, which was derived from the open hand, the fingers with the exception of the thumb being held together; X for 'ten' would be a double V; fifty would be the 'five' with a vertical stroke, and doubled would represent 100; and a horizontal stroke on the base of the fifty, 500 (see Fig. 4). According to another theory these symbols were based on the decimal system,

I	II	III	IIII	Λ	X	Λ	X	Δ
1	2	3	4	5	10	50	100	500

FIG. 4.

ETRUSCAN NUMERALS

X for 'ten' being derived from two oblique lines crossed, 'hundred' being the same symbol with the addition of a vertical line, and 'five' and 'fifty' being the same symbols halved (Fig. 4a). Concerning the origin of the Rom. symbols C (100), M (1000), L (50), and D (500), the most probable theory is that they derive from the Gk. letters *theta*, *phi*, and *khi*, which the Roma. did not use as letters but retained as numbers. As to the use of *theta* for 100 we have also early forms (see Fig. 5a), and we may assume that written rapidly with a stylus or a reed on the circular symbol was left incomplete, and under the influence of the initial of C(ENTUM) ('hundred') it became C. *Phi* (Fig. 5b) became the symbol for 1000 and under influence of M(ILLE) ('thousand') became M. An early form of the Gk. letter *khi* (Fig. 5c) became L for 50. D is generally thought to be merely half of the letter *phi*; it was occasionally written C (see Fig. 5b) and appears very commonly

as D. The Etruscans and the Roma. also employed other numerical symbols, but the aforementioned were the most commonly used. The vitality of the Rom. system is astonishing; it was used throughout the Middle Ages, holding its own against the Indo-Arabic N., even

$$\oplus, \otimes, \ominus, \odot = \text{C}, \text{C} = 100$$

a

$$\Phi, \text{C}\text{I}\text{D}, \text{h}, \text{M} (\text{cl}, \infty, \bowtie, \sim) = \text{M} = 1000$$

b

$$\downarrow, \downarrow, \perp, \text{L} = 50$$

being preferred for the calculation of money accounts, and, of course, it is still in use at the present day, though apparently confined to such purposes as the numbering of chapters in a book, and the chaptering of private statutes to differentiate them from public acts.

The 'Arabic' Numerals.—The expression 'Arabic N.' used for our common system of numerical notation is a misnomer. Moreover the origin of this system is not quite certain. It is, however, generally believed that our common numerical symbols originated in India, that they were carried to Bagdad in the eighth century A.D., and thence found their way to Europe, where they were known, in Spain and in Italy, at least in the tenth century. The Arabs themselves attributed the origin of the 'Arabic' N. to the Hindu and called them *hindāsi*. The great Arabian mathematician ('Abū 'Abdallāh Mohammed ibn Mūsā) al-Huwārizmī, of the seventh to eighth century, wrote a treatise on the *hisāb hindi*, 'the Hindu calculation.' Carra de Vaux (*Scientia*, 1917, p. 273), however, suggested that the Arabic word *hind*, or rather *hnd*, does not mean 'Hindu,' but is of Persian origin (*ēnd*), meaning 'arithmetic measure, geometry'; the 'Arabic' N. did not originate in India from alphabetic letters (as it is generally believed), but were conventional symbols invented in neo-Platonic schools, and

were used in Persian pre-Islamic schools, whence they passed to Bagdad, on one hand, and on the other hand, to India. But Carra de Vaux is practically alone in holding such view. On the other hand, it must be pointed out that our 'Arabic' N. were not used by the Arabs, who evidently derived their forms from some other source, and in course of time further modified them in some respect (see Fig. 6). At any rate, N. are found in Spain as early as the tenth century; they were called *hurūf al-ḡubār*, 'the dust N.', probably because they were written on the dust *abacus* (see below) instead of being represented by counters. The first European scholar who is definitely known to have employed the new N. is Gerbert, who in 989 became Pope Sylvester II. He went to Spain in 967. The oldest definitely dated European MS. that contains these N. was written in Spain in 976 (see Fig. 6, line 3). The later changes in the forms of N. which took place in Italy may be seen in the same fig. (line 20).

A little consideration will convince one that, however obvious it may be to suggest arbitrary signs for the N. from 1 to 9, the relative positions of such signs according to a decimal, indicates a maturity of thought in calculation that no merely arbitrary system can explain. It will be seen that what to moderns may seem arbitrary is in reality a slow development, starting from a simple if cumbersome principle, and worked out by a gradual and highly ingenious eclecticism. Lastly, researches by various scholars show that the Hindu system, all-important from the fact that after being improved by Arabian, It., and other savants, it formed the basis of the system now in vogue throughout Europe, though admittedly obscure in origin, is not only clearly of high antiquity, but reveals on inquiry a foundation of still older systems, which began the only obvious mode of constructing symbols of number, viz. by repetitions of a single unit, and developed gradually by the use of zero, and a true denomination for each cipher, determinable on a decimal system. The great problem in these various ancient systems was to keep numbers of different denominations separate; it did not occur all at once even to the subtle orientals to represent units, tens, hundreds, etc., by position, for the use of a sign for zero comes late in the developed Indo-Arabic notation. The independent employment of a zero-symbol by the pre-Columbian Mayas (see above) has no influence on the development of our common notation.

The old method of keeping digits distinct was by means of the *abacus*, or reckoning-board, consisting of balls strung on wires or rods set in a rectangular frame. The *abacus* was used both by the Gks. and the Roms., and is still used in many oriental countries, especially China, for complex calculations. The movable balls are used as counters to record the steps in an arithmetical operation, and each column or compartment represented a particular value to be assigned to a counter or ball placed or

moved on to it. As soon as distinctive symbols or ciphers are used instead of counters to represent the numbers from 1 to 9, and a sign for zero used, the *abacus* or any other similar mechanical contrivance becomes superfluous, and the problem of calculation by reference to position is solved. Apparently Europe owes the whole of its modern arithmetic

to the Indians and Arabians, for the decimal system or mode of reckoning by tens through the instrumentality of the zero seems to come from India through the Arabs. Whether the Gks. arrived at the decimal system and the use of position and the zero as the most convenient mode of reckoning, independently of the oriental nations, is apparently unknown. Certainly it seems that the value of position might soon have been suggested to them by the dash which, as shown above, was written on the left of a sign for thousands; at all events it is possible that from this use of the dash or stroke the Gks. began to associate high numbers with position to the left. If then, for example, $7000+800+40+2$ were represented by ζ, ω, μ, and β respectively, it would be a natural step to eliminate the dash and run the four symbols together thus ζωμβ with a line or vinculum over the top to differentiate from a mere word. However, our common numerical system, improperly known as the 'Arabic N.', is the most simple and the most developed of all other, ant. or modern, numerical systems.

Numismatics (from Gk. νόμισμα, a coin with customary value, currency), study of coins and currency, has engaged attention since the 17th century, when their historical and artistic value was first appreciated. The stimulus then given to coin collecting resulted in the formation of notable cabinets by many scholars and gentlemen; such national collections as those of France, Austria, and Sweden began as royal cabinets. To-day the study is widespread, both among private collectors and also in public institutions, which emphasise the value of N. in furnishing historical, economic, and artistic evidence. Numismatic societies and journals exist all over the world.

Early coinage sprang from the desire for a more generally acceptable exchange medium than cattle or axes or spits (characteristic of biblical, Homeric, and W. European economies), or knives or cloth (used in early Chinese times), when it was seen that metal (normally copper or silver or gold), exchanged by weight, combined reasonable universality with utility, durability, and beauty. The copper talent (the limit of human burden) quickly emerged as the Gk. unit of weight. But fluctuating metal values, and the

cumbrousness of weighing out metal in bars or broken fractions, still hampered exchange until (as evidenced by Pollux quoting Xenophanes of Colophon) Lydian kings, c. 700 B.C., revolutionised currency by expressing copper values in small pieces of a more precious metal (electrum), by ensuring centralised control of weight and purity, and by stamping these pieces with a standard design. Ability to dictate the exchange value of distinctively marked metal within a given area is the origin of true coinage.

Peninsular Greece followed suit with silver, its characteristic metal: Pheldon of Argos (c. 670 B.C.) was credited with the revaluation of the old iron spits of the Peloponnese in terms of silver coins struck with the 'turtle' design at Ægina, a 'handful' of six spits being worth a new silver drachma. The age of colonisation had intensified Gk. trade, which thus increased the need for coinage, and by c. 600 both Corinth and Athens were in a position to strike their own coins. They too adopted the drachma unit, related to the universal talent by the intermediate mina weight (=60 talent) borrowed from the E.; but the price of silver varied owing to differing availability and transport costs, and this caused variety in the weight of the drachma, heaviest at Ægina, lightest at Corinth, and tended to divide the world into rival groups. Most Gk. weight standards were offshoots, in one sense or another, of these original systems, Asiatic, Æginetan, and Attic-Corinthian-Euboic.

By 500 B.C. many Gk. city states had their own mints, and by 350 Gk. coinage was universally regarded as an important sign of political autonomy. The distribution of the various coinages, in hoards and site-finds, accurately mirrors the main streams of Gk. commerce. Each state adopted a distinctive coin device (an owl at Athens, a pegasus at Corinth (see illus., 3), a barley-ear at Metapontum, etc.), with or without an inscription giving the city's name, as a guarantee of weight and purity. The coins were circular in shape, and bore 'types' on both sides, and, though often struck very carelessly, came to display a wonderful degree of skill and beauty, as at Elis (see illus., 2), Amphipolis, and many Sicilian cities. By c. 400 B.C. master engravers were signing their dies.

Soon after 450 B.C. Imperialist Athens had tried, with some success, to subject a wide variety of independent mints and standards to her own economic control. A more important attempt was made, at the end of the fourth century B.C., by the Macedonian Empire, which coined great quantities of gold and silver with standard types from mints in Greece, Asia, and the Levant: these bore a royal portrait (e.g. of Alexander the Great) in place of the old city badge. In areas not subject to Macedon the former idioms continued, the Rhodian and S. It. coinages gaining special importance.

By 300 B.C. a purely Lat. coinage was increasing in central Italy, including Rome, in the form of asses, i.e. cast bars or disks of bronze, originally about 1 lb. in

1, Corinth, silver stater, fourth century B.C.; 2, Elis, silver stater, 8th century B.C.; 3, Rome, silver denarius, second century B.C.; 4, Rome (Caracalla), silver antoninianus, A.D. 215; 5, Louis le Debonnaire of Germany, silver denier, 814-40; 6, Ethelred II. of England, silver penny, 979-1016; 7, St. Louis of France, silver gros tournois, 1226-70; 8, Florence, gold fiorino, from 1251; 9, Henry VIII. of England, gold angel, 1509-26; 10, Arabic silver dirhem, A.D. 708; 11, Jahangir Khan of India, silver half-rupee, 1619.

weight, with their fractions. Contact with Gk. colonies of S. Italy resulted at Rome in experimental silver coins, struck, and on a Gk. standard; and increasing use of silver led to a new silver-bronze ratio expressed, c. 190-180, in the denarius, worth 10 (and later 16) asses of steadily shrinking weight and size. This coin, which was destined to dominate the coinage of the Rom. Republic and early empire and to father the medieval denier and penny, was soon produced in great volume, at first from the central mint of Rome, later from subsidiary It. mints as well, and finally also from 'travelling' military mints, reflecting the deep economic repercussions of Rome's wars of conquest. In contrast with the multiple coinages of Gk. city states, the Rom. Republic struck a virtually uniform and severely centralised coinage for the Mediterranean area as a whole. Technical control was vested in an ann. board of three moneyers, who at first rigidly respected the original 'types,' head of Roma-Bellona, and the Dioscuri (see illus., 3). But by 100 B.C. moneyers were developing designs which reflected the majesty of Rome by reference to the achievements of its noble families, and from this it was a short step to the personally controlled issues (including gold) of the great war-lords, Sulla, Pompey, and Julius Caesar, the last of whom received the right of portraiture on his coins. Rom. coinage was by now imperial in all but name, and, save for base-metal issues still permitted to local communities, supplied vast dominions with centrally controlled money.

It became openly imperial with Augustus's foundation of the principate (27 B.C.), which involved fundamental reform based on gold aureus, silver denarius, brass sesterius and dupondius, and copper as, struck at various mints, with Lyons and Rome at first dominant. Henceforth it acquired new importance as a flexible imperial gazette, emphasising the virtues of imperial rule by means of rapidly changing 'types' which almost always included the emperor's portrait and titles with some allusion to his policy or achievement (see illus., 4, Caracalla). Inflation, beginning with Nero, and debasement, increasing after A.D. 200, led to economic collapse c. A.D. 250; but Diocletian's economic and monetary reforms (A.D. 296) paved the way to a coinage temporarily stabilised on gold solidus, silver siliqua, and sundry copper denominations: solidus and siliqua survived the economic chaos of the fifth century and became the basis of early medieval currency. Late imperial coinage was struck at a large number of co-ordinated mints, and supplied an area extending from Spain to Asia Minor and from Britain to Egypt; and, though unofficial issues sometimes reflected local shortage or political disturbance, these were not frequent.

The collapse of the W. empire in A.D. 476 left to the invading Franks, Goths, Burgundians, etc., the massive tradition of imperial coinage, which they preserved and adapted. Until c. A.D. 700 the use of

gold in W. Europe continued; later, gold was mainly replaced by silver, as in the Rhineland, Gaul, and Britain, though it was retained at Byzantium, the cap. of the still flourishing E. Empire and the source of a coinage which, remarkable for its Greco-Rom. idiom and for the beauty of its religious types, continued until it was overwhelmed by Turkish power in the fifteenth century, though not before it had decisively affected the medieval coinage of Russia.

In central and W. Europe the virtual disappearance of gold coinage resulted in the medieval system built on the silver denier (see illus., 5, Louis de Debonnaire, emperor of Germany, A.D. 814-40), normal in England in the form of the penny. Early medieval coins in most countries were struck by a wide variety of mints. Their religious idiom was strong (see illus., 6, Ethelred II. of England), though their style was often rough: the inscriptions usually indicated the minting authority, the mint, and not infrequently the moneyer. The Holy Rom. Empire gave universality to the system, which, even when imperial control weakened and the rights of coinage passed to independent authorities (princely, eccles., and civic), remained in general use.

The crusades revived W. knowledge of the Levant and led to a resumption of gold coinage in Europe: to the earlier gold 'bezants' of Byzantium were added the florino of Florence (see illus., 8) and the sequins of Venice, Italy taking a large part in E. contacts. France, Spain, and England (the last with her nobles, ryals, and (see illus., 9) angels) followed suit with gold coinages in the thirteenth and fourteenth centuries: this multiplication of values encouraged the introduction of the Fr. gros tournois (see illus., 7, St. Louis, 1226-70), a silver coin much larger than the denier and imitated in England as the groat, worth four pennies. The development of central European silver-mines and the discovery of the rich deposits of the new world were soon reflected in the profuse issue of the large silver thaler and its derivative family, of which the increased size allowed die-engravers scope for the splendid designs of the Renaissance to replace the austere Gothic idiom. The monarch's portrait became in general a standard requirement on the obverses: the reverses were usually given up to increasingly elaborate heraldic or naturalistic designs, often accompanied by religious inscriptions. Technical difficulties in striking such large coins were overcome by the introduction of machinery from 1580 onwards, adopted in England in 1662, after which time a grained ('milled') or raised edge protected coins against the evil of clipping.

Emphasis on gold and silver was modified from the seventeenth century onwards by the general development of low-value copper coins for everyday use, especially in France, Germany, and the Netherlands, an example soon followed in England, at first in the form of municipal or private trade tokens (q.v.). The pattern of European coinage continued

without major change in the eighteenth and nineteenth centuries, though momentarily interrupted by the Fr. Revolution and by Napoleon's conquests. After 1814 it was radically altered. The rising price of gold made it unsuitable for further use as a coinage metal, and its place was largely taken by bank-notes (*q.v.*), which had already enjoyed a long hist.; and with the crumbling of monarchies and the rise of dictatorships republican or nationalist types displaced the traditional designs. The Second World War did for silver what the first did for gold, and nickel alloys are now in general use to take its place.

The expansion of the Brit. Empire from the seventeenth to the nineteenth century saw European coinage grafted on to many overseas possessions. The E. India Company's coinage, begun in the seventeenth century, was transformed after 1857 into the imperial coinage of India. Amer. issues, first produced for the New England colonists, lapsed after 1773, to be replaced by the earlier U.S. issues from which, in association with the coinage of Canada (from 1820), the great N. Amer. dollar coinage has developed: the S. Amer. coinages derive more directly from the currency traditions of the invading Spaniards. The nineteenth century saw coinage extended to the W. and E. Indies, Africa, Australia, and New Zealand, and to many colonies, such as Hong Kong: even now many of such issues are produced by the Royal Mint (*q.v.*) in London, which, besides contracting to coin for other govts., has also struck its share of the Maria Theresa dollars that for 150 years have been a traditional currency in N. Africa and the Middle E.

In contrast to the European coinage family, based on the idiom of state sovereignty displayed with the utmost variety of pictorial type and inscription, the immense Moslem group, extending in its time from Spain to Turkestan, is externally one of the most homogeneous in the world. It began in the seventh century A.D., as a religious coinage from which representation of the human figure was excluded: its types consisted only of Arabic inscriptions defining ruler, mint, and date and including certain religious formulae. The spread of the Moslem faith introduced minor variations as Arabic coinages absorbed, or were merged in, other systems, sometimes becoming bilingual (as in the Sassanian series), and sometimes even admitting a pictorial type, as in the zodiacal series of Jehangir Khan in India (*see* illus., 11). But in general the original form has been strictly preserved. The gold dinar and the silver dirhem (*see* illus., 10), widespread in the Middle E. and characteristic of early N. European trade routes, developed a tradition of calligraphic beauty alive in Moslem coins to-day. The coinage of India has been in part Moslem and in part Hindu with Sanskrit inscriptions and pictorial designs.

Of the Far E. family Chinese coinage began in remote antiquity. The first round coins, which give a glimpse of an earlier stage of tool- and cloth-money,

were made, by casting (regularly preferred in China to striking), appreciably before the first Lydian or Gk. coins; and the Christian era saw a long-estab. series of pierced circular coins of bronze, the standard Chinese coinage metal. For some nineteen centuries this continued with little change. The coins bore no pictorial representation of the emperors: their ideographs mentioned only mint and denomination. In the twentieth century the series has been Europeanised, being based on a struck silver pictorial dollar of 100 cents. The origin of Jap. coinage was later by sev. centuries, owing to isolation and a simple agric. economy: even after the first copper was produced in the seventh century A.D., the majority of coinage from the ninth to the fifteenth century was imported from China. Afterwards a true Jap. series was developed, based on the gold oban and koban, and from the late nineteenth century has followed the decimal system, in gold, silver, and copper, with traditional pictorial types but no imperial portraiture.

Notice must be taken, finally, of certain quasi-monetary issues which, apart from tokens (*see* TRADE TOKENS) and jetons (*q.v.*), fall outside the class of true coinage. These are mostly pieces of necessity, such as siege-pieces (*e.g.* struck by Charles I. in England) or camp-money (as produced in the Boer War) or purely temporary money (in the form of leather or porcelain or even of postage stamps) to tide over a period of crisis. In addition, many examples survive, side by side with true coinage, of primitive 'commodity currencies' such as sugar, tobacco, tea, or salt. Medals (*q.v.*) have never enjoyed the status of pieces of currency.

The chief public coin collections are as follows: in England, at the Brit. Museum and the univs. of Oxford, Cambridge, and Glasgow; on the continent of Europe, at Paris, Brussels, The Hague, Copenhagen, Stockholm, Oslo, Munich, Vienna, Rome, and Budapest (the disposition of the great Berlin collection, which is now in Russian hands, is uncertain); and in New York. They are fed, partially, by recurrent finds of coins formerly hoarded for safety. The law of treasure trove varies from country to country: in the United Kingdom the Crown claims associated objects of gold and silver for their archaeological or historical value, allocating to the Brit. Museum what is there required and paying to the finder the full antiquarian value of any object thus retained. *See also* COINS; MEDALS.

Numismatic Society, Royal, see **ROYAL NUMISMATIC SOCIETY**.

Nummulites, or **Money Fossils**, genus of Foraminifera, so called from the resemblance of the fossilised shells to small pieces of money. They occur principally in the Eocene, and are abundant in the Bracklesham beds. If heated over a spirit lamp and then dropped into water they split transversely, and display numerous spiral coils which are divided into hundreds of tiny chambers. The side walls of the chambers are usually arranged in such relation to one another that they give the appearance of a series of radii from the centre of the shell. The shells vary from $\frac{1}{2}$ to 2 in. in diameter.

Nummulitic Limestone, Eocene formation, almost entirely composed of nummulites. It is often sev. thousand ft. thick, and is widely spread over many parts of Central Europe, Asia, N. Africa, and America. It attains an altitude of over 16,000 ft. in W. Tibet, and the pyramids of Egypt are built entirely of it.

Nun (Lat. *nonna*), woman who has consecrated herself to God by vow and who has also bound herself to live in a convent under a certain rule. From the beginning of the Christian Church the existence of women devoted to virginity and religious offices may be recognised, and it is probable that they early joined together in communities. The commonest formula for vows is that binding them to voluntary poverty, chastity, and obedience, to which is sometimes added a fourth concerning the particular task, e.g. education of poor girls, to which they dedicate themselves. The older orders, e.g. Benedictines, take different vows but the difference in practice is slight. Convents are either under the authority of the bishop of the diocese in which they are situated, or they are attached for purposes of supervision to the corresponding male branch of the order, and in this case they are termed 'exempt,' i.e. from episcopal control, the ultimate authority for them being the Holy See. Ns. are either enclosed, which means that they never leave their cloister, or unenclosed, in which case they go out to perform works of charity in schools, hospitals, etc.; nearly all modern orders are of this latter type. All Ns. bound by 'solemn' vows are under the obligation of reciting the divine office in choir; but practically all modern orders have 'simple' vows which do not carry this obligation, largely on account of the calls of the work in which they are engaged. See also **CONVENT**.

Nunc Dimittis, or **The Song of Simeon**, canticle which forms part of the office of compline in the Rom., Anglican, and

most of the medieval breviaries. It also appears in the order of evening prayer, where it is placed after the second lesson. The canticle is taken from Luke ii. 29-32.

Nuncio, see **LEGATE**.

Nuncmar, see **HASTINGS, WARREN**.

Nuncupative Will, verbal will or oral declaration of one's testamentary intentions before witnesses. In general a will, both in Eng. and Scots law, is totally void unless made in writing. Soldiers or sailors over 14 years of age can dispose of their goods and chattels by a N. W., but since the Navy and Marines (Wills) Act, 1865, a N. W. made by a man in his majesty's naval or marine forces will not be effectual so as to dispose of his wage or other money due to him by the Admiralty, though apparently the Admiralty have a discretion to pay the wages to the claimant under an oral will. It is to be noted that the term N. W. is often applied to an informal written will made by a soldier on active service, such wills generally being valid if sufficiently proved. It is doubtful how far the N. W. of a civilian is valid, but in all cases where effect has been given to such a will, it was satisfactorily proved that the testator at the time of making it was in extremis. See also **DONATIO MORIS CAUSA**. See Jarman, *On Wills*.

Nuneaton, municipal bor. and mrkt. tn. of Warwickshire, England, on the Anker, 8½ m. N.E. of Coventry and 97 m. from London, on the Midland Region railway. Its chief buildings are the churches of St. Nicholas and St. Mary the Virgin, the former a handsome church in various styles of architecture and with a square embattled tower and pinnacles. There is a sixteenth-century grammar school and a free school (1712); also coal-mines, iron-works and manuf. of woven worsted articles, elastic, ribbon, etc., and of tiles, sanitary pipes, and glazed bricks. Here was b. the novelist George Eliot (Marian Evans). A nunnery, founded in 1150, gave the tn. its name, and on its ruins was built the church of St. Mary's (1877). Pop. 55,000.

Núñez, or **Nonius, Fernán** (c. 1470-1553), Sp. writer and teacher, b. at Valladolid. He was a prof. of Gk. at Alcalá and Salamanca Univs. He pub. various eds. of the classics and helped to compile the Lat. version of the Septuagint.

Núñez Cabeza de Vaca, **Alvar**, see **VACA**, **ALVAR NÚÑEZ CABEZA DE**.

Nunkiang, prov. of China, in Manchuria. The chief products are wheat, soya-bean, kaoliang, and gold. Through N. passes the Changchun railway. Cap. Tsitsihar. Area 25,849 sq. m. Pop. 2,407,000.

Nun Moth (*Liparis monacha*), black and white moth known as Black Arches in Britain. It is a great pest in Europe, since its caterpillars destroy tree leaves. Poison dust-spraying from the air has been successfully used.

Nunn, Sir Percy (1870-1944), Eng. educationist, son of E. S. N., LL.D. Educated at Bristol Univ., he taught in secondary schools from 1891 to 1905. In the latter year he was made vice-president of the London Day Training College and

in 1913, prof. of education in the univ. of London (prof. emeritus, 1937). He succeeded Sir John Adams as principal of the college (1922). In 1932 the college was transferred to the control of London Univ. and became the Institute of Education. N. continuing in office as director until 1936. He was president of the Training College Association in 1915; chairman of the education section of the Brit. Psychological Society, 1919; president of the Mathematical Association, 1923; and visiting prof., Columbia Univ., 1925. He also served as a member of the advisory committee of the Colonial Office on education and as a senator of London Univ. From 1923 to 1924 he was president of the Aristotelian Society, and in 1927 he delivered the ann. philosophical lecture to the Brit. Academy on 'Anthropomorphism and Physics.' His pub. include a report for the Board of Education on *The Training of Teachers in Mathematics* (1912); *Teaching of Algebra* (1914); *Education Reform* (1917); *Relativity and Gravitation* (1923); and *Education: its Data and First Principles* (1920), generally regarded as his best work. The central thesis of his work on the data and first principles of education maintains that the primary aim of all educational effort should be to help boys and girls to achieve the highest degree of individual development of which they are capable, while not undervaluing the just claims of public duty and social service. N. gives much attention to the significance and the value of intelligence tests, and explains the ideas underlying the theory of the tests from the psychological standpoint in an analysis of the concepts of *hormé* and *mémé* (the use of the term *hormé* embracing the concepts of purposive energy as manifested both in conscious and unconscious behaviour; and that of *mémé* all the varied phenomena referred to by Samuel Butler to memory conscious or unconscious). On vocational education N. concludes that, if conducted in a liberal spirit, it is permissible but cannot be made universal. On the other hand, 'in its concentration of interest on matters whose social value is evident, in its strong appeal to the practical activities, it contains elements which should, in some form, have a large place in every educational scheme.'

Nuoro, prov. of Sardinia in the centre of the is. and also a tn. in the same prov. Area 2800 sq. m. Pop. (prov.) 210,000; (tn.) 10,000.

Nupe, native kingdom of northern Nigeria, W. Africa, bounded by the R. Niger. It has an area of 6400 sq. m. and a pop. of 326,000. N. is an African community which has maintained its individuality through many cycles of change. Among the factors which have contributed to its solidarity is, primarily, the attachment of the people to the principle of kingship; while a second and centripetal has been the acceptance of the brotherhood of Islam, the creed of the ruling race. N. was one of the emirates formerly included in the Fulani empire of Sokoto. The old cap. was Itabba, which

the explorer R. Lander visited. Another Eng. explorer, Baikie, also visited Rabba, in the time of King Masaba, whose successors, however, were hostile to the Brit. In 1881-82 the R. Niger Company gave material help to the emir of N. in his struggle with rebels, thus inaugurating Brit. control of the destinies of N. and over the riv. tribes generally. But in 1896-97 the company was involved in a conflict with the then Fulani emir of N. and the emir of Ilorin, who were raiding for slaves in the vils. along the banks of the Niger, which were under the protection of the company. Eventually Bida, the new cap., was attacked in 1899 by Brig.-Gen. Lugard (later Lord Lugard), but it was only when he led a larger expedition against N. in 1901 that he succeeded in entering the tn. and installing a new emir, who agreed to recognise the Brit. protectorate and to put down slave-raiding. Bida is a trade centre, and is known for its embossed, if unsubstantial brassware, glass bangles, and kola or *laboshe*. The tn. has a wide central avenue and shady trees and is remarkable for its numbers of blue-robed men, and women with henna-dyed teeth and picturesque head-dress. The products of N. include cattle, rice, guinea-corn, and shea-butter. See A. Burns, *History of Nigeria*, 1929, and S. F. Nadel, *A Black Byzantium. The Kingdom of Nupe in Nigeria*, 1942.

Nuphar, genus of aquatic plants (family Nymphaeaceae), of which two are Brit. *N. luteum*, the common yellow water-lily or brandy-bottle, is common in lakes and rivs. It bears large, yellow, strongly-scented globose flowers and both submerged and floating leaves. A drink is prepared by the Turks from the flowers. *N. pumilum*, a much smaller plant, occurs in small lakes in Scotland.

Nuraghe, Nurragghi, Nurags, are the round towers of Sardinia, of which there are about 3000, and which are of very great antiquity. These towers, which resemble the brochs of Scotland and the talyots of Minorca, are built of various stones, such as granite, basalt, and limestone, and consist of two or three storeys, reached by means of a spiral staircase. Their original purpose is not known, nor is there any existing information as to their builders. See J. Fergusson, *Rude Stone Monuments in all Countries: their Age and Uses*, 1872, and Sir R. Lambert Playfair, *Handbook to the Mediterranean* (3rd ed.), 1890.

Nur ed-Din Mahmud, Malek-al-Ade (1117-73) (surnamed 'El-Shahid' (the martyr) by Mohammedan historians), sultan of Syria, b. at Damascus. He succeeded his father as emir of Aleppo in 1145, and tried to expel the Christians from Palestine. The Christian defeat at Edessa led to the second crusade, but by 1151 every Christian stronghold in Palestine was in his hands. He was defeated by Baldwin, king of Jerusalem, and narrowly escaped imprisonment; later, however, he overthrew the Christian princes of Tripolis and Antioch. In 1169 he overran Egypt, and was created sultan of Syria and Egypt by the caliph of Bagdad.

Nuremberg (Ger. Nürnberg), city of Bavaria, Germany, 100 m. N.W. of Munich. It was the commercial cap. of Bavaria, and lies in a sandy but productive plain. Formerly among the richest of the free imperial tns., until the Second World War, it still retained its anct. walls and moat, as well as some of the interesting old gateways, and many of the old towers. The castle (Kaiserschloss), picturesquely situated on a rock on the N. side of the tn., dated from about the beginning of the eleventh century, and was a favourite residence of the Ger. emperors in the later Middle Ages. The city also had sev. interesting churches, among the best being those of St. Lawrence (Lorenz), the masterpiece of the sculptor Adam Krafft; St. Sebald, with its celebrated shrine consisting of a bronze sarcophagus and canopy; and the church of Our Lady, with the Tüchersche altar. Among other public buildings were the Renaissance tn. hall, the Germanic national museum, which included a picture gallery containing works by Holbein, Dürer, and others, and the municipal library, with about 80,000 vols. and 2000 valuable MSS. The city was an important railway and commercial centre, and the chief market in Europe for hops. The prin. manufs. were fancy articles in metal, carved wood, and ivory. 'Dutch' toys and clocks, lead pencils and hardware. N. was the first of the imperial tns. to embrace Protestantism. It was here that the National Socialist party normally held their ann. congress, when Hitler made it the occasion of his most fulminatory utterances. It was at N. in Sept. 1935 that the Nazi laws against the Jews were enacted.

In the Second World War N. was first bombed by the R.A.F. in the autumn of 1941 and sev. times subsequently, particularly on Aug. 10, 1943, when over 1500 tons of bombs were dropped, and again on Aug. 23 of the same year, and on Jan. 2, 1945. As a result of the war, the old part of N., the anct. walled city, the finest medieval relic in Germany, was all but obliterated. The venerable church of St. Sebald, St. Lawrence, and the Frauenkirche, a trinity of noble churches, were in ruins, as also was the Rathaus. The central square, which had been renamed Adolf Hitler Platz, was found fringed with ruins and mounds of rubble when the Allies entered the city in 1945. The damage was worsened by shelling and further air attack during the final battle. Pop. (1933) 411,000. See C. Headlam, *The Story of Nuremberg*, 1899.

Nuremberg Trial, international trial of major Ger. war criminals following the Second World War, which occupied nine months between Nov. 1945 and Oct. 1946 and ended in the conviction and sentence of most of the surviving leaders of the Third Reich for their part in preparing and waging aggressive war and for crimes against humanity. Long before the war had ended the Allies gave consideration to the perplexing question of the treatment which should be meted out to Hitler and his leading criminal associates and, in the meantime, the International War Crimes

Commission was set up to examine material bearing upon individual war crimes. From the start it was agreed that it was impossible to put on trial and punish the small men for individual crimes and crimes which they were in some cases ordered to commit, unless adequate steps were taken against the big men who had inspired and contrived these enormities in the mass. Some were inclined to argue for the shooting of the Nazi leaders out of hand, but the alternative of a public trial before a bench of judges nominated by the chief allied govs. gradually prevailed, though it was only in the last year of the war that negotiations were begun and completed for a four-power (America, Britain, Russia, and France) pact under which the Nuremberg court would be set up. Hence emerged the charter of the court, a document entirely without precedent, which authorised the tribunal, sitting as a court of criminal jurisdiction, for the trial of those brought before it for breaches of international law and cognate war crimes. The objection raised in some quarters that the course taken involved the condemnation, after the event, of men for acts which had not been declared to be crimes against international law at the time when they were perpetrated was misconceived; for the substantive law that the tribunal applied already existed, e.g. the Kellogg pact, which condemned recourse to war as an instrument of national policy, was a treaty of 1928 and Germany was one of its sixty-three signatories. The defect in the past in these prohibitive provisions of international law had been that there was no court with power to try and to punish the transgressor. It was the creation of the court, not the enunciation of the law, that was the novelty; and few people felt their sense of justice outraged when, on Germany's collapse, the Allies decided to create such a court rather than allow those who were guilty of such outrages against humanity to violate the law with impunity.

The trial was actually opened on Nov. 20, 1945, under the presidency of Lord Justice Sir Geoffrey Lawrence. The tribunal consisted of four members, each with an alternate to act in case of illness or the like, and each contracting country chose its own member and alternate. The accused were Marshal Goering (q.v.); Rudolf Hess, the Fuehrer's one-time deputy (q.v.); Joachim von Ribbentrop (q.v.), Reich foreign minister; Dr. Robert Ley, leader of the Ger. labour front; Alfred Rosenberg, gauleiter of Poland; Dr. Hans Frank, a former governor-general of Poland; Hans Kaltenbrunner, Heydrich's (q.v.) successor as chief of the Ger. security police; Julius Streicher (q.v.), governor of Franconia; Marshal Keitel, chief of staff and commander of the Wehrmacht; Dr. Walter Funk, Reich minister of economics; Dr. Hjalmar Schacht, Germany's leading economic and financial expert for many years; Gustav Krupp von Bohlen, head of the Krupp armament works; Adm. Raeder, naval commander-in-chief from 1935 to 1943; Adm. Doenitz (q.v.); Baldur von Shirach, founder of the

Hitler Youth; Fritz Sauckel, responsible for the Reich's total mobilisation and enslaving foreign workers in Ger. factories; Prof. Albert Speer, Reich minister of armaments and war production; Martin Bormann, chief of Hitler's chancellery, and deputy Fuehrer in place of Hess; Franz von Papen, Ger. diplomat; Gen. Alfred Jodl, Hitler's personal military adviser; Baron von Neurath, foreign minister before Ribbentrop became gauleiter of Czechoslovakia; Arthur von Seyss-Inquart, minister of the interior and security in the Austrian Cabinet, and later Nazi commissioner for Holland; and Hans Fritzsche, deputy propaganda minister and a leading broadcaster. Robert Ley committed suicide in prison (Oct. 25, 1945); Krupp von Bohlen's physical and mental condition precluded his trial; Bormann was tried in his absence under the provisions of the charter.

The indictment charged the defendants with crimes against peace by the planning, preparation, initiation, and waging wars of aggression, which were also wars in violation of international treaties and agreements, with war crimes, and with crimes against humanity (see also CRIMES, WAR). It charged them with responsibility for the death of 12,000,000 men, women, and children, and in his final speech at Nuremberg Sir Hartley Shawcross, Brit. attorney-general, demanded the death penalty for all the prisoners, whom he said should be held responsible for the deaths of that number of victims. The tribunal was, further, asked by the prosecution to declare a number of named groups or organisations to be criminal within the charter, so that membership rendered the individual member liable to the death penalty. All the defendants were represented by counsel and also all counsel were chosen by themselves. The case against the defendants was opened (Nov. 21) by the chief Amer. prosecutor, Justice Robert Jackson, who said that the crimes the tribunal 'sought to condemn had been so calculated, so malignant and devastating that civilisation could not tolerate their being ignored because it could not survive their being repeated. The trial represented the practical effort of four of the most mighty nations, with the support of fourteen more, to utilise international law to meet the greatest menace of their times—aggressive war. These twenty-two broken men and others created in Germany under the *Fuehrerprinzip* a national socialist despotism equalled only by the dynasties of the ant. East. . . . They led their people on a mad gamble for domination, diverted energies and resources to the creation of what they thought to be an invincible war machine, and they overran their neighbours, bringing in millions of human beings as slave labourers. At length bestiality and bad faith reached such excess that they aroused the sleeping forces of imperilled civilisation which by its united efforts had ground the German war machine to fragments.' The Brit. prosecutors included, besides the attorney-general, Sir David Maxwell Fyfe. The

manner in which the latter discharged his onerous task proved to the world what an effective instrument for establishing truth and exposing falsehood is the Brit. way of cross-examination. Gen. Rudenko was the chief prosecutor for Soviet Russia. The nature of the crimes was such that both prosecution and judgment must be that of victor nations over vanquished foes. Yet if they were the first war leaders of a defeated nation to be brought to trial, they were also the first to be given a chance to plead for their lives in the name of the law. The charter of the tribunal which gave them a hearing was also the source of their only hope. The court did not seek to convict the defendants on the testimony of their foes; there was no count of the indictment that could not be proved by Ger. documents and records and by captured films. Some 403 open sessions of the tribunal were held. Thirty-three witnesses gave evidence orally for the prosecution against the individual defendants, and sixty-one witnesses, in addition to nineteen for the defendants, gave evidence for the defence. A further 143 witnesses gave evidence for the defence by means of written answers to interrogatories. The tribunal appointed commissioners to hear evidence relating to organisations and the tribunal itself heard twenty-two witnesses for the organisations. Much of the evidence presented to the tribunal on behalf of the prosecution was documentary evidence, captured by the allied armies in Ger. Army headquarters, gov. buildings, and elsewhere. Some of the documents were found in salt mines, buried in the ground, hidden behind false walls, and in other places thought to be secure from discovery. The case, therefore, against the defendants rested in a large measure on documents of their own making, the authenticity of which was not even challenged except in one or two cases. Of the twenty-two prisoners present at the trial, only three were acquitted. These were Schacht, von Papen, and Fritzsche. The tribunal sentenced twelve of the accused to death, three to imprisonment for life, and four to lesser terms. The Soviet judge dissented from the acquittals. The Allied Control Council rejected all appeals for clemency by the prisoners and also rejected the plea by Goering, Jodl, and Keitel to be shot instead of hanged. Shortly before he was to have been hanged, Goering committed suicide by taking cyanide in his cell. The remaining Nazis sentenced to death were hanged at Nuremberg on Oct. 16.

The court refrained from declaring three of the groups named in the indictment to be guilty. These were the Reich Cabinet, the S.A. (mass militia of the Nazi party), and the high command. 'In effect' (runs the judgment of the tribunal on this point) 'a member of an organisation which the tribunal declared to be criminal might be subsequently convicted of the crime of membership and be punished for the crime by death.' That was not to assume that international or military courts which would try those individuals would not exercise appropriate standards of justice.

This was a far-reaching and novel procedure. Its application, unless properly safeguarded, might produce great injustice.' The tribunal (under Article 9 of the charter) was 'vested with discretion as to whether it would declare any organisation criminal and the discretion was one to be exercised in accordance with well-settled legal principles, one of the most important of which was that criminal guilt is personal, and that mass punishment should be avoided.' If satisfied of the criminal guilt of any organisation or group the tribunal 'should not hesitate to declare it to be criminal because the theory of "group criminality" was new or because it might be unjustly applied by some subsequent tribunals.' It was evidently reasonable to refrain from declaring the Reich Cabinet and the general staff criminal groups. Those were bodies whose essential functions were *prima facie* legitimate. The number of persons involved, moreover, in the general staff and high command, was small enough for the individual trial of implicated officers to serve the purpose more effectively than a declaration of criminality. The indicted members of the general staff and high command were military leaders of the Reich of the highest rank, men who at one time or another had been commanders-in-chief of the three services, their chiefs of staff or officers, like Keitel and Jodl who had held high office in the supreme command. The tribunal found that according to the evidence the planning of such commanders at staff level, the constant conferences between staff officers and field commanders, and their operational technique in the field and at headquarters were much the same as that of the armed forces of all other countries. The formations declared criminal were, firstly, the Leadership Corps of the National Socialist party; secondly, the *Schutzstaffel* and its offshoot the *Sicherheitsdienst*, better known under the initials S.S. and S.D., and, thirdly, the *Geheime Staatspolizei* or Gestapo. The first was the motive force of the whole ruthless policy of aggression, and therefore of all the crimes that followed upon that policy; the second were the assassins who served the brutal will of the tyrants; the third were the spies and torturers. To have voluntarily worn any of their shameful uniforms was therefore an offence in itself. Most of the twenty-two principal defendants were found guilty, in general terms, as members of the Leadership Corps, but each of them had many and grave particular charges to answer. In legal language, the court held that a criminal organisation was analogous to a criminal conspiracy in that the essence of both was co-operation for criminal purposes. The tribunal rejected the excuse of the Nazi leaders that Hitler was responsible for everything and it rejected the idea that a common plan would not exist because Hitler was the dictator. For 'Hitler could not make aggressive war by himself; he had to have the co-operation of statesmen, military leaders, diplomats, and business men. When

with knowledge of his aims, they gave him their co-operation they made themselves parties to the plan he initiated. That they were assigned to their tasks by a dictator did not absolve them of responsibility for their acts.' The tribunal in the course of its judgment came to the following important decisions (*inter alia*): continued planning with aggressive war as the objective was established, beyond all doubt; certain of the defendants planned and waged aggressive war against twelve nations; war crimes were committed on a vast scale never before seen in the history of war. They were perpetrated in all the countries occupied by Germany and on the high seas.

In declaring that aggressive war was the 'supreme international crime' for which individual heads of state could not escape punishment by seeking refuge in their sovereign rights the Nuremberg Military Tribunal in effect pronounced the judgment of the world's conscience upon an indictment without parallel in recorded history. The proposition that 'the principle of international law, which under certain circumstances protects the representatives of a state, cannot be applied to acts which are condemned as criminal by international law' is perhaps the most far-reaching laid down in the Nuremberg judgment; for it means that henceforth the law recognises no wholly irresponsible rule in the world; and absolute rulers whose acts cannot be challenged in their own countries may yet, in certain circumstances, be arraigned before a court of higher jurisdiction. As to the evidence, it may be said that never previously in history has a disintegrating major power, in surrendering, yielded practically all its state secrets, military, political, and economic from confidential speeches of its leaders down to their secret diaries and private correspondence. After the discoveries at Flensburg, Berchtesgaden, and scores of other minor hiding places, it seems unlikely that any of the important events and developments of Hitler's twelve years' regime will remain obscure or open to conflicting interpretation. But manifestly time will be required to prepare a full official publication, with expert commentaries, on so great a mass of material, and the great lesson in contemporary history, which the full range of these documents contains, could not be learned at the N. T.; for it was not the task of the tribunal to present to the world an authentic, fully documented account of those twelve years. Its task was to judge and to sentence twenty-two war criminals and pronounce on a number of groups or formations, and the prosecution made use of these documents which happened to be in allied hands only where and when they helped to substantiate particular points in the charges. See also P. de Mendelssohn, *The Nuremberg Documents: Some Aspects of German War Policy, 1939-1945*, 1946; D. M. Kelley (psychiatrist to the prison), *Twenty-Two Cells in Nuremberg*, 1947; and Sir D. Maxwell Fyfe (ed.), *War Crimes Trials*, 1948.

A number of Ger. commanders were

tried in 1948 by a U.S. military tribunal which gave judgment (Oct. 27) in the case of three field marshals, nine generals, and an admiral for alleged war crimes. The judgment, delivered by Judge Young (president) and Judge Harding, quoted at length from the findings of the international tribunal which sentenced Goering and his associates and said that the American tribunal would not fix a general rule, but only determine the individual guilt or innocence of the defendants. Staff officers (continued the judgment) had played an indispensable part in spreading the evil which originated with Hitler and the Nazi leaders, but to find an individual criminally guilty he must have passed the order (the indictments charged the prisoners with carrying out such orders as to execute commissars or the compulsory recruitment of Fr. labour, etc. etc.) to the chain of command, and the order must be on the face of it criminal. The court observed that there had been some opposition among the military leadership to Hitler's plans, but in spite of their opposition they allowed themselves to be used by him. Among those tried were F.-M. Wilhelm von Leeb, who was commander-in-chief of Army Group N. against Russia until Jan. 1942, when he resigned. He was found not guilty of war crimes against belligerents and prisoners, but guilty of crimes against civilians. The court believed that there was much to be said for him by way of mitigation, especially as no criminal order had been adduced in evidence which bore his signature or the stamp of his approval. He was sentenced to three years' imprisonment, but released immediately; F.-M. Hugo Sperrle, who before 1942 commanded an air fleet operating against Britain and later was deputy for F.-M. von Rundstedt (q.v.) as commander-in-chief in France. He was charged with enforcing the Sauckel decree for compulsory recruitment of Fr. labour, but was acquitted; Gen. Hoth was found guilty of crimes against members of the armed forces and civilians in the E. He passed on the order received from von Brauchitsch to execute commissars and it was ruthlessly carried out by those under his control. He also co-operated in the killing and beating of civilians. He was sentenced to fifteen years' imprisonment; F.-M. von Keuchler was declared guilty of crimes against belligerents and civilians and sentenced to twenty years; Lt.-Gen. Hermann Reinecke, a member of the Nazi party, convicted of criminal segregation of prisoners of war for 'liquidation' or turning them over to the Gestapo, and Lt.-Gen. Walter Warlimont, who had a big part in bringing out and enforcing the order to execute captured prisoners of war and in plans of incitement to lynch captured airmen, were sentenced to imprisonment for life. Sev. other generals were sentenced to terms of imprisonment. Adm. Otto Schniewind, the only naval officer accused at this trial, was discharged.

At the end of Aug. 1948 the Brit. War Office announced that the gov. had decided to bring F.-M. von Brauchitsch,

F.-M. von Rundstedt, F.-M. von Manstein, and Col.-Gen. Adolf Strauss to trial as war criminals by a military court in the Brit. zone of Germany. F.-M. von Manstein was then seventy-six and almost blind: his trial took place at Hamburg (Oct.-Dec. 1949) and he was sentenced to eighteen years' imprisonment. F.-M. von Brauchitsch (aged sixty-seven) died in a Brit. military hospital at Hamburg on Oct. 18, 1948.

Following the first great trial, twelve separate cases were heard by U.S. military courts. The final case was that in which twenty-one Ger. diplomatists, civil servants, industrialists, economists, and others, judged by a U.S. military tribunal at Nuremberg, were sentenced to varying terms of imprisonment on April 15, 1949. The defendants at this trial included von Weizsaecker, head of the Ger. Foreign Office during most of the war, sentenced to seven years' imprisonment for assisting aggression in one case and of crimes against humanity; Lammers, head of the Reich's chancery, convicted on all counts, including plunder and spoliation (twenty years' imprisonment); Schwerin von Krosigk, minister of finance, convicted of plunder and spoliation (ten years); Berger, an S.S. (q.v.) general and chief of prisoner-of-war affairs, associated with conscripting children in the E. for labour in Germany and with peculiarly sadistic murders at Lublin of young Jews and with the murder of a Fr. general prisoner of war (twenty-five years); Darre, minister of food and agriculture; Pleiger and Kehrl, industrial and economic planners; Rasche, head of the Dresdner Bank; Steengracht van Moyland, Weizsaecker's successor; Keppler, who organised the agency for 'Germanising' E. ters.; Bohle; Wormann; Stuckart, head of the Ministry of the Interior under Himmler; Veesenmayer, who ushered the Ger. regime into Hungary in 1944; Dietrich and others, sentenced to terms varying from four to fifteen years. Two of the three judges found five men guilty of assisting aggression; four of ill treating belligerents; fourteen of offences against civilians; nine of plunder and spoliation; and twelve of being members of criminal organisations. The third member of the court fled dissenting views on sev. of the convictions. Dealing with Weizsaecker, the tribunal majority found that he assisted in the seizure of Bohemia and Moravia in 1939 in that he stultified all attempts by the Brit., Fr., and even the Its. to frame a joint guarantee with Germany of the independence of what then remained of Czechoslovakia as provided for in the Munich pact (q.v.). Judge Christianson, president of the tribunal, and Judge Maguire declared that 'international law was not statutory and consisted in part of practice and principle. History had proscribed aggression long before the last conflict. The accused were charged under Control Council Law (No. 10) enacted by the Allied Control Council on Dec. 20, 1945, and Article II., section 2, declared that any person who was principal or accessory was guilty of a crime outlawed

by the law. The fact that a person acted under orders did not free him of responsibility for a crime, though it might be considered in mitigation. It was apparent that the success of the Nazi programmes depended largely on the men holding positions of authority in the various government departments. The tribunal concurred in, and applied the principles laid down by the International Military Tribunal (see above in the judgment in the leading trial). The third member of the court (Judge Powers) (who filed dissenting views) held that the guilt of Lammers, von Weizsäcker, and sev. others had not been estab. against them personally, but that they had been declared guilty only because they knew of the crimes.

Since the first great trial there were altogether 177 defendants in the dock, apart from those who committed suicide in their cells or were released from trial because of illness. Of these defendants 142 were convicted and 24 sentenced to death by hanging. The prosecution had a staff of 1746 to assemble material and conduct the cases in court, and for the defence 373 Ger. and 2 Amer. lawyers were engaged. Among the defending counsel were 55 members of the Nazi party, 9 members of the S.A., and 3 who held S.S. membership. All the documents collected were sent to archives in Washington.

Nursery Rhymes, jingling rhymes invented for the amusement of children, or perhaps survivals of anct. folklore, invocations or incantations preserved from remote antiquity. Many of them are without doubt survivals from O.E. May-day celebrations, ring-songs, and dances which were once practised by grown-up people. The jingling metre and doggerel rhymes, in which the sense is often sacrificed to the attempted rhyme, have been handed down orally from one generation of children to another. The verses generally consist of a rhyming couplet or a quatrain in which the second and fourth lines rhyme, and there is frequently a refrain accompanying the quaint old airs which have been handed down as their setting. The nursery rhyme proper, embodying a tale set forth simply, and marked by either wit or pathos, is almost peculiar to the Eng. tongue; the equivalents in the Lat. or Teutonic tongues are more ornate and fantastical. The 'counting-out' rhymes, in which one word is dropped for each player and the one on whom the last word falls drops out from the ring, form a most interesting branch of folklore, and are undoubtedly of great antiquity. Newell, *Games and Songs of American Children*, 1884, 1903; Lucy Chisholm, *Collection of Nursery Rhymes*, 1911; *Mother Goose's Nursery Rhymes* (Everyman's Library); and L. Derwent, *Nursery Rhyme Anthology*, 1938.

Nursery School. The N. S. in Britain is intended to provide for the healthy physical and mental development of children between two and five years of age. Its purpose is twofold: nurture and education. Welfare centres are concerned with the health of the infant up to the age of two. The school doctor examines the five-year-old when he enters the primary school, but until the advent of the N. S. there was no proper provision in Britain for the 2,000,000 children between the ages of two and five. In 1918 the minister of education, H. A. L. Fisher, attempted to bridge this gap. Realising the serious degree of physical defect apparent in children on their admission to school, he warmly advocated the estab. of N. S. in all areas. During the year ending March 1919 thirteen N. S. were recognised by the then Board of Education. These consisted mainly of voluntary pioneer schools which had been estab. before the passing of the Act. Then came the national call for economy. The N. S. in existence were regarded as costly institutions, and the estab. of further schools was not recommended by the board. Margaret McMillan (q.v.), the pioneer of this movement, had long foreseen that the cost of the small school was likely to prove a stumbling-block. She had always advocated the large open-air school, but the authorities had declined to follow her lead, because they feared the spread of infection if large numbers of the 'unprotected' little ones were gathered together, and they considered that ideal home conditions could more readily be realised in the small school. By her experiment at Deptford Margaret McMillan proved conclusively that a large N. S. of 260 children could be maintained at the low ann. cost of less than £12 per child, and that with open-air conditions there is no undue risk of infection. In Dec. 1929 a circular was sent out from the minister of health and the president of the board of education concerning the welfare of the pre-school child. The essentials for healthy development at this age were summed up as follows: open-air conditions, sun and light, exercise and play, rest, food, and cleanliness. The local authorities were encouraged to establish and support open-air N. S. where these needs could be met. During the years before 1939 a number of N. S. were opened up and down the country and some colleges began to offer training for girls who wished to specialise in N. S. work. With the advent of the war, when fathers were called up and mothers urged into industry, the need for N. S. became more urgent. Many wartime nurseries were opened jointly by the Ministries of Education and Health. These catered chiefly for the child of the working mother. Infant schools opened nursery classes for children from three to five years and with evacuation a large number of residential nurseries appeared. In 1944 the passing of the Butler Education Act made it necessary for local authorities to set up N. S. where there was the demand, but in 1947 the building of new N. S. was banned

by the Ministry of Education. In 1945 the minister of education took over 315 of the war-time nurseries and organised them into N. S., but apart from these there have been few N. S., although day nurseries have once more been opened by the Ministry of Health for children whose mothers are working. In 1949 plans for twenty-one new N. Ss. were passed for building, practically all in industrial areas. The high cost of building a N. S. has been considerably lessened by the realisation that N. S. of the shelter type which were advocated by Margaret McMillan are a suitable form of accommodation for young children. To this end the N. S. Association has designed a new building, similar to those first erected in Deptford. A prototype of this design has been built at Cookham and has been taken over by the Berkshire education authority. In view of the greatly reduced cost of building the prototype, other authorities are now planning N. Ss. on similar lines and it is expected that many more will be built in different parts of the country, so helping to improve the present lamentable position, when only 1.10 per cent of Brit. children between two and five years can find a place in a N. S. See Margaret McMillan, *The Nursery School*, 1930; Susan Isaacs, *The Intellectual Growth of Young Children*, 1935; V. Fedaevsky, *The Nursery School in Soviet Russia*, 1936; and Mrs. P. E. Cusden, *The English Nursery School*, 1942.

Nursing. Sick N. has evolved into a highly skilled profession since the Crimean war. In ant. times there were in existence hospitals, or at least some kind of dispensary system, for the sick poor in Egypt, India, Greece, and Rome. Essentially, however, organised N. as a branch of medical treatment may be said to have taken its rise amongst the deacons of the early Christian Church. From the fourth century on the development of N. was rapid, and the institutions were managed by the clergy, and the nurses recruited from the male and female monastic orders. Throughout the Dark and Middle Ages this system obtained. The oldest institutions in England are St. Thomas's and St. Bartholomew's Hospitals, and their names indicate their religious connection. The Reformation caused a secular system to be introduced. Any measure of systematic N. was not attempted until the middle of the nineteenth century, and until then all the skill that nurses possessed was acquired in the course of their work in the wards. Germany saw the birth of the new system at the foundation of the institute of Pastor Fliedner in 1836 at Kaiserswerth; and it was at this place that Florence Nightingale was trained. Pastor Fliedner's institute was soon followed by the formation of societies in Philadelphia (1838) and in London (1840). The latter was founded by Mrs. Fry, and the nurses were trained at Guy's and St. Thomas's Hospitals. Between 1842 and 1851 sev. schools were formed on the Continent.

The pub. of the horrors of the Crimean war gave a new impetus to the pro-

fession, and raised it considerably in the public esteem. Florence Nightingale with a band of trained nurses undertook the administration of the hospitals, and reformed them, besides nursing the sick. As a result, too, in 1860 the Nightingale Fund Training School for Nurses was founded at St. Thomas's Hospital, with public subscriptions given in recognition of her great work; and all over the Continent similar schools were soon estab. During recent years the practice of preventive medicine and the advance of medical science generally have made it essential that nurses should be highly skilled and trained.

Nursing as a Profession.—N. ranks high as a profession for women, since it has an essentially feminine appeal. It gives an opportunity for service, combined with the prospect of professional standing and an assured future with good salary and pension rights. The profession is also open to men. The number of male nurses has increased very considerably of recent years. Training is available to men in a number of general hospitals and mental hospitals, lists being obtainable from the Ministry of Health and the General N. Council for England and Wales.

To train as a nurse it is necessary to possess good health, an even temperament, and a spirit of service. The usual age of entry is between the ages of eighteen and thirty years. Entry to hospital is generally by way of a preliminary training school attached to the hospital, or in the case of the smaller hospitals through a central preliminary training school. This period varies from three to four months, and at its completion the student enters the hospital and continues training in the wards and depts. The length of training varies; in some hospitals it is three and others four years. Three years is the period required by the General N. Council for England and Wales, the statutory body responsible for the training and professional education of the student nurse. This body regulates and sets the preliminary state examination which can be taken in two parts. Part I. (theoretical) may be taken on completion of a pre-nursing course, arranged by many schools, and is taken at the completion of general education and prior to entering the preliminary training school, or at the completion of six months' training in the hospital. Part II. (practical) is taken after twelve months' training. The final state examination is taken at the completion of three years' training. The successful candidate then becomes a state-registered nurse and her name is entered on the register kept by the General N. Council. Many hospitals now give training under a system known as the 'block system of training,' which means that the student takes the theoretical part of training away from the wards; during the time in this school of N. she works entirely as a student, returning to the wards again after a period of about six weeks. Other hospitals have a modification of this system and others have a study-day a week. Many hospitals have adopted a straight

span of duty. The twenty-four hours are split into three spans of eight hours each.

At the completion of training many opportunities present themselves to the state-registered nurse. The post of staff nurse in hospital prepares for greater responsibility and higher posts such as that of ward sister, assistant matron, sister-tutor, and matron. There is the Queen's Institute of District Nurses, for those who like to nurse the sick in their own homes and who like to work from their own home. Private N. appeals to many. At the present time great emphasis is laid on the preventive side of medicine and there is a wide field for work as health visitors, school nurses, and industrial nurses. Interesting work is available with any of the services attached to his majesty's forces (see MILITARY NURSING SERVICE), and in the field of medical missions. Many post-graduate courses are arranged. A diploma of N. can be taken at the univs. of London and Leeds. The sister-tutor's diploma is awarded by the univ. of London. Courses are also arranged for hospital administration, the qualification of health visitors, etc. Training for qualification of midwives is controlled by the Central Midwives' Board. Part I. training qualifies a nurse to act as a maternity nurse, working with a doctor, and Part II. gives the qualification as a state-certified midwife.

Salaries and emoluments are controlled by a Whitley Council and an overall salary is paid, the nurse repaying the hospital for board and residence. The nurse pays a share of the superannuation contribution.

Certain hospitals have training schools (q.v.) for assistant nurses, those who qualify becoming state-enrolled assistant nurses. The nurse's name is then entered on the roll kept by the General N. Council. This training covers a period of two years and is designed for those who cannot take the full training for state registration.

Salaries range approximately as follows:
(1) for a student nurse:

Gross Salary	Repayment to Hospital
First year £200	£100
Second year £210	£100
Third year £225	£100

Male nurses employed in the administrative co. of London receive an additional allowance of £24 14s. per annum; those employed in the Metropolitan Police dist. outside the administrative co. of London, an additional payment of £14. 6s. per annum.

(2) For a pupil or probationer assistant nurse:

Gross Salary	Repayment to Hospital
First year £200	£100
Second year £210	£100

The same allowance as above is paid to male nurses. Slightly higher salaries are paid to those training for mental and tuberculosis N.

(3) Salaries of (a) enrolled assistant nurse; (b) staff nurse (S.R.N.); and (c) ward sister are as follows:

Gross Salary	Repayment to Hospital
(a) £285 by ann. increments of £12 10s. to £385 . . .	£120
(b) £315 by ann. increments of £12 10s. to £415 . . .	£120
(c) £375 by ann. increments of £15 to £480 and further increment of £20 to £500 . .	£130

Salaries for assistant matron, sister-tutor, and matron are on a higher level and under review at the present time (1950). Salaries for male nurses are approximately £10 per annum higher than above.

The status of the nurse is protected by the Nurses' Bill of 1943, by which Act it is an offence for any person to call herself/himself nurse who is not a state-registered or state-enrolled assistant nurse. The Nurses' Bill, which was before Parliament in 1949, is an Act to reconstitute the General N. Council for England and Wales and otherwise to amend the Nurses' Acts, 1919-45, to establish standing nurse training committees, registration of nurses trained abroad, etc. The professional negotiating organisation for nurses is the Royal College of Nursing. The National Council of Nurses of Great Britain and N. Ireland is an association of affiliated organisations through which the member bodies are affiliated to the International Council of Nurses. The Brit. Red Cross Society and the St. John's Ambulance Brigade arrange for lectures in home nursing and first aid. Members of the detachments are taught practical first aid and N. procedures. These societies have given very valuable help in augmenting hospital staffs most particularly during the two world wars.

Home Nursing.—Treatment of illness or injury in the home, usually by the non-professional, though also by the dist. nurse (see under NURSING). With the extension of hospital services in modern times the field of home N. has become more restricted. It is rare for even the simplest operation to be performed in the home. But a knowledge of home N. is still essential for the treatment of minor illnesses or injuries, for the care of more serious cases, both before the patient is removed to hospital or N.-home, and during convalescence. Cases of influenza and sometimes pneumonia, acute infectious fevers such as measles, chicken-pox, and whooping cough, and simple digestive disturbances are normally treated at home, as well as chronic cases such as surgical tuberculosis in children and chronic rheumatism and chronic bronchitis in old people. Home N. also embraces the treatment of accidents such as bruises, cuts, burns, and sprains.

Some knowledge of home N. is indispensable in every household, and is particularly necessary in homes where there are young children. Although some knowledge of medicine and hygiene is required, the essential qualifications for home N.

are common sense, sympathy, and resourcefulness. The same qualities of obedience and loyalty which are demanded of the hospital nurse are demanded of the home nurse. If she is sensible and capable she can do much to further the work of the doctor by carrying out his orders exactly and efficiently. Her actions can make or mar his prescribed treatment.

The arrangement of the sick-room is an important part of home N. The ideal situation is in the upper part of the house, since the air is purer and ventilation easier, and in infectious cases an upper room can be more easily isolated. It is normally quieter also, and a room which faces S. or S.W. allows for the maximum amount of sunlight and warmth. Sensible ventilation is an essential aspect of the hygiene of the sick-room, since purity of atmosphere is most important. It is necessary to keep the temp. constant, to avoid draughts, and to arrange for suitable lighting. The home nurse is always careful to avoid overfurnishing of the sick-room, since this would result in the collection of dust and might hamper her movements, but she should do her utmost to make the room as pleasant and cheerful as possible, by the choice, for example, of well-arranged flowers as decorations, which are removed each night.

Much of the art of home N. lies in the ability to adapt skilfully. While the home nurse possesses a number of medicines and bandages she usually lacks the facilities which the hospital nurse possesses, and it is frequently impossible for her to provide the ideal sick-room. She therefore makes the best of the materials available, always taking scrupulous care in matters of hygiene. She cleans and dusts the sick-room daily, disturbing the patient as little as possible, for the amateur nurse can easily irritate the patient by noisiness or over-attention. Like the hospital nurse and the doctor, the home nurse is concerned with the prevention, as well as the cure, of illness. By isolation, by the routine disinfecting of all objects used in the sick-room, and by the immediate burning of soiled articles such as used bandages and swabs, she can do much to lessen the risk of infection breaking out among other members of the household.

One of the first essentials for the home nurse is to learn the use of the clinical thermometer, to read it accurately, cleanse it properly, and to acquaint herself with the various methods in which the temp. of the patient may be taken and recorded. She performs such duties as bed-making and washing of the patient, and such tasks are best done by using the methods followed in hospitals. A routine knowledge of the methods of changing dressings, of the way to administer drugs, food, and any treatment ordered, at the exact time, in the exact quantity and exactly as ordered, and of the accounting to the doctor of all that has taken place since his last visit clearly and dispassionately are all duties of the home nurse. The greatest care should be given to the dainty

serving of appetising meals and to introducing a measure of variety. The advance in the development of reliable patent medicines has lightened the home nurse's responsibilities in many cases, making only sensible administration, and not preparation also, necessary. The efficient home nurse always possesses a clinical thermometer, a satisfactory stock of the reliable patent medicines suitable for the treatment of the minor ailments such as aspirins, laxatives, burn ointment, etc., as well as supplies of lint, bandages, adhesive plaster, elastoplast, and antiseptics.

While the home nurse's duties frequently consist of carrying into effect the orders of a doctor, she is often called upon to act upon her own initiative in an emergency (but should never hesitate to send for the doctor), and this entails coolness and common sense. Often the home nurse is also a housewife, and is forced to combine the running of a home with the extra task of applying first aid to an injury or N. a sick person for many weeks, and this dual occupation necessitates that she be a person of good health, courage, and method, since otherwise both patient and home may suffer. Her responsibilities are great; to complete a successful convalescence, to deal with the rapidly alternating condition of a feverish patient, or with the changing moods of a sick child, require a person who combines skill with deep sympathy.

The home nurse is usually dealing with patients who are not so ill as those under the treatment of the hospital nurse, and much of her work is connected with restoring her patient's confidence and interest in life, as well as health. She avoids fussiness and is always tactful and optimistic. She coaxes her patient to health, taking care not to give the appearance of bullying or forcing. Her task is complicated by the fact that her patients are usually members of her own family; she has no need, like the hospital nurse, to treat them consciously as individuals. Her effort has rather to be directed in the opposite direction, in the curbing of over-emotionalism, even though her firmness concerns those to whom she is related. The successful home nurse requires many of the qualities of the hospital nurse.

Nusseerabad, see NASIRABAD.

Nut, Egyptian goddess, one of the great company of Heliopolis, wife of the earth-god Seb. She personified the vault of heaven and is represented as such with raised body studded with stars, and pendant legs and arms, arched over the recumbent figure of Seb. N. was the primeval mother of the gods and mistress of the sky, figured at times as the celestial cow; her children were Osiris, Horus, Set, Isis, and Nephthys. Apparently she is not identical with the N. who was one of the ladies of the sycamore and provided refreshment for the soul before it started its dismal journey after death.

Nut, strictly a fruit, with a woody pericarp which decays to set free the seed or seeds (e.g. hazel, beech, acorn, and Sp. chestnut). The fruit of the horse chestnut is properly described as a berry-like capsule. Most of them are rich in oils and starches, and their value as food has received much attention in recent years. Many nutritious articles of diet, including butter substitutes, are prepared from them. The most important are the coco-nut, Brazil, walnut, chestnut, hazel, cashew, and pea-nut. See also GROUND-NUTS. See F. N. Hower, *Nuts: Their Production and Everyday Uses*, 1948.

Nutation is compounded of a number of independent motions of the earth's axis, the most important of which is known as *Lunar N.*, with a period of 18 years 220 days, the time of a sidereal revolution of the moon's nodes. The major and minor semi-axes of the ellipse described are 9.2 in. and 6.8 in., respectively. There is also a *Solar N.* with a period of half a tropical year, and in addition, a *Fortnightly N.* The value of the N., taking all the contributory factors into consideration, can be computed for any star by using certain constants which are given in the *Nautical Almanac* each year for every day of the year. See PRECESSION.

Circumnutation is a term used in botany for the irregular movements of the stem apex.

Nutoracker, or *Nucifraga*, genus of birds of the crow family. *N. caryocatactes*, occasionally visits Britain. It is about the size of a jackdaw, having a brown back, with a long white spot on each feather, dark brown head, white tipped outer tail-feathers, black feet, and a black bill. In flight and habits it resembles the jay. It feeds on fruit, a variety of insects, and also the eggs and young of small birds. The nest is a big, clumsy structure, and in it about three eggs are laid, which are very light green, spotted with pale brown.

Nut-galls, see GALL-FLIES.

Nuthatch, or *Sitta Europaea*, passerine bird fairly common in the S. half of England and in Europe. Its plumage is bluish-grey above, and the under-surface is light reddish-brown or buff; the throat

is white, and the tail-feathers have white tips. The bill is powerful and wedge-shaped, and is used to force away the bark in the search for insects, as well as to break nuts. It is a skilful climber, able to descend a tree head downwards. As in other tree-climbing birds, its first toe is much developed. The nest, is made commonly in a hole in a tree, and the mouth of it is plastered up with mud, except for a hole just big enough to give the bird admittance. In it are laid about seven white eggs, spotted with reddish-brown.

Nutley, tn. of Essex co., New Jersey, U.S.A. Plush, paper, cutlery, pharmaceutical preparations, hats, and leather goods are manufactured. Pop. 21,900.

Nutmeg, kernel of the fruit of sev. species of *Myristica*, of the family Myristicaceae, tropical trees or shrubs, natives of Asia, Madagascar, and America. The fleshy part of the fruit is rather hard, and is often eaten as a sweetmeat, resembling candied fruit; the nut is enveloped in a curious yellowish-red aril, the mace. Ns. yield a peculiar yellow fat, called oil of mace, and by distillation an almost colourless essential oil.

Nutmeg State, see CONNECTICUT.

Nutria, see under COYPU.

Nutrition, see BLOOD; CALORY; CIRCULATION; DIET; DIGESTION; FOOD AND FEEDING.

Nuts, see under SCREWS, BOLTS, AND NUTS.

Nux Vomica, seeds of a small evergreen tree, *Strychnos Nux-vomica* (family Loganiaceae). The seeds are circular and disk-like, about the size of a halfpenny, and covered with soft fawn hairs. The tincture of the Brit. Pharmacopoeia is made by treating with rectified spirit the seeds when finely powdered. The tree occurs in Indian forests as well as in the N. parts of Australia. The rind of the fruit is brittle, and the pulp white and gelatinous, and a number of seeds are produced in each fruit. They have been used to produce a brown dye. The existence in them of strychnine and brucine was not discovered until the early part of the nineteenth century; their presence accounts for the value of N. V. as a tonic.

Nyam-Nyams, see NIAM-NIAM.

Nyanja Dialects, see under NEGRO-AFRICAN LANGUAGES, *Bantu*.

Nyanza: 1. See ALBERT NYANZA, EDWARD NYANZA, and VICTORIA NYANZA. The two lakes formerly known as Albert Edward N. are now known as Lake Albert and Lake George. 2. Prov. of Kenya, cap. Kisumu.

Nyasa, or **Nyanja**, large lake in S.E. Africa, discovered by Livingstone in 1859. Its greatest length is 350 m., and its breadth from 15 to 45 m., with a total area of 14,000 sq. m. It is 1650 ft. above sea level. The lake has abundance of fish, and is drained by the Shire into the Zambesi.
